1.0 Executive Summary

The purpose of this study is to develop annual and summer week-day emission inventories for Texas airport activities for calendar years 2012, 2014, 2017, 2020, 2023, 2026, and 2028. The annual and average summer weekday inventories include all counties in the eight-county Houston-Galveston-Brazoria (HGB), nine-county Dallas-Fort Worth (DFW) 1997 eight-hour ozone nonattainment areas, and the four-county DFW 1997 one-hour nonattainment areas. The HGB 1997 eight-hour ozone nonattainment areas include the following counties: Brazoria, Chambers, Fort Bend, Galveston, Harris, Liberty, Montgomery, and Waller. The DFW 1997 eight-hour ozone nonattainment areas include the following counties: Collin, Dallas, Denton, Ellis, Johnson, Kaufman, Parker, Rockwall, and Tarrant. The DFW 1997 one-hour nonattainment areas include the following counties: Collin, Dallas, Denton, and Tarrant. Eastern Research Group (ERG) developed emissions for nitrogen oxide (NO_x) and volatile organic compounds (VOCs). The inventories will be used to support the State Implementation Plan (SIP) and other airport-related inquiries.

The emissions associated with airport activities include:

- Commercial aviation (SCC: 2275020000)
- Air taxis
  - Piston driven (SCC: 2275060011)
  - Turbine driven (SCC: 2275060012)
- General aviation
  - Piston driven (SCC: 2275050011)
  - Turbine driven (SCC: 2275050012)
- Military (SCC: 2275001000)
- Auxiliary Power Units (SCC: 2275070000)
- Ground Support Equipment
  - Compressed natural gas (CNG)-fueled (SCC: 2268008005)
  - Diesel-fueled (SCC: 2270008005)
  - Gasoline-fueled (SCC: 2265008005)
  - Liquefied petroleum gas (LPG)-fueled (SCC: 2267008005).

To estimate emissions from these sources, ERG compiled and supplemented base year 2012 and 2014 activity data provided by local airports with publicly available activity data. Two approaches were used to estimate emissions from the compiled activity data. ERG used the Federal Aviation Administration's (FAA) Emissions and Dispersion Modeling System (EDMS) if the activity data had aircraft-specific data. If such detailed data were not available, then ERG applied a more general approach for different aircraft types (i.e., air taxis, general aviation, and military aircraft) using available generic emission estimating procedures. Additional information on methodology are included later in the document.

Locally based activity and emissions were obtained, allowing for a more complete data set. Table 1-1 shows the percentage of activity data collected from local airports and the percentage of data supplemented using publicly available data. The data provided by local airports accounts for most of the activity within the SIP counties for both 2012 and 2014.

Table 1-1. 2012 and 2014 Annual Landing and Takeoff (LTO) Summary by Data Source

Data Source	LTOs		Percentage	
	2012	2014	2012	2014
Local-Airport-Provided Data	1,071,618	1,132,242	53%	53%
Publicly Available Data	966,601	993,408	47%	47%
Total	2,038,219	2,125,650	100%	100%

In 2012, general aviation aircraft outfitted with turbine engines accounted for 39% of the total aircraft activities, including activity associated with auxiliary power units and ground support equipment. Commercial aircraft, general aviation aircraft outfitted with piston engines, air taxis outfitted with turbine engines, military aircraft, and air taxis outfitted with piston engines account for 34%, 20%, 7%, 2%, and 1% of the total aircraft activities, respectively.

In 2014, commercial aircraft accounted for 40% of the total aircraft activities, including activity associated with auxiliary power units and ground support equipment. General aviation aircraft outfitted with turbine engines, general aviation aircraft outfitted with piston engines, air taxis outfitted with turbine engines, air taxis outfitted with piston engines, and military aircraft account for 34%, 17%, 7%, 1%, and 1% of the total aircraft activities, respectively.

In 2012 and 2014, Harris County has the highest activity; the airports located in this County accounted for 31% and 41%, respectively, of all activity in scope for this project for 2012 and 2014.

2.0 Introduction

2.1 Purpose and Objectives

The purpose of this study is to develop annual and summer week-day emission inventories for Texas airport activities for calendar years 2012, 2014, 2017, 2020, 2023, 2026, and 2028. The airport emissions inventories will include all counties in the eight-county Houston-Galveston-Brazoria (HGB) and nine-county Dallas-Fort Worth (DFW) 1997 eight-hour ozone nonattainment areas. The HGB 1997 eight-hour ozone nonattainment areas include the following counties: Brazoria, Chambers, Fort Bend,

Galveston, Harris, Liberty, Montgomery, and Waller. The DFW 1997 eight-hour ozone nonattainment areas include the following counties: Collin, Dallas, Denton, Ellis, Johnson, Kaufman, Parker, Rockwall, and Tarrant. The DFW 1997 one-hour nonattainment areas include the following counties: Collin, Dallas, Denton, and Tarrant. ERG developed emissions inventories for nitrogen oxide (NO_x) and volatile organic compounds (VOCs). The inventories will be used to support the State Implementation Plan (SIP) and other airport related inquires.

To develop the comprehensive inventories for the aircraft source category, ERG conducted the following tasks:

- Compile 2012 and 2014 activity data from local airports and publicly available data sources.
- Calculate 2012 and 2014 emission estimates using EDMS 5.1.4.1 and generic emission factors.
- Project 2014 activity and emission estimates to 2017, 2020, 2023, 2026, and 2028 using the FAA's Terminal Area Forecast dataset.
- Calculate average summer weekday emissions.
- Summarize activity and emissions data.

The methods used for this study comply with the United States Environmental Protection Agency (EPA) guidance on developing aircraft emissions inventories as stated in the *Quality Assurance Project Plan for the Development of a Commercial Aircraft Hazardous Air Pollutants Emission Inventory Methodology*[1]. It should be noted that the engine-specific factors used in the model were derived from testing data used to certify the engines and account for U.S. and international emission standards. The inventories will be used to support the SIP and other airport-related inquires.

2.2 Report Organization

Section 3.0 of this report identifies the national and local activity data sources included in this study. This section describes how ERG pulled from each activity data source to compile the 2012 and 2014 activity dataset. This section also documents any assumptions or manipulations that had to be made to each data source to facilitate compiling the activity dataset.

Section 4.0 summarizes the emissions estimation methodology and the results of the 2012 and 2014 emissions inventories. This section also summarizes the activity and emission projection procedures for 2017, 2020, 2023, 2026, and 2028 and the results of the future years' emissions inventories. This section includes summary emissions tables on a county-level basis and by SCC for NO_x and VOCs.

The NO_x and VOC emissions associated with airport activities are included in the access database submitted with this report for 2012, 2014, 2017, 2020, 2023, 2026, and 2028.

2.3 Background

This report covers airport activities as point sources. The aircraft source category includes all aircraft types used for public, private, and military purposes. Following are the four typical aircraft types and their Source Classification Codes (SCC):

- Commercial aviation (SCC: 2275020000)
- Air taxis
  - Piston driven (SCC: 2275060011)
  - Turbine driven (SCC: 2275060012)
- General aviation
  - Piston driven (SCC: 2275050011)
  - Turbine driven (SCC: 2275050012)
- Military (SCC: 2275001000)

Commercial aircraft transport passengers, freight, or both tend to be larger aircraft that are driven with jet engines. Air taxis (AT), which are also considered to be commercial aircraft, are usually smaller aircraft (less than 60 passengers) that operate on a limited basis compared to larger commercial aircraft that carry between 60 and 800 passengers. General aviation (GA) includes most other aircraft used for recreational flying and personal transportation. Aircraft that support business travel, usually on an unscheduled basis, are included in the GA category.

Aircraft tend to emit significant amounts of NO_x and VOC. The national AT and GA fleet includes both jet and propeller-driven aircraft. Most of the AT and GA fleet are comprised of piston- (or propeller-) driven aircraft, though these aircraft types also include smaller business jets. The piston-driven aircraft tend to have higher VOC emissions and lower NO_x emissions than larger jet-powered aircraft. According to the EPA, propeller-driven aircraft and jet- (or turbine-driven) aircraft account for 72.1% and 27.9%, respectively, of all GA emissions. Propeller-driven aircraft and jet- (or turbine-) driven aircraft account for 21.8% and 78.2%, respectively, of all AT emissions.[2] EPA has used this estimate as a national-scale default value in recently published studies investigating lead emissions from aviation sources.

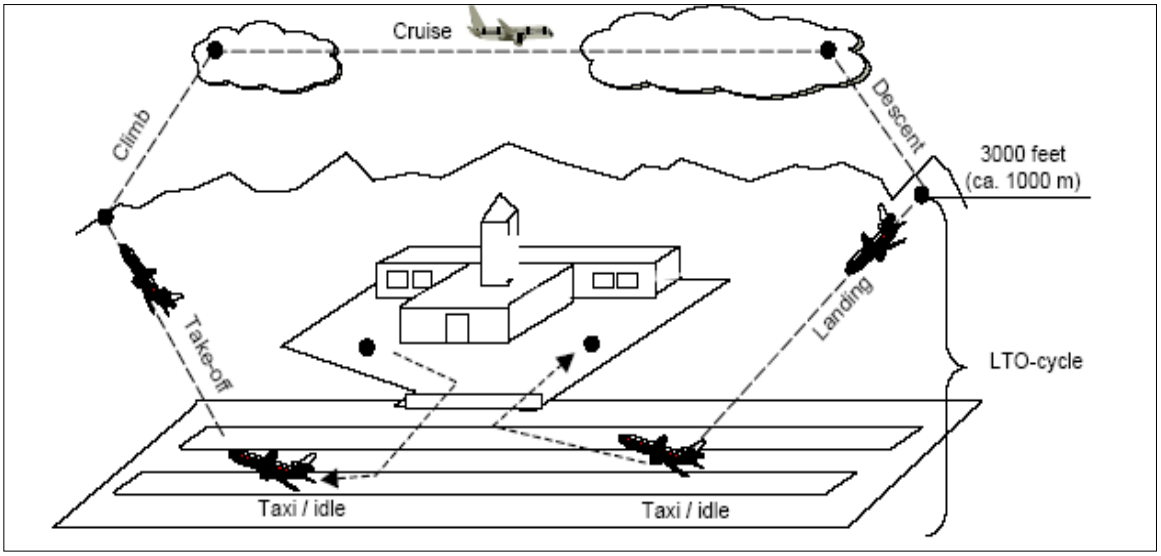
Military aircraft comprise a wide range of aircraft types such as training aircraft, fighter jets, helicopters, and jet- and propeller-driven cargo planes of varying sizes. Because of a lack of information concerning the make-up of the military aircraft fleet, EPA has assumed that most military aircraft are jet-powered.

Aircraft emissions are associated with an aircraft's LTO cycle. The cycle begins when the aircraft approaches the airport on its descent from cruising altitude, then lands and taxis to the gate, where it idles during passenger deplaning. The cycle continues as the aircraft idles during passenger boarding, taxis back onto the runway, takes off, and ascends (or climbs out) to cruising altitude. Figure 2-1 illustrates the six specific operating modes in an LTO cycle:

- Approach
- Taxi/idle-in
- Taxi/idle-out
- Idling
- Takeoff
- Climb out.

The LTO cycle provides a basis for calculating aircraft emissions associated with airports. During each mode of operation, an aircraft engine operates at a specific power setting and fuel consumption rate for a given aircraft make and model. Emissions for one complete cycle are calculated by multiplying emission factors for each operating mode for each specific aircraft engine and the typical period of time the aircraft is operating.

Figure 2-1. Landing and Takeoff Cycle



3.0 Data Sources of Texas Airport Activities Inventoried

This section explains the various sources where ERG obtained various aircraft activity data. There are two general sources of airport data. The preferred sources are from the airports themselves. The other sources of data are from the FAA.

3.1 Local Data from Airports

This subsection describes the process ERG used to obtain the local based airport activity data.

3.1.1 Contacting Airports

ERG contacted local Texas airports by telephone to request 2012 and 2014 activity data and to identify and characterize control strategies used or planned at each airport. The airports contacted included the medium to large airports identified for the 2011 Air Emissions Reporting Requirements (AERR) inventory effort and additional small airports. Of the 591 airports located in the SIP counties, ERG contacted a total of 330.

ERG requested each airport to provide the following:

- 2012 and 2014 landing and takeoff data for aircraft make/model.
- Average taxi-in and taxi-out times.
- Emission control strategies used (i.e., gate electrification, auxiliary power units) for 2012 and 2014 and the expected emission reduction.

Of the airports contacted, 22 submitted operations data, four submitted taxi time estimates, and four provided control strategies. Table 3-1 summarizes the airports that ERG contacted that provided data.

Table 3-1. Summary of Data Provided by Local Airports[1]

State Facility Identifier	Facility Name	Contact Name	Phone Number	Data Provided

[1] For a more detailed account of the communications between ERG and the airports contacted, see Appendix A.

3.1.2 Summary of Local Data Received

As noted in the previous section, ERG collected local data from 22 of the airports contacted. In addition, four airports submitted taxi time estimates, and four provided control strategies.

The local data were available in different formats depending on how each airport recorded airport activity. The 2012 operations data were submitted as annual totals, annual totals by generic aircraft type categories, or annual totals by specific aircraft make and model.

Of the airports from which ERG collected local data, 13 submitted operations or LTO data as annual totals. Table 3-2a summarizes the 2012 and 2014 operations data submitted as annual totals and Table 3-2b summarizes the 2012 and 2014 LTO data submitted as annual totals. Lone Star Executive Airport also provided the percentage of gates that were electric (see Table 3-6).

Table 3-2a. Operations Data: Submitted as Annual Totals

State Facility Identifier	Facility Name	2012 Annual Operations	2014 Annual Operations
F18 (CPT)	Cleburne Muni	8,550	24,456
CXO	Lone Star Exec	62,497	61,035
TKI	McKinney National	83,374	97,630

87TS	Star Houston	130	130

One of the airports (Denton Municipal Airport) submitted operations data as monthly totals by generic aircraft type categories. Table 3-3 summarizes the 2012 and 2014 operations data submitted as monthly totals by generic aircraft type categories. Denton Municipal Airport did not provide data for December 2014, as they were unavailable at the time data were collected.

Table 3-3. Denton Municipal Airport 2012 and 2014 Operations Data: Submitted as Monthly Totals by Generic Aircraft Type Categories

Month	Year	Air Carrier	Air Taxi	General Aviation Local LOC	General Aviation Itinerant	Military Local	Military Itinerant

N/A – Not applicable.

Four of the airports provided 2012 and 2014 data by specific aircraft type and four provided data by specific aircraft-engine combinations. Republic Helicopters provided annual LTO totals by specific aircraft. Table 3-4 summarizes the 2012 and 2014 activity data for Republic Helicopters.

Table 3-4. Republic Helicopters 2012 and 2014 LTOs: Submitted by Specific Aircraft Type

State Facility Identifier	Airport Facility	Aircraft Code	2012 LTOs	2014 LTOs
2TE1	Republic Helicopters	BELL206	3,871	3,564
2TE1	Republic Helicopters	BELL222	413	448

Flyin' B and Propwash airports provided annual Touch and Go (TGO) totals by specific aircraft. TGOs are defined as LTO cycles that have 0 minutes of taxi time. Table 3-5 summarizes the TGO totals.

Table 3-5. 2012 and 2014 TGOs: Airport Submitted by Specific Aircraft Type

State Facility Identifier	Airport Facility	Aircraft Code	2012 TGOs	2014 TGOs
39R	Flyin' B	R44	50	50
16X	Propwash	CNA150	1,250	1,250
16X	Propwash	MOONEY-M20K	1,250	1,250

Dallas Love Field provided aircraft specific arrival counts for 2012 and 2014. Dallas Fort Worth International Airport and the Houston airports (Ellington Field Airport, William P Hobby Airport, and George Bush Intercontinental Airport) provided aircraft-engine-specific LTO cycle data and air taxi time for 2012 and 2014. Additionally, the Houston airports provided aircraft-engine specific LTO and taxi time data for the projected years 2017, 2020, 2023, 2026, and 2028. Appendix B summarizes the activity data for Dallas Love Field, Dallas Fort Worth International, and the Houston airports.

Dallas Love Field, William P Hobby, and George Bush International airports also provided the percentage of gates that were electric. William P Hobby and George Bush International airports provided the gate electrification percentage by airline. Table 3-6 lists the gate electrification percentages.

Table 3-6. Gate Electrification Percentages

State Facility Identifier	Airport Facility	Airline	2012 Percentage of Electric Gates	2014 Percentage of Electric Gates
CXO	Lone Star Exec	-	53%	
DAL	Dallas Love Field	-	45%	42%
IAH	George Bush Intercontinental/Houston	United Airlines	52%	
HOU	William P Hobby	Southwest Airlines	51%	

For local airports that submitted aggregated annual totals and also had publicly available data by specific aircraft make/model, ERG adjusted the publicly available data to reflect the total data provided by the local airport. Therefore, specific aircraft data could be retained. For example, an airport provided an annual total of 30,000 LTOs and the publicly available aircraft make/model-specific activity data for that airport totals 25,000 LTOs. In this case, ERG applied a factor of 1.2, developed by dividing the local airport-provided LTO total by the publicly available LTO total to the aircraft make/model-specific LTO data to be consistent with the airport-provided activity level.

The local data provided by airports were the basis for the TCEQ's 2012 and 2014 aircraft inventory. ERG filled the data gaps using publicly available 2012 and 2014 data. For

consistency between the local dataset and the publicly available dataset, ERG converted the 2012 and 2014 operations data into LTO cycles. This combined dataset will be used as the 2012 and baseline 2014 activity data for this study.

3.2 Publicly Available Data Sources of Texas Airport Activities

ERG compiled publicly available activity data from the following sources:

- Bureau of Transportation Statistics (BTS) T-100 segment dataset.[3]
- FAA Terminal Area Forecast (TAF) dataset. [4]
- FAA Airport Operations: Standard Report (ATADS) dataset.[5]
- FAA Airport Master Record (5010) dataset.[6]

ERG adjusted the compiled data for duplicates associated with the four datasets. This section discusses each data source investigated for this project, summarizing the publicly available data and noting any limitations or data gaps.

3.2.1 T-100 Dataset

The T-100 data is an activity dataset that includes information provided by domestic and international commercial air carriers. During the time period of this study, only January through August activity data were available for 2014. To obtain the missing months from the 2014 activity dataset, ERG adjusted data from September through December for 2013 to reflect 2014 data using scale factors developed from the TAF dataset. The 2012 activity dataset was available in its entirety and. had the most specific data of the four datasets. The T-100 data included airport, aircraft make and model, and LTO cycle data. ERG incorporated the engine information from the FAA's Emissions and Dispersion Modeling System 5.1.4.1 (EDMS) default engine list into the dataset. Appendix C summarizes the T-100 data used for this study.

3.2.2 TAF/ATADS Datasets

As an improvement over the 2011 emissions inventory effort, ERG included the ATADS activity data in the 2012 and 2014 emissions inventory development. The ATADS dataset is air traffic operations from the FAA's National Airspace System and. is considered to include more operations data than the TAF dataset. The ATADS dataset is provided in the same format as the TAF dataset.

The TAF dataset is an FAA dataset derived from a variety of sources such as reported traffic at FAA towered facilities, data reported directly by airports, and FAA-derived estimates from historical information. This dataset includes airport, aircraft categories, and operations data.

The aircraft categories included AC, AT, military (MIL), and GA. As mentioned in Section 2.3, propeller-driven aircraft and jet- (or turbine-driven) aircraft account for 72.1% and 27.9%, respectively, of all GA emissions. Propeller-driven aircraft and jet- (or turbine-) driven aircraft account for 21.8% and 78.2%, respectively, of all AT emissions. The aircraft categories from AT and GA were broken out into piston and jet engines. This breakout is important because piston engines have different emission factors than jet engines.

ERG removed the overlap between the ATADS and TAF dataset from the TAF dataset, as the ATADS dataset includes more operations data for each aircraft type. For consistency between the other two datasets, ERG converted the ATADS/TAF operations data into LTO cycles. Because there was overlap between the ATADS/TAF and T-100 datasets and t. he T-100 activity had a higher priority than the TAF dataset because it had greater detail, ERG removed the duplicate data from the ATADS/TAF dataset.

3.2.3 5010 dataset

The 5010 dataset comprises data EPA compiled from the FAA's airport 5010 master plan data and estimated activity levels based on statistical techniques described in greater detail in the EPA aviation lead report from December 2010[7]. The 5010 data were provided by the EPA to the states via the EPA's National Emissions Inventory (NEI). These data include airport, aircraft categories, and LTO cycle data.

The aircraft categories include AC, AT, MIL, and GA. The aircraft categories in the 5010 dataset are AT and GA broken out into piston- and jet engine-powered aircraft as they tend to include some of the smallest airports and landing strips.

ERG adjusted the 2010 dataset to reflect the 2012 and 2014 activity levels using the TAF dataset.

4.0 Summary of 2012, 2014, 2017, 2020, 2023, 2026, and 2028 Emissions

4.1 Emission Estimation Methodology

To develop the most accurate aircraft emission inventory possible, ERG took two different approaches. If aircraft-specific data were available, ERG used the FAA's EDMS model in conjunction with detailed aircraft activity data from T-100 (see Appendix C for T-100 data). If such detailed data were not available, then ERG applied a more general approach for different aircraft types (i.e., air taxis, general aviation, and military aircraft) using available generic emission estimating procedures. Using these two complementary approaches provides the most accurate emission estimates for the larger commercial jets, which tend to be the most significant aircraft emission source, while still providing estimates for smaller aircraft.

4.1.1 Emissions and Dispersion Modeling System

There are 591 airports in the eight-county HGB and nine-county DFW 1997 eight-hour ozone nonattainment areas; 16 are airports for which detailed aircraft activity data were available. To estimate 2012 and 2014 emissions for these airports, ERG used local data, when available, and T-100 segment data (summarized in Appendix C) in conjunction with the FAA EDMS model – version 5.1.4.1.

EDMS is an emission estimating tool developed by the FAA and can estimate criteria and HAP emissions from a variety of stationary and mobile sources. Stationary sources include fuel storage tanks, power and heat generation, surface coating, degreasing, and incineration. Mobile sources include aircraft, auxiliary power units (APUs), ground support equipment (GSE), road traffic (including shuttle bus services), and vehicle emissions from parking areas.

For the 2012 and 2014 emissions inventory, the EDMS analysis was limited to aircraft, APU, and GSE emissions. Note that emissions from APU and GSE are reported separately to the NEI and have their own SCC codes. The APU SCC code is 2275070000, and the GSE SCC codes are 2265008005, 2267008005, 2268008005, and 2270008005 for GSE fueled by gasoline, LPG, CNG, and diesel, respectively.

EDMS allows users to customize time-in-mode and mixing height to estimate more precise aircraft emissions. Time-in-mode is synonymous with the LTO cycle discussed above. For each large airport, ERG developed airport specific taxiing and idling times and mixing height to adjust time-in-mode for approach and climb-out modes. ERG collected taxiing and idling times from on-time performance reports submitted to BTS by certificated air carriers[8] and collected upper-air weather observations compiled by the National Climatic Data Center and published by the EPA Support Center for

Regulatory Air Models.[9] ERG identified the closest weather service station to each large airport. The mixing height provides a vertical cutoff for EDMS modeling of aircraft emissions.

For each individual aircraft make and model (e.g., Boeing 747-200 series), EPA has assigned an engine type and code, which can be linked to the engines in EDMS. EDMS incorporates the latest aircraft engine emission factors from the International Civil Aviation Organization Engine Exhaust Emissions Data Bank.[10]

EDMS uses the following equation to estimate aircraft emissions:

$$E_{il} = \sum Tk \times NE_{jl} \times (FF_{jlk} / 1000) \times (EI_{jlk}) \times LTO_{jl}$$

Where:

E_{il}	=	Emission of pollutant i in pounds produced by the aircraft make j and model l
T_k	=	Operating time in mode k (min)
NE_{jl}	=	Number of engines associated with aircraft make j and model l
FF_{jlk}	=	Fuel flow for individual engine used on aircraft make type j and model l operating in mode k (lbs/min)
EI_{ilk}	=	Emission index for pollutant i for each engine associated with aircraft make j and model l operating in mode k (lbs of pollutant /1,000 lbs of fuel)
i	=	Pollutant (i.e., HC, VOC, CO, NOx SO2)
j	=	Aircraft make (e.g., Boeing, McDonald Douglas, Airbus)
l	=	Aircraft model (e.g., B-737 300 series)
k	=	Mode (approach, taxi, climbout).

APUs are most often on-board generators that provide electrical power to the aircraft while its main engines are shut down and to provide startup power form the main engines. The APU is, in effect, a small jet engine and the calculations for the emissions generated by it are similar to that of an aircraft engine operating at an optimal power setting only. APU emissions are generated per LTO cycle.

ERG estimated emissions from APUs using the following equation within EDMS:

$$E_{ij} = T \times (FFj/1{,}000) \times (EI_{ij})$$

Where:

E_{ij}	=	Emission of pollutant i in pounds produced by the auxiliary power unit installed on aircraft type j for one LTO cycle
T	=	Operating time per LTO cycle (min)
FF_j	=	Fuel flow for each auxiliary power unit used on aircraft type j (lbs/min)
EI_{ij}	=	Emission index for pollutant i for each auxiliary power unit used on aircraft type j (lbs of pollutant /1,000 lbs of fuel)
i	=	Pollutant (i.e., VOC, NO_x)
j	=	Aircraft type (e.g., B-737, MD-11)

APU emissions can be reduced by using electricity and pretreated ventilation air from the terminals. Where local data indicated that such enhancements are part of the facilities emission reduction strategy, ERG reduced APU emissions by the percentages listed in Table 3-6, in Section 3.1.2.

Upon arrival at a gate, aircraft are met by GSE to unload baggage and service the lavatory and cabin and prior to aircraft departure, GSE loads baggage, food, and fuel. When an aircraft departs from a gate, a tug may be used to push or tow the aircraft away from the gate and to the taxiway. ERG derived GSE emission factors used by EDMS from EPA's NONROAD2005 model; these factors are based on fuel, brake horsepower, and load factor.

ERG estimated GSE emissions by applying activity data to an appropriate emission factor within EDMS with the additional emission reduction outside of EDMS as noted in the following equation:

$$EE = A \times EF \times (1\text{-}CE/100)$$

Where:

EE	=	Emission estimate (tons per year)
A	=	Annual activity level
EF	=	Emission factor (tons/activity)
CE	=	Anticipated emission reduction (percentage)

GSE activity level (minutes per arrival, minutes per departure) is assigned based on the type of service. For example, a fuel truck servicing a large commercial aircraft has a different operating time than the same fuel truck servicing a smaller aircraft.

4.1.2 Generic Emission Estimating Procedures

EDMS can provide emission estimates if the aircraft make and model are known. Often this is not the case for air taxis, general aviation, and military aircraft activity in the TAF and 5010 datasets. For 582 smaller airports operating in eight-county HGB and nine-county DFW 1997 eight-hour ozone nonattainment areas , ERG used the generic approach that relies upon representative criteria emission factors provided by EPA, using the following equation:

$$E_{ixj} = LTO_i \times FR_x \times EF_{ij}$$

Where:

E_{ixj}	=	Emission estimate for aircraft type i equipped with engine type x and pollutant j (lbs/year)
LTO_i	=	Annual count of LTO cycles for aircraft type i
FR_x	=	Fraction of LTOs equipped with engine type x
EF_{ij}	=	Generic emission factor for aircraft type i equipped with engine type x and pollutant j (lbs/LTO)
i	=	Aircraft type (i.e., air taxi, general aviation, and military)
x	=	Engine type (i.e., jet or turboprop, and piston engine)
j	=	Criteria pollutant j

Critical to the calculation is the application of representative emission factors that account for the different aircraft in the national fleet. Table 4-1 lists the generic emission factors for NO_x and VOC by aircraft type.[11]

As discussed above, when the GA and AT breakout is unknown, EPA has assumed that 72.1% of all GA activity are powered by propeller-driven aircraft and 27.9% are jet (or turbine) driven; and 21.8% of all AT activity are powered by propeller-driven aircraft and 78.2% are jet (or turbine) driven. The 5010 data had the piston and jet engines already disaggregated.

Table 4-1. Emission Factors for Aircraft Types (pounds per LTO)

Aircraft Type	Pollutant	
	VOC	NO_X
Commercial	6.16	18.6
Air Taxi (jet)	1.01	0.78
Air Taxi (propeller)	0.17	0.16
General Aviation (jet)	0.69	0.32
General Aviation (propeller)	0.15	0.065
Military	1.42	0.16

4.1.3 Emission Projection Procedures

ERG used the 2014 inventory as the base year in the emission projection procedure, as it was the most recent dataset gathered and more accurate than projecting the 2012 inventory. The 2014 base year inventory was projected to 2017, 2020, 2023, 2026, and 2028 using projection factors developed from the TAF dataset. The 2012 inventory used actual 2012 data and was not back casted from 2014. Therefore local actual data were used in both 2012 and 2014.

The TAF dataset includes all operations data for the years 1990 to 2040 by generic aircraft type for all TAF airports. ERG developed projection factors by calculating the ratio of base year operations and projection year operations by airport and aircraft type. ERG also developed projection factors by aircraft type to project the emissions from airports that are not included in the TAF dataset. Appendix D lists the growth factors.

4.1.4 Summary of Texas Airport Emissions

The results of implementing the emission estimation methodology and emission projection procedures for the years 2012, 2014, 2017, 2020, 2023, 2026, and 2028 are presented in Table 4-2 through Table 4-7. Tables 4-2 and 4-3 present the daily NO_x and VOC emissions for DFW 4-county areas; Tables 4-4 and 4-5 present the daily NO_x and VOC emissions for DFW 9-county areas; and Tables 4-6 and 4-7 present the daily NO_x and VOC emissions for the eight HGB counties.
