Notes:

U = Analyte was not detected at or above the SDL.

J = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample was prepped or analyzed beyond the specified holding time

b = The compound was found in the blank and sample

NA = Not Analyzed

* = LCS or LCSD exceeds the control limits

Bold Italic = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas Risk Reduction Program

PCL = protectice concentration level

1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenuation Action Level

All results reported in milligrams per liter (mg/L)

P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

U = Analyte wiU = Analyte was not detected at or above the SDL.

J = Result is le‡ = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample wiH = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not AnalNA = Not Analyzed

* = LCS or LCSI* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas FTRRP = Texas Risk Reduction Program

PCL = protectiiPCL = protectice concentration level

1 TRRP PCL = €1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = AttenuaAAL = Attenuation Action Level

All results repAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

Notes:

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

U = Analyte wa U = Analyte was not detected at or above the SDL.

J = Result is le J = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample wa H = Sample was prepped or analyzed beyond the specified holding time

b = The compc b = The compound was found in the blank and sample

NA = Not Anal NA = Not Analyzed

* = LCS or LCS * = LCS or LCSD exceeds the control limits

Bold Italic = E ***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas I TRRP = Texas Risk Reduction Program

PCL = protecti PCL = protective concentration level

1 TRRP PCL = C 1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW 2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenua AAL = Attenuation Action Level

All results rep All results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

U = Analyte wiU = Analyte was not detected at or above the SDL.

J = Result is leJ = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample waH = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not AnalNA = Not Analyzed

* = LCS or LCSI* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas fTRRP = Texas Risk Reduction Program

PCL = protectiiPCL = protectice concentration level

1 TRRP PCL = t1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = AttenuaAAL = Attenuation Action Level

All results repiAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

Notes:

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

U = Analyte wasU = Analyte was not detected at or above the SDL.

J = Result is lesJ = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample wasH = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not AnalNA = Not Analyzed

* = LCS or LCSI* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas fTRRP = Texas Risk Reduction Program

PCL = protectiPCL = protectice concentration level

1 TRRP PCL = C1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenua AAL = Attenuation Action Level

All results repAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

U = Analyte was not detected at or above the SDL.

J = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample was prepped or analyzed beyond the specified holding time

b = The compound was found in the blank and sample

NA = Not Analyzed

* = LCS or LCSD exceeds the control limits

Bold Italic = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas Risk Reduction Program

PCL = protectice concentration level

1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenuation Action Level

All results reported in milligrams per liter (mg/L)

P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

U = Analyte w: U = Analyte was not detected at or above the SDL.

J = Result is le: J = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample w: H = Sample was prepped or analyzed beyond the specified holding time

b = The compc: b = The compound was found in the blank and sample

NA = Not Anal: NA = Not Analyzed

* = LCS or LCS: * = LCS or LCSD exceeds the control limits

Bold Italic = E: ***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas I: TRRP = Texas Risk Reduction Program

PCL = protecti: PCL = protectice concentration level

1 TRRP PCL = C: 1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW: 2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenua: AAL = Attenuation Action Level

All results repr: All results reported in milligrams per liter (mg/L)

P1 - The %Diff: P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

Notes:

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

U = Analyte wiU = Analyte was not detected at or above the SDL.

J = Result is leJ = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample waH = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not AnalNA = Not Analyzed

* = LCS or LCS* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas rTRRP = Texas Risk Reduction Program

PCL = protectiPCL = protective concentration level

1 TRRP PCL = t1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = AttenuaAAL = Attenuation Action Level

All results repAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

Notes:

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

U = Analyte wa U = Analyte was not detected at or above the SDL.

J = Result is le J = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample wa H = Sample was prepped or analyzed beyond the specified holding time

b = The compa b = The compound was found in the blank and sample

NA = Not Anal NA = Not Analyzed

* = LCS or LCS * = LCS or LCSD exceeds the control limits

Bold Italic = E ***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas I TRRP = Texas Risk Reduction Program

PCL = protecti PCL = protectice concentration level

1 TRRP PCL = C 1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW 2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenua AAL = Attenuation Action Level

All results repo All results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes: Notes:

U = Analyte wiU = Analyte was not detected at or above the SDL.

J = Result is leJ = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample weH = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not AnalNA = Not Analyzed

* = LCS or LCSI* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas fTRRP = Texas Risk Reduction Program

PCL = protectiiPCL = protectice concentration level

1 TRRP PCL = C1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = AttenuaAAL = Attenuation Action Level

All results repiAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

Notes:

U = Analyte wasU = Analyte was not detected at or above the SDL.

J = Result is lesJ = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample wasH = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not AnalNA = Not Analyzed

* = LCS or LCSI* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas rTRRP = Texas Risk Reduction Program

PCL = protectiPCL = protective concentration level

1 TRRP PCL = C1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenua AAL = Attenuation Action Level

All results repAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes: Notes:

U = Analyte w:U = Analyte was not detected at or above the SDL.

J = Result is le:J = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample w:H = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not Anal NA = Not Analyzed

* = LCS or LCS:* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas ITRRP = Texas Risk Reduction Program

PCL = protectiPCL = protectice concentration level

1 TRRP PCL = (1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenua AAL = Attenuation Action Level

All results repAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes: Notes:

U = Analyte w:U = Analyte was not detected at or above the SDL.

J = Result is lesJ = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample wxH = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not AnalNA = Not Analyzed

* = LCS or LCSI* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas fTRRP = Texas Risk Reduction Program

PCL = protectiPCL = protective concentration level

1 TRRP PCL = C1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = Attenua AAL = Attenuation Action Level

All results repAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes: Notes:

U = Analyte w;U = Analyte was not detected at or above the SDL.

J = Result is lesJ = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

H = Sample wzH = Sample was prepped or analyzed beyond the specified holding time

b = The compcb = The compound was found in the blank and sample

NA = Not AnalNA = Not Analyzed

* = LCS or LCSI* = LCS or LCSD exceeds the control limits

Bold Italic = E***Bold Italic*** = Exceeds the TRRP Tier 1 PCL. PCLs from TCEQ TRRP Tier 1 Tables, last revised November 12, 2014

TRRP = Texas fTRRP = Texas Risk Reduction Program

PCL = protectiPCL = protective concentration level

1 TRRP PCL = C1 TRRP PCL = GWGWIng = Ingestion of COCs in Class 1 or 2 groundwater

2 Tier 2 AirGW2 Tier 2 AirGWInh-V PCL = Calculated Tier 2 Invalation Exposure PCL

AAL = AttenuaAAL = Attenuation Action Level

All results reptAll results reported in milligrams per liter (mg/L)

P1 - The %Diff P1 - The %Difference between the primary and confirmation column/detector is >40%. The higher value has been reported.

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

F - RPD exceeded lab control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Pink highlighted wells are COA wells

Biege highlighted wells are AMP wells

Dark green highlighted wells are background

Light green highlighted wells are POE wells

MW-17 and MW-29 are sampled as part of the SEHB program and not all Central Plant analytes are required.

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{vw}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{GW}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{tw}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{vw}GW_{ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{tw}GW_{ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{sw}GW_{ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{GW}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{tw}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

PCL - Protective Concentration Level

Concentrations exceed the TCEQ TRRP Tier 1 $^{GW}GW_{Ing}$ PCL

Sample Detection Limit is above PCL

Sampling as Specified in the 2018 RAP.

All concentrations are reported in milligrams per liter (mg/L)

--- Not analyzed

NS - Not sampled

< - Not detected above method detection limit

J - Estimated concentration

H - Bias in sample result is likely to be high.

L - Bias in sample result is likely to be low.

D - The result is from a diluted sample

Notes:

GWPS - Groundwater Protection Standard

Concentrations in **Bold** exceed the SDL

Acronyms

J - Estimated concentration between the SDL and the MQL

U - Not detected at the SDL

SDL - Sample Detection Limit

NAPL - Non-aqueous phase liquid

L – Bias in sample result is likely low

* - LCS or LCSD is outside acceptance limits.

Notes:

- PCL listed is the lowest applicable TRRP Tier 1 groundwater PCL
- TRRP Tier 1 PCLs listed are from the TRRP Tables dated March 31, 2017
- Concentrations in **bold** exceed the SDL

"-" - Not Analyzed

- Concentrations in **red bold** exceed the Tier 1 residential PCL for BTEX or Tier II Residential PCL for TPH
- Concentrations in **red bold** and shaded exceed the Tier I commercial/industrial PCL for BTEX or Tier II commercial/industrial PCL for TPH

Acronyms

(U)	Not detected above the Sample Detection Limit
(J)	Estimated value
(b)	Found in blank and sample
TRRP	Texas Risk Reduction Program
PCL	Protective Concentration Level
NC	Not calculated
NE	Not established
NA	Not Analyzed

ATTACHMENT

Compliance Plan Activities Schedule

Compliance Plan Activities Schedule
KM Liquids Terminals LLC - Galena Park Terminal
Galena Park, Texas
Hazardous Waste Permit No. 50054

Field Tasks

Facility Unit(s) and Basic Elements	Activitiy	Frequency	Scheduled Date	Compliance Plan Section
Southeast Holding Basin (NOR 017)				
Monitoring and Recovery Wells	Top of Casing Elevation Accuracy Verification	Every Five Years	May 2024	Compliance Plan Attachment C
Monitoring and Recovery Wells	Groundwater Sampling	Semiannually	First 60 Days of 1st and 3rd Quarters	HW-50054-000 Provision XI.F.3.a-c
Monitoring wells	1) Water Level Measurement 2) Field Determination of pH, EC, Temperature, and Turbidity 3) Field Observatinos of Groundwater 4) Total Depth and Silt Build Up 5) Well Inspections	Semiannually - during sampling events	First 60 Days of 1st and 3rd Quarters	HW-50054-000 Provision XI.F.3.d.(1)-(5)
Recovery Wells	1) Water Level Measurement 2) Field Determination of pH, EC, Temperature, and Turbidity 3) Field Observatinos of Groundwater 4) Well Inspections	Semiannually - during sampling events	First 60 Days of 1st and 3rd Quarters	HW-50054-000 Provision XI.F.3.d.(1)-(3) and (5)
Recovery Wells	Measure Total Depth and Silt Build Up	When groundwater production decreases by 25% from the initial production	Starting with Issuance of CP Modification (11/8/19)	HW-50054-000 Provision XI.F.3.d.(4)
Recovery Well Counter Readings and Flow Rates	Record	Weekly	Starting with Issuance of CP Modification (11/8/19)	HW-50054-000 Provision XI.B.10.a
Recovery System Piping and Ancillary Equipment	Inspect for Deterioration and leaks	Weekly	Starting with Issuance of CP Modification (11/8/19)	HW-50054-000 Provision XI.B.10.b
Recovery System	Leak Reporting	As needed	Starting with Issuance of CP Modification (11/8/19)	HW-50054-000 Provision XI.B.10.b
Recovery System	System Shutdown Reporting	As needed	Starting with Issuance of CP Modification (11/8/19)	HW-50054-000 Provision XI.B.10.c
CAMU (North Holding Basin) (NOR 004)				
Monitoring and Recovery Wells	Top of Casing Elevation Accuracy Verification	Every Five Years	May 2024	Compliance Plan Attachment C
Monitoring and Recovery Wells	Groundwater Sampling	Semiannually	First 60 Days of 1st and 3rd Quarters	HW-50054-000 Provision XI.F.3.a-c

Re: Notice of Uncompleted Weekly Compliance Activities
KM Liquids Terminals LLC
Galena Park, Texas Facility
TCEQ SWR No. 30573
Hazardous Waste Permit/Compliance Plan No. 50054
EPA I.D. No. TXD026481523; CN 601545940; RN 100237452

Dear Ms. Hatfield:

Per my verbal notification this afternoon, this letter is to provide formal written notification to the Texas Commission on Environmental Quality (TCEQ) that Kinder Morgan failed to complete the weekly Compliance Plan activities at the Galena Park Terminal for the week of December 24 – 29, 2023 per the Compliance Schedule approved by the TCEQ by letter dated March 5, 2020. The primary field technician responsible for conducting the weekly activities was out on vacation and his scheduled replacement had a medical issue that required treatment and a stay in the hospital. Kinder Morgan did not become aware of the issue until the morning of January 2, 2024.

If you have any further questions regarding this information, please do not hesitate to contact me at (713) 654-6035.

Sincerely,
KM Liquids Terminals LLC

Johnny Kennedy, P.G.
Remediation Manager

	21-Jul-23		8.57	19.03	--	0.00	-10.46	NM (RW)

Notes:
MSL - Mean Sea Level
TOC - Top-of-casing
NAPL - Non-aqueous phase liquid
-- - NAPL not observed
ft. - Feet
* - May 2019 well Survey
Corrected Groundwater Elevation = (NAPL Thickness X 0.87) + Depth to Groundwater
NM (RW) - not measured, recovery wells are only measured when the pump is removed for maintenance
** - The MW-5 well pad was reconstructed on July 2, 2019. To accommodate the new well pad, 6.65" (0.55') of the top of the well casing was removed yielding an approximate new TOC measurement of 20.88'-0.55' = 20.25'. 20.25' is the assumed TOC until surveyed again.
*** - the groundwater level was below the pump assembly, making it inaccessible to be measured.

Notes:
MSL - Mean Sea Level
TOC - Top-of-casing
NAPL - Non-aqueous phase liquid
-- - NAPL not observed
NM- Not measured
ft. - Feet
Corrected Groundwater Elevation = (NAPL Thickness X 0.87) + Depth to Groundwater
NM (RW) - not measured, recovery wells are only measured when the pump is removed for maintenance
* - May 2019 well Survey
** - December 2021 well survey
*** - well not gauged January 2023 - no access. July water level was top of pump.
**** - the groundwater level was below the pump assembly, making it inaccessible to be measured.

Notes:
MSL - Mean Sea Level
TOC - Top-of-casing
NAPL - Non-aqueous phase liquid
-- - NAPL not observed
ft. - Feet
RSD = Relative Survey Datum (wells referenced to arbitrary 100-ft datum on site)
Corrected Groundwater Elevation = (NAPL Thickness X 0.87) + Depth to Groundwater

NOTES:
GWPS (Table IV - Corrective Action Program, Compliance Plan No. CP-50054) Ground-Water Protection Standards
(mg/L) - Milligrams per liter
J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
NM - Not monitored
Bold - Exceeds GWPS limits
(Deg. C) - Degree Celsius
(µS/cm) - Microsiemens per centimeters
NS - Not Sampled

SWU -Upper Panther Creek surface sample
SWM - Middle Panther Creek surface sample
SWD - downgradient Panther Creek surface samp
PC - Panther Creek
NA - Nor applicable

Notes

* = GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

mg/L - Milligrams per Liter

X - In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries wereoutside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte found to be high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limit

NS - Not sampled

Bold Italic - Concentrations in bold italics exceed the Groundwater Protection Standard (GWPS) as listed in Table IV of the Compliance Plan No. CP-50054.

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

CAO - Corrective Action Observation

POC - Point of Compliance

NA- Not analyzed

N/A - Not applicable

NE – Not Evaluated

*- - LCS and/or LCSD is outside acceptance limits, low biased.

*1 - LCS/LCSD RPD exceeds control limits.

*+ - LCS and/or LCSD is outside acceptance limits, high biased.

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample

E - The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated

F - RPD exceeded lab control limits.

U - Analyte was not detected.

NR - Not Reported

CAS - Corrective Action System

POE - Point of Exposure

J - The target analyte was positively identified below the guantitation limit and above the detection limit.

K - Sample analysed outside of recommended hold time.

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H - The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

B - A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

PSO - Potentiometric Surface Observation

Notes:

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW Permit 50054

AAL = Attenuation Action Level

All results reported in milligrams per liter (mg/L)

NA = Not Analyzed

TRRP = Texas Risk Reduction Program

PCL = protective concentration level

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Bold Italic = Exceeds the GWPS

[1]TRRP PCL = $^{GW}GW_{ing}$ = Ingestion of COCs in Class I or 2

Benzene is the only analyte required in CP Table IIIA for the west migration pathway and it is compared to the TRRP $^{GW}GW_{ing}$ PCL
CAO wells do not have a GWPS

U = Analyte was not detected at or above the SDL.

J = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

* = LCS or LCSD exceeds the control limits

L = the LCS data for this anlytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

Notes:

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

AAL = Attenuation Action Level

All results reported in milligrams per liter (mg/L)

NA = Not Analyzed

TRRP = Texas Risk Reduction Program

PCL = protectice concentration level

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Bold Italic = Exceeds the GWPS

[1] TRRP PCL = $^{GW}GW_{Ing}$ = Ingestion of COCs in Class 1 or 2 groundwater

Benzene is the only alayte required in CP Table IIIA for the west migration pathway and it is compared to the TRRP $^{GW}GW_{Ing}$ PCL

CAO wells do not have a GWPS

U = Analyte was not detected at or above the SDL.

J = Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

* = LCS or LCSD exceeds the control limits

L - The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{GW}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

GWPS - Groundwater Protection Standard

Concentrations in **Bold** exceed the SDL

Acronyms

J - Estimated concentration between the SDL and the MQL

U - Not detected at the SDL

SDL - Sample Detection Limit

NAPL - Non-aqueous phase liquid

L - Bias in sample result is likely low.

* - LCS or LCSD is outside acceptance limits.

Re: Report Transmittal – Response Action Completion Report, Old Pump House No. 5 Area of Concern, East Plant
KM Liquids Terminals LLC - Galena Park Terminal
Galena Park, Texas
ISWR No. 30573
Hazardous Waste Permit No. HW-50054
EPA I.D. No. TXD026481523

Dear Ms. Sifuentes-Chavez:

Please find enclosed one hard copy and one electronic copy of the Response Action Completion Report (RACR) for the Old Pump House No. 5 (OPH5) Area of Concern (AOC) located in the East Plant on the KM Liquids Terminals LLC (KMLT) Galena Park Terminal. This RACR was prepared to document the completion of response actions for groundwater and soil at OPH5 in accordance with the above-referenced Hazardous Waste Permit and Compliance Plan.

KMLT is proposing to remove the corrective action groundwater monitoring requirements for OPH5 from Compliance Plan (CP) Tables III, IIIA, and V as part of the renewal of the Hazardous Waste Permit and Compliance Plan. In addition, the status of OPH5 in CP Table II will be updated to closed with the date that the remedy standard was completed. The Hazardous Waste Permit and Compliance Plan renewal application will be submitted to the Texas Commission on Environmental Quality (TCEQ) by July 7, 2024.

If you have any questions regarding this submittal or require additional information, please feel free to contact me at (713) 654-[redacted]

Sincerely,
KM Liquids Terminals LLC

Johnny Kennedy
Remediation Manager

Remedy Standard A

___ Self-Implementation Notice Submittal date: _____

___ Response Action Plan - Approval date: _____

Remedy Standard B

X Response Action Plan - Approval date: April 10, 2018

List all media (surface soil, subsurface soil, groundwater, sediment, surface water, air) that contained or contains a PCLE zone and specify the response action taken for each media. Indicate the type of removal, decontamination, physical control, or institutional control action that was used in the response action. If a media with a PCLE zone was not addressed in the response action, provide an explanation below.

Media	COCs[1]	Removal	Decontamination	Physical Control	Institutional Control	Modified Response Objective[2]		
						PMZ	WCU	TI
Surface Soil	VOCs/SVOCs	--	--		Deed Notice	X	--	--
Subsurface Soil	VOCs/SVOCs	--	--		Deed Notice	X	--	--
Groundwater	VOCs/SVOCs LNAPL	X (LNAPL)	MNA		Deed Notice	X	--	--

Is there a media that contains a PCLE zone that was not addressed in the response action? yes ___ X no ___

If yes, provide justification for not addressing the PCLE zone in the response action.

Not Applicable

Current land use of the on-site affected property: ___ Residential X Commercial/industrial

Projected future land use of the on-site property (if known): ___ Residential X Commercial/industrial

[1] Specify either a specific COC or, if the response action is the same for all COCs in one type, specify the type of COC (for example, VOCs, SVOCs, metals).

[2] If a modified groundwater response objective was used, check the type(s) of modifications.

Explain why you believe the response action to be complete.

Old Pump House No. 5 (OPH5) is located in the East Plant of the KM Liquids Terminals LLC (KMLT) Galena Park Terminal. The site of the KMLT Galena Park Terminal has been used for heavy industrial purposes since prior to 1928 and was the site of a former Texaco oil refinery. Old Pump House No. 5 has been present in East Plant since at least 1944 and is currently used to transfer product from locations within the Galena Park terminal and from onsite storage to nearby barge or ship docks.

During an inspection of the subgrade containment area associated with the pump house, seeps of oily liquids into a below-grade concrete containment area were observed on the north and west walls. To evaluate the nature of the seeps and identify a potential source, soil borings were completed adjacent to and outside the containment in the area of the seeps on July 18, 2014. The results of the July 2014 investigation showed that light non-aqueous phase liquids (LNAPL) was present in the subsurface. A fingerprint analysis of the LNAPL indicated that the LNAPL was a weathered gasoline, and the release was likely historical in nature and associated with the former refinery operations. Based on the results of the July 2014 investigation and in accordance with the KMLT Galena Park Terminal RCRA Permit/Compliance Plan effective at that time, notification was made of the discovery of a new Area of Concern and an affected property assessment (APA) under the Texas Risk Reduction Program (TRRP) was completed. The results of the APA were reported to the Texas Commission on Environmental Quality (TCEQ) in an Affected Property Assessment Report (APAR) dated September 29, 2015. The APAR was approved by the TCEQ in a letter dated December 11, 2015.

The soil and groundwater assessment collected and analyzed for target chemicals of concern (COCs). Target COCs included: benzene, ethylbenzene, toluene, total xylenes (BTEX), polycyclic aromatic hydrocarbons (PAHs), 1-methylnaphthalene, 2-methylnaphthalene, styrene, lead, 1,2-dichloroethane (1,2-DCA), and 1,2-dibromoethane (EDB). The list of target COCs chosen was based on the results of the LNAPL fingerprint analysis which showed the LNAPL to be a weathered gasoline. The source of the gasoline was likely associated with the historical refinery operations in that area of the KMLT Galena Park Terminal.

Based on the results of the APA, a soil Protective Concentration Level Exceedance (PCLE) zone for BTEX, 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene and a groundwater PCLE zone for benzene, ethylbenzene, and 1-methylnaphthalene have been identified. The Critical Protective Concentration Level (PCL) used to define the PCLE zones are based on human health exposure pathways with no ecological component and assume a commercial/industrial exposure scenario. The results show that the only potential exposure pathways where COC concentrations in environmental media exceed the critical PCLs are the soil-to-groundwater pathway for soil and the groundwater ingestion pathway for groundwater. The reported soil COC concentrations did not exceed their respective Residential Assessment Level (RAL) for the $^{Tot}Soil_{Comb}$ and $^{Air}Soil_{Inh\text{-}V}$ (where applicable) pathways and the reported groundwater COC concentrations did not exceed their respective RAL for the $^{Air}GW_{Inh\text{-}V}$ (where applicable) pathway.

The shallow groundwater beneath the affected property flows to the southwest towards the Houston Ship Channel. The groundwater beneath the affected property is not currently used, there are no actual or threatened potential receptors and given the current and expected future use of the site, groundwater is unlikely to have future beneficial use.

The results of the APA show the extent of the LNAPL in the subsurface has been defined and is isolated to the area north of the pump house. The approximate areal extent of the LNAPL is 80 feet by 55 feet (4,400 sq. ft.). The LNAPL body is relatively small and given the presumed age has likely reached an equilibrium stage and is not mobile. To further refine the nature of the groundwater PCLE zone and to determine source area groundwater concentrations, monitoring well OPHMW-8 was installed in February 2016 at the location of former temporary piezometer OPHSB-6.

In the 2018 Response Action Plan (RAP), KMLT proposed the following response action for the affected property: establish a Plume Management Zone (PMZ) with institutional controls and LNAPL removal using a passive drain system and recovery from wells containing LNAPL. The TCEQ approved the RAP on April 10, 2018. The RAP was subsequently incorporated into the Resource Conservation Recovery Act (RCRA) Permit within the 2018 Class 3 Permit Modification application. The Revised RCRA Permit was issued on November 8, 2019. The response actions proposed in the RAP have been incorporated into the annual Corrective Action Report in accordance with reporting requirements of Section XI.G and those listed in the Compliance Plan Table VII of RCRA Permit 50054.

The response actions included the following:

- Semi-annual groundwater monitoring of the Point of Exposure (POE), Attenuation Monitoring Points (AMP) and Corrective Action Observation (CAO) wells within the PMZ;
- LNAPL recovery through an automated LNAPL recovery pump; and
- Deed restriction (filed on February 6, 2020) which limits property use to commercial/industrial and restricts the use of groundwater within the established PMZ.

A LNAPL Baildown Testing and LNAPL Transmissivity Report for OPH5 was submitted to the TCEQ in May 2022. The report documented that the LNAPL plume is not expanding; the LNAPL transmissivity data indicates that the LNAPL is not readily recoverable. As outlined in the Performances Measures section of the RAP (RAP Worksheet 3.0), KMLT recommended that the active NAPL recovery be discontinued permanently. In a letter dated August 12, 2022, TCEQ granted conditional approval to cease permanent LNAPL recovery with the following conditions: continue to monitor LNAPL thicknesses for changes in its condition and distribution and verify that no explosive conditions are generated by the LNAPL. KMLT submitted a response letter to the TCEQ on October 12, 2022, which presented the following: they would continue to monitor LNAPL thicknesses during semiannual groundwater monitoring events and they have an extensive hydrocarbon monitoring system (both above grade and below grade) in place to monitor the atmosphere for explosive vapors at OPH5 and the piping manifold associated with the pumphouse. If explosive atmospheric conditions were to develop in the area, the various monitor alarms would be triggered and corrective action would be taken by KMLT safety personnel. KMLT proposed that this system would be adequate to monitor for potential explosive conditions generated by the LNAPL. The TCEQ issued an approval letter on December 12, 2022, indicating KMLT responses adequately addressed TCEQ's comments. These reports submitted by KMLT and the TCEQ response letters are provided in Appendix 9.

As documented in the annual Corrective Action Reports, the semiannual groundwater monitoring events have demonstrated that COCs in POE, AMP and CAO wells have been below the groundwater protection standard (GWPS) established in the RCRA Permit for greater than 5 years. Additionally, the residual LNAPL thicknesses remaining at select monitoring wells appears to be stable and within historical ranges.

The deed restriction at OPH5 will continue to prevent residential land use and prohibit groundwater use beneath the area. This will prevent potential exposure to remaining COCs in groundwater or residual LNAPL.

The completed response actions for OPH5 PCL exceedance (PCLE) zones under Remedy Standard B include the following:

- LNAPL removal and demonstration through transmissivity testing that the LNAPL is not mobile or readily recoverable.
- An institutional control in the form of a deed restriction is in place to limit land use to commercial/industrial and prohibit groundwater use at OPH5.
- Reduction of COC concentrations through natural attenuation.

Groundwater PCLE zone has been addressed through the use of PMZ monitoring and natural attenuation. COC concentrations in groundwater have been reported at concentrations below the critical PCLs in the POE, AMP and CAO wells for a period of three years beginning in 2021. Per the 2018 *Response Action Plan - RAP Worksheet 3.0 Performance Measures and Potential Problems,* groundwater objectives have been met and as such, no further corrective action is required at OPH5. KMLT is requesting no further action for OPH5 and to update CP Table II as part of the RCRA Permit Renewal Application to designate no further action.

Checklist for Report Completeness	ID No. 30573	Report Date: June 4, 2024

Checklist for Report Completeness

Use this checklist to determine the portions of the form that must be submitted for this report. Answer all questions by checking Yes or No. If the answer is Yes include that portion of the report. If the answer is No, do not complete or submit that portion of the report. All form contents that are marked "Required" must be submitted. Form contents marked with an asterisk (*) are not included in the blank form and are to be provided by the person.

Confirmation of Response Action Objectives	RACR Worksheet 1.0	Page 1 of 5
	ID No. 30573	Report Date: June 4, 2024

Use this worksheet to describe the attainment of the response action objectives in each media.

Response Action Objectives

What was the selected remedy standard for this affected property? ___ A X B

List the environmental media to which this applies Surface soil, subsurface soil, and groundwater
Repeat this section for each medium that had a different response action objective.

Provide a detailed description of the response action. Describe the removal actions, decontamination actions, treatment system(s), physical or institutional control actions, and any actions for ecological considerations (ecological services analysis and compensatory restoration plans) that were conducted in each media and indicate if there were any differences between the actions taken and the actions proposed in the SIN or RAP.

General Response Action Objectives

Remedy Standard B is being pursued for surface soil, subsurface soil, and groundwater PCLE zones for OPH5 to limit potential contact with affected media, reduce potential leaching into groundwater, and reduce COC concentrations in groundwater by:

- LNAPL recovery and subsequent transmissivity testing to verify LNAPL is not mobile or has been recovered to the extent practicable;
- Institutional controls (i.e., deed restriction); and,
- PMZ to monitor and confirm that the plume is stable and/or decreasing. The COC concentrations in groundwater have been reported below the applicable PCLs for the last three years.

Soil Response Action Objectives

For soils within the affected property, the PCLE zone is based on soil COCs leaching to groundwater. COCs with concentrations above the critical PCLs include: benzene, toluene, ethylbenzene, total xylenes, naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene. Concentrations of soil COCs do not exceed RALs for any other applicable soil exposure pathway. The proposed soil response action consisted of establishing a PMZ for the Class 2 groundwater PCLE zone beneath the affected property. Soils containing COCs in excess of the critical PCLs are wholly contained within the PMZ. The groundwater PCLE has been limited in extent and has been stable since monitoring began in 2015. The soil response action objective was achieved by preventing exposure through the use of groundwater monitoring and institutional controls.

Groundwater Response Action Objective

The response action to address the groundwater PCLE zone at the affected property consisted of a PMZ and LNAPL recovery. The PMZ prevented exposure to COCs in the identified soil and groundwater PCLE zones through the use of institutional control mechanisms (e.g., deed recordation and administrative controls through the KMLT permitting process) that prohibit the use of the affected groundwater within the PMZ. The LNAPL recovery reduced the amount of LNAPL present in the subsurface thereby reducing the source zone for the groundwater impact.

The PMZ utilized a groundwater monitoring program to verify that the plume is stable and is not migrating to the POE beyond the PMZ at concentration levels exceeding applicable PCLs. The applicable PCLs (^{SW}GW and/or $^{Air}GW_{Inh\text{-}V}$ PCLs) were established in the RAP and were subsequently included as GWPSs in CP Tables III and IIIA of the Class 3 RCRA Permit Renewal Application. Groundwater analytical data from 2015 to 2023 has demonstrated a stable groundwater plume that is not exceeding the applicable PCLs at the POE or AMP wells.

The response objective with respect to the LNAPL was to remove the LNAPL to the extent practicable. The LNAPL recovery was achieved through removal at wells containing LNAPL, using an automated LNAPL recovery pump (i.e., Magnum Spill Buster™) and/or a portable pump (e.g., peristaltic pump) and a passive drain system that was installed in the north wall of the below-grade concrete containment area. The LNAPL recovery system was terminated when TCEQ concurred that the transmissivity testing confirmed the LNAPL was not mobile and LNAPL had been recovered to the extent practicable.

The response actions were conducted in accordance with the RAP. No deviations from the RAP were identified. In addition to the response actions above, response actions are also included in the Hazardous Waste Permit and Compliance Plan, which include maintenance of perimeter fencing and onsite security measures to restrict access at the facility.

Describe how the response action achieved the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33, as applicable. Explain how the response action was appropriate based on the hydrogeologic and COC characteristics. Describe any unprotective conditions that continued or resulted from the remedial actions and the actions taken to mitigate unprotective conditions.

For soils within the affected property, the PCLE zone is based on soil COCs leaching to groundwater. COCs with concentrations above the critical PCLs include: benzene, toluene, ethylbenzene, total xylenes, naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene. Concentrations of soil COCs do not exceed RAL for any other applicable soil exposure pathway. The proposed soil response action consists of establishing a PMZ for the Class 2 groundwater PCLE zone beneath the affected property. Soils containing COCs in excess of the critical PCLs will be wholly contained within the proposed PMZ.

Institutional controls have been implemented at OPH5 and prevent exposure by restricting land use to commercial/industrial and prohibiting groundwater use.

Response actions for the groundwater PCLE zone included the use of PMZ to monitor COC concentrations over time. COC concentrations in groundwater have been below the applicable PCL for a three-year time period; as such, response actions have been achieved. Once the TCEQ has approved the request for no further action and the renewal application for the Hazardous Waste Permit and Compliance Plan, groundwater monitoring and reporting for OPH5 will be concluded.

If different from the information provided in the RAP, explain how the COCs were handled, treated, disposed, or transferred to another media and document that the response action did not result in any additional exposure conditions due to response action activities.

As presented in the RAP, the LNAPL and contaminated groundwater recovered by the passive drain system in the subsurface containment area and the LNAPL recovered at wells with installed Spill Busters™ were routed to KMLT's wastewater treatment systems and treated, stored, disposed, or recycled in an authorized on-site unit or off-site facility. The purged groundwater was managed through KMLT's wastewater treatment systems.

Explain how the response action achieved the objectives within the reasonable time frame.

Groundwater response actions were achieved in less than the proposed 10-year time frame as described in the RAP. The institutional controls were filed in February 2020 and will remain in place to prevent residential use and restrict groundwater beneath OPH5.

Were physical controls used as part of the response action? ___ Yes X No
If yes, describe the type and purpose of the physical control and discuss how the physical control has proved effective.

Not Appliable

Soil Response Action Objectives

When using removal and/or decontamination with controls or controls only, demonstrate that the physical

control or combination of measures reliably contained COCs within and/or derived from the surface soil and subsurface soil PCLE zone materials over time.

For soils within the affected property, the PCLE zone is based on soil COCs leaching to groundwater. COCs with concentrations above the critical PCLs include: benzene, toluene, ethylbenzene, total xylenes, naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene. Concentrations of soil COCs do not exceed RAL for any other applicable soil exposure pathway. The proposed soil response action consists of establishing a PMZ for the Class 2 groundwater PCLE zone beneath the affected property. Soils containing COCs in excess of the critical PCLs will be wholly contained within the proposed PMZ. The soil response action objective was achieved by preventing exposure through the use of groundwater monitoring and institutional controls.

Explain how the removal or decontamination action reduced the concentration of COCs to the critical surface soil and subsurface soil PCL throughout the soil PCLE zone and prevented COC concentrations above the critical soil PCLs from migrating beyond the original boundary of the soil PCLE zone.

For soils within the affected property, the PCLE zone is based on soil COCs leaching to groundwater. COCs with concentrations above the critical PCLs include: benzene, toluene, ethylbenzene, total xylenes, naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene. Concentrations of soil COCs do not exceed RAL for any other applicable soil exposure pathway. The proposed soil response action consists of establishing a PMZ for the Class 2 groundwater PCLE zone beneath the affected property. Soils containing COCs in excess of the critical PCLs will be wholly contained within the proposed PMZ. The soil response action objective was achieved by preventing exposure through groundwater monitoring and institutional controls.

Groundwater Response Action Objectives

Name of groundwater-bearing unit to which this information applies: Uppermost Groundwater Bearing Unit (UGBU)

Repeat this section for each groundwater-bearing unit for which a different response action was conducted.

Groundwater classification	1	X 2	3
	___	___	___

Was a modified groundwater response action used for any part of the groundwater PCLE zone (§350.33(f)(2), (3), or (4))? ___ Yes X ___ No

If yes, complete the appropriate portions of this report.

Explain how the removal or decontamination actions reduced the concentration of COCs to the critical groundwater PCL throughout the groundwater PCLE zone and prevented COC concentrations above the critical groundwater PCL from migrating beyond the original boundary of the groundwater PCLE zone. If COC concentrations above the critical groundwater PCL ever migrated beyond the original boundary of the groundwater PCLE zone, explain the actions taken to address the increase in the PCLE zone.

Response actions for the groundwater PCLE zone has been addressed through the use of PMZ monitoring and natural attenuation. COC concentrations in groundwater have been below the critical PCLs in the POE, AMP and CAO wells for a three-year time period, and, as such, response actions have been achieved. Once the TCEQ has approved the request for no further action and the renewal application for the Hazardous Waste Permit and Compliance Plan, groundwater monitoring and reporting for OPH5 will be concluded.

Explain how the response action prevented COCs from migrating to air at concentrations above the PCLs for air if the groundwater-to-air PCLs ($^{Air}GW_{Inh\text{-}V}$) were exceeded.

The $^{Air}GW_{Inh\text{-}V}$ PCL has not been exceeded at any point within the plume during the monitoring program. The release is historical in nature and there is no additional source material being added to the system. In addition, the proposed LNAPL removal, in addition to natural source zone depletion, will further reduce the source mass and reduce the likelihood that COC concentrations would increase.

Explain how the response action prevented COCs from migrating to surface water at concentrations above the PCLs for groundwater discharges to surface water if surface water was a factor.

Calculated ^{SW}GW PCLs for the affected property are included in the 2018 RAP. Two of the POEs (monitoring wells OPHMW-5 and OPHMW-4) are located adjacent to the nearest downgradient surface water (i.e., Houston Ship Channel) and have never exceeded the ^{SW}GW PCLs. The lower of the ^{SW}GW PCL or the $^{Air}GW_{Inh\text{-}V}$ PCL for each COC will be used as the critical PCL for each COC at the POE. No COC concentrations in any of the PMZ wells have exceed the ^{SW}GW PCLs.

Explain how the response action prevented human and ecological receptor exposure to the groundwater PCLE zone.

The groundwater response action is to establish a PMZ and to recover LNAPL. The PMZ prevented exposure through the use of institutional control mechanisms and establishing appropriate AALs based on the most conservative potential exposure scenario. The institutional control restricts groundwater use and residential land use and the AALs have been protective of potential surface water receptors and onsite workers. The PMZ monitoring program verified that the plume is stable and there is no potential for human health or ecological exposure at levels exceeding the applicable PCLs.

Waste Management

Describe the volume and final disposition or reuse location of waste or environmental media that was removed from the affected property during the response action, if not previously reported under STEERS. Provide copies of all manifests, other documentation of disposition, and landowner consent for reuse of soil in Appendix 8.

The LNAPL and contaminated groundwater recovered by the passive drain system in the subsurface containment area and the LNAPL recovered at wells with installed Spill Busters™ will be routed to KMLT's wastewater treatment systems and treated, stored, disposed, or recycled in an authorized on-site unit or off-site facility. The purged groundwater will be managed through KMLT's wastewater treatment systems.

Plume Management Zone	RACR Worksheet 2.0 Page 1 of 1	
	ID No. 30573	Report Date: June 4, 2024

Complete this worksheet when a PMZ was used as part of the response action. Include in Attachment 2A a map of the PMZ with alternate POE(s) and attenuation monitoring points identified and the current groundwater PCLE zone (if applicable). If a PMZ was not used, do not submit this worksheet.

Groundwater-bearing unit Uppermost Groundwater Bearing Unit (UGBU)
Repeat this worksheet for each groundwater-bearing unit for which a PMZ was used.
Groundwater classification X 2 ___ 3

Is/was NAPL present? X Yes ___ No
If so, describe how the response action achieved the performance criteria in §350.33(f)(4)(E).

The LNAPL recovery was achieved through removal at wells containing LNAPL (e.g., OPHMW-7), using an automated LNAPL recovery pump (i.e., Magnum Spill Buster™) and/or portable pump and a passive drain system that was installed in April 2016, as an Interim Corrective Measure (ICM) in the north wall of the below-grade concrete containment area associated with the Old Pump House No. 5. This was further shown through the transmissivity testing performing in 2022 which demonstrated that the LNAPL was not mobile and had been removed to the extent practicable.

If this is a Class 2 groundwater, explain how the response action ensured that leachate from the surface soil and subsurface soil PCLE zones did not increase concentration of COCs greater than the measured concentrations at time of RAP submittal. (§350.33(a)(2))

The release is historical in nature and associated with operational practices from approximately 70 years ago. There have been no known new releases in the area and there is no evidence that the source mass is increasing. Given the age of the release, it is likely that the COCs in groundwater and soil have reached an equilibrium point and source area concentrations are not likely to increase. Current conditions show that soil concentration of select COCs exceed the soil-to-groundwater ingestion PCL but are not present in groundwater at levels exceeding the groundwater ingestion PCLs. Additionally, the LNAPL removal, combined with natural source zone depletion, has reduced the source mass and groundwater concentrations at the POE and AMP wells continue to show stable or decreasing trends.

Provide documentation that the COCs did not migrate beyond the downgradient boundary of the PMZ at concentrations above the critical PCL. Include supporting documentation in Attachments 1A, 1B, and 2A.

The PMZ monitored the COC concentrations within the plume and at the downgradient extent of the plume. Groundwater generally flows to the southwest and west, toward the Houston Ship Channel. Because the groundwater ingestion pathway was eliminated with the institutional controls of the PMZ, the groundwater to surface water exposure pathway and the groundwater to air inhalation exposure pathway are considered to be complete and are the basis of the critical PCLs/AALs. Groundwater data collected between 2015 through 2023 have not detected concentrations above the applicable PCLs in the POE and AMP. This demonstrates that the PMZ has been effective in showing that COC concentrations have not migrated beyond the PMZ boundary.

Plume Management Zone	RACR Worksheet 2.0 Page 1 of 1	
	ID No. 30573	Report Date: June 4, 2024

List the attenuation action level determined for each attenuation monitoring point. Illustrate the attenuation monitoring points, initial, maximum, and final groundwater PCLE zones (or groundwater concentrations if less than the critical PCL) on the map in Attachment 2A.

COC	Attenuation Monitoring Point (well number)	Attenuation Action Level* (mg/L)	Maximum concentration measured at the attenuation monitoring point (mg/L)
Benzene	OPHMW-10 OPHMW-11	23	0.0031
Ethylbenzene	OPHMW-10 OPHMW-11	3800	0.002
Toluene	OPHMW-10 OPHMW-11	6080	0.000499
Total Xylenes	OPHMW-10 OPHMW-11	1300	0.000633
1-Methylnaphthalene	OPHMW-10 OPHMW-11	18.2	0.000362
2-Methylnaphthalene	OPHMW-10 OPHMW-11	547	0.000671
Naphthalene	OPHMW-10 OPHMW-11	41	0.000598

Technical Impracticability	RACR Worksheet 3.0 Page 1 of 1	
	ID No. 30573	Report Date: June 4, 2024

Use this worksheet to document the use of technical impracticability to modify the groundwater response objectives. Also, complete Worksheet 2.0 to document the plume management zone for the area of technical impracticability. Include a map of the groundwater PCLE zone and area of technical impracticability in Attachment 3A. If technical impracticability was not used as part of the response action, do not submit this worksheet.

If additional information beyond that provided in the RAP is available, describe how it was determined that it was technically impractical to reduce the COC concentrations in groundwater to the critical PCLs. Describe the response actions taken that did not prove effective. Provide graphs in Attachment 1B to illustrate COC concentrations over time and with distance from the source for each response action that did not prove effective. Describe in Worksheet 1.0 the removal/decontamination actions that were conducted for any PCLE zone outside the area of technical impracticability.

Not applicable

Did COCs above the critical PCL migrate beyond the area of technical impracticability and/or beyond the initial boundary of the PCLE zone?

___ yes ___ no

If yes, explain the actions taken to mitigate the migration of COCs.

Not applicable

Institutional Controls	RACR Worksheet 4.0 Page 1 of 1	
	ID No. 30573	Report Date: June 4, 2024

Complete this worksheet if an institutional control will be or has been used as part of the response action. Include in Appendix 3 copies of filed institutional controls and drafts of the proposed institutional controls, copies of landowner concurrences, and a list of landowners from whom landowner concurrence will be requested.

Specify the property for which this applies. KMLT East Plant, Galena Park, Texas

Repeat this worksheet for each different property for which an institutional control will be used.

Institutional Control	Type of Institutional Control[3]				Property Ownership		Anticipated or actual filing date[4]
	Deed notice	Restrictive covenant	VCP Certificate of Completion	Equivalent zoning or governmental ordinance	Check if pertinent tract of land is owned by the person	Check if the pertinent tract of land is owned by an innocent owner or operator	
Document use of commercial/industrial land use (§350.31(g))	X				X		February 26, 2020
Document use of physical or institutional control under Remedy Standard B §350.31(g))							
Document notice of on-going long term response action (§350.31(h))							
Document use of occupational inhalation criteria as RBELs (§350.74(b)(1))							
Document variance from the default exposure factors (§350.74(j)(2)(L))							
Document the use of a non-default soil exposure area (§350.51(l)(3)&(4))							
Document WCU exclusion area (§350.33(f)(2))							
Document establishing a PMZ (§350.33(f)(4)(C)(I))	X				X		February 26, 2020
Document the demonstration of technical impracticability (§350.33(f)(3)(F))							
Relocation of soils containing COCs for reuse (§350.36(b)(4) and (c)(4))							
Other (specify)							

[3] Check the appropriate box(es) to indicate the type of institutional control required for the response action.
[4] Specify date or amount of time after RAP approval.

Performance Measures

List and describe the performance measures for each environmental medium containing a PCLE zone that were used to determine if reasonable progress is being made by the response action in a timely manner. Provide documentation that these performance measures were met. Attach additional information if necessary.

The goal of the PMZ is to prevent exposure to the COCs within the boundaries of the PMZ and to verify that COCs do not migrate beyond the boundaries of the PMZ such that exposure could occur. This was accomplished by use of an institutional control restricting the use of groundwater and implementation of a response action effectiveness monitoring program. Monitoring was conducted on a semi-annual basis to confirm that the COC concentrations within the PMZ remain at a level that is protective of the POE. The level of protectiveness was determined by comparing the groundwater concentrations to the AALs. Concentrations of groundwater COCs were compared to the AALs to demonstrate that the plume is stable, confined to/within the PMZ, and does not exhibit the potential to migrate beyond the PMZ.

Performance of the LNAPL recovery system was monitored by measuring the LNAPL thicknesses in affected wells and by measuring the rate of LNAPL recovery. As presented in the RAP, LNAPL recovery was regularly assessed and the need for further LNAPL recovery was discussed in annual reports until a determination was made that all readily recoverable LNAPL has been removed. The LNAPL Baildown Testing and LNAPL Transmissivity completed in 2022 documented that the LNAPL plume is not expanding; the LNAPL transmissivity data indicates that the LNAPL is not readily recoverable. The TCEQ concurred in their August and December 2022 correspondence that active LNAPL recovery was no longer required.

The monitoring system associated with PMZ was monitored for three years. Per the RAP, if after three years there are no significant, consistent exceedances of the critical PCLs/AALs in the PMZ wells, the response action, with respect to the soil and groundwater PCLE zone, will be considered complete. As such, based on no PCL or AAL exceedances over the past three years, the response action is considered complete and no further action appears warranted.

Problems

Complete the table for the response action. When the response action consisted of several components or multiple actions, complete one table for each major component or action.

Response Action Name/Designation: Plume Management Zone / LNAPL Recovery System

List the problems that were encountered during the response action, describe the impact of each problem, and the response to the problem.

Description of the Problem	Impact	Did this cause a response action failure?		Corrective Response
		Yes	No	
None Encountered				

Operation and Maintenance	RACR Worksheet 6.0 Page 1 of 1	
	ID No.: 30573	**Report Date:** June 4, 2024

Use this worksheet to describe the operation and maintenance (O&M) activities conducted for each response action.

Response Action Name/Designation: Plume Management Zone
List all portions of the response action to which this information applies. Repeat this worksheet for each major component or operation.

Describe the O&M and inspection activities that were conducted to operate and maintain response action components.

Each groundwater monitoring well in the monitoring system was inspected during each semiannual sampling event to confirm well integrity and identify any needed repairs.

Response Action Name/Designation LNAPL Recovery System
List all portions of the response action to which this information applies. Repeat this worksheet for each major component or operation.

Describe the O&M and inspection activities that have been conducted to operate and maintain response action components.

The system performance was generally monitored on a weekly or biweekly basis but was periodically modified based on LNAPL recurrence to wells, recovery rates and equipment operational status. The monitoring activities included documenting the thickness of LNAPL in wells containing LNAPL, confirming that the installed Spill Busters were powered up and operational, recovering LNAPL via portable pump as applicable, and measuring the discharge rate from the system, noting what percentage of the discharge is LNAPL.

As previously discussed, the LNAPL recovery system was terminated after TCEQ approval in December 2022.

Dear Ms. Hatfield:

In response to your April 10, 2018 conditional approval letter for the *Draft Revised Response Action Plan* (RAP) for the KM Liquids Terminals LLC (Kinder Morgan) Galena Park Old Pump House 5 AOC (OPH5), and CP Table VIII of the Compliance Plan modification issued November 8, 2019, Kinder Morgan is submitting this proof of filing of the institutional control (IC) document (RP-2020-86142) for the affected property at the Kinder Morgan Galena Park Terminal, Galena Park, Texas. The affected property was surveyed by a Texas-licensed surveyor, who provided a metes and bounds description and sealed plat map of the affected area. A listing of constituents of concern (COC) and a description of the maintenance monitoring is also included. The deed notice was filed with the Harris County Clerk on February 26, 2020. The referenced IC proof of filing is attached.

If you have any questions or require any additional information at this time, please do not hesitate to contact me at (713) 654-6035.

Sincerely,
KM Liquids Terminals LLC

Johnny Kennedy, P.G.
Remediation Manager

Texas Risk Reduction Program
Deed Notice

STATE OF TEXAS §
§
COUNTY OF HARRIS §

This Notice is filed to provide information concerning certain environmental conditions and/or use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows:

A legal property description used in the last recorded vesting deed, covering the Property that includes the entire Recorded tract of land held by the owner executing this deed, is attached hereto and incorporated by reference as Exhibit A.

Portions of the soils and groundwater of the Property contain certain identified chemicals of concern causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property is described as follows:

METES AND BOUNDS DESCRIPTION of an 1.807 acre tract of land, extending over, through, along and across, a called 123.5686 acre tract of land (Parcel Three) as recorded in File No. G867917, Official Public Records of Real Property of Harris County, Texas, and also across a called 40 foot wide fee strip, as recorded in Volume 2501, Page 242, Harris County Deed Records, said tracts being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows:

Bearing and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83, U.S. survey feet.

COMMENCING at a brass disc set in concrete found on the South right-of-way line of Clinton Road (called 100' wide), and also being the Northeast corner of a called 24.2862 acre tract (Parcel Two) as recorded in File No. G867917, Official Public Records of Real Property of Harris County, Texas, the POINT OF COMMENCING having coordinates N = 13,832,307.72, E = 3,168,749.80;

THENCE, along and with the East line of said 24.5862 acre tract, South 03° 28' 15" East, at a distance of 387.55 feet pass the Southeast corner

of said 24.5862 acre tract, the same being on the North line of a called 40' wide fee strip as recorded in Volume 2501, Page 242, Harris County Deed Records, at a distance of 427.55 feet pass the Northeast corner of said 123.5686 acre tract, the same being on the South line of said 40' wide fee strip, in all a distance of 1,109.56 feet to a point on the above mentioned East line;

THENCE departing said East line, and over and across said 123.5686 acre tract South 86° 1' 45" West, a distance of 1,398.61 feet to the POINT OF BEGINNING, having coordinates N = 13,832,115.52, E = 3,167,420.94 ;

THENCE, the following five (5) courses:

1. *South 53° 12' 28" West, a distance of 301.44 feet to a point for corner;*
2. *North 30° 04' 12" West, a distance of 274.25 feet to a point for corner;*
3. *North 47° 11' 09" East, a distance of 182.37 feet to a point for corner;*
4. *North 87° 30' 46" East, a distance of 108.85 feet to a point for corner;*

THENCE, South 36° 18' 34" East, a distance of 230.16 feet to the POINT OF Beginning and containing 1.807 acres of land.]

The certified metes and bounds description and corresponding plat map of the affected Property for soil and for groundwater (referred to as the Plume Management Zone) are attached hereto and incorporated herein by reference as Exhibit B

The chemicals of concern (COCs) in soil and groundwater at the Affected Property (the Plume Management Zone), define here as exceeding the TRRP Protective Concentration Levels for residential and commercial/industrial land use, are summarized below:

Soil: benzene, toluene, ethylbenzene, o-xylenes, total xylenes, 1-methylnaphthalene, 2-methylnaphthalene, naphthalene, lead

Groundwater: benzene, ethylbenzene, 1-methylnaphthalene, 2-methylnaphthalene, naphthalene, and light non-aqueous phase liquid (LNAPL)

This Notice is required for the following reasons:

The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone. A plume management zone is defined as an area of groundwater containing concentrations of chemicals of concern exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC §350.33(f)(4). The

undersigned has established a plume management zone so that the chemicals of concern in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached Exhibit B provides the location and extent of the plume management zone and describes the maintenance and monitoring required. This maintenance and monitoring is required until TCEQ approves some modification of those requirements. Exposure to groundwater within the plume management zone for any purpose is not advised until such time when all of the chemicals of concern no longer exceed their respective protective concentration levels. This deed notice [and the physical control] must not be removed or modified without prior approval from TCEQ.

The Affected Property currently meets TRRP standards for commercial/industrial use. Based on the reports, the chemicals of concern pose no significant present or future risk to humans or the environment based on commercial/industrial land use. No further remediation of the Affected Property is required by the TCEQ as long as the Affected Property is not to be used for residential purposes as the property may not be protective for residential use. If any person desires in the future to use the Affected Property for residential purposes, the TCEQ must be notified at least 60 days in advance of such use and additional response actions may be necessary before the property may be used for residential purposes. Persons contemplating a change in land use for the Affected Property are encouraged to review the definitions for commercial/industrial and residential land use contained in TRRP as the definition of residential land use is broad.

As of the date of this Notice, the record owner of fee title to the Property is KM Liquids Terminals LLC with address of 1001 Louisiana Street, Suite 1000, Houston, Texas 77002

FIELD NOTES

373.721 acres of land situated in the Ezekiel Thomas Survey, A-73 Harris County, Texas, being located on the North shore of the Houston Ship Channel and extending Northward to the Southwest side of Hunting Bayou, and being more particularly described in nine (9) tracts, with respect to the "Texas Coordinate System", South Central Zone, NAD27, South Central Zone, said lands being described as follows:

TRACT I

114.23 acres of land, out of that certain 123.5686 acre tract described in Deed conveying 463.8705 acres of land from Texaco, Inc. to South States Terminals Company recorded under Harris County Clerk's File No. G 867916, and being described as follows:

BEGINNING at the Northeast corner of said 123.5686 acre tract on the South line of the T&NO RR 40 foot wide R.O.W., and having coordinates: X=3,200,372.11 and Y=709,442.27;

THENCE South 3° 28' 30" East, 2334.00 feet to the Southeast corner of said 123.5686 acre tract in the waters of the Houston Ship Channel;

THENCE in a Northwesterly direction with the Southerly lines of said 123.5686 acre tract and along the Northerly waters of said ship channel with the following three (3) courses and distances:

1. South 88° 17' 37" West, 769.90 feet to an angle corner;
2. North 75° 09' 23" West, 1039.00 feet to an angle corner;
3. North 72° 13' 55" West, 904.52 feet to the Southwest corner of said 120.00 acre tract;

THENCE North 3° 30' 10" West, with the West line of said 123.5686 acre tract, 1334.37 feet to a point for corner at its intersection with the South line of said T&NO RR 40 foot wide R.O.W.;

THENCE in an Easterly direction with the South lines of said railroad R.O.W. with the following five (5) courses and distances;

1. North 86° 31' 10" East, 1083.22 feet to a point of curve;
2. With said curve to the left having a radius of 478.59 feet, a central angel of 43° 33' 00" and an arc length of 363.77 feet to its point of tangency;
3. North 43° 58' 10" East, 100.00 feet to another point of curve;
4. With said curve to the right having a radius of 438.59 feet, a central angel of 43° 33' 00" and an arc length of 333.37 feet to its point of tangency;
5. North, 86° 31' 10" East, 812.00 feet to the POINT OF BEGINNING and containing 114.23 acres of land.

TRACT 2

36.75 Acres of land being described as follows:

BEGINNING at a point for the northeast corner, on the west line of that certain 123.5686 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc., to South States Terminals Company recorded under Harris County Clerk's File No. G 867916, and the south line of the 80-foot wide right-of-way of the T&NO RR, and having coordinates: X=3,197,198.14 and Y=708,941.83;

THENCE South 3° 30' 10" East, with the west line of said 123.5686 acre tract 1312.45 feet to its southwest corner within the waters of the Houston Ship Channel;

THENCE South 76° 22' 54" West, along the northerly waters of said ship channel an approximate distance of 1141.58 feet to the southeast corner of a 16-foot wide Texas Pipeline Company right-of-way;

THENCE North 3° 26' 35" West, with the east line of said pipeline right-of-way 1538.71 feet to its intersection with the south line of said T&NO RR right-of-way;

THENCE North 87° 48' 43" East, with the south line of said railroad right-of-way 1122.53 feet to the POINT OF BEGINNING, and containing 36.75 acres of land.

TRACT 3

71.02 Acres of land being described as follows:

BEGINNING at a point for the northeast corner on the south line of the 80-foot wide right-of-way of the T&NO RR at its intersection with the west line of the Arco Pipeline Company 25-foot wide fee strip, and having coordinates: X=3,196,352.59 and Y=708,886.60;

THENCE South 3° 26' 35" East, with the west line of said Arco fee strip 1606.00 feet to the southwest corner of said Arco strip within the waters of the Houston Ship Channel;

THENCE South 63° 01' 16" West, along the north side of said ship channel an approximate distance of 1764.41 feet to a point for corner;

THENCE North 1° 18' 10" West, 2345.72 feet to a point for corner on the south line of said 80-foot wide railroad right-of-way;

THENCE North 87° 48' 43" East, with the south line of said right-of-way 1530.39 feet to the POINT OF BEGINNING and containing 71.02 acres of land.

TRACT 4

0.53 Acres of land being known as a "Pipeline Alley" lying adjacent to and on the east side of a 16-foot wide Texas Pipeline Company right-of-way and being described as follows:

BEGINNING at the northwest corner of a 7.2143 acre tract leased to CXI on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,106,663.42 and Y=709,670.91;

THENCE South 3° 26' 35" East, with the west line of said CXI tract, 692.04 feet to its southwest corner on the north line of the 80-foot wide T&NO RR right-of-way;

THENCE South 87° 48' 43" West, with the north line of said railroad right-of-way 33.38 feet to its intersection with the east line of said Texas Pipeline Company right-of-way;

THENCE North 3° 26' 35" West, with the east lines of said pipeline right-of-way, 692.12 feet to its intersection with the south right-of-way line of Clinton Drive;

THENCE North 87° 56' 52" East, with said south right-of-way line, 33.38 feet to the POINT OF BEGINNING and containing 0.53 acres of land.

TRACT 4

10.03 Acres of land being described as follows:

BEGINNING at the northwest corner of that certain 24.2862 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc. to South States Terminals Company recorded under Harris County Clerk's File No. G 876916, on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,197,751.08 and Y=709,710.64'

THENCE South 3° 30' 10" East, with the west line of said 24.2862 acre tract, 668.98 feet to its intersection with the curved north line of the T&NO RR right-of-way, generally 80 feet wide;

THENCE in a westerly direction with the north lines of said railroad right-of-way with the following two (2) courses and distances:

1. With a curve to the right having a radius of 246.48 fee, a central angle of 23° 57' 51" and an arc length of 103.09 feet, (the chord of said arc bears South 75° 49' 53" West,
2. South 87° 48' 43" West, 789.72 feet to the most southerly southeast corner of the 7.2143 acre tract leased to CXI;

THENCE in a northeasterly direction with the irregular southeast boundary of said CXI tract with that following five (5) courses and distances:

1. North 3° 04' 30" West, 182.57 feet to an interior corner,
2. North 84° 50' 40" East, 197.27 feet to another southeast corner,
3. North 3° 04' 30" West, 343.91 feet to another interior corner,
4. North 87° 56' 52" East, 490.97 feet to its most easterly southeast corner,
5. North 1° 56' 57" West, 154.29 feet to its northeast corner on the south right-of-way line of Clinton Drive;

THENCE North 87° 43' 30" East, with said south right-of-way line, 194.01 feet to the POINT OF BEGINNING and containing 10.03 acres of land.

TRACT 5

0.53 Acres of land being known as "Pipeline Alley" lying adjacent to and on the east side of a 16-foot wide Texas Pipeline Company right-of-way and being described as follows:

BEGINNING at the northwest corner of a 7.2143 acre tract leased to CXI on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,106,663.42 and Y=709,670.91;

THENCE South 3° 26' 35" East, with the west line of said CXI tract, 692.04 feet to its southwest corner on the north line of the 80-foot wide T&NO RR right-of-way;

THENCE South 87° 48' 43" West, with the north line of said railroad right-of-way 33.38 feet to its intersection with the east line of said Texas Pipeline Company right-of-way;

THENCE North 3° 26' 35" West, with the east lines of said pipeline right-of-way, 692.12 feet to its intersection with the south right-of-way line of Clinton Drive;

THENCE North 87° 56' 52" East, with said south right-of-way line, 33.38 feet to the POINT OF BEGINNING and containing 0.53 acres of land.

TRACT 6

10.03 Acres of land being described as follows:

BEGINNING at the northwest corner of that certain 24.2862 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc. to South States Terminals Company recorded under Harris County Clerk's File No. G 867916, on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X= 3,197,751.08 and Y=709,710.64;

THENCE South 3° 30' 10" East, with the west line of said 24.2862 acre tract, 668.98 feet to its intersection with the curved north line of the T&NO RR right-of-way, generally 80 feet wide;

THENCE in a westerly direction with the north lines of said railroad right-of-way with the following two (2) courses and distances:

1. With a curve to the right having a radius of 246.48 fee, a central angle of 23° 57' 51" and an arc length of 103.09 feet, (the chord of said arc bears South 75° 49' 53" West, 102.34 feet), to its point of tangency,
2. South 87° 48' 43" West, 789.72 feet to the most southerly southeast corner of the 7.2143 acre tract leased to CXI;

THENCE in a northeasterly direction with the irregular southeast boundary of said CXI tract with that following five (5) courses and distances:

1. North 3° 04' 30" West, 182.57 feet to an interior corner,
2. North 84° 50' 40" East, 197.27 feet to another southeast corner,
3. North 3° 04' 30" West, 343.91 feet to another interior corner,
4. North 87° 56' 52" East, 490.97 feet to its most easterly southeast corner,

5. North 1° 56' 57" West, 154.29 feet to its northeast corner on the south right-of-way line of Clinton Drive;

THENCE North 87° 43' 30" East, with said south right-of-way line, 194.01 feet to the POINT OF BEGINNING and containing 10.03 acres of land.

TRACT 7

1.48 Acres of land being, in part out of that certain 24.2862 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc., to South States Terminals Company recorded under Harris County Clerk's File No. G-867916, and being described as follows:

BEGINNING at the northwest corner of said 24.2862 acre tract leased on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,197,751.08 and Y=709,710.64;

THENCE North 86° 31' 10" East, with said south right-of-way line, 91.00 feet to the northwest corner of a 20.0000 acre tract conveyed to Lubripac;

THENCE North 3° 30' 10" East, with the west line of said Lubripac tract, 708.33 feet to its southwest corner on the north line of a 40 foot wide T&NO RR right-of-way;

THENCE South 86° 31' 10" West, with said north line, 91.00 feet to a point for corner;

THENCE North 3° 30' 10" West, in part with the west line of said 24.2862 acre tract, 708.33 feet to the POINT OF BEGINNING and containing 1.48 acres of land.

TRACT 8

1.83 Acres of land being the residue of a 12.16 acre tract of land, in part out of that certain 24.2862 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc., to South States Terminals Company recorded under Harris County Clerk's File No. G 867916, and being described as follows:

BEGINNING at the northeast corner of said 24.2862 acre tract leased on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,200,346.23 and Y=709,868.49;

THENCE South 3° 30' 10" East, with the east line of said 24.2862 acre tract, 387.00 feet to its southeast corner on the north line of the 40 foot wide T&NO RR right-of-way;

THENCE South 86° 31' 10" West, with said north line, 812.00 feet to a point of curve;

THENCE 32.30 feet in a westerly direction along the arc of said curve to the left having a radius of 478.59 feet, a central angle of 3° 51' 59" and a long chord that bears South 84° 35' 10" West, 32.29 feet to the southwest corner of this 7.478 acre tract;

THENCE North 2° 43' 25" West, with the east line of 4.686 acre tract of land sold to Texaco, 388.12 feet to its intersection with the south right-of-way line of Clinton Drive;

THENCE North 86° 31' 10" East, with said south right-of-way line of Clinton Drive, 839.18 feet to the POINT OF BEGINNING and containing 7.48 acres of land.

Save and except the following 5.649 acre tract as described below:

Being a 5.649 acre tract of land out of the Ezekiel Thomas Survey, Abstract Number 73 and situated in Harris County, Texas, being out of and a portion of the residue of a called 24.2862 acre tract of land conveyed to GATX Terminals Corporation (also known as KM Liquids Terminals, L.P.) as described in deed recorded under Harris County Clerk's File Number (H.C.C.F. No.) G867917, said 5.649 acre tract of land being more particularly described as follows (Bearings shown heron are based on the south line of said residue of a called 24.2862 acre tract of land, being South 86° 31' 10" West);

COMMENCING, for reference at a 1/8-inch pin inside a 6-inch iron pipe found in the south Right-of-Way (R.O.W.) line of Clinton Drive (100 feet R.O.W.) and marking the northeast corner of said residue of a called 24.2862 tract;

THENCE, South 86° 29' 11" West, along the south R.O.W. line of said Clinton Drive and the north line of said residue of a called 24.2862 acre tract, a distance of 154.00 feet;

THENCE, South 03° 28' 41" East, departing the south R.O.W. line of said Clinton Drive and the north line of said residue of a called 24.2862 acre tract, crossing a pipeline corridor and over and across said residue of a called 24.2862 acre tract, a distance of 30.00 feet to a 5/8-inch iron rod with cap stamped "Terra Surveying" set in the south line of said pipeline corridor, marking the northeast corner and the POINT OF BEGINNING of the herein described tract, from which a ½-inch iron rod with cap stamped "Gullett Assoc" bears South 03° 28' 41" East, 0.59 feet;

THENCE, South 03° 28' 41" East, a distance of 358.25 feet to a 1/2 –inch iron rod with cap stamped "Gullett Assoc" found in the south line of said residue of a called 24.2862 acre tract and the north line of a called 2.4947 acre tract (40-foot wide Right-of-Way) as described in a deed to Texas and New Orleans Railroad Company recorded under Volume (Vol.) 2501, Page (Pg.) 242 of the Harris County Deed Records (H.C.D.R.) and marking the southeast corner of the herein described tract;

THENCE, South 86° 31' 10" West, along the south line of said residue of a called 24.2862 acre tract and the north line of said 2.4947 acre tract, at a distance of 561.89 feet (called 561.9 feet) passing a ½-inch iron rod with cap stamped "Gullett Assoc" found, continuing a total distance of 689.32 feet to a 5/8-inch iron rod with cap stamped "Terra Surveying" set marking the southeast corner of a called 4.607 acre tract of land conveyed to Texaco Refining and Marketing Inc., as described in deed recorded under H.C.C.F. No. S836081 and marking the southwest corner of the herein described tract;

THENCE, North 02° 45' 24" West, departing the south line of said residue of a called 24.2862 acre tract and the north line of said 2.4947 acre tract, along the east line of said 4.607 acre tract, at a distance of 338.12 feet passing the most northeasterly corner of said 4.607 acre tract, continuing over and across said residue of a called 24.2862 acre tract, a total distance of 358.10 feet to a 5/8-inch iron rod with cap stamped "Terra Surveying" set in the south line of the aforesaid pipeline corridor, being South 02° 45' 24" East, 29.79 feet from the aforesaid south R.O.W. line of Clinton Drive, marking the northwest corner of the herein described tract;

THENCE, North 86° 30' 15" East, continuing over and across said residue of a called 24.2862 acre tract and along said south line of the pipeline corridor, at a distance of 122.93 feet passing a ½-inch iron rod with cap stamped "Gullett Assoc" which bears South 07° 02' 30" West, 0.59

feet, continuing a total distance of 684.82 feet to the POINT OF BEGINNING and containing 5.649 acres of land.

TRACT 9

120.36 Acres of land being the residue of a 191.43 acre tract of land, in part out of that certain 316.0457 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc., to South States Terminals Company recorded under Harris County Clerk's File No. G 867916, and in part out of those certain 43.328 acre and 49.301 acre tracts described in a deed to General American Transportation Company recorded in Volume 2433, Page 332, Harris County Deed Records, said 130.361 acres of land being described as follows:

BEGINNING at the southeast corner of said 316.0157 acre tract leased on the north right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,200,339.61 and Y= 709,968.27;

THENCE South 86° 31' 10" West, with said north right-of-way line, 64.62 feet to the southeast corner of a 50 foot by 100 foot tract conveyed to Entex, Inc.;

THENCE in a counterclockwise direction with the east, north and west lines of said Entex tract with the following three (3) courses and distances:

1. North 3° 31' 20" West, 100.00 feet,
2. South 86° 31' 10" West, 50.00 feet,
3. South 3° 31' 20" East, 100.00 feet to its southwest corner on the north right-of-way line of Clinton Drive;

THENCE in a westerly direction with the South lines of said 316.0157 acre tract and with said north right-of-way line with the following two (2) courses and distances:

1. South 86° 31' 10" West, 2510.70 feet to an angle point,
2. South 88° 04' 16" West, 46.38 feet to the southwest corner of said 316.0157 acre tract, and the southeast corner of said 43.328 acre tract, being the southeast corner of Tract 4-A of seven parcels totaling 107.5551 acres conveyed to Arco Pipeline Company;

THENCE generally in a northerly direction with the easterly and northerly lines of Tract 4-A, Tract 3, Tract E, Tract D, Tract C-2 and Tract C-1 of said seven Arco Pipeline Company parcels, with the following twelve (12) courses and distances:

1. North 3° 24' 05" West, with the west line of said 316.0157 acre tract and the east line of said 43.328 acre tract 1243.39 feet,
2. South 86° 35' 55" West, 300.00 feet to a point within said 43.328 acre tract,
3. North 3° 24' 05" West, 300.00 feet,
4. North 86° 35' 55" East, 300.00 feet to a point on the common line between said 43.328 acre and said 316.0157 acre tracts,
5. South 3° 24' 05" East, with said common line 100.00 feet,

6. North 86° 31' 10" East, entering said 316.0157 acre tract, 884.30 feet, to the southeast corner of Tract 3,
7. North 3° 24' 05" West, 161.57 feet,
8. North 86° 29' 39" East, 735.70 feet to the southeast corner of Tract E,
9. North 3° 24' 05" West, 1062.41 feet to the northeast corner of said Tract D,
10. South 83° 50' West, 187.96 feet to a point of curve,
11. With said curve to the right having a radius of 484.28 feet, a central angle of 45° 07' 31" and an arc length of 381.41 feet to its point of tangency,
12. North 51° 02' 29" West, 254.36 feet to the lower southwest corner of a 60.57 acre tract surveyed by G.P. Surveyors in October, 1995,

THENCE North 86° 31' 10" East, 262.45 feet to the center of Hunting Bayou and in the northeasterly line of said 191.43 acre tract;

THENCE in a southeasterly direction down Hunting Bayou with the meanders of its centerline and with the westerly and southerly lines of said 102.1255 acre tract with the following six (6) courses and distances:

1. South 57° 41' East, 93.94 feet,
2. South 72° 25' East, 180.00 feet,
3. North 81° 10' East, 315.00 feet,
4. North 89° 30' East, 190.00 feet,
5. North 82° 45' East, 580.00 feet,
6. South 79° 10' East, 188.00 feet to the southeast corner of said 102.1255 acre tract on the east line of said 316.0157 acre tract;

THENCE South 3° 31' 20" East, with the east line of said 316.0157 acre tract, 2849.65 feet to the POINT OF BEGINNING and containing 130.36 acres of land.

Save and except the following 10.000 acres as described below:

ALL that certain 10.0000 acres (435,600 square feet) of land situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, and being out of the residue of that certain 316.0157 acre tract described as Parcel One in instrument to GATX Terminals Corporation recorded under File Number G867917 of the Harris County Official Public Records of Real Property (H.C.O.P.R.R.P.); said 10.0000 acres (435,600 square feet) of land being more particularly described by metes and bounds as follows (all bearings are referenced to the westerly line of said 316.0157 acre tract, having a bearing of North 03° 24' 05" West):

COMMENCING at a ½ inch iron rod found for the southwesterly corner of said 316.0157 acre tract, the southeasterly corner of a called 19.396 acre tract described in instrument to ARCO MIDCON, LLC, recorded under File Number V904204, H.C.O.P.R.R.P., from which a concrete monument found with a "TEXACO" star on top bears S67° 28'W, 0.71 feet, said point also being in the northerly right-of-way of Clinton Drive (100 feet wide), as described in instruments

recorded in Volume 704, Page 216, and Volume 1011, Page 47, of the Harris County Deed Records, (H.C.D.R.);

THENCE North 03° 24' 05" West, 184.69 feet, leaving the northerly right-of-way of said Clinton Drive, with the westerly line of said 316.0157 acre tract, the easterly line of said 19.396 acre tract, to a 5/8 inch iron rod with cap stamped "A.L. SIKES RPLS 2914" set for the POINT OF BEGINNING of the herein described tract;

THENCE North 03° 24' 05" West, with the westerly line of said 316.0157 acre tract, the easterly line of said 19.396 acre tract, at 818.69 feet, passing the most easterly northeast corner of said 19.396 acre tract, at 1,058.69 feet passing the most southerly northeast corner of the residue of a called 38.1524 acre tract described as Tract-A in instrument to Four Corners Pipe Line Company, recorded under File Number R276485, H.C.O.P.R.R.P., said corner being the southeasterly corner of the residue of a called 40.2186 acre tract described in instrument to GATX Terminals Corporation, recorded in Volume 2433, Page 332, H.C.D.R., in all a distance of 1,089.00 feet, to a 5/8 inch iron rod with cap stamped "A.L.SIKES RPLS 2914" set for the northwesterly corner of this tract;

THENCE North 86° 35' 55" East, 400.00 feet to 5/8 inch iron rod with cap stamped "A.L. SIKES RPLS 2914" set for the northeasterly corner of this tract;

THENCE South 03° 24' 05" East, 1eet to 5/8 inch iron rod with cap stamped "A.L. SIKES RPLS 2914" set for the southeasterly corner of this tract;

THENCE South 86° 35' 55" West, 400.00 feet, to the PLACE OF BEGINNING and containing 10.0000 acres (435,600 square feet) of land.

Total Lands of Kinder Morgan Liquid Terminals LLC: 373.721 Acres

METES AND BOUNDS DESCRIPTION FOR A

1.807 ACRE AREA

PLUME MANAGEMENT ZONE

METES AND BOUNDS DESCRIPTION of an 1.807 acre tract of land, extending over, through, along and across, a called 123.5686 acre tract of land (Parcel Three) as recorded in File No. G867917, Official Public Records of Real Property of Harris County, Texas, and also across a called 40 foot wide fee strip, as recorded in Volume 2501, Page 242, Harris County Deed Records, said tracts being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows:

Bearing and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83, U.S. survey feet.

COMMENCING at a brass disc set in concrete found on the South right-of-way line of Clinton Road (called 100' wide), and also being the Northeast corner of a called 24.2862 acre tract (Parcel Two) as recorded in File No. G867917, Official Public Records of Real Property of Harris County, Texas, the POINT OF COMMENCING having coordinates N = 13,832,307.72, E = 3,168,749.80;

THENCE, along and with the East line of said 24.5862 acre tract, South 03° 28' 15" East, at a distance of 387.55 feet pass the Southeast corner of said 24.5862 acre tract, the same being on the North line of a called 40' wide fee strip as recorded in Volume 2501, Page 242, Harris County Deed Records, at a distance of 427.55 feet pass the Northeast corner of said 123.5686 acre tract, the same being on the South line of said 40' wide fee strip, in all a distance of 1,109.56 feet to a point on the above mentioned East line;

THENCE departing said East line, and over and across said 123.5686 acre tract South 86° 1' 45" West, a distance of 1,398.61 feet to the **POINT OF BEGINNING**, having coordinates N = 13,832,115.52, E = 3,167,420.94 ;

THENCE, the following five (5) courses:

1) South 53° 12' 28" West, a distance of 301.44 feet to a point for corner;
2) North 30° 04' 12" West, a distance of 274.25 feet to a point for corner;
3) North 47° 11' 09" East, a distance of 182.37 feet to a point for corner;
4) North 87° 30' 46" East, a distance of 108.85 feet to a point for corner;

THENCE, South 36° 18' 34" East, a distance of 230.16 feet to the **POINT OF BEGINNING** and containing 1.807 acres of land.

- *Draft Revised Response Action Plan, East Plant Gate 6 Area to the 2014 RAP,* dated March 5, 2018
- *Draft Response Action Plan, Old Pump House (OPH) No. 5 Area of Concern, (East Plant),* dated March 28, 2018;

Kinder Morgan Liquids Terminals, LLC - Galena Park;
TCEQ SWR No. 30573; TCEQ Hazardous Waste Permit/Compliance Plan 50054;
EPA ID No. TXD026481523;
Customer No. CN601545940; Regulated Entity No. RN100237452

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above referenced Response Action Plans (RAPs) received by the Remediation Division on January 24, March 6, and April 2, 2018, respectively. Based on the TCEQ review, the Draft RAPs fulfill the requirements of 30 Texas Administrative Code (TAC) §350.94. The TCEQ hereby approves Draft RAP with the following conditions:

- Within one-hundred-twenty (120) days from the date of this letter please submit the above referenced Response Action Plans (RAPs) as part of a Class 3 Permit Modification application. The Modification to the Permit shall incorporate proposed response actions for the OPH No. 5 Area of Concern, East Plant Gate 6 Area, and the TCI Plant, and any other areas at the Galena Park site in which the response action will take more than 3 years to complete. Please submit an original and three copies of the Class 3 Permit Modification application to the IHW Permits Section at mail code MC130.
- The TCEQ recommends that the Implementation Schedule for the submittal of proof of institutional controls (ICs) in the form of deed notice be consistent between RAPs. For example, proof of filing be submitted within 120 days of RAP approval in accordance with 30 TAC §350.33.
- Since the CP Attachment A maps for the final draft permit will be in black and white the TCEQ recommends that the designated monitoring well location for point-of-exposure well, attenuation monitoring, etc., have a different symbol so the different well can be easily distinguished from one another.
- Revise the deed Notice language in Appendix 4 of the RAPs to include the following information as required by 30 TAC §350.111 and per TCEQ Guidance RG-366/TRRP 16 *Institutional Controls under TRRP*:

- A metes and bounds description of the portion(s) of the affected property to which the IC applies;
- A plat map clearly demarcating the portion(s) of the affected property to which the IC applies. The map must contain a north arrow, a correlating map scale, and a legend identifying any used symbols or abbreviations;
- Both the metes and bounds and plat map need to be certified by a registered professional land surveyor or registered by the Texas Bard of Professional Surveying attesting to the accuracy of the descriptions.
- A list of constituents of concern for each environmental media that contain concentrations above their respective protective concentration levels (PCLs).
- A description of any monitoring and maintenance requirements of the physical controls and/or ICs, or compliance with health and safety plans.
- The TCEQ Program and identifier number which should be SWR No. 30573.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the plan.

Questions concerning this letter should be directed to me at (512) 239-2034 or maureen.hatfield@tceq.texas.gov. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals.

Sincerely,

Maureen Hatfield, P.G., Project Manager

Re: Approval Conditional
Interim Corrective Measures Effectiveness Report, Tract A (North Plant), dated May 17, 2022
Technical Report - Light Non-aqueous Phase Liquid (LNAPL) Bail/Down Testing and LNAPL Transmissivity – Old Pump House 5 (OPH5) Area of Concern (AOC), East Plant, dated May 24, 2022
Kinder Morgan Liquids Terminals, LLC – Galena Park;
TCEQ SWR No. 30573; CN601545940; RN100237452
TCEQ Hazardous Waste Permit/Compliance Plan No. 50054
EPA ID No. TXD026481523;

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above-referenced reports and approves them with the following comments:

1. May 17, 2022, Interim Corrective Measures Effectiveness Report, Tract A (North Plant). This report generally meets the requirements of Provisions XI.H.8 of the above-referenced Permit. Please continue to submit interim measures reports per Permit Provision XI.H.8.

2. May 24, 2022, Technical Report - LNAPL Bail/Down Testing and LNAPL Transmissivity – OPH5 AOC, East Plant: The report concludes that (a) the small LNAPL plume within the OPH5 plume management zone (PMZ) is stable and is not expanding and (b) the LNAPL is not readily recoverable based on its transmissivity data. The report recommends ceasing LNAPL permanently. The TCEQ concurs on this proposal, with the following conditions per TCEQ guidance RG-366/TRRP-32 Risk-Based NAPL Management:

    a. Continue to monitor LNAPL thicknesses for changes in its condition or distribution; and,
    b. Verify that no explosive conditions are generated by the LNAPL.

    If the groundwater protective concentration level exceedance (PCLE) zone expands or explosive conditions are present due to LNAPL, propose a

modification to the Response Action Plan (RAP) per 30 Texas Administrative Code (TAC) §350.33(f)(4)(C)(i).

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the RAP.

Questions concerning this letter should be directed to me at (512) 239-2034. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all future documents to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals. Note that the electronic and hard copies should be identical, complete copies. A Correspondence ID Form (TCEQ Form 20428) must accompany each document submitted to the Remediation Division and should be affixed to the front of your submittal. The Correspondence ID Form helps ensure that your documents are identified correctly and are routed to the applicable program for a timely response.

Sincerely,

Maureen M. Hatfield, P.G., Project Manager

Re: Approval of *Kinder Morgan's (KM's) October 12, 2022 Response to TCEQ's August 12, 2022 Comment letter regarding the Interim Corrective Measures Effectiveness Report (RAER) – Tract A and Light Non-aqueous Phase Liquid (LNAPL) Bail/Down Testing and LNAPL Transmissivity – Old Pump House 5 Area*
Kinder Morgan Liquids Terminals, LLC – Galena Park; TCEQ SWR No. 30573; CN601545940; RN100237452; EPA ID No. TXD026481523;
TCEQ Hazardous Waste Permit with Compliance Plan No. 50054

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has completed the review of KM's response and has determined that it adequately addresses the comments in TCEQ's August 12, 2022 letter. Therefore, the above-referenced response, RAER and LNAPL Reports generally meet the reporting requirements in Permit Provision XI.G and CP Table VII.

Questions concerning this letter should be directed to me at (512) 239-2034. When responding by mail, please submit one paper copy and one electronic copy (on USB, disc) of all future documents to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals. Note that the electronic and hard copies should be identical, complete copies. A Correspondence ID Form (TCEQ Form 20428) must accompany each document submitted to the Remediation Division and should be affixed to the front of your submittal. The Correspondence ID Form helps ensure that your documents are identified correctly and are routed to the applicable program for a timely response.

Sincerely,

Maureen M. Hatfield, P.G., Project Manager

Re: Report Transmittal – LNAPL Baildown Testing and LNAPL Transmissivity, OPH5 AOC, East Plant
KM Liquids Terminals LLC - Galena Park Terminal
Galena Park, Texas
ISWR No. 30573
Hazardous Waste Permit No. HW-50054
EPA I.D. No. TXD026481523

Dear Ms. Hatfield:

Please find enclosed one original hard copy and an electronic copy (on USB drive) of the above-referenced report. The report was prepared to document light non-aqueous phase liquids (LNAPL) baildown field testing and LNAPL transmissivity determination for the Old Pump House #5 (OPH5) Area of Concern (AOC) in East Plant at the KM Liquids Terminals LLC (KMLT) Galena Park Terminal. The intent of the testing and analyses was to evaluate the recoverability of the LNAPL present in the subsurface at the OPH5 AOC after approximately six years of LNAPL recovery efforts. A prior LNAPL baildown test and evaluation completed in 2016 and presented in the August 2018 Response Action Plan (RAP) for the OPH5 AOC indicated LNAPL transmissivities in the range of 1.77 ft^2/day to 3.42 ft^2/day, indicating LNAPL was recoverable at that time.

To address the LNAPL in the subsurface at the OPH5 AOC, LNAPL recovery began in 2016 with the installation of the passive drain system, which is documented in the August 2018 RAP, and was further enhanced with the installation of a Spill Buster® (an automatic LNAPL recovery system) in OPHMW-7 in 2017 and initiation of manual recovery from OPHMW-1 and OPHMW-8 in 2018. Manual recovery at OPHMW-1 was replaced with a Spill Buster® in early 2021. Manual LNAPL recovery and recovery using the Spill Busters® was continued until May of 2021 when, with Texas Commission on Environmental Quality (TCEQ) concurrence, LNAPL recovery was temporarily stopped (except for the passive drain system) to monitor LNAPL rebound and assess the need to continue LNAPL recovery. At the time LNAPL recovery was ceased, LNAPL thicknesses in the affected wells was generally less than 0.1 feet and recovered volumes, excluding the passive drain system, were less than 0.1 liters per week.

The new LNAPL transmissivity data and the significant reduction in LNAPL recovery volume presented in the attached report indicate all readily recoverable LNAPL has been removed.

KMLT requests your consideration for the recommendation provided by Tetra Tech to cease active NAPL recovery permanently, while continuing to operate the passive subsurface drain system.

If you have any questions regarding this submittal or require additional information, please feel free to contact me at (713) 654-6035, or if you wish you can e-mail me at [redacted]

Sincerely,
KM Liquids Terminals LLC

Subject: LNAPL BAILDOWN TESTING AND LNAPL TRANSMISSIVITY – OPH5 AOC, EAST PLANT, KM LIQUIDS TERMINALS LLC - GALENA PARK TERMINAL, 906 CLINTON DRIVE, GALENA PARK, TEXAS

Dear Mr. Kennedy:

Tetra Tech, Inc. (Tetra Tech) has prepared this letter report to document light non-aqueous phase liquids (LNAPL) baildown field testing and data analyses related to the Old Pump House #5 (OPH5) Area of Concern (AOC) in East Plant at the KM Liquids Terminals LLC (KMLT) Galena Park Terminal. The purpose of the testing and analyses was to evaluate the potential recoverability of the LNAPL present in the subsurface at the OPH5 AOC. The location of the OPH5 AOC on the KMLT Galena Park Terminal is illustrated in Figure 1 and the location of wells associated with the AOC are illustrated in Figure 2.

The area of the OPH5 AOC is currently being remediated under the Corrective Action Program required by the Galena Park Terminal's Hazardous Waste Permit/Compliance Plan (HW-50054). The response action at OPH5 includes a groundwater plume management zone (PMZ) within which a small stable LNAPL plume is being managed. During development of the response action for the area, it was determined that the LNAPL in the subsurface was readily recoverable and therefore the response action included LNAPL recovery within the PMZ.

Recovery and monitoring of LNAPL was initiated in 2016. Initially recovery was through a passive subsurface drain system installed in the wall of a large below grade containment area located adjacent to the LNAPL plume. The LNAPL recovery was subsequently enhanced by the installation of a Spill Buster® system and manual recovery. Historical recovery and monitoring data through first quarter 2021 showed that LNAPL thicknesses and LNAPL recovery volume had been reduced significantly since 2016. With the permission of the Texas Commission on Environmental Quality (TCEQ), LNAPL recovery was stopped, except recovery from the passive drain system, in April 2021 and a monthly monitoring program was instituted to monitor for LNAPL rebound. The monitoring data since shutdown show that LNAPL thicknesses in the affected wells/sumps have over time shown some rebound but are variable. A summary of the historical gauging and recovery data is included as Table 1.

As outlined in the TCEQ approved Response Action Plan (RAP) for OPH5, LNAPL recovery is to be assessed at the OPH5 AOC on a regular basis. The purpose is to determine if the LNAPL

plume continues to be stable and if the LNAPL continues to be readily recoverable. To complete that assessment, an LNAPL baildown test was conducted at one of the monitoring wells associated with the OPH5 AOC (OPHMW-8) on November 18, 2021 and again on January 18, 2022. The purpose was to determine the current LNAPL transmissivity and evaluate whether a recovery endpoint had potentially been reached as suggested by the historical recovery data. The tests and subsequent evaluations were completed in general accordance with procedures outlined in the American Petroleum Institute's (API's) April 2016 User Guide – API LNAPL Transmissivity Workbook: A tool for Baildown Test Analysis (API 2016).

The LNAPL baildown test at OPH5MW-8 included a pretest gauging of fluid levels in the well, rapid removal of the LNAPL in the well (using a peristaltic pump), recordation of the total volume of LNAPL recovered, and subsequent monitoring, by hand using an interface probe, of the depth to LNAPL and depth to groundwater. The field data are summarized in Table 2.

The baildown test analyses were completed using the API LNAPL Transmissivity (Excel) Workbook (API 2016). Well and aquifer-specific data in addition to the test data were input into the workbook. The analyses were completed assuming an unconfined aquifer and a sandy silt formation. The model uses the Bower and Rice, Cooper and Jacob, and Cooper, Bredehoeft and Papadopulos methods to estimate LNAPL transmissivity. The model input and output are included in Attachment 1. The results for the November 2021 testing, using the various methods in the API Workbook, show LNAPL transmissivities ranging from 0.17 ft^2/day to 0.25 ft^2/day with an average LNAPL transmissivity of 0.21 ft^2/day. LNAPL transmissivity values in the range of 0.1 to 0.8 ft^2/day are generally accepted as cutoff values below which LNAPL is largely immobile under either natural or active recovery conditions (ITRC 2009). The November 2021 testing results would suggest that the LNAPL in the subsurface in the OPH5 area has reached a point where it is no longer readily recoverable.

To confirm the November 2021 results, the LNAPL baildown testing was repeated at OPHMW-8 in January 2022. The results for the January 2022 testing show LNAPL transmissivities ranging from 0.20 ft^2/day to 0.61 ft^2/day with an average LNAPL transmissivity of 0.43 ft^2/day. The results are comparable to the results for the November 2021 testing and support the conclusion that the LNAPL at the OPH5 AOC is likely immobile, not readily recoverable, and a recovery endpoint has been reached.

Groundwater monitoring data collected since 2016 show that the LNAPL plume associated with the OPH5 AOC is not expanding and is stable. Active LNAPL recovery between 2016 and 2021 reduced the observed LNAPL thickness in the area from a high of 3.94 feet to 0.04 feet or less depending on well location. Since ceasing active LNAPL recovery in first quarter of 2021, LNAPL thicknesses have rebounded but the LNAPL thickness at the individual wells are not consistent and are highly variable, ranging from 0.44 feet to 2.55 feet in OPHMW-1, 0.02 feet to 1.65 feet in OPHMW-7, and 0.04 feet to 2.51 feet in OPHMW-8. The variability may be due in part to rainfall and the level of soil saturation in the area. Given that the LNAPL plume is not expanding and that the LNAPL transmissivity data indicates that the LNAPL is not readily recoverable, and as outlined in the Performances Measures section of the RAP (RAP Worksheet 3.0), Tetra Tech recommends that the TCEQ be petitioned to cease active NAPL recovery permanently.

Tetra Tech appreciates the opportunity to provide KMLT with professional environmental consulting services. Should you have any questions or comments regarding this letter report, please do not hesitate to contact Vincent Swadis by telephone at 832-251-6093 or by email at [redacted]

Sincerely,

Re: Response to TCEQ Comments and Conditional Approval dated August 12, 2022:
Interim Corrective Measures Effectiveness Report, Tract A (North Plant), dated May 17, 2022
Letter Report - *Light Non-aqueous Phase Liquid (LNAPL) Bail/Down Testing and LNAPL Transmissivity – Old Pump House 5 (OPH5) Area of Concern (AOC), East Plant*, dated May 24, 2022
Kinder Morgan Liquids Terminals, LLC – Galena Park
906 Clinton Drive
Galena Park, Texas
TCEQ SWR No. 30573; CN601545940; RN100237452
TCEQ Hazardous Waste Permit/Compliance Plan No. 50054
EPA ID No. TXD026481523

Dear Ms. Hatfield:

KM Liquids Terminals LLC (KMLT) has prepared this letter to address the comments in your letter dated August 12, 2022 regarding the above-referenced reports, and to provide additional information, as applicable. Each KMLT response below is refenced to the Texas Commission on Environmental Quality (TCEQ) assigned comment number.

TCEQ Comment #1 – May 17, 2022, Interim Corrective Measures Effectiveness Report, Tract A (North Plant). This report generally meets the requirements of Provisions XI.H.8 of the above-referenced Permit. Please continue to submit interim measures reports per Permit Provision XI.H.8.

Response to Comment #1 – Comment noted.

TCEQ Comment #2 – May 24, 2022, Technical Report - LNAPL Bail/Down Testing and LNAPL Transmissivity – OPH5 AOC, East Plant: The report concludes that (a) the small LNAPL plume within the OPH5 plume management zone (PMZ) is stable and is not expanding and (b) the LNAPL is not readily recoverable based on its transmissivity data. The report

recommends ceasing LNAPL permanently. The TCEQ concurs on this proposal, with the following conditions per TCEQ guidance RG-366/TRRP-32 Risk-Based NAPL Management:

a. Continue to monitor LNAPL thicknesses for changes in its condition or distribution; and,
b. Verify that no explosive conditions are generated by the LNAPL.

If the groundwater protective concentration level exceedance (PCLE) zone expands or explosive conditions are present due to LNAPL, propose a modification to the Response Action Plan (RAP) per 30 Texas Administrative Code (TAC) §350.33(f)(4)(C)(i).

Response to Comment #2 (general) – Comment noted.

Response to Comment #2a – KMLT will monitor LNAPL thicknesses for changes in its condition or distribution during the semiannual groundwater monitoring required by Provision XI.F.3.d.(1).

Response to Comment #2b – KMLT has an extensive hydrocarbon monitoring system, both above grade and below grade, in place at OPH5 (see attached diagram). The system is in place to monitor the atmosphere for explosive vapors at Old Pumphouse #5 and the piping manifold associated with the pumphouse. If explosive atmospheric conditions were to develop in the area, the various monitors would alarm, and corrective action would be taken by KMLT safety personnel. KMLT proposes that this system will be adequate for meeting the conditions stated in TCEQ Comment 2b.

KMLT appreciates the opportunity to work with the TCEQ to resolve the comments above. If you have any questions or require additional information regarding this letter, please feel free to contact me at (713) 654-6035, or if you wish you can e-mail me at [redacted]

Sincerely,
KM Liquids Terminals LLC

Johnny Kennedy, P.G.

1.0 INTRODUCTION

This Groundwater Sampling and Analysis Plan (SAP) provides guidance for KM Liquids Terminals LLC (Kinder Morgan) personnel, subcontractors, and consultants who do groundwater monitoring tasks at the Galena Park Terminal to fulfill site obligations under the terminal's Hazardous Waste Permit/Compliance Plan (Permit No. HW-50054). This SAP outlines procedures and defines equipment for the collection of representative groundwater samples from monitoring wells and is designed to meet the requirements of 30 Texas Administrative Code (TAC) 335.163(4) and (5) and also 40 CFR 270.30(j).

This SAP is applicable to the groundwater monitoring activities related to the Corrective Action Program at the Galena Park Terminal but may also serve as a reference guide for other groundwater monitoring programs being conducted at the terminal unless specifically authorized otherwise under those other programs. The Corrective Action Program at the Galena Park Terminal applies to the units specified in Compliance Plan (CP) Table I (Waste Management Units and Areas Subject to Groundwater Corrective Action and Compliance Monitoring) of the Hazardous Waste Permit/Compliance Plan.

2.0 CORRECVTIVE ACTION PROGRAM MONITORING SYSTEM

The Corrective Action Program groundwater monitoring system at the Kinder Morgan Galena Park Terminal consists of Point of Compliance (POC) wells, Corrective Action Observation (CAO) wells, Point of Exposure (POE) wells, Background wells, Attenuation Monitoring Point (AMP) wells, Potentiometric Surface Observation (PSO) wells, and Corrective Action System (CAS) wells (recovery wells). The current Corrective Action Program wells and their designation are summarized in CP Table V (Designation of Wells) and CP Attachment A. The well locations are illustrated in CP Attachment A. The Corrective Action Program wells are sampled on a regular basis in accordance with Provision XI.F.3 of the Permit.

3.0 ENVIRONMENTAL HEALTH AND SAFETY CONSIDERATIONS

Groundwater Sampling and Analyses will be performed according to a Health and Safety Plan (HASP) applicable to groundwater sampling conditions at the Galena Park Terminal.

A. Site personnel work under a specific written site procedure.
B. Environmental Contractors prepare a site-approved HASP for all field activities. The Environmental Contractor's HASP will be prepared in accordance with HASP protocol for groundwater sampling at the Kinder Morgan Texas, Galena Park Terminal that include:
    1. Safe work procedures consistent with site safety protocols.
    2. Personal protection equipment (PPE) consistent with assessment of known or potential groundwater contaminants.
    3. Disposal procedures for various media, decontamination rinses, and used PPE.

The site-approved HASP is provided to all field personnel and reviewed with the project manager prior to beginning work, with emphasis on all safety and environmental protection precautions during the well maintenance and sampling tasks.

4.0 FIELD ACTIVITIES

This section provides detailed procedures and requirements for conducting the field activities necessary for collection of the data required by Hazardous Waste Permit/Compliance Plan for the Kinder Morgan Galena Park Terminal. The field activities are conducted on a semiannual or annual basis and include a static water level and NAPL survey, a well integrity inspection, and groundwater sampling,

4.1 Field Preparation

Prior to mobilization to the field for the sampling program, project personnel will review this SAP to ensure collection of all necessary field data and conformance with the procedures described below. Analytical data from the previous sampling event should be reviewed to identify the order in which wells are to be purged and sampled (i.e., recommend sampling in order of increasing constituent concentration).

All groundwater monitoring wells will be sampled using low-flow sampling technique and all recovery wells (CAS wells) will be sampled by collecting the groundwater samples directly from recovery wells as they are pumping using the dedicated pumps and piping used for groundwater remediation. The use of dedicated equipment for groundwater collection will minimize the need for decontamination of sampling equipment between sampling locations and the potential for cross-contamination. All necessary equipment will be procured and/or prepared for use prior to implementation of field activities.

The project manager will review sampling program objectives and determine the Sample Detection Limits (SDLs) needed for comparison with applicable risk-based criteria (i.e. GWPS.). The sampling program will be coordinated with the approved laboratory to ensure that properly prepared sample kits are provided and that analytical methods and laboratory procedures will achieve the necessary SDLs. The sample kits will include all necessary sample containers with closures and appropriate preservatives; wet ice coolers; indelible water-proof labels; and chain-of-custody/analysis request forms.

4.2 Field Personnel

Individuals with experience in environmental sampling that are thoroughly trained and familiar with all aspects of the sampling protocol will perform the groundwater sampling. If two or more people are involved in sample collection, the senior member of the team will be responsible for complete documentation of sampling. The sampling team will be provided by the approved contractor retained by the Kinder Morgan to conduct the field activities.

4.3 Field Documentation

Documentation of sampling events will be written in waterproof ink and maintained as a permanent record. Field notes will be written in a bound field notebook, with pages numbered sequentially, appropriately dated, and signed. In addition, water-level measurements, well purging records, well inspection results, and documentation of on-site testing of groundwater during sampling will be recorded on standardized forms designed to meet the needs of the facility and subsequent data management needs.

Information to be recorded during the sampling event includes: identification of sampling personnel, identification of wells measured/sampled, dates and times of measurement/sample collection, weather conditions, results of static water level measurements; deficiencies in the physical condition of wells noted during well inspections; purging/sampling methods and volumes; results of field water quality measurements; volume of sample collected; analyses to be performed; container type; and sample preservatives.

4.4 Decontamination Procedure

To the extent practicable, groundwater monitoring wells will be sampled using dedicated equipment, such as peristaltic pumps with dedicated down-hole tubing, dedicated low-flow bladder pumps, disposable bailers, or other suitable sampling equipment. The use of dedicated and/or disposable sampling equipment for groundwater collection will minimize the need for decontamination of sampling equipment between sampling locations and the potential for cross-contamination. Equipment made from inert, non-reactive materials such as Teflon®, stainless steel, or other suitable materials will be used to the extent practicable. When non-dedicated equipment is used during the sampling event, the equipment will be thoroughly cleaned prior to use in each well. The equipment will be washed using the following procedure: 1) start with a solution of Alconox® and water, 2) triple rinse with fresh water, 3) spray with 10% isopropanol solution, 4) rinse with fresh water, 5), rinse with deionized water and, 4) air dry. All decontamination fluids will be contained and disposed of as directed by Kinder Morgan personnel.

4.5 Static Water Level and NAPL Survey

Prior to monitor well purging and sample collection, static water levels will be measured in all existing groundwater monitoring wells at the terminal and noted on the appropriate form. The static water level in the well will be measured to the nearest 0.01 feet with an electronic water level indicator. The depth to water level measurements will be taken in the same monitoring well sequence as the sequence the wells will be sampled. Prior to collecting the water level measurements each well will be allowed to equilibrate to atmospheric pressure by removing the well cap and allowing the well to sit for approximately 30 minutes. Between wells, the static water level measuring probe and line that contacted the well will be: 1) wiped with a paper towel soaked with isopropanol, 2) rinsed with deionized water, and 3) air dried. Additionally, the total depth of the each well will be measured to the nearest 0.01 feet during the static water level survey to determine how much, if any, silt has accumulated in the bottom of the well.

At all monitoring wells, the presence or absence of non-aqueous phase liquids (NAPLs) will be determined and noted on a static water level survey form. Any wells in which evidence of NAPL is, or previously has been detected will be sounded using an electronic interface probe, transparent bailer, weighted string, or other suitable device to permit measurement of the thickness of any NAPL accumulation.

It should be noted that generally NAPLs are suspected to be potentially present if dissolved concentrations in the groundwater exceed 1% of the solubility of the pure constituent. Wells with a measurable thickness of NAPL or with a distinctive sheen in discharge water will generally not be sampled for dissolved constituents because: 1) the presence of NAPL confirms that groundwater at the monitoring well is affected, and 2) results of analysis of dissolved-phase constituents are frequently non-representative because of mixing of NAPL with the groundwater during sampling.

4.6 Well Integrity Inspection

All wells are completed with a protective casing or manway and locking cap. Wells will be unlocked prior to initiating sampling procedures and re-locked when sampling is completed and at any time the sampling team leaves the area. Lock keys will be kept at the terminal.

Wells will be inspected to confirm well integrity and identify needed repairs. The inspection shall note any of the following:

- Lock is in place and operable.
- A plug or cap is in place on the inner well casing.
- Integrity of protective casing (or manway) and barrier post (if applicable).
- The monitoring well is clearly labeled.
- The standpipe or flush-mount well covers are in good condition.
- The concrete pad surrounding the well is free of cracks, which penetrate the entire slab.
- The well is free of obstructions.
- The total depth of the well will be measured and the percent screen section blocked by sediment will be determined.
- The condition of the monitoring well is acceptable.

Well inspections should note any observed deficiencies and any deficiencies will be noted in the field records and brought to the attention of the responsible terminal personnel upon completion of each sampling event. During each sampling event, wells will be sounded to total depth to detect the presence of silt accumulation at the base of the well or other obstruction. Measured well bottoms will be recorded on the well purging field form. If twenty percent of the monitoring well screen is blocked by sediment, the well will be developed prior to sampling.

4.7 Well Purging

4.7.1 Purging Equipment and Method

Wells to be sampled which do not have installed pumping equipment will be purged prior to groundwater sample collection. For wells which have installed pumping equipment, samples will be collected directly from the recovery wells (CAS wells) as they are pumping using the dedicated pumps and piping used for groundwater remediation. Groundwater sampling of non-

pumping wells at the Kinder Morgan Galena Park Terminal will be conducted using low-flow sampling techniques. Dedicated tubing will be assigned to each well and the samples will be collected using either a downhole bladder pump or a peristaltic pump or other appropriate equipment. If necessary, sampling can be conducted with a new disposable bailer with nylon cord and wearing dedicated nitrile or latex or other appropriate gloves.

Sample intake depths (i.e. depth of pump intake or depth of bottom of tubing) will be set relative to the top of the well casing, recorded, and used for all subsequent sampling events. The sample intake depths should be set at the mid-point of the screened section and not less than two feet from the bottom of the well. The depth setting of the pump and/or tubing intake for each well will be indicated on the field sampling form.

Low-flow sampling must be conducted in such a manner as to minimize the amount of drawdown in the well during purging and sampling. The objective is to sample groundwater directly from the screened interval (at a point 50% down the screen interval) without mixing of stagnant water from above the screened interval during the sampling process. Pumping rates of no more than 0.1 to 0.5 L/min should be used and water levels in the well monitored at regular intervals, and recorded, to ensure that drawdown in the well does not exceed the method criteria. At no time during the well purging or sampling should the water level drop below the top of the well screen section.

To the extent practicable, drawdown in the well should not exceed 0.3 feet. If, however, drawdown using the minimal discharge that can be achieved exceeds 0.3 feet but remains stable and does not go below the top of the screened interval, continue pumping until the indicator field parameters stabilize. During subsequent low flow sampling events, duplicate to the extent practicable, the extraction rate (based on final pumping rates when indicator field parameters stabilized during previous sampling events) used at each well. The optimum purge rate for each well will be indicated on the field sampling form.

If a well can not be purged using low-flow sampling techniques without producing excessive drawdown (i.e., the water level declines into the screened portion of the well), bailers can be used as an alternative purging and sampling method. A new disposable bailer will be used to extract water from the well until either the well has gone “dry” or three well casing volumes has been removed. A bailed well must be allowed to recharge for at least one hour prior to collecting any samples. Samples will be collected using the disposable bailer. During purging and sampling, the disposable bailer will be lowered slowly into the well and decanted carefully to minimize agitation and the chance for incidental spills.

4.7.2 Purge Volumes

Wells purged using low-flow techniques will be considered purged when the field parameters have stabilized and a volume greater than the drawdown volume of the casing (drawdown below static water level, in feet, times the unit volume per foot of casing) plus the extraction tube volume has been removed.

Wells purged using a bailer will be considered purged when the well has gone “dry” or a minimum of three casing volumes has been removed. A casing volume is equal to the length of

the water column in feet (total well depth relative to top of well casing minus depth to water relative to top of well casing) times the unit volume per foot of casing.

Casing Volume Calculation

A well casing volume is defined as the height of the water column times gallons per foot (gpf) stored in the well casing (0.16 gpf for 2-inch diameter casing, and 0.65 gpf for 4-inch diameter casing), and can be calculated as follows:

$$\text{Casing Volume} = [\pi \text{ (well radius, ft)}^2 \text{ (water column height, ft)}] \text{ (7.4805 gal/ ft}^3\text{)} = \text{gallons}$$

Substituting values to calculate the volume of a one-foot length of two-inch diameter well casing:

$$\text{Casing Volume} =[3.14159 \text{ (2-inch/2} \bullet \text{ 1 ft/12 inches)}^2 \text{ (1 ft)}] \text{ (7.4805 gal/ ft}^3\text{)} = 0.16 \text{ gal}$$

4.7.3 Field Parameters

Field parameters must be monitored during low-flow purging activities to verify that the groundwater collected is representative of the aquifer. The field parameters should be monitored where possible using a flow-through cell. Readings of the field parameters should be taken at regular intervals based either on time or volume purged. Purging is complete and sampling may begin when all indicator field parameters have stabilized. The required field parameters and guidance for determining whether parameter stabilization has been achieved is presented in the table below:

Field Sampling Parameters and Stabilization Criteria

Parameter	Change in Parameter for Three Consecutive Readings
Specific Conductance	± 3%
pH	± 0.2 S.U.
Dissolved Oxygen	± 10%
Redox Potential	± 10 mV
Temperature	± 10%
Turbidity	± 10%

For samples collected from the sample taps at recovery wells, one set of parameter measurements will be taken at the time of sample collection. All meters used to collect the field parameters must be calibrated according to manufacture's specification the day of the sampling event before going into the field. Calibration of the meters will be documented on the field sampling form. Meter calibrations will be checked between well locations by testing with a known standard. If the meters go out of calibration by 10% of more the meter will be recalibrated. Meter recalibration will be documented on the field sampling form.

4.7.4 Management of Purge Water

All purge water will be collected in suitable containers, labeled, and staged in an area designated by Kinder Morgan personnel. Purge water disposal will be managed by an approved contractor designated by Kinder Morgan personnel.

4.8 Groundwater Sampling

4.8.1 Sample Collection and Handling

For wells sampled using low-flow techniques, sampling should be conducted as soon as practicable following purging, preferably within 15 minutes. A bailed well must be allowed to recharge for at least one hour prior to collecting any samples. For wells with low recharge rates that are essentially dewatered during purging (i.e. purged "dry"), the well can be sampled up to 24 hours following completion of purging without further purging or bailing.

Groundwater samples will be collected and handled to minimize the potential for cross-contamination, loss of volatile constituents, or other interference. Sampling personnel will wear clean latex, nitrile or other chemical resistant, non-reactive gloves when handling sampling equipment and containers, and will minimize contact with the sampled groundwater. Care will be taken to prevent contact of the bailer, cord, or other down-hole equipment with the ground or other potential sources of sample contamination. Gloves will be changed and disposed of as waste between sampling locations.

4.8.2 Sampling Order

Well locations will be sampled in order of increasing groundwater constituent concentrations in order to minimize potential for cross-contamination. The suggested parameter bottle filling order is: volatiles, semi-volatiles, herbicides, and metals.

4.8.3 Special Considerations for Volatile Organic Compound Sampling

The proper collection of samples for dissolved VOCs requires minimal disturbance of the sample to limit volatilization and subsequent loss of volatiles from the sample. The principal objective is to provide a valid sample for analysis that has been subjected to a minimal amount of turbulence.

The following procedures should be followed when collecting VOC samples:

- Open the vial, set the cap in a clean place, and place the proper amount of preservative (HCL) in the vial or use vials with preservative already added by the laboratory.
- Fill the vial to the top until a convex meniscus forms on the top of the vial. Do not overfill the vial.
- Check that the cap has not been contaminated and carefully cap the vial. Place the cap directly over the top and screw down firmly. Do not over-tighten and break the cap.
- Invert the vial and tap gently. If an air bubble appears, remove the lid, add water from the well to top off the sample, and close again. It is important that no entrapped air remains in the sample vial.
- Place collected samples in the cooler immediately upon collection and ensure that the samples remain at <6°C but do not allow them to freeze.
- Group VOA samples of similar concentration in common coolers and laboratory sample batches for reduced likelihood of cross contamination during transport and laboratory

analysis. It is recommended that samples be shipped or delivered to the laboratory daily. The holding time for preserved VOC samples, under most protocols, is 14 days.

4.8.4 Filtering of Samples

According to Texas Commission of Environmental Quality (TCEQ) protocols, groundwater samples collected for analyses of total metals should not be filtered in the field prior to preservation by acidification. In some instances, turbidity present in collected groundwater can result in acidification of suspended sediments and anomalously high values for total metals. Therefore, groundwater samples with turbidity values less than 50 NTUs can be analyzed without filtration. For groundwater samples that exceed 50 NTUs, samples should be filtered with a 10-micron filter (only). Samples will be filtered in the field using and a new filter.

4.8.5 Sample Shipment

Sample jars will be packed in bubble wrap (or other suitable material) to prevent breakage and retained in wet ice coolers pending transport to the laboratory with adequate ice packs to maintain samples at a temperature of <6°C until received by laboratory. The laboratory will control the temperature upon receipt. Coolers that are to be shipped by express courier or shipped by air will not be accepted by the carrier if they are leaking fluid; therefore, ice must be packed in leak-proof bags or cool packs used to prevent leakage of fluids from the coolers.

5.0 SAMPLE MANAGEMENT AND ANALYTICAL REQUIREMENTS

5.1 Sample Custody

5.1.1 Sample Custody Control

Sampling personnel will be responsible for the care of collected samples until the containers have been transferred to the custody of the laboratory or courier, preferably no more than 24 hours after collection. Sampling personnel will assure that the collected samples are in the sampler's physical possession, in view at all times, or stored in a secure area to prevent tampering.

5.1.2 Chain of Custody and Sample Shipment

After sample collection, the chain of custody form will be filled out in waterproof ink in legible handwriting and will accompany the samples throughout all phases of shipment and handling. The chain of custody at a minimum will include a list of samples collected, the collection time and date, the analyses requested and method number, the container type and size, and the preservative. The sample cooler will be unique-code-sealed with a custody seal to ensure integrity. The custody seal will be affixed to the cooler such that the cooler can not be opened without breaking the seal.

5.1.3 Sample Delivery and Receipt of Samples

Upon delivery of samples to the laboratory or courier, the sampler will retain a copy of the chain of custody form, signed by the sampler and laboratory personnel indicating the date and time the

sample was relinquished and received. A copy of the chain of custody form showing all signatures from the sampler to the laboratory will be incorporated in the permanent project record.

5.2 Sample Containers/Preservatives/Labels

Samples will be collected in clean, method-specified containers, with appropriate preservatives. Sample containers and preservatives will be supplied by the approved analytical laboratory. Pending use, the sample containers will be stored with lids secured in a clean cooler or box.

Once a sample has been collected, the sample container lid will be secured and a water-proof adhesive label affixed. The label will include sample identification, time and date of collection, sampler's initials, and other pertinent information, as appropriate. The samples will be retained in a cooler as described above pending transport to the laboratory.

The following information will be included on sample labels affixed to field sample containers:

- Site Identification - the site name and location or a unique project number which identifies the site;
- A unique sample ID;
- Collection time and date;
- Name of sampler;
- Requested analysis; and
- Sample preservation

5.2 Sample Analyses

Groundwater samples collected from the Corrective Action Program areas will be submitted to an approved laboratory and analyzed for the area specific indicator parameters listed in CP Table IIIA (Corrective Action Program Table of Indicator Parameters and Groundwater Protection Standard).

5.3 Quality Assurance Plan

All sampling will adhere to strict quality assurance/quality control (QA/QC) requirements to ensure high quality data. Accordingly, sample results will be considered to be representative of the media sampled and to be reproducible within defined statistical limits. These QA/QC protocols will include the following:

- Conformance with the stated requirements of this SAP, including the method of obtaining samples, number and type of sampling containers with precise identification, sample preservation techniques and approved holding times, sample identification codes, and documentation procedures.
- Collection and frequency of QC samples as described below.
- Following the approved decontamination procedure described in this SAP.
- Clear labeling of all samples using appropriate identifiers, identifying sample number, sample location, sample date and time, name of sampler, requested analysis, and sample preservation technique.

- Use of standard COC records to document transfers of samples from point of sampling through to the laboratory.

At a minimum a Level II USEPA Quality Analysis and Quality Control (QA/QC) reporting system must be used for the GMP. The required level of QA/QC will include the following analysis:

- 1 method blank every 20 samples (minimum of one);
- 1 matrix spike every 20 samples (minimum of one);
- 1 lab calibration check sample every 20 samples (minimum of one);
- 1 matrix spike duplicate in 20 samples as a minimum;
- 1 field duplicate sample per 20 samples as a minimum;
- 1 field blank per day of sampling (VOC and SVOC analysis);
- 1 trip blank sample per cool box (for VOC analysis only); and
- 1 equipment blank for the project (for VOC and SVOC analysis);

This level of QA/QC will also require the reporting of the following parameters:

- laboratory sample identification;
- client sample identification;
- analytical method;
- sample collection date;
- date of extraction for SVOCs and Herbicides;
- date of sample digestion for metals;
- date of sample receipt;
- date of analysis;
- detection limits; and
- dilution factors.

5.4 Field Quality Assurance Quality Control Samples

Field Quality Assurance and Quality Control (QA/QC) procedures include the collection of additional samples to measure the effectiveness of the sampling procedures. The following types of QA/QC samples are incorporated into this SAP.

5.4.1 Trip Blank

Trip blanks for VOAs will be prepared by the laboratory. One VOA vial per sample shipping container or cooler will be filled with Type II reagent-grade water, transported to the site with the empty sample bottles, carried with the sample bottles during all sampling activities, and returned to the laboratory for analysis. Contaminants found in the trip blank can be attributed to interaction between the sample and the container, possible contamination due to diffusion of constituents through the septa, or contamination introduced by the laboratory. At a minimum, one trip blank will be analyzed per sampling event and should not be shipped back to the laboratory until the last shipment of samples is sent. One trip blank will be included with each cooler-shipment of a multi-shipment sampling event. The trip blank will be analyzed for VOCs.

5.4.2 Field Blank

A field blank consists of a VOA vial filled with organic-free water, including necessary preservative. To meet the data quality objectives, one field blank will be collected and analyzed for VOCs, SVOCs, and herbicides. A field blank should be collected adjacent to the well most downwind of the sample area where ambient conditions could influence parameter concentration. The field blank bottle(s) are set out beside the well, with the bottle caps off, in a position upwind or nearest to a source of air emission. Contaminants found in the field blank can be attributed to the ambient conditions in the vicinity of the sample location. Frequency will be one per day of sampling.

5.4.3 Equipment Blank

An equipment blank must be performed only when non-dedicated equipment is used. An equipment blank consists of a bottle set, including necessary preservatives, that is filled with deionized water rinsate from the decontaminated equipment used for sampling (i.e., rinse water will be poured from a bailer). Contaminants found in the equipment blank can be attributed to leaching from the sample tubing or equipment or to incomplete decontamination of the sample equipment. If applicable, an equipment blank is collected during sampling events for each sampling matrix, at a frequency of one per day of sampling or one every twenty samples, which ever is the higher frequency. The equipment blank will be analyzed for VOCs, SVOCs, and herbicides.

5.4.4 Duplicate Sample

A field duplicate sample consists of a bottle set, including necessary preservatives, that is filled from one of the sampled wells and assigned a sample identification. The well number that corresponds to the duplicate sample will be recorded in field documentation, but not divulged to the analytical laboratory (blind coding). The meet the data quality objectives, one field duplicate will be collected during each sampling event and analyzed for all project analytes. The duplicate sample provides a measure of precision, or reproducibility of the sample result. Precision as a relative percent deviation (RPD) will be calculated according to the following equation:

$$RPD\% = \frac{(R1-R2) \times 100\%}{(R1+R2)(0.5)}$$

Where:
RPD = Relative Percentage Deviation (%)
R1 = Result from first sample
R2 = Result from duplicate sample

5.4.5 Matrix Spike

For each matrix sampled and sampling batch (every 20 samples), enough sample needs to be collected from one location so as to allow the laboratory to prepare one matrix spike and one matrix spike duplicate for each analytical method employed. Check with the approved laboratory before conducting the sampling event to determine if any extra sample volume will need to be collected.

5.6 QA/QC Review of Analytical Results

The results of analyses of trip blanks, field blanks, and equipment blanks will be used to evaluate sampling procedures and identify external sources of contamination that may influence analytical results. Acceptance criteria for precision of analyses of duplicate samples will be determined by the approved laboratory. Acceptable accuracy for control samples is method dependent and also subject to the performance acceptance criteria of the particular laboratory that is used. General method performance guidelines can be reviewed in the QC portion of each of the applicable EPA SW-846 series methods.

Analytical results as reported by the laboratory will be subject to a thorough QA/QC review. This review will include the following to assess analytical results accuracy:

- Holding Time Review - Check for exceedances of prescribed holding times.
- Blank Review - Review blank analyses for evidence of potential contaminants.
- Duplicate Review - Check for analytical precision and/or sample heterogeneity.
- Spike Review - Review matrix and surrogate spike recovery ranges and spike duplicate relative percent differences as a check for analytical accuracy and for extraction precision and accuracy.
- Elevated Detection Limits - identify samples with elevated detection limits (above the numerical standards used to assess the significance of the data) as a result of sample dilution or small sample volume.

INFORMATION SUMMARY

Kinder Morgan Galena Park Terminal	
Facility Name / Location:	Galena Park Terminal 906 Clinton Drive Galena Park, Texas 77547 (713) 254-4023 (24 Hr.) (713) 472-7660 (Fax)
EPA FRP ID#	FRP-06-TX-00024
USCG Facility ID #: **MISLE**:	HOUWF042 6227455
DOT OPS Tracking #:	1506
Lat / Long:	29° 43' 56" N / 95° 13' 34" W
County:	Harris
Maps / Diagrams:	Area Location Map Provided in Figure 1.2 Facility Diagram Provided in Figure 1.3.
Landside Directions:	From George Bush Intercontinental Airport: Head west on N Terminal Rd. Slight right onto John F Kennedy Blvd. Merge onto North Sam Houston Pkwy E E/Sam Houston Tollway E/Texas 8 Beltway E via the ramp on the left to US-59 E. Take the exit onto U-59 S toward Houston, Take the exit onto I-610 E. Take exit 28 for Clinton Dr. Turn left onto Clinton Dr. (Destination will be on the right.) From William P Hobby Airport: Head northeast on Hobby Airport Loop. Continue onto Broadway St. Turn right onto Bellfort St. Turn left onto Gulf Fwy. Take the ramp on the left onto I-45 N. Take exit 40B to merge onto I-610 E toward TX-225/Pasadena. Take exit 28 for Clinton Dr. Turn right onto Clinton Dr. Make a U-Turn. (Destination will be on the right.)
Waterside Directions:	From the 610 bridge on Buffalo Bayou, proceed east 2.89 miles to the location. The Facility dock is immediately east of Panther Creek before reaching the Washburn Tunnel.

FIGURE 1.1

INFORMATION SUMMARY

Kinder Morgan Galena Park Terminal (Cont'd)	
Certification:	The Company grants full authority to the designated Qualified and Alternate Qualified Individuals to implement the Facility Response Plan and to: ● Activate and engage in contracting with oil spill removal organizations, ● Act as liaison with the pre-designated Federal On-Scene Coordinator (FOSC), and ● Obligate funds required to carry out response activities. The Company certifies that the Plan meets the requirements of subpart F of part 154.
Wellhead Protection Area:	No (Source, Sean Ables, TCEQ, at 512-239-1758)
Date of Facility Start up:	1935
24 Hour Contact Information:	See below (Qualified Individual)

REQUIRED NOTIFICATIONS

REQUIRED NOTIFICATIONS	
NATIONAL RESPONSE CENTER (NRC)	
c/o United States Coast Guard (CG-5335) - Stop 7581 2100 2nd Street, SW Washington, DC 20593-0001	(800) 424-8802 (24 Hr.) (202) 267-2675 (Day Phone)
REPORTING REQUIREMENTS (40 CFR 300.300(b)) TYPE: Any discharge or sighting of oil on navigable waters. (40 CFR 110.6 and 33 CFR 153.203) VERBAL: Immediately (not later than one (1) hour of confirmed discovery to meet 49 CFR 195.52(a). See DOT notification for follow-up NRC notification criteria within 48 hours.) WRITTEN: If an RQ limit is reached, refer to state requirements for written report requirements. NOTE: A call to the NRC must also be made for spills or releases of hazardous substances that meet or exceed their RQ.	
USCG SECTOR HOUSTON-GALVESTON*	
13411 Hillard St. Houston, TX 77034	(281) 464-4854 (24 Hr.)
REPORTING REQUIREMENTS (33 CFR 153.203, 40 CFR 300.300(b)) TYPE: Any oil discharge that has impacted or threatens to impact navigable waters or release of hazardous substances in an amount equal to or greater than the reportable quality. VERBAL: Notification to the USCG is typically accomplished by the call to the NRC. WRITTEN: If an RQ limit is reached, refer to state requirements for written report requirements. NOTE: A call to the NRC must also be made for spills or releases of hazardous substances that meet or exceed their RQ. *If direct reporting to the NRC is not practicable, reports may be made to the USCG or EPA predesignated OSC for the geographic area where the discharge occurs. (40 CFR 300.300(b))	

FIGURE 3.5

REQUIRED NOTIFICATIONS (Cont'd)

REQUIRED NOTIFICATIONS (Cont'd)	
US EPA REGION 6 EMERGENCY RESPONSE*	
1201 Elm Street, Suite 500 Dallas, TX 75270	(800) 424-8802 (24 Hr.) (800) 887-6063 (Non-Emergency) (214) 665-2200 (Non-Emergency)

REPORTING REQUIREMENTS (40 CFR 300.300(b), App. F, Sec. 1.3.1.1, to 40 CFR)

TYPE: Any oil discharge that has impacted or threatens to impact navigable waters or release of hazardous substances in an amount equal to or greater than the reportable quality.

VERBAL: Notification to the EPA is typically accomplished by the call to the NRC.

WRITTEN: As requested by the agency. Within 15 days after an incident involving a RCRA hazardous waste, submit Figure 3.10 to the Regional Administrator.

NOTE: *If direct reporting to the NRC is not practicable, reports may be made to the USCG or EPA predesignated OSC for the geographic area where the discharge occurs. (40 CFR 300.300(b))

STATE OF TEXAS SPILL REPORTING HOTLINE/TEXAS STATE EMERGENCY RESPONSE COMMISSION (TERC)	
Texas Commission of Environmental Quality 12100 Park 35 Circle Austin, Texas 78753	(800) 832-8224 (24 hr.) (512) 239-0400

REPORTING REQUIREMENTS: CITATION: 40 CFR 355.40; App. F, Sec.1.3.1.1.7, to 40 CFR 112; 30 TAC 327

TYPE: All spills of oil or petroleum products into water AND spills on land that meet or exceed 5 barrels or more.

VERBAL: Immediately

WRITTEN: Within 30 working days of the discovery of a reportable discharge or spill, the person responsible must submit written information to the appropriate TCEQ regional office describing the details and supporting the adequacy of the response.

NOTE: The documentation must contain one of the following:

1) Information from the initial notification (see Fig 2.4), and a statement that the response to the discharge or spill has been completed and a description of how the action was conducted (See *Additional Information* below).

2) A request for an extension of time to complete the response, along with the reasons for the request, and a projected work schedule outlining the time required to complete the response action. Proceed according to the projected schedule unless otherwise notified by the appropriate TCEQ regional director.

3) A statement and explanation that the discharge or spill response has not been, and is not expected to be, completed within the maximum allowable extension (six months from the date of the discharge or spill), along with a projected work schedule.

REQUIRED NOTIFICATIONS (Cont'd)

REQUIRED NOTIFICATIONS (Cont'd)	
DEPARTMENT OF TRANSPORTATION (FOR DOT JURISDICTIONAL FACILITIES*)	
Office of Pipeline Safety Pipeline and Hazardous Material Safety Administration 1200 New Jersey Avenue SE-E-22-321 Washington, District Of Columbia 20590	(800) 424-8802 (24 Hr.) (202) 267-2675 (24 Hr.) (202) 267-1322 (Fax) (202) 366-4566

REPORTING REQUIREMENTS:

TYPE: In addition to the reporting of accidents to the NRC as noted below, a written accident report (PHMSA Form 7000-1, via the online PHMSA Portal, and provided on in Appendix F) must be submitted for releases resulting in any of the following:

1. Explosion or fire not intentionally set by the operator.
2. Release of five gallons or more of hazardous liquid or carbon dioxide, except that no report is required for a release of less than five barrels resulting from a pipeline maintenance activity if the release is:
   a. not one described under the NRC's reporting conditions;
   b. confined to Company property or pipeline right-of-way; and
   c. cleaned up promptly.
3. death of any person.
4. personal injury necessitating hospitalization.
5. estimated property damage, including cost of cleanup and recovery, value of lost product, and damage to the property of the operator or others, or both, exceeding $50,000.

VERBAL: Call to the NRC, within one (1) hour of confirmed discovery and within 48 hours revise or confirm initial report, meets the required verbal notification under DOT reporting requirement.

WRITTEN: As soon as practicable, an accident meeting any of the above criteria must be reported via the PHMSA Portal at the following link: UR https://portal.phmsa.dot.gov/portal

Note: In the event that the link does not direct you to the site, paste the URL into your browser.

2.1 DISCOVERY PROCEDURES

The following actions are taken by personnel immediately upon becoming aware of a discharge or emergency incident, before the Emergency Response Team (ERT) (described in Section 5.0) is formed and functioning. Timely implementation of these initial steps is of the utmost importance because they can greatly affect the overall response operation.

Initial Response Actions to Consider

INITIAL RESPONSE ACTIONS – SUMMARY[1]

Personnel and Public Safety is first priority

1) Warn personnel – Enforce safety and security measures.
2) Stop the product flow – Secure pumps, close valves, etc. remotely (not within spill area).
3) Eliminate sources of ignition - Shut off motors, electrical circuits, open flames, etc. and isolate sources of ignition.
4) Initiate containment – Activate Fire Department and/or OSRO, as necessary, to respond to fire and/or begin active containment measures.
5) Notify National Response Center – EHS Representative typically makes agency notifications.
6) Notify other agency notifications – EHS Representative typically makes agency notifications.
7) Notify other Internal and/or External, as appropriate.

[1] Recommended form detailing immediate actions from Appendix F to 40 CFR Part 112, Section 1.7.1.2A.

Timely implementation of these initial steps is of the utmost importance because they can greatly affect the overall response operation.

It is important to note that these actions are intended only as guidelines. The appropriate response to a particular incident may vary depending on the nature and severity of the incident and on other factors that are not readily addressed. Note that, without exception, personnel and public safety is first priority.

4.2 INCIDENT SPECIFIC RESPONSE ACTIONS

Spill or Leak / Failure of Manifold / Mechanical Loading Arm / Transfer Equipment / Hoses / Piping Rupture / Piping Leak (both under pressure and not under pressure) / Equipment Failure

- Shut down pumping equipment.
- Close upstream and downstream block valves.
- Ensure that all drainage valve(s) are "closed".
- Mitigate spreading of the product, as the situation demands. Potential containment strategies include:
  - Earthen dike/berm
  - Ditching
  - Spreading sorbent material over the spill
- Prevent the spill from entering the waterways, sewer, etc. to the greatest extent possible, from a safe distance.
- Utilize Air Monitoring Equipment to assure that areas are safe to enter for continued response operations.
- Return the line/rack to service when repairs are complete.
- Clean up spilled product to eliminate possible environmental problems. Be alert for underground cables.
- Inform local operators such as utilities, telephone company, railway.
- If the spill escapes the containment area, review the location of socio-economic and environmentally sensitive areas identified in ICP Appendix A and the ESMs Figure A.2. Determine which of these may be threatened by the spill and direct the response operation to these locations. Initiate protection and recovery actions.
- Complete follow-up and written reporting, as the situation demands.

Storage Tank Leak / Tank Overfill / Tank Failure

- Shut down all product movement operations and isolate the tank.
- Ensure that the containment area/dike walls drainage valve(s) is "closed".
- If near tank bottom, consider filling tank with water and maintain water bottom to suspend the discharge.
- Utilize Air Monitoring Equipment to assure that areas are safe to enter for continued response operations.
- Block drainage of spilled material from traveling offsite.
- Stop all traffic in hazardous area (inside and outside of property boundaries), as the situation demands.
- Remove product from containment/dike area (at a sump or in a low area).
- If applicable, process remaining product through the separator system.
- Empty tank as soon as possible.
- Clean up product spill to eliminate any possible environmental problems. Be alert for underground cables.

4.2 INCIDENT SPECIFIC RESPONSE ACTIONS (Cont'd)

Storage Tank Leak / Tank Overfill / Tank Failure (Cont'd)

- Inform local operators such as utilities, telephone company, railway.
- If necessary, call one (1) of the approved waste removal companies to remove the remaining sludge and residue from the containment area. Contact the Environmental Manager, if necessary, to coordinate the removal of waste from the Facility for disposal.
- If the spill escapes the containment area, review the location of socio-economic and environmentally sensitive areas identified in Appendix A. Determine which of these may be threatened by the spill and direct the response to these locations. Initiate protection and recovery actions.
- Complete follow-up and written reporting, as the situation demands.

Leak or Spill at the Vehicle Refueling Area

- Evacuate personnel from the truck loading/unloading area, as the situation demands.
- Shut down all loading/unloading operations, pump motors and valves.
- Guard against all source of ignition.
- Stop all traffic from entering the affected area.
- If a line leaks, close off riser valves and/or tank valves.
- Clean area as appropriate with vacuum equipment, sorbent material, or flush (with water) all remaining product into the separator system.
- Turn off all vehicles.

Vapor Cloud (Massive Spill, Line Rupture, etc.)

- The person who discovers the vapor cloud will sound the alarm and notify the supervisor on duty and vacate the area.
- **Remember: the only proper action in the presence of a vapor cloud is to get away from it. Do not shut off electrical equipment.**
- All personnel will report to the evacuation muster point for roll call and further instructions.
- After all personnel have been accounted for, the Plant Manager or the Area Supervisor will initiate the following actions as deemed necessary:
  - Shut down transfer and blending operations.
  - Evacuation of adjacent property.
  - Only the fire department will be permitted to enter the plant.
- Contact the appropriate agencies and potentially affected neighbors (refer to Figure 3.5 – 3.9).

4.2 INCIDENT SPECIFIC RESPONSE ACTIONS (Cont'd)

Explosions and/or Fire

INDIVIDUAL DISCOVERING THE FIRE - (All Employees)

In the event that a fire response is required, the following actions should be taken, in order:

NOTE: If the situation warrants, and your personal safety is ensured, initial efforts to extinguish small incipient stage fires may prove to the best action. In these situations, if you believe that your personal safety is not at risk, and you can take interim measures to mitigate a situation while the Fire Department is deploying - do so.

- Notify the Management (any level).
  - Acknowledge information and switch all emergency communications to an alternate channel.
  - Shut down or secure all operations.
  - Note time of call.
  - Sound the emergency siren, contact the local fire department.
  - Have staff member check weather for any changes in wind direction.
- Account for contractors and Company personnel.
- IC mobilize to scene.
  - Check wind direction - approach from upwind.
  - Confirm and conduct a preliminary assessment of the situation upon arrival at the scene.
  - Evaluate scene for potential hazards (i.e., overhead power lines, obstacles wind direction).
  - Determine what product is involved and have SDS pulled and reviewed for PPE and firefighting instructions.
- Assemble Company personnel at the Command Post.
  - Fill positions (as required) in the Incident Management System.
  - If not already present, notify IC, Safety Officer, and Operations Chief.
  - Have fire pumps started and on standby (if applicable).
  - Initiate internal and external notifications in accordance with the fire and other.
- Eliminate any sources of ignition in the immediate area.
  - Shut down pumps and any movement into/ out of area.
  - Shut down contractor activity.
  - Stop traffic flow into and out of area.
  - Adjacent tank pumps and motors.
  - Be aware of static electricity.
- Establish objectives and priorities based on this assessment:
  - The Fire Department should quickly get water on the fire and cooling water on adjacent assets.
  - Be aware of overhead power lines, DO NOT flow water near them.
  - Find a way to get water to the fire quickly and safely (i.e., monitors, hydrants, truck).
  - Water will quickly fill the dike area.
  - Evaluate the water usage and determine whether or not to open/ close the internal and external dike drains.

FIGURE 4.1

FLAMMABLE LIQUIDS
(e.g. Gasoline, Diesel, Naphtha)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 128	• HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames. • Vapors may form explosive mixtures with air. • Vapors may travel to source of ignition and flash back. • Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). • Vapor explosion hazard indoors, outdoors or in sewers. • Those substances designated with a "P" may polymerize explosively when heated or involved in a fire. • Runoff to sewer may create fire or explosion hazard. • Containers may explode when heated. • Many liquids are lighter than water. • Substance may be transported hot.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 50 meters (150 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering area

EVACUATION	**Large Spill** □ Consider initial downwind evacuation for at least 300 meters (1,000 feet). **Fire** □ If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (½ mile) in all directions; also, consider initial evacuation for 800 meters (½ mile) in all directions.

Information excerpted from the *2016 Emergency Response Guidebook*.

2.4 EVACUATION

In case of an emergency evacuation, some or all of the following steps are taken, depending on type of emergency and circumstances:

_____ Sound alarm or give verbal alarm by radio/cell phone or in person.
_____ Call 911.
_____ Initiate emergency shutdown procedures.
_____ Shutdown product transfer operations.
_____ Proceed to the Evacuation Regrouping Area/Muster Point for Roll Call.

Factors affecting the evacuation include:

Location of Stored Materials

The large bulk storage tanks are located in the North, East, Central and West Plant containment areas.

Hazard Imposed by Spilled Material

The hazard imposed is flammability. Refer to Safety Data Sheet (SDS) for health risks and response measures for treatment when exposed.

Spill Flow Direction

A large spill leaving secondary containment would flow by sheet flow to the nearest outfall, which would discharge into the Houston Ship Channel.

Prevailing Wind Direction and Speed

The prevailing wind direction is out of the North at 8 to 9 mph from January to April and out of the southeast at 6 to 8 mph from May to December.

Water Currents, Tides, or Wave Conditions (if applicable)

Water currents, tides, or wave conditions are not applicable because there no over water evacuation.

Arrival of Route of Emergency Response Personnel and Response Equipment

Emergency response personnel and equipment arrive via Clinton Drive.

Evacuation Routes

All evacuation routes lead to one of four muster areas. The primary Muster Area #1 located on Clinton Drive. There are three alternate muster areas designated as Muster Area #2 through #4 as the situation dictates.

Alternate Routes of Evacuation

Primary and alternate routes are interchangeable and identified on Evacuation Diagram.

2.4 EVACUATION (Cont'd)

Transportation of Injured Personnel Nearest Emergency Medical Facility

Head north toward Clinton Dr. Take N. Shaver St. to Westside Dr. in Pasadena. Turn left onto Westside Dr. Turn left onto Spencer Hwy. Drive to your destination. Bayshore Medical Center, 4000 Spencer Hwy, Pasadena, TX 77504.

Location of Alarm/Notification Systems

Audible alarm is activated from Gate 1 of the Security Building. Radios are main form of emergency notification and are usually used prior to alarm activation. The Whelen alarm system has very specific instructions as described below:

- The alarm system should be tested each week at 15:00 Wednesday in concurrence with the Galena Park test.
- Whoever completes the test needs to fill in the test log indicating the date, time, and who completed the test along with any comments.
- If there is a problem with the alarm system, contact the Fire & Safety coordinator ASAP at (361) 726-1614 (Adam Walton).
- Weekly alarm test: Press test button & send button. You should hear an audio stating that it is a test along with four horns and an all clear.
- Emergency alarm: Press emergency button & send button. You should hear an audio stating that there is an emergency proceed to the evacuation point and await further instructions.
- Shelter in place: Press shelter in place button & send button. You should hear a horn, an audio stating to shelter in place and another horn.
- Lightning: Press lightning button & send button. You should hear a horn then an audio stating we are under a lightning advisory cease all work, then another horn.
- All Clear: Press all clear button & send button. You should hear a horn, then an audio stating this is an all clear, then another horn.
- PA: To use the PA press the PA button & send. Key up the microphone and speak slowly and clearly. This will last for 45 seconds. Anything longer you will need to repeat PA and send.
- Loss of power: In the event we have a loss of power we need to power up the black box and the digital receiver on top of the black box.

Centralized Check-In Area for Evacuation Validation

The evacuation assembly areas for the Facility area designated as Muster Area #1 - #4. The muster points are located on the Evacuation Diagram.

Mitigation Command Center

The HBU 405 Clinton Drive, Galena Park will be the initial Command Post.

Location of Shelter-In-Place

The shelter-in-place location will be wherever you are, in a building with the AC turned off or in a turned off vehicle.

2.4 EVACUATION (Cont'd)

Employees Performing Rescue and Medical Duties during Evacuation

- Perform search of affected area, if personnel are missing and it is safe to do so.
- Account for all personnel.
- Report results of accountability to IC.
- Immediately call 911, if a medical emergency is discovered, and provide them with your name and location of the medical emergency.
- Do not move the injured person except in cases of immediate danger.
- Apply first aid to the level to which you have been trained.
- Await EMS and support ambulance personnel, as instructed.

Community Evacuation Plan

Harris County, Office of Homeland Security and Emergency Management has a community evacuation plan. The following agencies are in charge of community evacuations: Galena Park LEPC, Galena Park Fire Department, Galena Park Police Department, and the Harris County Sheriff Department.

1.0 PURPOSE AND SCOPE

1.1 PLAN PURPOSE/OBJECTIVES

The purpose of this Integrated Contingency Plan ("Plan") is to assist the Galena Park Terminal ("Facility") personnel prepare for and respond quickly and safely to an incident at the Facility involving fires, explosions, or any planned or unplanned sudden or non-sudden release of petroleum products, hazardous materials, hazardous waste or hazardous waste constituents into air, soil, or surface water. The Plan provides techniques and guidelines for achieving an efficient, coordinated and effective response to an incident which may occur at the Facility.

The specific objectives of the Plan are to:

- Establish an Emergency Response Team, assign individuals to fill the positions on the team and define the roles and responsibilities of team members.
- Define notification, activation, and mobilization procedures to be followed when an incident occurs.
- Define organizational lines of responsibility to be adhered to during a response operation.
- Ensure compliance with certain federal, state, and local regulatory requirements. A summary of the applicable regulations addressed by this plan is provided in Section 1.5.
- Ensure consistency with the National Contingency Plan and Area Contingency Plan(s) for the area of operation.

1.2 FORMAT AND SCOPE OF PLAN

This Plan has been developed under the general guidance published in the Federal Register by the EPA entitled "The National Response Team's Integrated Contingency Plan" (61 FR 28642). The NRT guidance was developed in conjunction with the Environmental Protection Agency, Department of Transportation (U.S. Coast Guard, Research and Special Programs Administration, replaced by PHMSA), Department of the Interior (Minerals Management Service, replaced by BSSE), and the Department of Labor (Occupational Safety and Health Administration). This guidance also provides for state and local contingency planning requirements to be incorporated into the Plan.

This Plan contains prioritized procedures for the Facility personnel to mitigate or prevent any discharge resulting from operations. Facility spill mitigation procedures and response guidelines are provided in Section 4.0 for discharges that could result from any of the following scenarios:

- Tank overfill/failure
- Piping rupture/leak
- Explosion and/or fire
- Equipment failure (e.g. pumping system failure, relief valve failure, etc.)

1.2 FORMAT AND SCOPE OF PLAN (Cont'd)

These scenarios could result in the following discharge volumes:

Worst Case Discharge Planning Volumes		
EPA	**USCG**	**DOT PHMSA**
167,142 BBL	5,351 BBL	15,941 BBL (DOT Pipeline) 50,143 BBL (DOT Breakout Tank) 35 BBL (Largest Historical DOT Discharge)

The worst case discharge volume is utilized in calculating the planning volume for response resources. The planning volume is used to determine the necessary on-water recovery capacity to respond within the three tiered response times. The identified oil spill recovery devices should be capable of arriving at the scene of a discharge within the time specified in Appendix B. Appendix B of this Plan demonstrates a series of calculations and planning volume determinations based on the regulation. The inclusion of these calculations is for demonstration of the response planning volumes and response capability necessary for on-water and on-shore recovery requirements as the result of the discharge scenarios outlined in the table above.

1.3 PLAN DISTRIBUTION PROCEDURES

Distribution will be handled in the following manner:

- Distribution of the Plan is controlled by the number on the front cover. A List of Plan Holders is included in the Foreword to facilitate control.

- Company personnel who may be called upon to provide assistance during discharge response activities will have access to a copy of the Plan for their use and training.

- It is the responsibility of any person holding a copy of the Plan to ensure that the copy is transferred to their replacement in the event of reassignment or change in responsibility.

- The respective regulatory agencies will also be distributed a copy of the Plan as noted in the List of Plan Holders located in the Foreword.

1.4 PLAN REVIEW AND UPDATE PROCEDURES

Annual Review/Update

The Facility will coordinate the following Plan review and update procedures.

- At least once each year, review and make appropriate revisions as required by operational or organizational changes.

- At least once each year, review and make appropriate revisions as required by changes in the names and telephone numbers detailed in Section 3.0.

- Gulf Liquids EHS will coordinate the word processing, publication, and distribution efforts of completing the revisions and maintaining the Plan.

- Plan review opportunities may occur during Response Team Tabletop Exercises or actual emergency responses that includes:
  - Post-drill or incident evaluations
  - Follow-up changes to be implemented
  - Time table for implementation

Incorporation of Plan Revisions

The **Plan Holder,** immediately upon receipt of any revisions, shall:
- ***Review and insert the revised pages into the Plan.***
- Discard the obsolete pages.

Agency OPA 90 Requirements

The Facility shall revise and resubmit revised portions of the Plan for each change that may materially affect the response to a Worst Case Discharge, including:

CONDITIONS REQUIRING CHANGES	EPA	USCG	DOT PHMSA
A change in the facility's configuration that materially alters the information included in the	✔	✔	✔
A change in the type of oil (petroleum oil group) handled, stored, or transferred/ transported that materially alters the required response resources.	✔	✔	✔
A change in the name(s) or capabilities of the oil spill removal organization.		✔	✔
A material change in capabilities of the oil spill removal organization(s) that provide equipment and personnel to respond to discharges of oil.	✔		✔
A material change in the facility's spill prevention and response equipment or	✔	✔	✔

1.4 PLAN REVIEW AND UPDATE PROCEDURES (Cont'd)

Agency OPA 90 Requirements (Cont'd)

CONDITIONS REQUIRING CHANGES	EPA	USCG	DOT PHMSA
Any other changes that materially affect the implementation of the Plan.	✔	✔	✔
A change in the name of the Oil Spill Removal		✔	✔
A change in the listings of economically important or environmentally sensitive areas identified in the applicable ACP in effect six (6) months prior to the plan		✔	✔

- **EPA** – Requires any significant changes that materially may affect the response to a Worst Case Discharge to be submitted within 60 days of the change to the EPA's Regional Office [40 CFR 112.20(d)(1)]. If the Facility is a significant and substantial harm facility, EPA will review the Plan periodically (not to exceed five years). The Facility will submit non-material changes to EPA as the revisions occur.

- **USCG** - Revisions must be sent to the appropriate USCG Sector location in a timely manner. A full review of the plan must be conducted annually within 30 days prior to the previous plan approval letter from the COTP. The revisions should be accompanied by a cover letter containing a detailed listing of all revisions. If, during this annual review no revisions are required, the Facility will indicate the completion of the annual review on the Record of Revisions in Foreword.

- **DOT/PHMSA** - The Facility shall revise and resubmit significant changes to the Pipeline Response Plans Officer within 30 days. The operator will review the Plan in full at last every five years from the date of the last submission date and resubmit the Plan to the OPS. A complete plan must be submitted to PHMSA within this five year review period or whenever there are new or different operating conditions or information that would substantially affect the implementation of the plan. PHMSA may require revisions to this Plan at any time if deficiencies are found under their applicable regulations or during an actual response.

- **Timing for Submitting Revisions** - When submitting revisions to the applicable agencies, always include the Facility identification number (see the top of Figure 1.1) with the revisions. The applicable agencies require revisions to be submitted as follows if any of the changes fall into the categories listed above.

1.4 PLAN REVIEW AND UPDATE PROCEDURES (Cont'd)

OSHA Emergency Action Plan Elements (Section 1-3 and Appendix E) will be reviewed with each employee covered by the plan when:

- Plan is developed or employee is assigned initially to a job.
- Employee's responsibilities under the plan change,
- Plan is changed.

Amendment of EPA RCRA Contingency Plan Elements

- Changes requiring amendment may include:
  - Applicable regulations are revised.
  - Plan fails in an emergency.
  - The Facility changes – in its design, construction, operation, maintenance, or other circumstances (e.g. expansion, type or quantity of waste handled) – in a way that materially increases the potential for fires, explosions, or releases of hazardous waste, or hazardous waste constituents, or changes the response necessary in an emergency.
  - Emergency Coordinator(s) change.
  - Emergency Equipment List changes.

1.5 REGULATORY COMPLIANCE

The development, maintenance, and utilization of this Plan implements company policy and addresses the following regulatory requirements and guidelines:

- Federal Oil Pollution Act of 1990: U.S. EPA Final Rule for Non-Transportation Related On-shore Facilities as published in 40 CFR Part 112.20.
- Federal Oil Pollution Act of 1990: U.S. Coast Guard Final Rule for Marine Transportation Related Facilities as published in 33 CFR Part 154.
- Federal Oil Pollution Act of 1990: U.S. DOT Final Rule for Transportation Related On-shore Facilities as published in 49 CFR 194.
- U.S. EPA Resources Conservation and Recovery Act (RCRA) Regulation as published in 40 CFR Part 265.50-265.56.
- OSHA's Emergency Action Plan Regulation as published in 29 CFR 1910.38(a).
- OHSA's Emergency Response Plan as published in 29 CFR 1910.120(q)(1-2).
- Texas General Land Office: Discharge Prevention and Response Plan as published in 31 TAC 19.13.

1.5 REGULATORY COMPLIANCE (Cont'd)

This Plan is consistent with the most recent version of the applicable Area Contingency Plans (ACPs). The applicable ACPs for the Facility are:

- US Environmental Protection Agency - Region VI, Regional Integrated Contingency Plan
- U.S. Coast Guard – Central Texas Coastal Zone Area Contingency Plan

This Plan is consistent with the most recent version of the National Contingency Plan (NCP). The NCP for the Facility is:

- U.S. Environmental Protection Agency; National Oil and Hazardous Substances Pollution Contingency Plan; Final Rule.

INFORMATION SUMMARY

Kinder Morgan Galena Park Terminal (Cont'd)	
Certification:	The Company grants full authority to the designated Qualified and Alternate Qualified Individuals to implement the Facility Response Plan and to: ● Activate and engage in contracting with oil spill removal organizations, ● Act as liaison with the pre-designated Federal On-Scene Coordinator (FOSC), and ● Obligate funds required to carry out response activities. The Company certifies that the Plan meets the requirements of subpart F of part 154.
Wellhead Protection Area:	No (Source, Sean Ables, TCEQ, at 512-239-1758)
Date of Facility Start up:	1935
24 Hour Contact Information:	See below (Qualified Individual)

FIGURE 1.1

INFORMATION SUMMARY

Kinder Morgan Galena Park Terminal (Cont'd)

Dates and Types of Substantial Expansion:

1933	GATX purchased Central Plant property from Texaco (approximately 70 tanks)
1960	Dale Moore Annex (West Plant) was purchased; GATX has since built 78 tanks in the West Plant.
1982	1 North and East Plants were purchased for Texaco (13 Tanks)
1998	Constructed (4) 100,000 BBL tanks in East Plant for oil storage
2001	Kinder Morgan purchased GATX Terminals Corporation (domestic operations).
2002	Demolished 3- 80,000 BBL and 2 118,000 BBL tanks. Constructed 2 – 90,000 BBL and 2-100,000 BBL tanks
2006	Constructed 2- 100,000 BBL tanks, 8 tanks central plant
2007	Constructed (2) 100,000 BBL tanks West Plant
2008	Constructed (7) 100,000 BBL tanks East Plant, Constructed manifold # 33 and began first half of # 3400 manifold, Constructed # 4 ship dock
2009	Constructed (7) 150,000 BBL tanks East Plant, Constructed manifold # 3500 and completed second half of # 3400 manifold, Constructed # 3 Barge dock, Construction begun on (1) 125,000 BBL tank West Plant
2010	Completed construction of 125-1
2010	Added # 3 Barge Dock fire pump
2010	Demolished waste water tank 5-20
2011	Constructed (1) 15,000 BBL tank 15-3
2012	Demolished Tank 7, 80,000 BBL Tank.
2013	Begin construction (5) – 150,000 BBL tanks
2014	Installed five (5) 150,000 bbl. tanks
October 2014	Installed first of 9-1 tanks
February 2015	Purchased Vopak
March 2015	Last of 9 tanks installed
Sep 2015	Tank 100-20 in Service
Aug 2016	New section on VCU's added and expansion to increase max loading rates across KM Docks to Marine VCU's.
June 2021	Added Butane Sphere

FIGURE 1.1

INFORMATION SUMMARY (Cont'd)

Description of Operations (EPA)

Description of Operation:

- Bulk liquid product is transported into the terminal facility via tank truck, railcar, pipeline, barge or ship. It is unloaded dockside through pipelines leading directly to the storage tanks. The product is transported from the facility via tank truck, railcar, pipeline, barge or ship.
- The Facility is a bulk refined petroleum product storage terminal.
- The number and volumes of tanks at the facility are identified in Appendix C.
- The facility utilizes five (5) ship and three (3) barge docks.
- The Facility operates 24 hours per day, seven days per week.
- The Facility's Worst Case Discharge amount: 167,142 Bbls (EPA)

Date of Initial Storage: 1935

Products Handled:

- Petroleum Products (Oil Groups 1-3)

Note: All facility SDS located and maintained online: http://kmonline/ehs/Pages/sdsvault.aspx

FIGURE 1.1

INFORMATION SUMMARY (Cont'd)

Description of Operations (USCG)

General Operation:

The Galena Park Terminal is a bulk liquid storage terminal. The terminal stores a variety of refined petroleum products in large, above ground storage tanks. The Kinder Morgan Pasadena Terminal utilizes six (6) docks as follows: Ship Dock #1, #2, #3, and #4 and #5 Docks #2 and #3.

Dock Details:

Maximum loading rate to a vessel: 10,000 bph

The following table describes the type and maximum size of vessels which can call on each dock.

Dock Name/Number	Type of Vessel	Number and Maximum Size of Vessel
S/D #1	Cargo Ship	1-750' Ship
	Tank Ship	1-300' Barge
	Tank Barge	2-300' Barges
S/D #2	Cargo Ship	1- 850' Ship
	Tank Ship	2- 300' Barges
B/D #2	Tank Barge	4-300' Barges
S/D #3 B/D #1	Cargo Ship	1- 850' Ships
	Tank Ship	2- 300' Barges
	Tank Barge	2-300' Barges
B/D #3	Tank Barge	2- 300' Barges
S/D #4	Cargo Ship	1- 750' Ship
	Tank Ship	1- 750' Ship
S/D #5	Tank Barge	1 – 750' Barge
	Cargo Ship	1 – 850' Ship

FIGURE 1.1

INFORMATION SUMMARY (Cont'd)

Description of Operations (DOT PHMSA)

General Information:

- This Plan is written in English and understood by personnel responsible for carrying out this plan.
- The Galena Park Terminal is a Single Response Zone located in Harris County, Texas.

Line Section ID	Length	Diameter	Product	County	State
16" LCRC	1,056'	16"	Refined Product	Harris	Texas
8" ARCO	1,056'	8"	Refined Product	Harris	Texas

PLOT PLAN

NORTH, EAST, CENTRAL AND WEST PLANTS

EVACUATION ROUTES

DWG. NO. 88-FPP-CIMA

SCALE NTS | TERMINAL 88 | DATE 12-14-10

2.0 DISCOVERY

2.1 DISCOVERY PROCEDURES

The following actions are taken by personnel immediately upon becoming aware of a discharge or emergency incident, before the Emergency Response Team (ERT) (described in Section 5.0) is formed and functioning. Timely implementation of these initial steps is of the utmost importance because they can greatly affect the overall response operation.

Initial Response Actions to Consider

INITIAL RESPONSE ACTIONS – SUMMARY[1]

Personnel and Public Safety is first priority

1) Warn personnel – Enforce safety and security measures.

2) Stop the product flow – Secure pumps, close valves, etc. remotely (not within spill area).

3) Eliminate sources of ignition - Shut off motors, electrical circuits, open flames, etc. and isolate sources of ignition.

4) Initiate containment – Activate Fire Department and/or OSRO, as necessary, to respond to fire and/or begin active containment measures.

5) Notify National Response Center – EHS Representative typically makes agency notifications.

6) Notify other agency notifications – EHS Representative typically makes agency notifications.

7) Notify other Internal and/or External, as appropriate.

[1] Recommended form detailing immediate actions from Appendix F to 40 CFR Part 112, Section 1.7.1.2A.

Timely implementation of these initial steps is of the utmost importance because they can greatly affect the overall response operation.

It is important to note that these actions are intended only as guidelines. The appropriate response to a particular incident may vary depending on the nature and severity of the incident and on other factors that are not readily addressed. Note that, without exception, personnel and public safety is first priority.

2.2 EMERGENCY/INCIDENT CLASSIFICATION

It is important to properly classify the emergency level to ensure a proper response. The emergency level of the incident will affect the notifications and the initial response to the incident.

2.2.1 Level 0 Response

A Level 0 response is an event that:

- Requires immediate response by the Emergency Response Team but does not result in any injuries
- Involves little or no property damage
- Has little or no environmental impact
- Attracts no media attention
- Requires only routine or no reporting to regulatory agencies
- Is easily handled by the Emergency Response Team

A Level 0 response however, could develop into a Level 1 or Level 2 response if not immediately controlled (see Figure 2.1).

2.2.2 Level 1 Response/Emergency Response Line (ERL) Conference Call

A Level 1 response is a more significant event that may:

- Involve injuries to an employee, contractor or the general public
- Result in property damage greater than $5,000
- Involve a fire, explosion or environmental impact
- Involve local media attention
- Likely be reportable to some federal, state or local agencies

For the most part, Level 1 responses are within the capability of Emergency Response Team, but may require certain corporate resources to help mitigate the problem or conduct subsequent investigations. A Level 1 response can quickly escalate to a Level 2 response if not mitigated (see Figure 2.1).

2.2 EMERGENCY/INCIDENT CLASSIFICATION (Cont'd)

2.2.3 Level 2 Response/ERL Plus Conference Call

A Level 2 response is a major event that may include:

- Fatalities or serious injuries to employees or the public
- Extensive property damage or environmental impact
- Regional or national media attention
- Involvement of federal regulatory agencies.

Response to a Level 2 or Level 3 response requires significant additional resources/support beyond what may be locally available.

FIGURE 2.1

RESPONSE LEVELS

Level 0	Level 1	Level 2
No regulatory notification is required	Unplanned notification of a local, state or federal agency is required Un-permitted or un-scheduled release of product, other material or substance, or chemical spill that requires reporting to a governmental agency	
No continuing or potential harm to human life or property Involves (or potentially involves) the occurrence of an "Abnormal Operation" on the pipeline system Involves customer concerns with a low impact	Any product or chemical release, harmful substance or threatened release, into a river, stream, creek, pond or other water body Evacuations or unplanned road closures that result in significant impact to the public	Major operations disruption or unplanned lengthy shutdown (could include "Safety Related Conditions") Service interruption to a wholesale customer, town distribution system, government installation or industrial plant Significant media or public attention
Any personal injury that requires a physician's emergency treatment but that does not require formal hospital admittance Any employee or contractor injury that could involve lost time from work Any employee injury that involves the administering of first aid Involves a significant near miss with injury/illness implications (employee or contractor) Employee fatality due to an off-the-job incident Involves employee lost work time due to an off-the-job incident	Any employee or contractor injury or illness that requires in-patient hospitalization as the result of work-related activities involving Company equipment and/or facilities	The death of employee(s) or contract employee(s) as the result of work-related activities involving Company equipment or facilities Any fatality or injury to a member of the public

FIGURE 2.1

RESPONSE LEVELS (Cont'd)

Level 0	Level 1	Level 2
Estimated property damage is less than $5,000	Any incident where the estimated property damage to Company equipment, vehicles or facilities; or Company's portion of the repairs, cost, spill remediation and/or emergency response, or product lost is likely to be greater than $5,000	
	Any fire not intentionally set, including but not limited to, any unintentional ignition of hazardous Liquids (products, HVLs, HVPs, etc.) and minor fires, such as small grass fires, transformer poles, small pumps, or single piece of electrical equipment	Major fire, rupture or explosion that involves Company equipment or facilities
Involves a significant near miss with operations and maintenance implications (including ROW)	Evidence of a non-notified excavation on the ROW by a third party	
Theft, Fraud or Misuse of company property by an employee Theft <$25,000 by an external party	Theft >$25,000 by an external party	
	Regulatory (DOT, OSHA, FERC or EPA, TSB or state/local equivalents) inquiry or involvement in any of the above-listed events, including regulatory agency representative(s) on site Unannounced agency inspections directly related to compliance with their associated regulations (e.g., PHMSA, OSHA, EPA, TSB, state, etc) that are not of the routine nature. Routine unannounced inspections that do not require ERL notification, include, but are not limited to, IRS, Air Quality, USCG, HazMat Waste, and although not an Agency per se, Orthodox Union Rabbi visits, In the case of an agency visit for a specific discipline (Air, Waste, Water, product quality, etc.) the specific support department should be notified directly.	

FIGURE 2.1

RESPONSE LEVELS (Cont'd)

Level 0	Level 1	Level 2
	Security Incidents, which include: ○ Suspicious surveillance of a facility with indications of criminal/terrorist activities ○ Bomb threats ○ Persons making hostile threats against the company or company personnel ○ Security breach where someone is found in the facility ○ Suspicious package found at the facility or suspicious mail delivered to the facility ○ Theft of chemicals or hazardous materials in quantities sufficient to result in loss of life if used as a weapon (e.g.; propane cylinders, any volume of ammonium nitrate, bulk quantities of HAZMAT) A Company Security event which meets any one of the following: ○ Change in Homeland Security Advisory System (HSAS) Threat Level or Maritime Security (MARSEC) Level ○ Credible threat information that would affect Kinder Morgan assets ○ Significant security incident at a Kinder Morgan facility ○ Event that requires a meeting of Corporate Security Committee (CSC) to strategize on countermeasure or response to a threat or incident	Significant security event that involves: sabotage, violent attacks on or destruction of property and people, hijackings/hostage taking, intentional release of chemical/ biological/ radioactive agents A major Company Security event which meets any one of the following criteria: ○ Management directions based on change in the HSAS Threat Level ○ Credible threat information that can be shared outside of CSC and management personnel ○ Major security incident at a Kinder Morgan facility
	Any Level 0 incident where there is any uncertainty about meeting reporting criteria.	

Note: Response actions will vary depending on the nature and severity of the incident and on other factors that are not readily addressed here. Without exception, personnel and public safety is first priority. The following initial actions should be considered when responding to any emergency. More detailed incident specific response actions are included in Section 4.

2.3 INITIAL NOTIFICATION

The typical notification responsibilities for each person potentially involved in the initial response are listed below:

Person Discovering Discharge, Fire, or Release to the Environment *(Air, Water, or Soil)*

_____ Immediately Notify **Terminal Manager/Qualified Individual** (contact information is listed in Figure 3.1).
_____ Activate the ERT**,** as the situation demands (contact information is listed in Figure 3.2).

Qualified Individual

_____ **Activate local responders** (fire, police, medical, etc.) and/or **emergency response contractors** (see Figure 3.3) as the situation warrants.
_____ Make other Internal or External notifications as required.

2.4 EVACUATION

In case of an emergency evacuation, some or all of the following steps are taken, depending on type of emergency and circumstances:

_____ Sound alarm or give verbal alarm by radio/cell phone or in person.
_____ Call 911.
_____ Initiate emergency shutdown procedures.
_____ Shutdown product transfer operations.
_____ Proceed to the Evacuation Regrouping Area/Muster Point for Roll Call.

Factors affecting the evacuation include:

Location of Stored Materials

The large bulk storage tanks are located in the North, East, Central and West Plant containment areas.

Hazard Imposed by Spilled Material

The hazard imposed is flammability. Refer to Safety Data Sheet (SDS) for health risks and response measures for treatment when exposed.

Spill Flow Direction

A large spill leaving secondary containment would flow by sheet flow to the nearest outfall, which would discharge into the Houston Ship Channel.

Prevailing Wind Direction and Speed

The prevailing wind direction is out of the North at 8 to 9 mph from January to April and out of the southeast at 6 to 8 mph from May to December.

2.4 EVACUATION (Cont'd)

Water Currents, Tides, or Wave Conditions (if applicable)

Water currents, tides, or wave conditions are not applicable because there no over water evacuation.

Arrival of Route of Emergency Response Personnel and Response Equipment

Emergency response personnel and equipment arrive via Clinton Drive.

Evacuation Routes

All evacuation routes lead to one of four muster areas. The primary Muster Area #1 located on Clinton Drive. There are three alternate muster areas designated as Muster Area #2 through #4 as the situation dictates.

Alternate Routes of Evacuation

Primary and alternate routes are interchangeable and identified on Evacuation Diagram.

Transportation of Injured Personnel Nearest Emergency Medical Facility

Head north toward Clinton Dr. Take N. Shaver St. to Westside Dr. in Pasadena. Turn left onto Westside Dr. Turn left onto Spencer Hwy. Drive to your destination. Bayshore Medical Center, 4000 Spencer Hwy, Pasadena, TX 77504.

Location of Alarm/Notification Systems

Audible alarm is activated from Gate 1 of the Security Building. Radios are main form of emergency notification and are usually used prior to alarm activation. The Whelen alarm system has very specific instructions as described below:

- The alarm system should be tested each week at 15:00 Wednesday in concurrence with the Galena Park test.
- Whoever completes the test needs to fill in the test log indicating the date, time, and who completed the test along with any comments.
- If there is a problem with the alarm system, contact the Fire & Safety coordinator ASAP at (361) 726-1614 (Adam Walton).
- Weekly alarm test: Press test button & send button. You should hear an audio stating that it is a test along with four horns and an all clear.
- Emergency alarm: Press emergency button & send button. You should hear an audio stating that there is an emergency proceed to the evacuation point and await further instructions.
- Shelter in place: Press shelter in place button & send button. You should hear a horn, an audio stating to shelter in place and another horn.
- Lightning: Press lightning button & send button. You should hear a horn then an audio stating we are under a lightning advisory cease all work, then another horn.

2.4 EVACUATION (Cont'd)

Location of Alarm/Notification Systems (Cont'd)

- All Clear: Press all clear button & send button. You should hear a horn, then an audio stating this is an all clear, then another horn.
- PA: To use the PA press the PA button & send. Key up the microphone and speak slowly and clearly. This will last for 45 seconds. Anything longer you will need to repeat PA and send.
- Loss of power: In the event we have a loss of power we need to power up the black box and the digital receiver on top of the black box.

Centralized Check-In Area for Evacuation Validation

The evacuation assembly areas for the Facility area designated as Muster Area #1 - #4. The muster points are located on the Evacuation Diagram.

Mitigation Command Center

The HBU 405 Clinton Drive, Galena Park will be the initial Command Post.

Location of Shelter-In-Place

The shelter-in-place location will be wherever you are, in a building with the AC turned off or in a turned off vehicle.

Employees Performing Rescue and Medical Duties during Evacuation

- Perform search of affected area, if personnel are missing and it is safe to do so.
- Account for all personnel.
- Report results of accountability to IC.
- Immediately call 911, if a medical emergency is discovered, and provide them with your name and location of the medical emergency.
- Do not move the injured person except in cases of immediate danger.
- Apply first aid to the level to which you have been trained.
- Await EMS and support ambulance personnel, as instructed.

Community Evacuation Plan

Harris County, Office of Homeland Security and Emergency Management has a community evacuation plan. The following agencies are in charge of community evacuations: Galena Park LEPC, Galena Park Fire Department, Galena Park Police Department, and the Harris County Sheriff Department.

2.5 FACILITY RESPONSE EQUIPMENT/RESOURCES

The Facility's response equipment is identified in Section 4.4. The Company has contracts in place with Oil Spill Removal Organizations and other clean-up contractors that are deployed, as necessary. Figure 5.3 lists the contracted Oil Spill Removal Organizations.

The Qualified individual has the authority to activate other Company resources or that of private contractors and other experts and consultants, as the situation demands.

2.6 EXPERTS AND CONSULTANTS

The Company maintains relationships with various environmental and technical consultants that can provide support in the event of an emergency incident. These consultants can provide expertise and support in the areas of emergency response management, environmental services, site assessment, permitting, waste treatment, recycling, dewatering, hazardous waste disposal, and remediation.

2.7 VOLUNTEERS

Volunteers will not be utilized by the Company for the response operations. All volunteers will be referred to the State or Federal On-Scene Coordinator, excluding mutual aid agreements.

2.8 COMMUNICATIONS

Effective and efficient communications systems are essential for emergency response at every level. The communications system will be utilized to gather information and current status reports as well as to provide coordination and direction to widely separated work groups involved in search, containment/ diversion, repair, traffic control, public control or evacuation, and restoration.

2.8.1 Central Communications System

Prearranged communication channels are of the utmost importance in dealing with Company emergencies. The notification procedures and telephone contacts documented in Section 3.0 will be reviewed in accordance with the earlier documented updating procedures. The predetermined communications channels include the following:

- A list of emergency telephone numbers for internal management and emergency response personnel.
- A list of emergency telephone numbers for various external resources such as the fire and police department, medical, and regulatory agencies.
- A list of emergency telephone numbers for contract response resources.

2.8 COMMUNICATIONS (Cont'd)

2.8.2 Communications Equipment

Field communications during a spill response to a small or medium discharge will be handled via the existing Company communications network. This network will utilize existing radios, landlines, cell phones, facsimile (fax) machines, and computers and will be maintained by Company personnel. In the event of a Worst Case Discharge, field communications will be enhanced with other Company and contract resources as the situation demands.

2.8.3 Communications Types

Telephone (Conventional) – Conventional land-line telephones are the most effective means of communication for regulatory and advisory notifications during a spill response operation. Additional telephone lines can be installed in the event of a prolonged response operation.

Telephone (Cellular) – Cellular telephones allow for added mobility and response effectiveness. Cellular phones are commonly maintained by certain Company personnel. Additional cellular phones can be secured in the event of a prolonged response operation.

Fax Machines – Fax machines allow for a rapid transfer of information/ documentation such as status reports/updates, written notifications, and purchase orders.

Computers – Computers are commonly used in networks which allow access to various other locations and Company personnel. Computers also speed the consolidation of information and preparation of written report.

Radios – Handheld and vehicle mounted radio sets are the most effective means of communication for the field response operation. The units are battery operated, multi-channeled, and have a typical range that will cover the area of the response operation. Additional radio sets and battery packs/charges will be necessary in the event of a prolonged response operation.

Satellite Phone - Satellite phones connect to geosynchronous orbiting satellites rather than cell towers on the earth's surface and provide phone service when cell towers are down.

3.0 NOTIFICATIONS

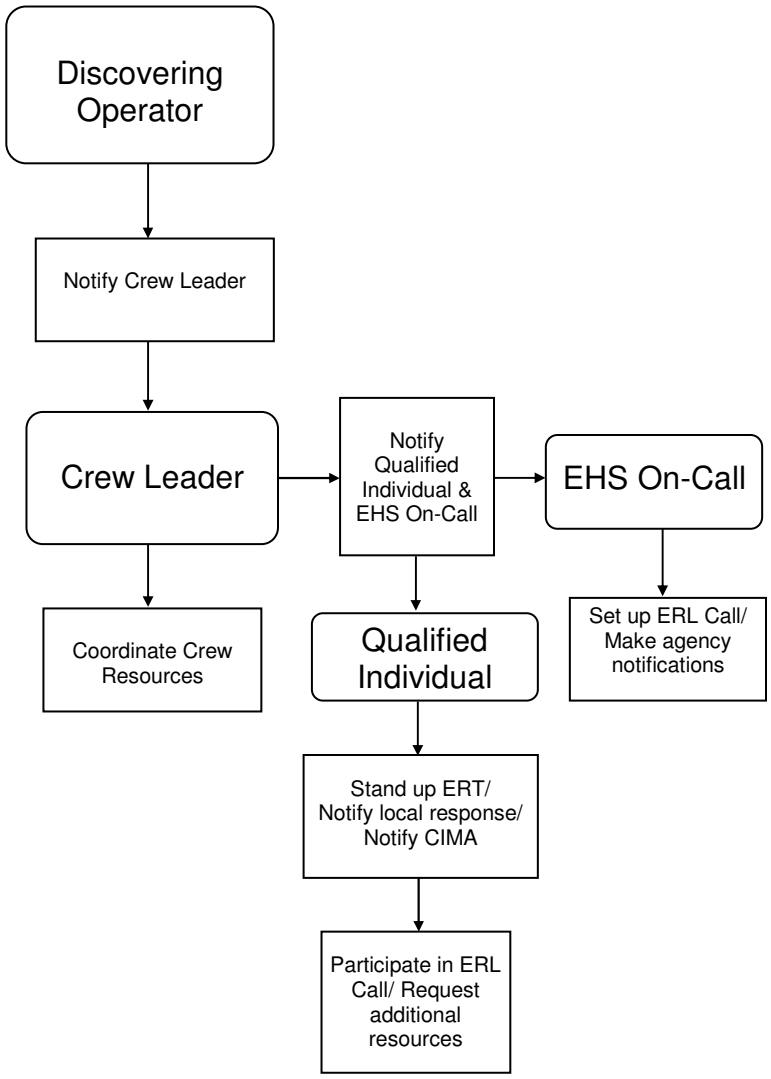
This Section is a guide for notification procedures that should be implemented immediately after discovering an emergency incident. Internal and external notifications are described separately for clarification purposes only. All notifications are of extreme importance and must be completed in a timely manner.

3.1 INTERNAL NOTIFICATIONS

The following internal notifications should be made for each emergency incident to the extent that the incident demands. In no event shall notification be delayed because the immediate supervisor cannot be reached. Authorization is given to bypass management levels if necessary to provide timely notification to appropriate management. The typical notification responsibilities for each person potentially involved in the initial response are listed below.

All emergency incidents will require some notification. The emergency category of the incident will affect the notifications and the initial response to the incident. It is important to properly classify the emergency category to ensure proper notifications and response.

INTERNAL NOTIFICATION SEQUENCE



3.2 EXTERNAL NOTIFICATIONS

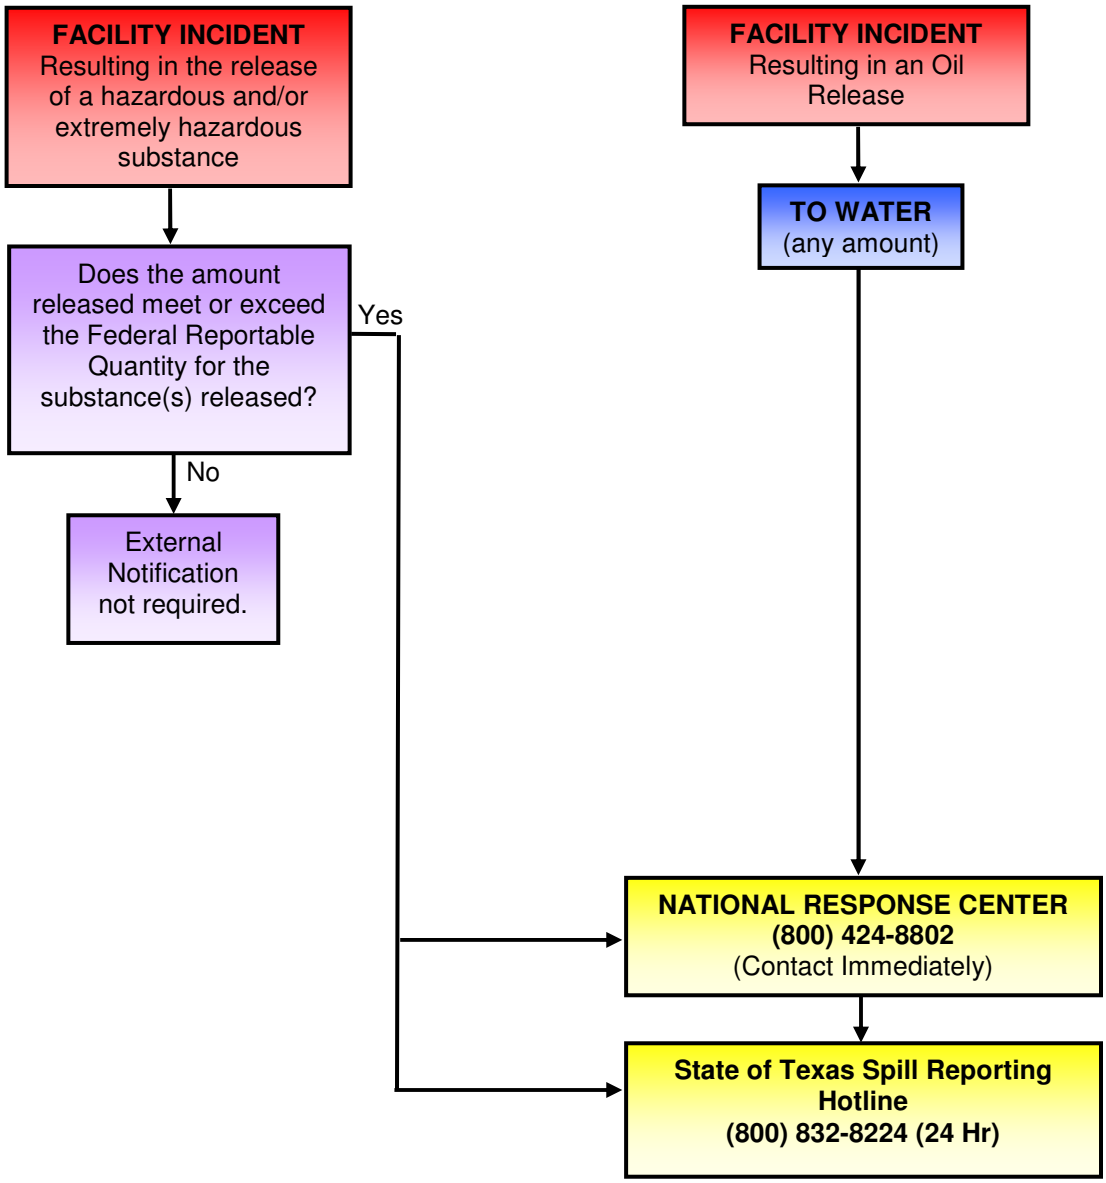
Depending on the type and level of incident, certain external notification may be necessary. Responsibilities for each person potentially involved in the external notifications are listed below.

Company Personnel

- Notify all regulatory/governmental agencies and other external organizations (contact information is listed in Figures 3.5 through 3.9).

- Document the release using the Notification Data Sheet (Figure 3.10).

EXTERNAL NOTIFICATION FLOWCHART



Note: See Figure 3.5 for additional Required Notifications.

NATIONAL RESPONSE CENTER (NRC)	
c/o United States Coast Guard (CG-5335) - Stop 7581 2100 2nd Street, SW Washington, DC 20593-0001	(800) 424-8802 (24 Hr.) (202) 267-2675 (Day Phone)
REPORTING REQUIREMENTS (40 CFR 300.300(b)) TYPE: Any discharge or sighting of oil on navigable waters. (40 CFR 110.6 and 33 CFR 153.203) VERBAL: Immediately (not later than one (1) hour of confirmed discovery to meet 49 CFR 195.52(a). See DOT notification for follow-up NRC notification criteria within 48 hours.) WRITTEN: If an RQ limit is reached, refer to state requirements for written report requirements. NOTE: A call to the NRC must also be made for spills or releases of hazardous substances that meet or exceed their RQ.	
USCG SECTOR HOUSTON-GALVESTON*	
13411 Hillard St. Houston, TX 77034	(281) 464-4854 (24 Hr.)
REPORTING REQUIREMENTS (33 CFR 153.203, 40 CFR 300.300(b)) TYPE: Any oil discharge that has impacted or threatens to impact navigable waters or release of hazardous substances in an amount equal to or greater than the reportable quality. VERBAL: Notification to the USCG is typically accomplished by the call to the NRC. WRITTEN: If an RQ limit is reached, refer to state requirements for written report requirements. NOTE: A call to the NRC must also be made for spills or releases of hazardous substances that meet or exceed their RQ. *If direct reporting to the NRC is not practicable, reports may be made to the USCG or EPA predesignated OSC for the geographic area where the discharge occurs. (40 CFR 300.300(b))

US EPA REGION 6 EMERGENCY RESPONSE*	
1201 Elm Street, Suite 500 Dallas, TX 75270	(800) 424-8802 (24 Hr.) (800) 887-6063 (Non-Emergency) (214) 665-2200 (Non-Emergency)
REPORTING REQUIREMENTS (40 CFR 300.300(b), App. F, Sec. 1.3.1.1, to 40 CFR) TYPE: Any oil discharge that has impacted or threatens to impact navigable waters or release of hazardous substances in an amount equal to or greater than the reportable quality. VERBAL: Notification to the EPA is typically accomplished by the call to the NRC. WRITTEN: As requested by the agency. Within 15 days after an incident involving a RCRA hazardous waste, submit Figure 3.10 to the Regional Administrator. NOTE: *If direct reporting to the NRC is not practicable, reports may be made to the USCG or EPA predesignated OSC for the geographic area where the discharge occurs. (40 CFR 300.300(b))	
STATE OF TEXAS SPILL REPORTING HOTLINE/TEXAS STATE EMERGENCY RESPONSE COMMISSION (TERC)	
Texas Commission of Environmental Quality 12100 Park 35 Circle Austin, Texas 78753	(800) 832-8224 (24 hr.) (512) 239-0400
REPORTING REQUIREMENTS: CITATION: 40 CFR 355.40; App. F, Sec.1.3.1.1.7, to 40 CFR 112; 30 TAC 327 TYPE: All spills of oil or petroleum products into water AND spills on land that meet or exceed 5 barrels or more. VERBAL: Immediately WRITTEN: Within 30 working days of the discovery of a reportable discharge or spill, the person responsible must submit written information to the appropriate TCEQ regional office describing the details and supporting the adequacy of the response. NOTE: The documentation must contain one of the following: 1) Information from the initial notification (see Fig 2.4), and a statement that the response to the discharge or spill has been completed and a description of how the action was conducted (See *Additional Information* below). 2) A request for an extension of time to complete the response, along with the reasons for the request, and a projected work schedule outlining the time required to complete the response action. Proceed according to the projected schedule unless otherwise notified by the appropriate TCEQ regional director. 3) A statement and explanation that the discharge or spill response has not been, and is not expected to be, completed within the maximum allowable extension (six months from the date of the discharge or spill), along with a projected work schedule.

DEPARTMENT OF TRANSPORTATION (FOR DOT JURISDICTIONAL FACILITIES*)	
Office of Pipeline Safety Pipeline and Hazardous Material Safety Administration 1200 New Jersey Avenue SE-E-22-321 Washington, District Of Columbia 20590	(800) 424-8802 (24 Hr.) (202) 267-2675 (24 Hr.) (202) 267-1322 (Fax) (202) 366-4566

REPORTING REQUIREMENTS:

TYPE: In addition to the reporting of accidents to the NRC as noted below, a written accident report (PHMSA Form 7000-1, via the online PHMSA Portal, and provided on in Appendix F) must be submitted for releases resulting in any of the following:

1. Explosion or fire not intentionally set by the operator.
2. Release of five gallons or more of hazardous liquid or carbon dioxide, except that no report is required for a release of less than five barrels resulting from a pipeline maintenance activity if the release is:
   a. not one described under the NRC's reporting conditions;
   b. confined to Company property or pipeline right-of-way; and
   c. cleaned up promptly.
3. death of any person.
4. personal injury necessitating hospitalization.
5. estimated property damage, including cost of cleanup and recovery, value of lost product, and damage to the property of the operator or others, or both, exceeding $50,000.

VERBAL: Call to the NRC, within one (1) hour of confirmed discovery and within 48 hours revise or confirm initial report, meets the required verbal notification under DOT reporting requirement.

WRITTEN: As soon as practicable, an accident meeting any of the above criteria must be reported via the PHMSA Portal at the following link: UR https://portal.phmsa.dot.gov/portal

Note: In the event that the link does not direct you to the site, paste the URL into your browser.

ADDITIONAL INFORMATION

Any information about the incident not recorded elsewhere in this report: _____

NOTE: DO NOT DELAY NOTIFICATION PENDING COLLECTION OF ALL INFORMATION.

4.0 INITIAL RESPONSE

4.1 EMERGENCY RESPONSE TEAM ACTIVATION

- Upon hearing the notification that a spill has occurred, all available, on-duty ERT members will immediately and without further notification, leave their normal job assignment (as conditions permit) and respond to the up-wind side of the emergency. The most qualified responding on-duty ERT member will serve as the ICS Operations Section Chief overseeing all tactical emergency response activities in the initial response. Additional members of the ERT will assume the various ICS positions based on the specifics of the incident and their capabilities.

4.2 INCIDENT SPECIFIC RESPONSE ACTIONS

Spill or Leak / Failure of Manifold / Mechanical Loading Arm / Transfer Equipment / Hoses / Piping Rupture / Piping Leak (both under pressure and not under pressure) / Equipment Failure

- Shut down pumping equipment.
- Close upstream and downstream block valves.
- Ensure that all drainage valve(s) are "closed".
- Mitigate spreading of the product, as the situation demands. Potential containment strategies include:
  - Earthen dike/berm
  - Ditching
  - Spreading sorbent material over the spill
- Prevent the spill from entering the waterways, sewer, etc. to the greatest extent possible, from a safe distance.
- Utilize Air Monitoring Equipment to assure that areas are safe to enter for continued response operations.
- Return the line/rack to service when repairs are complete.
- Clean up spilled product to eliminate possible environmental problems. Be alert for underground cables.
- Inform local operators such as utilities, telephone company, railway.
- If the spill escapes the containment area, review the location of socio-economic and environmentally sensitive areas identified in ICP Appendix A and the ESMs Figure A.2. Determine which of these may be threatened by the spill and direct the response operation to these locations. Initiate protection and recovery actions.
- Complete follow-up and written reporting, as the situation demands.

Storage Tank Leak / Tank Overfill / Tank Failure

- Shut down all product movement operations and isolate the tank.
- Ensure that the containment area/dike walls drainage valve(s) is "closed".
- If near tank bottom, consider filling tank with water and maintain water bottom to suspend the discharge.
- Utilize Air Monitoring Equipment to assure that areas are safe to enter for continued response operations.
- Block drainage of spilled material from traveling offsite.

4.2 INCIDENT SPECIFIC RESPONSE ACTIONS (Cont'd)

Storage Tank Leak / Tank Overfill / Tank Failure (Cont'd)

- Stop all traffic in hazardous area (inside and outside of property boundaries), as the situation demands.
- Remove product from containment/dike area (at a sump or in a low area).
- If applicable, process remaining product through the separator system.
- Empty tank as soon as possible.
- Clean up product spill to eliminate any possible environmental problems. Be alert for underground cables.
- Inform local operators such as utilities, telephone company, railway.
- If necessary, call one (1) of the approved waste removal companies to remove the remaining sludge and residue from the containment area. Contact the Environmental Manager, if necessary, to coordinate the removal of waste from the Facility for disposal.
- If the spill escapes the containment area, review the location of socio-economic and environmentally sensitive areas identified in Appendix A. Determine which of these may be threatened by the spill and direct the response to these locations. Initiate protection and recovery actions.
- Complete follow-up and written reporting, as the situation demands.

Leak or Spill at the Vehicle Refueling Area

- Evacuate personnel from the truck loading/unloading area, as the situation demands.
- Shut down all loading/unloading operations, pump motors and valves.
- Guard against all source of ignition.
- Stop all traffic from entering the affected area.
- If a line leaks, close off riser valves and/or tank valves.
- Clean area as appropriate with vacuum equipment, sorbent material, or flush (with water) all remaining product into the separator system.
- Turn off all vehicles.

Vapor Cloud (Massive Spill, Line Rupture, etc.)

- The person who discovers the vapor cloud will sound the alarm and notify the supervisor on duty and vacate the area.
- **Remember: the only proper action in the presence of a vapor cloud is to get away from it. Do not shut off electrical equipment.**
- All personnel will report to the evacuation muster point for roll call and further instructions.
- After all personnel have been accounted for, the Plant Manager or the Area Supervisor will initiate the following actions as deemed necessary:
  - Shut down transfer and blending operations.
  - Evacuation of adjacent property.
  - Only the fire department will be permitted to enter the plant.
- Contact the appropriate agencies and potentially affected neighbors (refer to Figure 3.5 – 3.9).

4.2 INCIDENT SPECIFIC RESPONSE ACTIONS (Cont'd)

Explosions and/or Fire

INDIVIDUAL DISCOVERING THE FIRE - (All Employees)

In the event that a fire response is required, the following actions should be taken, in order:

NOTE: If the situation warrants, and your personal safety is ensured, initial efforts to extinguish small incipient stage fires may prove to the best action. In these situations, if you believe that your personal safety is not at risk, and you can take interim measures to mitigate a situation while the Fire Department is deploying - do so.

- Notify the Management (any level).
  - Acknowledge information and switch all emergency communications to an alternate channel.
  - Shut down or secure all operations.
  - Note time of call.
  - Sound the emergency siren, contact the local fire department.
  - Have staff member check weather for any changes in wind direction.
- Account for contractors and Company personnel.
- IC mobilize to scene.
  - Check wind direction - approach from upwind.
  - Confirm and conduct a preliminary assessment of the situation upon arrival at the scene.
  - Evaluate scene for potential hazards (i.e., overhead power lines, obstacles wind direction).
  - Determine what product is involved and have SDS pulled and reviewed for PPE and firefighting instructions.
- Assemble Company personnel at the Command Post.
  - Fill positions (as required) in the Incident Management System.
  - If not already present, notify IC, Safety Officer, and Operations Chief.
  - Have fire pumps started and on standby (if applicable).
  - Initiate internal and external notifications in accordance with the fire and other.
- Eliminate any sources of ignition in the immediate area.
  - Shut down pumps and any movement into/ out of area.
  - Shut down contractor activity.
  - Stop traffic flow into and out of area.
  - Adjacent tank pumps and motors.
  - Be aware of static electricity.
- Establish objectives and priorities based on this assessment:
  - The Fire Department should quickly get water on the fire and cooling water on adjacent assets.
  - Be aware of overhead power lines, DO NOT flow water near them.
  - Find a way to get water to the fire quickly and safely (i.e., monitors, hydrants, truck).
  - Water will quickly fill the dike area.
  - Evaluate the water usage and determine whether or not to open/ close the internal and external dike drains.

4.3 PRODUCT SPECIFIC RESPONSE CONSIDERATIONS

The following emergency response guide(s) may be used by first responders during the initial phases of a hazardous material incident. Note: Safety data sheets meeting the requirements of 29 CFR 1910.1200 and 33 CFR 154.310(a)(5) are maintained separately at the Facility.

FIGURE 4.1

FLAMMABLE LIQUIDS
(e.g. Gasoline, Diesel, Naphtha)

The following information is intended to provide the initial responder(s) with data that may be useful in making quick decisions and executing prompt response actions. The information is intended for guideline purposes only.

HAZARD IDENTIFICATION / RECOGNITION

GUIDE NO. 128	• HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames. • Vapors may form explosive mixtures with air. • Vapors may travel to source of ignition and flash back. • Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). • Vapor explosion hazard indoors, outdoors or in sewers. • Those substances designated with a "P" may polymerize explosively when heated or involved in a fire. • Runoff to sewer may create fire or explosion hazard. • Containers may explode when heated. • Many liquids are lighter than water. • Substance may be transported hot.

HEALTH

- Move victim to fresh air. Call 911 or emergency medical service.
- Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- Wash skin with soap and water.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved, and take precautions.

PUBLIC SAFETY

- Isolate spill or leak area immediately for at least 50 meters (150 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate closed spaces before entering area

EVACUATION	**Large Spill** □ Consider initial downwind evacuation for at least 300 meters (1,000 feet). **Fire** □ If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (½ mile) in all directions; also, consider initial evacuation for 800 meters (½ mile) in all directions.

Information excerpted from the *2016 Emergency Response Guidebook*.

4.4 FACILITY RESPONSE EQUIPMENT / RESOURCES

The Facility relies on contracted OSROs and / or Company response equipment that can be brought from other facility within the Houston Operations area. The supply of response equipment located at the Facility is identified below.

RESPONSE EQUIPMENT TESTING/DEPLOYMENT
(App. F, Sec.1.3.3, to 40 CFR 112)

Date of Last Update: _____

Last inspection or Response Equipment Test Date:	
Inspection Frequency:	Quarterly
Last Deployment Drill Date:	
Deployment Frequency:	Semi Annual
Oil Spill Removal Organization Certification (if applicable):	

4.5 AIR MONITORING

During an incident in which oil or hazardous material has been spilled or potentially could affect the response, prior to engaging in any spill response activity, air monitoring should be conducted in the affected area.

It is imperative that all air monitoring equipment is operated and their data interpreted by trained personnel thoroughly familiar with the equipment.

- The air monitoring equipment should be calibrated before and after every use using the equipment manufacturer's recommended procedures and standards.
- Air monitoring measurements which are to be made prior to entry into the spill area include:
  - Lower Explosive Limit (LEL)
  - Oxygen content
- LEL readings above 10% require immediate evacuation of the area and elimination of ignition sources.
- Oxygen readings below 19.5% require the use of air supplied respiratory protection.
- Where unknown and multiple contaminants may be present, instrument readings should be interpreted conservatively.

The Incident Commander is responsible for industrial hygiene monitoring in the post discovery period and may refer to the Safety Officer.

4.6 DECONTAMINATION

Establishing "Exclusion (Hot)", "Contamination Reduction Zone (Warm)", and "Support (Cold)" zones are required to prevent the removal of contaminants from the contaminated area by response personnel and activities as well as unauthorized entry into contaminated areas.

- Regardless of the decontamination facilities available, all efforts to minimize personnel exposure should be taken.
- Decontamination facilities should be positioned prior to employee/ contractor entrance to areas where the potential for exposure to contamination exists. The appropriate Safety Data Sheets (SDS) are available to aid health professionals treating the injured parties. SDS are separately maintained at the Facility.
- Decontamination facilities should be designed to prevent further contamination of the environment and should have a temporary storage area for items that will be reused in the contaminated area.
- Particular attention should be paid to personal hygiene prior to eating, drinking, or smoking.

4.7 PERSONAL PROTECTIVE EQUIPMENT

The following represents OSHA/EPA designated PPE levels for responding to emergencies, post emergency cleanup sites, and/or Temporary Storage and Disposal (TSD) sites. The responder's PPE should be chosen based on his/her level of training and assigned job duties.

Personal Protective Equipment (PPE)	
LEVEL A • Self-Contained Breathing Apparatus (SCBA) (worn inside suit) • Encapsulated Chemical Protective Suit • Chemical Protective Gloves • Chemical Protective Boots • Hard Hat	**LEVEL B** • SCBA (worn outside suit) • Chemical Protective Suit w/Hood • Chemical Protective Boots • Chemical Protective Gloves • Hard Hat
LEVEL C • Air Purifying Respirator (APR) • APR Y2 Face / Full Face • Hard Hat • Glasses (worn with Y2 face APR) • Chemical Protective Boots • Chemical Protective Gloves • Chemical Protective Suit/Tyvek	**LEVEL D** • Hard Hat • Safety Glasses • Work Uniform / Clothes • Leather Gloves • Safety Boots • Flame Retardant Clothing (FRC)
MODIFIED LEVEL C Same as Level C except no APR requirements.	

5.0 SUSTAINED ACTIONS

5.1 INTRODUCTION

This section describes the processes for managing transition from the initial emergency response to sustained actions. The Emergency Response Team (ERT) will continue to maintain key functions during a sustained event but support will be provided through other corporate resources and contracted support.

The key to an effective emergency response is a rapid, coordinated, tiered response by the affected facility, and the Company consistent with the magnitude of an incident. The USCG Incident Management Handbook (IMH) contains an in-depth description of all ICS positions, ICS development, response objectives and strategies, command responsibilities, ICS specific glossary/acronyms, resource typing, the Incident Action Plan (IAP) process, and meetings.

Additional support personnel, local emergency services providers, mutual aid partners and/or emergency services contractors can called to respond to the Facility, as required. To support sustained and ongoing operations of a complex emergency, managers, supervisors and tactically trained and qualified emergency response personnel from other facilities may also be called upon for assistance by the Incident Commander.

5.1.1 Incident Action Plan

Emergency response activities are planned and coordinated through the use of an Incident Action Plan (IAP) which is developed for each Operational Period of a response by the Incident Management Team. For small responses, an ICS 201 (Incident Briefing Form), may be used as the IAP and, for all incidents, the ICS 201 will serve as the initial IAP (see Appendix F - ICS and Other Miscellaneous Forms).

5.1 INTRODUCTION (Cont'd)

5.1.1 Incident Action Plan (Cont'd)

For larger or more complex incidents, a more complete IAP will be necessary. These IAPs are generally created through the completion and compilation of several standard ICS forms. These forms include, but are not limited to:

NIMS ICS Forms		
ICS Form #	**Form Title**	**Prepared By**
IAP	Cover Sheet	Documentation Unit Leader
ICS-201-CG	Incident Briefing	Incident Commander (IC)
ICS-202-CG	Response Objectives	Planning Section Chief (Planning)
ICS-203-CG	Organization Assignment List	Resources Unit Leader (Planning)
ICS-204-CG	Assignment List	Resources Unit Leader (Planning)
ICS-204a-CG	Assignment List Attachment	Resources Unit Leader (Planning)
ICS-205-CG	Incident Radio Communications Plan	Communications Unit Leader (Logistics)
ICS-205A-CG	Communications List	Communications Unit Leader (Logistics)
ICS-206-CG	Medical Plan	Medical Unit Leader (Logistics)
ICS-207-CG	Incident Organization Chart	Resources Unit (Planning)
ICS-208-CG	Site Safety and Health Plan	Safety Officer
ICS-209-CG	Incident Status Summary	Situation Unit Leader (Planning)
ICS-210-CG	Status Change Card	Communications Center (Logistics)
ICS-211-CG	Check-In List	Resources Unit (Planning)
ICS211-p-CG	Check-In List (Personnel)	Resources Unit (Planning)
ICS-213-CG	General Message	Any message originator
ICS-213 RR-CG	Resource Request Message	Any message originator
ICS-214-CG	Unit Log	All sections and units
ICS-214a-CG	Individual Log	All sections and units
ICS-215-CG	Operational Planning Worksheet	Operations Section Chief (Operations)
ICS-217	Radio Frequency Assignment Worksheet	Communications Unit (Logistics)
ICS-218	Support Vehicle Inventory	Ground Support Unit (Logistics)
ICS-220-CG	Air Operations Summary	Operations Section Chief or Air Branch Director (Operations)
ICS-221-CG	Demobilization Check-Out	Demobilization Unit (Planning)
ICS-230-CG	Daily Meeting Schedule	All sections and units
ICS-231-CG	Meeting Summary	All sections and units
ICS-232	Resources at Risk Summary	Situation Unit Leader (Planning)
ICS-232a-CG	ACP Site Index	Situation Unit Leader (Planning)
ICS-233	Incident Open Action Tracker	Planning Section Chief (Planning)
ICS-234-CG	Work Analysis Matrix	Operations Section Chief (Operations)

5.1 INTRODUCTION (Cont'd)

5.1.2 Site Safety Plan

Site Safety Plans (SSP) are required by OSHA (29 CFR1910.120(b)(4)) for all hazardous waste operations. The SSP should address all on-site operations and hazardous as well as on-site emergency procedures. A template for use in producing an SSP is provided in Appendix F.

The SSP is typically prepared by the Safety Officer and approved by the Incident Commander or the Unified Command. All personnel must be familiar with the contents of the SSP and the SSP must be updated as conditions, operations and hazards associated with the response change.

5.2 QUALIFIED INDIVIDUAL

The Qualified Individual (QI) is responsible for the full implementation of the Integrated Contingency Plan, and is trained for these responsibilities. The Alternate Qualified Individual (AQI) provides relief to the QI, as needed. The QI is responsible for implementing response plans, directing response operations, and resolving internal conflicts that arise during response operations either directly or through the use of qualified designees. The QI or alternate must speak fluent English, be located in the United States, available on a 24-hour basis, and able to arrive at the Facility in a reasonable time.

It is the responsibility of the QI or his/her designee to coordinate with the Federal On-Scene Coordinator (FOSC) and State On-Scene Coordinator (SOSC) throughout the response.

DUTIES OF	
Qualified Individual (QI) include:	**Emergency Coordinator include:**
Activate internal alarms and hazard communication systems to notify all Facility personnel. Notify all response personnel, as needed. Identify the character, exact source, amount, and extent of the release, as well as the other items needed for notification. Notify and provide necessary information to the appropriate Federal, State, and Local authorities with designated response roles, including the National Response Center (NRC), State Emergency Response Commission (SERC), and local response agencies. Assess the possible hazards to human health and the environment due to the release. This assessment must consider both the direct and indirect effects of the release (i.e., the effects of any toxic, irritating, or asphyxiating gases that may be generated, or the effects of any hazardous surface water runoffs from water or chemical agents used to control fire and heat-induced explosion). Assess the interaction of the spilled substance with water and/or other substances stored at the Facility.	Activate internal facility alarms or communication systems, where applicable, to notify all facility personnel; and Notify appropriate State or local agencies with designated response roles if their help is needed. Identify the character, exact source, amount, and areal extent of any released materials whenever there is release, fire, or explosion. Where assessment indicates that evacuation of local areas may be advisable: Notify appropriate local authorities. Be available to help appropriate officials decide whether local areas should be evacuated; and Immediately notify either the government official designated as the on-scene coordinator for that geographical area, or the National Response Center (using their 24-hour toll free number 800/424-8802). Assess possible hazards to human health or the environment that may result from the release, fire, or explosion.

5.2 QUALIFIED INDIVIDUAL (Cont'd)

DUTIES OF	
Qualified Individual (QI) include:	**Emergency Coordinator include:**
Assess and implement prompt removal actions to contain and remove the substance released. Coordinate rescue and response actions as previously arranged with all response personnel. Activate and engage in contracting with oil spill removal organizations (OSRO). Use authority to immediately access Company funding to initiate cleanup activities. Direct cleanup activities until properly relieved of this responsibility. Arrangements will be made to ensure that the Qualified Individual (QI) or the Alternate Qualified Individual (AQI) is available on a 24-hour basis and is able to arrive at the Facility in a reasonable time. Act of liaison with the predesignated Federal On-Scene Coordinator (OSC). Be located within the United States, speak English fluently, familiar with the implementation of the plan, and trained in the responsibilities of the duties. The AQI shall replace the QI in the event of his/her absence and have the same responsibilities and authority.	Take all reasonable measures necessary to ensure that fires, explosions, and releases do not occur, recur, or spread to other hazardous waste at the facility. These measures must include, where applicable, stopping processes and operations, collecting and containing released waste, and removing or isolating containers. Monitor for leaks, pressure buildup, gas generation, or ruptures in valves, pipes, or other equipment, as appropriate, where operations stopped in response to a fire, explosion or release. Provide for treating, storing, or disposing of recovered waste, contaminated soil or surface water, or any other material that results from a release, fire, or explosion at the Facility immediately after the emergency. Ensure that, in the affected area(s): No waste that may be incompatible with the released material is treated, stored, or disposed of until cleanup procedures are completed; and All emergency equipment listed in the contingency plan is cleaned and fit for its intended use before operations are resumed.

5.3 EMERGENCY RESPONSE TEAM (ERT)

The number of positions/personnel required to staff the ERT will depend on the size and complexity of the incident. The duties of each position may be performed by the IC directly or delegated as the situation demands. The IC is always responsible for directing the response activities and will assume the duties of all the primary positions until the duties can be delegated to other qualified personnel.

5.4 INCIDENT MANAGEMENT ORGANIZATION

The Company Incident Management Organization effectively integrates two elements - the on-scene Emergency Response Team (ERT), and the longer term Incident Management Team (IMT.) Each of these elements has predefined roles and responsibilities summarized below.

- **Emergency Response Team (ERT)**. The ERT consists of Company personnel, industrial mutual aid and environmental contractor's units operating at the scene of an emergency under the command of the On-Scene Commander. Depending upon the nature of the incident, emergency response team operations could include firefighting, HAZMAT, medical, oil spill response, technical rescue and scene safety.

- **Incident Management Team (IMT) (e.g., Command Staff, Planning, Logistics, and Finance Sections).** Consists of other Company personnel who are responsible for managing the overall emergency response, addressing corporate, external and governmental notifications and supporting emergency and process control operations in the field. Some of these roles may be contracted out to capable third party companies that are specialized in this field.

The key to an effective emergency response is a rapid, coordinated, tiered response by the ERT/IMT and the Oil Spill Removal Organization (OSRO), consistent with the magnitude of an incident.

5.5 KM CRISIS SUPPORT TEAM (CST)

Kinder Morgan (KM) has established a Crisis Support Plan (CSP) to assist local field groups in responding to crises in their areas. In addition to typical emergencies such as releases, fires, and explosions, the plan may be used to address the response to less obvious crises such as negative media, national security threats and natural disasters that affect the overall well-being of KM.

During most emergencies and crises, the local facility response plan provides the appropriate immediate response. If the situation warrants, the Crisis Support Plan would be implemented to supplement local response activities by using personnel (called the Crisis Support Team (CST)) in the Houston, Texas; Orange, California; Lakewood, Colorado; and/or Alpharetta, Georgia offices – all of which can operate 24 hours per day when activated.

The focus of the KM Crisis Support Team (CST) is to augment the company's various existing emergency response plans and capabilities with additional resources, equipment, and crisis response planning, at the KM management level. The CSP provides the mechanism for activating the KM CST and affiliated Crisis Support Center.

5.6 INCIDENT COMMAND SYSTEM

The Incident Command System is intended to be used as an emergency management tool to aid in mitigating all types of emergency incidents. This system is readily adaptable to very small emergency incidents as well as more significant or complex emergencies. The Incident Command System utilizes the following criteria as key operational factors:

- Assigns overall authority to one individual
- Provides structured authority, roles and responsibilities during emergencies
- The system is simple and familiar, and is used routinely at all incidents
- Communications are structured
- There is a structured system for response and assignment of resources
- The system provides for expansion, escalation, and transfer/transition of roles and responsibilities
- The system allows for "Unified Command" where agency involvement at the command level is required.

Effective establishment and utilization of the Incident Command System during response to all types of emergencies can:

- Provide for increased safety
- Shorten emergency mitigation time by providing more effective and organized mitigation
- Cause increased confidence and support from Local, State, and Federal public sector emergency response personnel
- Provide a solid cornerstone for emergency planning efforts.

The Incident Command structure outlined in the IMH is shown in Figure 5.1. A description of each ICS position, the primary responsibilities, and pre-emergency planning activities are provided in Appendix D.

5.7 UNIFIED COMMAND

As a component of an ICS, the Unified Command (UC) is a structure that brings together the Incident Commanders of all major organizations involved in the incident to coordinate an effective response while still meeting their own responsibilities. The UC links the organizations responding to the incident and provides a forum for the Responsible Party and responding agencies to make consensus decisions. Under the UC, the various jurisdictions and/or agencies and responders may blend together throughout the organization to create an integrated response team. The ICS process requires the UC to set clear objectives to guide the on-scene response resources.

Multiple jurisdictions may be involved in a response effort utilizing Unified Command. These jurisdictions could be represented by any combination of:

- Geographic boundaries
- Government levels
- Functional responsibilities
- Statutory responsibilities

The participants of Unified Command for a specific incident will be determined taking into account the specifics of the incident and existing response plans and/or decisions reached during the initial meeting of the UC. The UC may change as the incident progresses, in order to account for changes in the situation.

5.7.1 Role of Federal On-Scene Coordinator (FOSC):

Federal On-Scene Coordinators (FOSCs) are the federal officials predesignated by EPA and the USCG to coordinate response resources. The FOSC, either directly or through his or her staff, monitors, provides technical assistance, and/or directs federal and potentially responsible party (PRP) resources. As the state and local responder's gateway to the resources of the NRS, it is the FOSC's responsibility to provide access to resources and technical assistance that may not otherwise be available to a community. Under the NCP, if federal involvement is necessary because state and local resources have been exceeded, the FOSC is obligated to coordinate the use of these resources to protect public health and the environment. During an oil or hazmat incident, EPA will usually provide FOSCs in the inland zone, and the USCG will generally provide FOSCs in the coastal zone, which become part of a Unified Command System with the responsible party.

5.7.2 Unified Command Responsibilities:

The UC is responsible for overall management of an incident. The UC directs incident activities and approves and releases resources. The UC structure is a vehicle for coordination, cooperation and communication that is essential to an effective response.

5.7 UNIFIED COMMAND (Cont'd)

5.7.2 Unified Command Responsibilities (Cont'd):

UC representatives must be able to:

- Agree on common incident objectives and priorities
- Have the capability to sustain a 24-hour-7-day-a-week commitment to the incident
- Have the authority to commit agency or Company resources to the incident
- Have the authority to spend agency or Company funds
- Agree on an incident response organization
- Agree on the appropriate Command and General Staff assignments
- Commit to speak with "one voice" through the Public Information Officer or Joint Information Center
- Agree on logistical support procedures
- Agree on cost-sharing procedures

W2	Protective Boom: 0*ft EDRC: 25,000 bbls TSC: 50,000 bbls	High Volume Ports: 30 hours Other Ports: 36 hours	High Volume Ports 36 hours Other Ports: 48 hours
W3	Protective Boom: 0*ft EDRC: 50,000 bbls TSC: 100,000 bbls	High Volume Ports: 54 hours Other Ports: 60 hours	High Volume Ports 60 hours Other Ports: 72 hours

1. Rivers/canals include bodies of water, including the Intracoastal Waterway and other bodies artificially created for navigation, confined within an inland area and having a project depth of 12 feet (3.66 meters).
2. EDRC stands for "effective daily recovery capacity," or the calculated recovery capacity of oil recovery devices determined by using a formula that takes into account limiting factors such as daylight, weather, sea state, and emulsified oil in the recovered material.
3. TSC stands for "temporary storage capacity," meaning sufficient storage capacity equal to twice the EDRC of an OSRO. Temporary storage may include inflatable bladders, rubber barges, certified barge capacity, or other temporary storage that can be utilized on scene at a spill response and which is designed and intended for the storage of flammable or combustible liquids. It does not include vessels or barges of opportunity for which no pre-arrangements have been made. Fixed shore- based storage capacity, ensured available by contract or other means, will be acceptable.

* In addition, 1,000 feet of containment boom plus 300 feet per skimming system.

RE: Letter of Intent – Agreement for Emergency Spill Response
Pasadena, KMET, JSTR, and Galena Park Terminals

Dear Mr. Allen,

Thank you for the opportunity to be of service to **Kinder Morgan.** ***OMI Environmental Solutions (Oil Mop)*** can provide emergency response services to your facilities on a 24-hour basis and, depending on availability and proximity of our facilities to the incident, in compliance with AMPD requirements, can respond to your location with emergency response equipment and personnel within one (1) hour. All of our response resources are listed within our United States Coast Guard ("USCG") Oil Spill Removal Organization ("OSRO") Classification. Our resources are maintained and exercised annually in accordance with the USCG PREP and OPA 90 readiness guidelines, and ***Oil Mop*** is listed as an MM through W3 Company with the USCG. Per 33 CFR 154.1045 paragraphs (c)(1) and (c)(2), all time and equipment requirements will be met for the worst-case discharge. ***OMI Environmental Solutions*** is also listed with the USCG as a Non-Floating Oils OSRO, and per 33 CFR 154.1045 paragraph (d), can meet vessel and facility on-scene response time requirements.

All of ***Oil Mop's*** response resources, maintenance and training records are available for inspection by **Kinder Morgan** upon request. ***Oil Mop*** will provide response services to **Kinder Morgan** on an immediate basis. In the event ***Oil Mop*** is unable to provide immediate response services for any reason whatsoever, ***Oil Mop*** will subcontract and/or assign the work to be performed hereunder. Response times will vary due to facility/vessel location.

The response agreement covers a five (5) year period, starting in **April 2021** through **April 2026.**

24-Hour Emergency Response Hotline

1-800-645-6671

This Letter of Intent will provide proof of our intention to respond with all available resources. Please reference the Master Service Agreement with ***OMI Environmental Solutions*** for Terms and Conditions.

Again, thank you for the opportunity to be of service to **Kinder Morgan.** If we can be of any further assistance, please feel free to call at any time.

Sincerely,

Neil Montgomery
Contracts Manager

Kinder Morgan Galena Park Terminal
Attn: Mr. Lance Wiley
906 Clinton Drive
Galena Park, TX 77547

RE: Letter of Intent - Emergency Response Capabilities

Dear Lance:

Anderson Pollution Control, Inc. d/b/a Horizon Environmental is pleased to offer our emergency response resources Kinder Morgan for Galena Park and Pasadena Locations listed below:

400 N Jefferson St. Pasadena, TX 77506-Jefferson Street Truck Rack (JSTR)
901 Light Company Rd. Pasadena, TX 77506-Kinder Morgan Export Terminal (KMET)
906 Clinton Drive Galena Park, TX 77547-Galena Park Terminal
1420 North Winter St. Pasadena, TX 77502-Pasadena/North Dock Terminal

Horizon Environmental can have the necessary resources to the geographic area that contains the terminal within the time frame intended by OPA 90. Horizon Environmental resources will be provided based upon availability at the time of notification. All of our facilities are manned with 40 hour HAZWOPER trained personnel that are capable of responding to oil spills.

Should you have any questions or comments regarding these provisions please feel free to contact me at the Horizon Environmental 24 Hour Emergency Response Hotline: (866) 609-6208 or by e-mail at davian.ploger@horizon-environ.com

Best Regards,

Davian M. Ploger
President/COO

Reference: 2021 P.R.E.P Report/ Letter of Intent to Respond

Dear Mr. Allen,

Phoenix Pollution Control and Environmental Services, Inc (Phoenix) is pleased to offer our emergency response resources in the event of an environmental emergency to your facilities.

Phoenix will be able to respond to an Average Most Probable Discharge release with the necessary resources and within the time-frame intended by OPA 1990. Phoenix resources will be provided based upon availability at the time of notification. All of Phoenix personnel are qualified and are capable of responding to oil and/or a Hazardous Material spill.

In regard to the Preparedness for Response Exercise Program (P.R.E.P.) requirements of Response Plan Holders under OPA-90, Phoenix is a U.S.C.G. certified Oil Spill Removal Organization (OSRO #206), a Certified Discharge Cleanup Organization (DCO) by the Texas General Land Office, and is an active Oil Spill/ Hazardous Material response company that exercises and utilize its spill response equipment on a regular basis.

Phoenix has a standard on-going training program for all of their response personnel. This training includes, but is not limited to, 40-hour Hazwoper, 8-Hour Refresher, Incident Command System, and Confined Space Entry. Phoenix as standard business practice, maintain complete maintenance records on all of their response equipment. If you require more details or wish to review our preventative maintenance or safety training records, please call us at 281.838.3400.

Phoenix maintains an active Drug, Alcohol and Background Check program, and is a member of:

- ISNetWorld
- PICS Contractor
- PICS
- Avetta
- DISA

Finally, we are available to participate in drills using our equipment, at your facility. I have attached our Equipment List, the current Emergency Response Rate Schedule, and a list of spill and drill activity for last year. Thank you for listing us on your OPA-90 Response Plan and we stand ready to respond for you if needed. To learn more about the other services that Phoenix offers, we urge you to visit our web site www.phoenixpollution.com

Sincerely,

PHOENIX POLLUTION CONTROL & ENVIRONMENTAL SERVICES, INC.

Attachment: 2020 Sample of Response/Deployment
Equipment List
2021 Emergency Response Rates

6.0 TERMINATION AND FOLLOW-UP

6.1 OBJECTIVES

The Incident Commander remains in charge until the emergency phase of the incident is over. Termination should be based on whether the release is no longer an immediate threat to: life, property, or the environment.

Criteria that should be applied include:

- The material causing the hazard is contained and no longer a threat to public receptors or sensitive environments (e.g. endangered/threatened species).

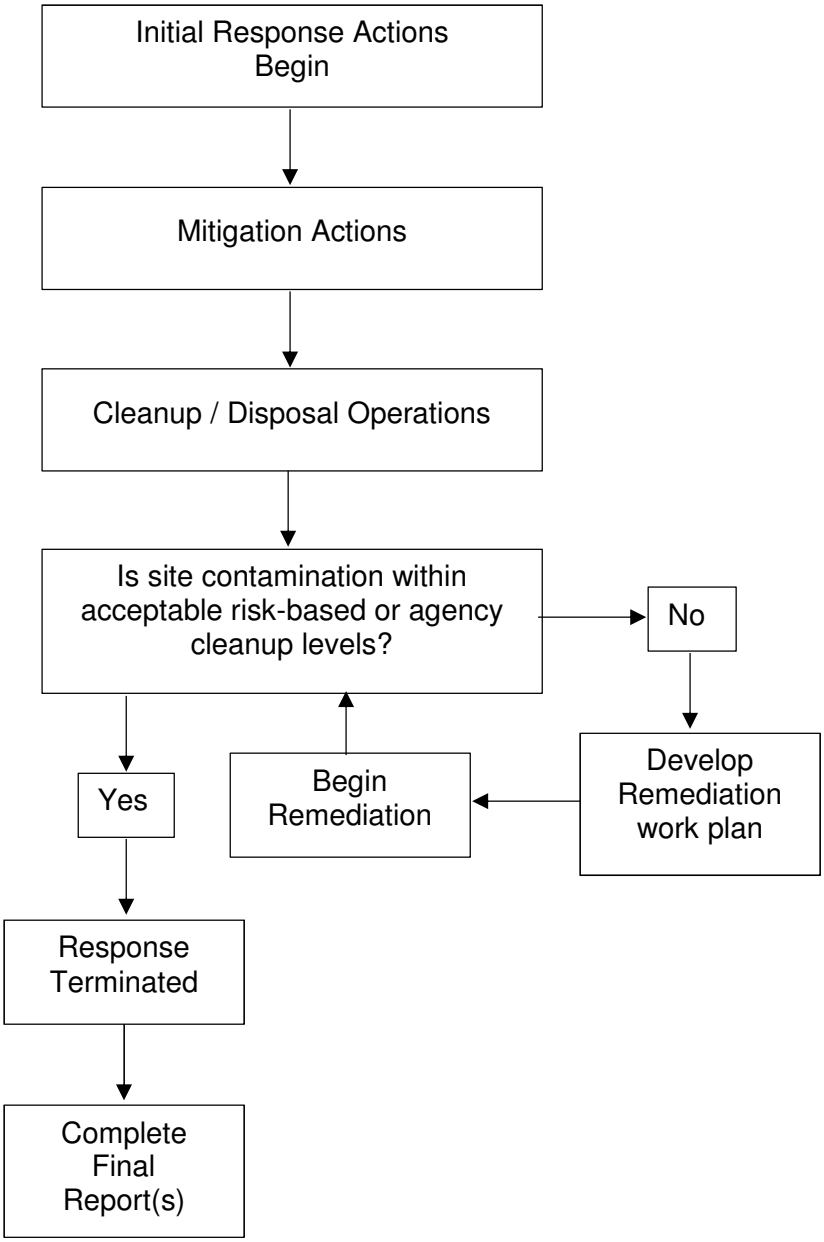
- Cleanup/Disposal Operations and Demobilization are complete.

- Sampling has confirmed contamination is within agency cleanup levels and site remediation is not required.
  - Where cleanup levels are not attained and remediation is required, the site enters the remediation phase.
  - Develop remediation work plan.
  - Begin remediation until desired cleanup levels are achieved.

- Agency and company final report(s) are filed.

FIGURE 6.1

RESPONSE PROCESS



6.2 LESSONS LEARNED

The review should involve answering the following questions:

- What was the cause of the emergency?
- Was it preventable? If so, how?
- Were inadequate or incorrect orders given or actions taken?
- What improvements to response actions or procedures should be implemented?
- Was the Integrated Contingency adequate for the response?

Use the Exercise, Drill, and Incident Evaluation log in Appendix F to document the findings.

6.3 FOLLOW-UP ACTIONS

What improvements or enhancements should be implemented?

- Training
- Procedures
- Response Actions
- Integrated Contingency Plan

Ensure changes are made by assigning a responsible party to each action item and a required completion date.

6.4 DISPOSAL PLAN

WASTE MANAGEMENT

The Facility has an environmental management system in place to ensure that wastes are properly characterized, evaluated, managed, and disposed of in accordance with state and federal requirements. All permits required to transport or dispose of recovered materials will be obtained by the organizations contracted for transportation or disposal.

OVERVIEW

A major oil spill response would generate significant quantities of waste materials ranging from oily debris and sorbent materials to sanitation water and used batteries. All these wastes need to be classified and separated (i.e., oily, liquid, etc.), transported from the site, and treated and/or disposed of at approved disposal sites. Each of these activities demands that certain health and safety precautions be taken, which are strictly controlled by federal and state laws and regulations.

6.4 DISPOSAL PLAN (Cont'd)

WASTE CLASSIFICATION

Solid Wastes

A solid waste is defined as any discarded material provided that it is not specifically excluded under the regulations. These exclusions cover materials such as domestic sewage and mixtures of sewage discharged through a sewer system or industrial wastewater point source discharges.

A discarded material is any material which is abandoned (disposed of, burned or incinerated) or accumulated, stored or treated prior to being abandoned. A discarded material is also any material recycled or any material considered inherently waste like. Recycled material is considered solid waste when used in a manner constituting disposal, placed on land or burned for energy recovery.

A solid waste may be considered a hazardous waste. A solid waste, as defined above, may be a hazardous waste if it is not excluded from regulation and is either a listed hazardous waste or exhibits the characteristics of a hazardous waste. A solid waste exhibits the characteristics of a hazardous waste if it exceeds the thresholds established in determining the following:

1) ignitability
2) corrosivity
3) reactivity
4) toxicity

A solid waste may also become a hazardous waste if it is mixed with a listed hazardous waste or, in the case of any other waste (including mixtures), when the waste exhibits any of the characteristics identified above.

Oily - Liquid Wastes

Oily liquid wastes (i.e., oily water and emulsions) that would be handled, stored, and disposed of during response operations are very similar to those handled during routine storage and transfer operations. The largest volume of oily liquid wastes would be produced by recovery operations (e.g., through the use of vacuum devices or skimmers). In addition, oily water and emulsions would be generated by vehicle operations (e.g., spent motor oils, lubricants, etc.), and equipment cleaning operations.

Non-Oily - Liquid Wastes

Response operations would also produce considerable quantities of non-oily liquid wastes. Water and other non-oily liquid wastes would be generated by the storage area and stormwater collection systems, vessel and equipment cleaning (i.e., water contaminated with cleaning agents), and office and field operations (i.e., sewage, construction activities).

6.4 DISPOSAL PLAN (Cont'd)

WASTE CLASSIFICATION (Cont'd)

Oily - Solid/Semi-Solid Wastes

Oily solid/semi-solid wastes that would be generated by containment and recovery operations include damaged or worn-out booms, disposable/soiled equipment, used sorbent materials, saturated soils, contaminated beach sediments, driftwood, and other debris.

Non-Oily - Solid/Semi-Solid Wastes

Non-oily solid/semi-solid wastes would be generated by emergency construction operations (e.g., scrap, wood, pipe, and wiring) and office and field operations (i.e., refuse). Vessel, vehicle, and aircraft operations also produce solid wastes.

WASTE HANDLING

A primary concern in the handling of recovered oil and oily debris is contaminating unaffected areas or re-contaminating already cleaned areas. Oily wastes generated during the response operations would need to be separated by type and transferred to temporary storage areas and/or transported to incineration or disposal sites. Proper handling of oil and oily wastes is imperative to ensure personnel health and safety.

Safety Considerations

Care would be taken to avoid or minimize direct contact with oily wastes. All personnel handling or coming into contact with oily wastes would wear protective clothing. A barrier cream can be applied prior to putting on gloves to further reduce the possibility of oily waste absorption. Safety goggles would be worn by personnel involved in waste handling activities where splashing might occur. Any portion of the skin exposed to oily waste would be washed with soap and water as soon as possible. Decontamination zones would be set up during response operations to ensure personnel are treated for oil exposure.

Waste Transfer

During response operations, it may be necessary to transfer recovered oil and oily debris from one point to another several times before the oil and oily debris are ultimately recycled, incinerated or disposed of at an appropriate disposal site. Depending on the location of response operations, any or all of the following transfer operations may occur:

- From portable or vessel-mounted skimmers into flexible bladder tanks, storage tanks of the skimming vessel itself, or a barge.
- Directly into the storage tank of a vacuum device.
- From a skimming vessel or flexible bladder to a barge.
- From a vacuum device storage tank to a barge.

6.4 DISPOSAL PLAN (Cont'd)

WASTE HANDLING (Cont'd)

Waste Transfer (Cont'd)

- From a barge to a tank truck.
- From a tank truck to a processing system (e.g., oil/water separator).
- From a processing system to a recovery system and/or incinerator.
- Directly into impermeable bags that, in turn, are placed in impermeable containers.
- From containers to trucks.

There are four general classes of transfer systems that may be employed to affect oily waste transfer operations:

- **Pumps:** Rotary pumps, such as centrifugal pumps, may be used when transferring large volumes of oil, but they may not be appropriate for pumping mixtures of oil and water. The extreme shearing action of centrifugal pumps tends to emulsify oil and water, thereby increasing the viscosity of the mixture and causing low, inefficient transfer rates. The resultant emulsion would also be more difficult to separate into oil and water fractions. Lobe or "positive displacement" pumps work well on heavy, viscous oils, and do not emulsify the oil/water mixture. Double-acting piston and double acting diaphragm pumps are reciprocating pumps that may also be used to pump oily wastes.

- **Vacuum Systems**: A vacuum truck may be used to transfer viscous oils but they usually pick up a very high water/oil ratio.

- **Belt/Screw Conveyors:** Conveyors may be used to transfer oily wastes containing a large amount of debris. These systems can transfer weathered debris laden oil either horizontally or vertically for short distances (i.e., 10 feet) but are bulky and difficult to set up and operate.

- **Wheeled Vehicles:** Wheeled vehicles may be used to transfer liquid wastes or oily debris to storage or disposal sites. These vehicles have a limited transfer volume (i.e., 100 barrels) and require good site access.

Table 1 provides a comparative evaluation of 15 types of transfer systems that could be available for transfer operations.

6.4 DISPOSAL PLAN (Cont'd)

WASTE STORAGE

Interim storage of recovered oil, oily and non-oily waste would be considered to be an available means of holding the wastes until a final management method is selected. In addition, the segregation of wastes according to type would facilitate the appropriate method of disposal. The storage method used would depend upon:

- The type and volume of material to be stored.
- The duration of storage.
- Access.

During an oil spill incident, the volume of oil that can be recovered and dealt with effectively depends upon the available storage capacity. Typical short-term storage options are summarized in Table 2. The majority of these options can be used either onshore or offshore. If storage containers such as bags or drums are used, the container must be clearly marked and/or color-coded to indicate the type of material/waste contained and/or the ultimate disposal option. Bladder or pillow tanks would be acceptable, if the available space can support the weight of both the container and the product.

Fuel barges may be the best option for temporary storage of oil recovered in open waters. Depending on size, these vessels may be able to hold up to 6,000 barrels of oil and water. The barge deck can be used as a platform for operating oil spill clean-up equipment and storing containment boom.

Empty barges have four to six feet draft which would increase when these barges are filled with oil or loaded with cargo. Consequently, they may not be able to enter shallow, nearshore waters.

It may be difficult to offload recovered oil stored inside barges. Due to natural forces which affect spilled oil, recovered oil may be very viscous or emulsified, rather than free-flowing. It may be necessary to use steam to heat viscous oil before pumping it from the barge.

Steel or rubber tanks can be used to store oil recovered near the shoreline. To facilitate offloading, demulsifiers may be used to break emulsions prior to placing the recovered substance into the barges or storage tanks.

Use of any site for storage is dependent on the approval of the local authorities. The following elements affect the choice of a potential storage site:

- Geology and Soil Type
- Ground water.
- Flooding and Proximity to Surface Water
- Slope.
- Covered material.

6.4 DISPOSAL PLAN (Cont'd)

WASTE STORAGE (Cont'd)

- Capacity.
- Climatic factors.
- Land use.
- Toxic air emissions.
- Security.
- Access.
- Public contact.

Temporary storage sites should use the best achievable technology to protect the environment and human health. They should be set up to prevent leakage, contact, and subsequent absorption of oil by the soil. The sites should be bermed (1 to 1.5 meters high) and double lined with plastic or visqueen sheets 6-10 millimeters or greater in thickness, without joints, prior to receiving loose and bagged debris. The edges of the sheet should be weighted with stones or earth to prevent damage by wind, and the sheet should be placed on a sand layer or an underfelt thick enough to prevent piercing. A reinforced access area for vehicles at the edge of the site should be provided. In addition, the oily debris should be covered by secured visqueen or tarps and an adequate stormwater runoff collection system for the size and location of the site would be utilized. Additionally, the sites should be at least 3 meters above mean sea level.

Oily debris can be hauled to approved temporary storage sites in visqueen lined trucks or other vehicles. Burnable, non-burnable, treatable and re-usable materials can be placed in well defined separate areas at temporary storage sites.

When the last of the oily debris leaves a temporary storage site, the ground protection would be removed and disposed of with the rest of the oily debris. Any surrounding soil which has become contaminated with oil would also be removed for disposal or treatment. If the soils were removed for treatment, they may be replaced if testing proves acceptable levels have been achieved. Treatment and remediation is encouraged when feasible. The temporary storage should be returned to its original condition.

WASTE DISPOSAL

Techniques for Disposal of Recovered Oil

Recovery, reuse, and recycling are the best choices for remediation of a spill, thereby reducing the amount of oily debris to be bermed onsite or disposed of at a solid waste landfill. Treatment is the next best alternative. There are some limitations and considerations in incinerating for disposal. Environmental quality of incineration varies with the type and age of the facility. Landfilling is the last option. Final disposal at a solid or dangerous waste landfill is the least environmentally sound method of dealing with a waste problem such as oily debris.

6.4 DISPOSAL PLAN (Cont'd)

WASTE DISPOSAL (Cont'd)

Techniques for Disposal of Recovered Oil (Cont'd)

During an oil spill incident, the Company would consult with the federal and state On Scene Coordinator (OSC) to identify the acceptable disposal methods and sites appropriately authorized to receive such wastes. The identification of suitable waste treatment and disposal sites would be used to develop an Incident Disposal Plan, which must be authorized by the U.S. Coast Guard and/or the EPA. An Incident Disposal Plan would include predesignated interim storage sites, segregation strategies, methods of treatment and disposal for various types of debris, and the locations/contacts of all treatment and disposal site selections. Onsite treatment/disposal will be preferred.

In order to obtain the best overall Incident Disposal Plan, a combination of methods should be used. There is no template or combination of methods that can be used in every spill situation. Each incident should be reviewed carefully to ensure an appropriate combination of disposal methods are employed.

The different types of wastes generated during response operations would require different disposal methods. To facilitate the disposal of wastes, they should be separated by type for temporary storage, transport and disposal. Table 3 lists some of the options that would be available to segregate oily wastes. The table also depicts methods that may be employed to separate free and/or emulsified water from the oily liquid waste.

The following is a brief discussion of some disposal techniques available for recovered oil and oily debris.

Recycling

This technique entails removing water from the oil and blending the oil with uncontaminated oil. Recovered oil can be shipped to refineries provided that it is exempt from hazardous waste regulations. There it can be treated to remove water and debris, and then blended and sold as a commercial product.

6.4 DISPOSAL PLAN (Cont'd)

WASTE DISPOSAL (Cont'd)

Incineration

This technique entails the complete destruction of the recovered oil by high temperature thermal oxidation reactions. There are licensed incineration facilities as well as portable incinerators that may be brought to a spill site. Incineration may require the approval of the local Air Pollution Control Authority. Factors to consider when selecting an appropriate site for onsite incineration would include:

- Proximity to recovery locations.
- Access to recovery locations.
- Adequate fire control.
- Approval of the local air pollution control authorities.

In Situ Burning/Open Burning

Burning techniques entail igniting oil or oiled debris and allowing it to burn under ambient conditions. These disposal techniques are subject to restrictions and permit requirements established by federal, state and local laws. They would not be used to burn PCBs, waste oil containing more than 1,000 parts per million of halogenated solvents, or other substances regulated by the EPA. Permission for *in situ* burning may be difficult to obtain when the burn takes place near populated areas.

As a general rule, *in situ* burning would be appropriate only when atmospheric conditions will allow the smoke to rise several hundred feet and rapidly dissipate. Smoke from burning oil will normally rise until its temperature drops to equal the ambient temperature. Afterwards, it will travel in a horizontal direction under the influence of prevailing winds.

Landfill Disposal

This technique entails burying the recovered oil in an approved landfill in accordance with regulatory procedures. Landfill disposal of free liquids is prohibited by federal law in the United States.

Non-burnable debris which consists of oiled plastics, gravel and oiled seaweed, kelp, and other organic material may be transported to a licensed, lined, approved municipal or private landfill and disposed of in accordance with the landfill guidelines and regulations. Landfill designation would be planned only for those wastes that have been found to be unacceptable by each of the other disposal options (e.g., waste reduction, recycling, energy recovery). Wastes would be disposed of only at company approved disposal facilities.

TABLE 1

Comments	E,J	B	B	B,J		F	A	B	B,D	A,C,D	F,G,I	F,G,I	F,G			G,H,I

KEY TO RATINGS: 5 = Best; 1 = Worst

KEY TO COMMENTS:

A. Normally require remote power sources, thus are safe around flammable fluids.
B. Should have a relief valve in the outlet line to prevent bursting hoses.
C. Air powered units tend to freeze up in sub-freezing temperatures.
D. Units with work ball valves are difficult to prime.
E. Some remotely powered types are designed to fit in a tanker's butterworth hatch.
F. Can also pump air at low pressure.
G. Transfer is batch-wise rather than continuous.
H. Waste must be in separate container for efficient transfer.
I. Transportable with its own prime mover.
J. High shear action tends to emulsify oil and water mixtures.

TABLE 2

TEMPORARY STORAGE METHODS

A.7 Shoreline and Habitat Response Zone Cleanup A-13

A.8 Alternative Response Strategies A-13
Figure A.1 Endangered/Threatened Species Listing A-14
Figure A.2 Environmental Sensitivity Maps A-16

A.1 CRITICAL AREAS TO PROTECT

The critical areas to protect are classified as having high, moderate, or low sensitivity to oil. Because a shoreline's sensitivity and type can change over time, the Shoreline Cleanup Assessment Team (SCAT) should perform on-site confirmations of sensitivity levels at the time of a spill. The Federal, State, and Local authorities will further clarify these categories at the time of the response. The categories are defined as follows:

HIGH SENSITIVITY

- Areas that are high in productivity, abundant in many species, extremely sensitive, difficult to rehabilitate, or inhabited by threatened or endangered species.
- Areas that consist of forested areas, bush/grassy areas, wooded lake areas, freshwater marshes, wildlife sanctuaries/refuges, and vegetated river and stream banks with vegetation present.

MODERATE SENSITIVITY

- Areas of moderate productivity, somewhat resistant to the effects of oiling.
- Areas that consist of degraded marsh habitat, clay/slit banks with vegetated margins, and gravel/cobble beaches.

LOW SENSITIVITY

- Areas of low productivity, man-made structures, and/or high energy.
- Areas that consist of gravel, sand, or clay material, barren/ rocky riverbanks and lake edges, man-made structures, and concrete/ compacted earthen drainage ditches.

A.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES

Environmental/Socio-economic sensitive areas are of extreme importance and must be considered when planning a response effort. Protection of the health and safety of the public and the environment, as well as the protection of the various socio-economic sensitivities, must also be promptly addressed in order to mitigate the extent of damage and minimize the cost of the clean-up effort.

All environmental and socio-economic sensitive areas are worthy of protection, but must be prioritized during a response effort. When making decisions on which areas to designate as collection areas and which to protect, the following sources may be consulted:

A.2 ENVIRONMENTAL/SOCIO-ECONOMIC SENSITIVITIES (Cont'd)

- U.S. Fish and Wildlife Services and related state agencies
- Applicable Area Contingency Plans
- Maps showing environmentally sensitive areas
- Other industry and private experts.

The Environmental and socio-economic sensitive areas in the vicinity of the Facility have been broken down into specific categories and identified in this Section.

Priority consideration will be given to those areas in the immediate vicinity of the Facility property. Specific actions that will be considered (as appropriate) include:

- Containment of the spill as close as possible to Facility property.
- Protection of shoreline areas to minimize environmental impact.
- Protection of the public boat ramps and private marinas.
- Protection of Public Parks.
- Protection of neighboring facility docks.
- Protection of the water intakes.
- Protection of fleeted vessels/barges in the area.

To further clarify the location of the sensitive areas of concern, details are provided in Section A.5 and Environmental Sensitivity Maps (Figure A.2) are provided later in this Section.

A.3 WILDLIFE PROTECTION AND REHABILITATION

The Company will work with Federal, State, and Local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill, as necessary. Oversight of wildlife preservation activities and coordination with Federal, State and Local agencies during an oil spill is the responsibility of the Incident Commander.

Special consideration should be given to the protection and rehabilitation of endangered species and other wildlife and their habitat in the event of an oil spill and subsequent response. Jurisdictional authorities should be notified and worked with closely on all response/clean-up actions related to wildlife protection and rehabilitation. Laws with significant penalties are in place to ensure appropriate protection of these species.

A.3.1 Endangered/Threatened Species

The U.S Fish and Wildlife Services (USFWS) and related state agencies classify the status of various wildlife species in the potentially effected states. A summary of critical birds, reptiles, mammals, and plant species status as related to the Facility's operating areas (area of the highest oil spill potential) is presented in Figure A.1 and are as current as of the publication date of this plan.

A.3 WILDLIFE PROTECTION AND REHABILITATION (Cont'd)

A.3.2 Wildlife Rescue

The Company will work with Federal, State, and Local agency personnel to provide labor and transportation to retrieve, clean, and rehabilitate wildlife affected by an oil spill, as the situation demands.

The following are items that should be considered for wildlife rescue and rehabilitation during a spill response:

- Bird relocation can be accomplished using a variety of deterrents, encouraging birds to avoid spill impacted areas. Care must be taken to avoid taking actions that could be construed as disturbing wildlife instead of being a deterrent.
  - Use of visual stimuli, such as inflatable bodies, owls, stationary figures, or helium balloons, etc.
  - Use of auditory stimuli, such as propane cannons, recorded sounds, or shell crackers.
  - Use of herding with aircraft, boats, vehicles or people (as appropriate)
  - Use of capture and relocation

A.3.3 Search and Rescue – Points to Consider

- **Company involvement should be limited to offering assistance as needed or requested by the agencies.**

- Prior to initiating any organized search and rescue plan, **authorization must be obtained from the appropriate Federal/State agency.**

- **Initial search and rescue efforts, if needed, should be left up to the appropriate agencies.** They have the personnel, equipment, and training to immediately begin capturing contaminated wildlife.

- With or without authorization, it must be anticipated that volunteer citizens will aid distressed/contaminated wildlife on their own. It is important to communicate to the public that it may be illegal to handle wildlife without express authority from appropriate agencies. Provisions should be made to support an appropriate wildlife rehabilitation organization; however, **no support should be given to any unauthorized volunteer rescue efforts.**

- The regulatory agencies and response personnel should be provided the name and location of a qualified rehabilitator in the event contaminated wildlife is captured.

- Resources and contacts that can assist with wildlife rescue and rehabilitation are provided in Section 3.0. This list includes:
  - Outside rehabilitation organizations
  - Local regulatory agencies

A.4 STAGING AREAS

When establishing personnel and equipment staging areas for a response to a discharge, the following criteria should be evaluated:

- Access to waterborne equipment launching facilities and/or land equipment.
- Access to open space for staging/deployment of heavy equipment and personnel.
- Access to public services utilities (electricity, potable water, public phone, restroom and washroom facilities, etc.)
- Access to the environmental and socio-economically sensitive areas that are projected for impact.

A.5 VULNERABILITY ANALYSIS (App F, Sec. 1.4.2 to 40 CFR 112)

Water Intakes

Water intakes are a critical resource and may be vulnerable to spills. Water intakes located within the planning distance are shown in the following table:

WATER INTAKE	LOCATION / DISTANCE	SITE ISSUE
NRG - Deepwater	0.0 Miles	In emergencies where power supply is interrupted, please notify as quickly as possible.
Armco Inc.	2.57 Miles	No site issues.
Phillips 66 Corporation	2.81 Miles	No site issues.
Ethyl Corporation	3.7 Miles	No site issues.
Coopers Marine Service Inc.	4.36 Miles	In emergencies were barge shipments are interrupted, please notify as quickly as possible.
Oiltanking of Texas Inc.	6.02 Miles	In emergencies where pipeline shipments may be involved, please notify as quickly as possible.
Vopak - Deer Park	7.89 Miles	No site issues.
Baywood Country Club	9.08 Miles	No site issues.
Southwestern Barge Fleet Service	10.4 Miles	In emergencies where barge shipments are interrupted, please notify as quickly as possible.
NRG - Sam Bertram	10.21 Miles	No site issues.
Western Towing Co.	10.64 Miles	No site issues.

Personnel or agencies associated with these intakes should be notified and these areas should be given special attention during any spill.

A.5 VULNERABILITY ANALSIS (App F, Sec. 1.4.2 to 40 CFR 112) (Cont'd)

Residential Areas (App F, Sec. 1.4.2(4) to 40 CFR 112)

The nearest residential area is approximately 0.25 mile east northeast of the Facility. At 13-15 miles downstream, multiple neighborhoods on the east shore of Burnet Bay and Crystal Bay could be impacted. The likely impacts to these areas are higher traffic volumes due to emergency response activities in the area and potentially the need to evacuate. Any evacuation efforts for these areas will be coordinated by the local emergency assistance agencies (police department, fire department, etc.).

Schools (App F, Sec. 1.4.2(2), to 40 CFR 112)

Schools, like residential areas may be affected in various ways. These may include but are not limited to, higher traffic volumes, evacuations, and possible exposure. Schools located within the planning distance (15 miles) and the 0.5-mile potential evacuation recommended by the 2016 Emergency Response Guidebook are shown in the following table:

SCHOOLS	LOCATION/DISTANCE	SITE ISSUE
Galena Park High School	1000 Keene St., Galena Park, TX 77547/0.8 mile Northeast	Evacuation could affect the school.

Any evacuation efforts for these school(s) will be coordinated by the local emergency assistance agencies (police department, fire department, etc.).

Medical Facilities (App F, Sec. 1.4.2(3), to 40 CFR 112)

No hospitals are located within planning distance and the 0.5 mile evacuation zone

Businesses (App F, Sec. 1.4.2(5), to 40 CFR 112)

A release could impact property and disrupt business activities. The immediate area surrounding the Facility is for the most part commercialized. The listing of businesses in the area is extensive. A partial list of businesses located within the planning distance is shown in the following table:

BUSINESSES	LOCATION/DISTANCE	SITE ISSUE
Kinder Morgan Export Terminal	901 Light Company Road Pasadena, TX	Where offsite impact could affect the facility, notify as appropriate.
Pasadena Refining System, Inc.	111 Red Bluff Rd., Pasadena, TX	Where offsite impact could affect the facility, notify as appropriate.

A.5 VULNERABILITY ANALSIS (App F, Sec. 1.4.2 to 40 CFR 112) (Cont'd)

Businesses (App F, Sec. 1.4.2(5), to 40 CFR 112) (Cont'd)

BUSINESSES	LOCATION/DISTANCE	SITE ISSUE
Chevron Phillips Chemical	1400 Jefferson Rd, Pasadena, TX	Where offsite impact could affect the facility, notify as appropriate.
Ethyl Corporation	1000 N. South St., Pasadena, TX	Where offsite impact could affect the facility, notify as appropriate.
Stolthaven	15602 Jacintoport Blvd., Houston, TX	Where offsite impact could affect the facility, notify as appropriate.
Oiltanking Houston	15631 Jacintoport Blvd., Houston, TX	Where offsite impact could affect the facility, notify as appropriate.
Jacintoport International LLC	16398 Jacintoport Blvd., Houston, TX	Where offsite impact could affect the facility, notify as appropriate.
Albemarle Corp.	2500 N. South St., Pasadena, TX	Where offsite impact could affect the facility, notify as appropriate.

Any evacuation efforts for these areas will be coordinated by the local emergency assistance agencies (police department, fire department, etc.).

Wetlands and other Sensitive Environments (App F, Sec. 1.4.2(5), to 40 CFR 112)

Based on U.S. Fish and Wildlife Service National Wetland Inventory Data, marshes and wetlands exist downstream from the Facility near Galveston Bay. Those sensitive areas that potentially could be affected by a release from the Facility are discussed in the following sections. The Wetlands Map (Figure A.3) details wetlands data from the U.S. Fish and Wildlife Service's National Wetlands Inventory. Flora and fauna are always present and are sensitive to the effects of a pollution incident. All environmental areas deserve protection from pollution, but they must be prioritized during a response so as to protect the most sensitive and susceptible areas to pollution.

Fish and Wildlife (App F, Sec. 1.4.2(7), to 40 CFR 112)

During a response situation, the USFWS and applicable state agencies should be contacted for information regarding wetlands and other sensitive environments. Upon contact, the agencies will be able to: identify and establish priorities for fish and wildlife, wetlands, and other sensitive environments requiring protection from any direct or indirect effects from a discharge. Fish found in the Houston Ship Channel include: catfish, trout, gafftop, red drum, and jackfish. Wildlife found in area could include: ducks, geese, egrets, ibis, raccoons, and squirrels.

A.5 VULNERABILITY ANALSIS (App F, Sec. 1.4.2 to 40 CFR 112) (Cont'd)

Lakes, Streams and Other Water Bodies (App F, Sec. 1.4.2(8), to 40 CFR 112)

The following waterbodies could be impacted by a release from the Facility within the planning distance:

WATER BODIES	
Buffalo Bayou/Houston Ship Channel	Scott Bay
Vince Bayou	Upper San Jacinto Bay
Greens Bayou	Tubbs Bay
Burnet Bay	Galveston Bay

Endangered Flora and Fauna (App F, Sec. 1.4.2(9), to 40 CFR 112)

The endangered flora and fauna that may be potentially impacted by a discharge originating at the Facility are detailed in Figure A.1. USFWS and applicable state agencies will be contacted for information regarding endangered species.

Recreational Areas (App F, Sec. 1.4.2(10), to 40 CFR 112)

The following recreational areas could be impacted by a release from the Facility within the planning distance:

RECREATIONAL AREAS
San Jacinto State Park – Approx. 9 miles downstream
River Terrace Park – Approx. 11 miles downstream
Bayland Park Marina – Approx. 15 downstream

Transportation Routes (air, land, and water) (App F, Sec. 1.4.2(11), to 40 CFR 112)

There are various public roadways and waterways which may be potentially affected by a discharge originating from the Facility.

TRANSPORTATION ROUTES	LOCATION/DISTANCE	SITE ISSUE
Clinton Drive	0.0 Mile (Adjacent to Facility)	Transportation/Commerce
Houston Ship Channel	0.1 Miles (South)	Transportation/Commerce

The local emergency assistance agencies (police department, fire department, etc.) and the U.S. Coast Guard (as applicable) would be contacted for traffic control in the area of the discharge.

A.5 VULNERABILITY ANALSIS (App F, Sec. 1.4.2 to 40 CFR 112) (Cont'd)

Utilities (App F, Sec. 1.4.2(12), to 40 CFR 112)

No utility should not be affected by an oil spill incident from the Facility. Any notification or evacuation efforts necessary will be coordinated by the local emergency assistance agencies (police department, fire department, etc.), State Police, U.S. Coast Guard, and other agencies as the situation demands.

Other Areas of Economic Importance (App F, Sec. 1.4.2(13), to 40 CFR 112)

There are no other areas of economic importance within the planning distance.

A.6 CONTAINMENT AND RECOVERY OF SPILLED PRODUCT (App F, Sec. 1.7.1.1(1), to 40 CFR 112)

General descriptions of various specific response techniques that may be applied during a response effort are discussed below. The Company's responders are free to use all or any combination of these methods as incident conditions require, provided they meet the agency approval, appropriate safety standards and other requirements relative to the situation encountered. Data was obtained from reports, manuals and pamphlets prepared by the American Petroleum Institute, Environmental Protection Agency and the United States Coast Guard. The most effective cleanup of a product spill will result from an integrated combination of clean-up methods. Each operation should complement and assist related operations and not merely transfer spillage problems to areas where they could be more difficult to handle.

The spill should be assessed as soon as possible to determine the source, extent and location of travel. Terrain and other physical conditions downgradient of the spill site will determine the methods of control at a point in advance of the moving product. Often, the bulk of a spill can be contained at a single location or a few key locations in the immediate vicinity of the source point. When possible, the execution of this type of initial containment strategy helps confine a spill to a relatively limited area.

A.6.1 Spill on Land (Soil Surfaces)

- **Confinement Methods**

  Product (rainbow sheen) can be trapped in ditches and gullies by earth dams. Where excavating machinery is available, dams can be bulldozed to contain lakes of product. Dams, small and large, should be effectively employed to protect priority areas such as inlets to drains, sewers, ducts and watercourses. These can be constructed of earth, sandbags, absorbents, or any other effective method. If time does not permit a large dam, many small ones can be made, each one holding a portion of the spill as it advances. The terrain will dictate the placement of the dams. If the spill is minor, natural dams or earth absorption will usually stop the product before it advances a significant distance. Cleanup is the main concern in such situations.

A.6 CONTAINMENT AND RECOVERY OF SPILLED PRODUCT (Cont'd)

A.6.1 Spill on Land (Soil Surfaces) (Cont'd)

- **Removal Methods**

  The recovery and removal of free product (rainbow sheen) from soil surfaces is a difficult job. The best approaches at present seem to be:

  - Removal with suction equipment to tank truck if concentrated in volumes large enough to be picked up.
  - Small pockets may have to be dipped up by hand.

A.6.2 Spill in Inland Urban Areas

Oil spills in urban areas can greatly impact recreational use, human health, wildlife habitat(s), and potential beach or park closures. Manmade structures along waterways require unique protection strategies. Manmade structures could include vertical shore protection structures such as seawalls, piers, and bulkheads, as well as riprap revetments and groins, breakwaters, and jetties. Vertical structures can be constructed of concrete, wood, and corrugated metal. They usually extend below the water surface, although seawalls can have beaches or riprap in front of them. These structures are very common along developed shores, particularly in harbors, marinas, and residential areas.

The range in degree of exposure to waves and currents varies widely, from very low in dead-end canals, to very high on offshore breakwaters. Boat wakes can generate wave energy in otherwise sheltered areas.

Maintaining shipping or other kinds of vessel traffic through navigation channels or waterways during a spill response is a difficult consideration because there is usually economic and political pressure to re-establish normal operations as soon as possible. For these reasons, recovery efforts must be coordinated through the Unified Command to ensure the cooperation of all parties involved.

- **Confinement Methods**

  In harbor areas, oil can often be contained by a vessel of opportunity or a dedicated Oil Spill Response Vessel (OSRV) using containment booms and skimmers. Optimum conditions for recovery operations would be with currents of 3 knots or less. The facility could also deploy boom from shore to contain and concentrate product in the vicinity of the release point until the product can be removed.

A.6 CONTAINMENT AND RECOVERY OF SPILLED PRODUCT (Cont'd)

A.6.3 Spill on Pond or Calm or Slow-Moving Water

- **Confinement Methods**

  A calm or slow-moving water offers the best conditions for removal of product from water. Although the removal is no easy task, the pond presents the favorable conditions of low or no current and low or no waves.

  The movement of product on a pond is influenced mainly by wind. The product will tend to concentrate on one shore, bank or inlet. Booms should be set up immediately to hold the product in the confined area in the event of a change in wind direction.

  If the spill does not concentrate itself on or near a shore (no wind effect), then a sweeping action using boats and floating booms will be necessary.

  The essential requirement for this operation is that it be done very slowly. The booms should be moved at not more than 40 feet per minute. Once the slick is moved to a more convenient location (near shore), the normal operations of removal should begin.

  If the slick is small and thin (rainbow effect) and not near the shoreline, an absorbent boom instead of a regular boom should be used to sweep the area very slowly and absorb the slick. The product may not have to be moved to the shoreline.

- **Removal Methods**

  If the confined slick is thick enough, regular suction equipment may be used first; however, in most instances, a floating skimmer should be used.

  If the floating skimmer starts picking up excess water (slick becomes thin), drawing the boom closer to the bank as product is removed will also keep film of product thicker. However, when the slick becomes too thin, the skimmer should be stopped and an absorbent applied (with a boat if necessary) to remove the final amounts. The floating skimmer (if speed is a must) or hand skimmers (if water is shallow enough) or both can be used to pick up the product-soaked absorbent. Before pumping the product-soaked absorbent with a floating skimmer, ensure that the absorbent in question can be pumped and will not harm the pump. Several types are nonabrasive to pump internals. If the floating skimmer is used first, the product–soaked absorbent/water mixture should be pumped into a tank truck.

A.6 CONTAINMENT AND RECOVERY OF SPILLED PRODUCT (Cont'd)

A.6.3 Spill on Pond or Calm or Slow-Moving Water (Cont'd)

A better method of retrieving the product-soaked absorbent is to draw it in as close to the shore as possible with the booms used to confine the product initially. The absorbent can then be hand skimmed from the water surface and placed in drums, on plastic sheets or in lined roll-off boxes. It should then be disposed of by acceptable means.

The final rainbow on the surface can be removed with additions of more absorbent.

A.6.4 Spill on Stream which Flows into a Pond

In certain locations where streams (small and large ones) flow into ponds at relatively short distances, it is conceivable that a spill could reach the pond before containment and recovery operations are set up. If time permits for containment operations to be set up on the stream in question, it then would be handled as described above depending upon the stream size involved.

However, if product in the stream is near the pond site or if product is flowing into the pond with a significant amount yet to arrive, a different containment should be employed.

- **Confinement Methods**

  Product on a stream flowing into a pond should be boomed as close to the entrance as possible. The boom should be positioned on the pond at an angle to the residential stream current so as to direct the surface water to a slower moving area. The area where the product is being deflected should be enclosed by booms to contain it. An additional boom for sweeping the product to the bank will be required. This area of containment should not have a current velocity of more than 1/2 knot (0.8 ft./sec.), preferably less.

- **Removal Methods**

  The removal of product from the pond's surface would be handled as described earlier.

  For sizable releases, collected product will usually be pumped into tank trucks and transported to a storage facility.

A.7 SHORELINE AND HABITAT RESPONSE ZONE CLEANUP

Spills in Manmade Canal

Exposed, Solid Man-made Structures

- **Description**
  - These are solid, man-made structures such as docks or piers.
  - Many structures are constructed of concrete, wood, or metal.
  - They are built to protect the shore from erosion by waves, boat wakes, and currents.
  - Attached animals and plants are sparse to moderate.
- **Predicted Oil Behavior**
  - Oil readily adheres to the dry, rough surfaces, but it does not adhere to wet substrates.
  - The most resistant oil would remain as a patchy band at or above the high-water mark.
- **Response Considerations**
  - Cleanup is usually not required.
  - High-pressure water spraying may be conducted to remove risks of contamination to people or vessels or to improve aesthetic.

A.8 ALTERNATIVE RESPONSE STRATEGIES

There are no pre-approved response options for inland spills within the United States. All spill team members will be informed that detergents or other surfactants are prohibited and any plans to use dispersants or in-situ burn by the Company will be submitted to the Federal On-Scene Coordinator for Regional Response Team approval prior to such action being taken.

FIGURE A.1

ENDANGERED/THREATENED SPECIES

(The following list of species is taken from the Texas Parks and Wildlife Department Website http://tpwd.texas.gov/gis/rtest/)

Harris County, Texas

AMPHIBIANS

FIGURE A.2

ENVIRONMENTAL SENSITIVITY MAPS

These maps are to be utilized as guidelines only. During a real response effort, Federal, State, and Local agencies should be contacted to provide further assistance in the proper identification and protection of the various environmental and socio-economic sensitive areas.

The Company places maximum priority upon the protection of the environment that may be endangered and the immediate commitment of response resources to protect all sensitive and endangered areas.

25. Booming Strategy **Recommendation**

Boom across entrance to prevent oil entering slip and adjacent marsh. Concrete culvert at back of slip leads to extensive marsh complex and special attention needs to be paid to tides and additional booming at culvert.

APPENDIX B

WORST CASE DISCHARGE ANALYSIS

Page

B.1 Discharge Calculations B-2
EPA
USCG
DOT PHMSA

B.2 Discharge Scenarios B-4
EPA/USCG Small Discharge B-4
EPA/USCG Medium Discharge B-7
EPA Worst Case Discharge B-10
PHMSA Worst Case Discharge B-15
USCG Worst Case Discharge B-16

B.3 Response Requirements B-17
Figure B.1 Response Planning Volume Calculations B-18

B.4 Planning Distance Calculation B-21

B.1 DISCHARGE CALCULATIONS

Regulatory planning standards require that potential discharge amounts be calculated in order to plan appropriately. Calculations are presented below:

EPA

Worst Case Discharge (WCD) = 100% of the largest single well at the facility.

WCD = 167,142 bbls

Medium Discharge = Discharge greater than 2,100 gallons (50 bbls) and less than or equal to 36,000 gallons (857 bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD.

Medium Discharge = 857 bbls

Small Discharge = A discharge of less than or equal to 2,100 gallons (50 bbls) and not to exceed the WCD.

Facility Small Discharge = 50 bbls

USCG

Facility WCD = 5,351 bbls

Maximum Most Probable Discharge (MMPD) = A discharge of 1,200 bbls or 10% of the WCD, whichever is less.

Facility MMPD = 95 bbls

Average Most Probable Discharge (MPD) = A discharge of 50 bbls or 1% of the WCD, whichever is less.

Facility AMPD = 10 bbls

B.1 DISCHARGE CALCULATIONS (Cont'd)

DOT PHMSA

Worst Case Discharge (WCD) = Largest volume (Bbls) of the following:

- Pipeline's maximum release time (hrs), plus the maximum shutdown response time (hrs), multiplied by the maximum flow rate (bph), plus the largest line drainage volume after shutdown of the line section.

WCD = 15,941 bbls (Pipeline)

--OR--

- Largest foreseeable discharge for the line section is based on the maximum historic discharge, if one exists, adjusted for any subsequent corrective action or preventive action taken.

WCD = 35 bbls release from tank 150-42.

--OR--

Capacity of the single largest breakout tank or battery of tanks within a single secondary containment system, adjusted for the capacity or size of the secondary containment system. Applicable adjustments for the largest tank at the Pipeline Facility including secondary containment include the following:

- Secondary containment capacity greater than 100% capacity of the largest tank and designed according to NFPA 30. **If yes, reduce by 50%.**
- Tank built, rebuilt and repaired according to API standard 620 / 650 / 653**. If yes, reduce by 10%**
- Overfill protection designed according to API RP 2350. **If yes, reduce by 5%.**
- Testing / cathodic protection designed according to API standard 650 / 651 / 653. **If yes, reduce by 5%.**

The maximum allowable credit is 70% of the volume of the largest tank (TK 187-1)

Facility WCD = 50,143 bbls

(167,142 bbls x 0.3) = 50,143 bbls (Breakout Tank) for a release from tank 187-1 .

B.2 DISCHARGE SCENARIOS

Small/Average Most Probable Discharge = 50 Bbls (EPA)/10 Bbls (USCG)

DISCHARGE SCENARIOS (App. F, Sec. 1.5, to 40 CFR 112)

App. F, Sec. 1.5.1.1, to 40 CFR 112			
Operations	Small (App. F, Sec. 1.5.1.1)	Medium (App. F, Sec. 1.5.1.1)	Worst Case (App. F, Sec. 1.5.2.1)
Loading & Unloading of Surface Transportation	X	X	
Facility Maintenance	X	X	
Facility Piping	X	X	
Pumping Stations & Sumps	X	X	
Oil Storage Tanks	X	X	X
Vehicle Refueling			
Age & Condition of facility components	0.0267 spills/yr Note 1	0.0267 spills/yr Note 1	0.0267 spills/yr Note 1

Note 1: Spill frequencies based on Federal Emergency Management Agency. (1989). *Handbook of Chemical Hazard Analysis Procedures*.

SMALL DISCHARGE SCENARIO (App. F, Sec. 1.5.1.2, to 40 CFR 112):

Scenario A and **Scenario B**:

Time: 0900

Weather conditions (App. F, Sec. 1.5.1.2.7, to 40 CFR 112): Thunderstorm with winds out of the west at 10 mph

Aquatic conditions (App. F, Sec. 1.5.1.2.7, to 40 CFR 112): 0.5 knots/hr.

NOTE: Although the scenario discussed will be limited to one of the above, the response steps and required action will be the same in all cases.

Scenario A (Facility Piping): 0900 Hours: The terminal operator making rounds in the containment area discovers a leak from Tank 25-19. The product is leaking from the transfer piping (Location of the material spilled - App. F, Sec. 1.5.1.2.5, to 40 CFR 112) into Panther Creek, which flows the Houston Ship Channel resulting in the discharge of 50-barrel of STAR-4. The likelihood that the discharge will travel offsite (App. F, Sec. 1.5.1.2.4, to 40 CFR 112) is high because the location of the discharge is the potentially Outfall-5 directly into Panther Creek. The probability of a chain reaction of failures (App. F, Sec. 1.5.1.2.9, to 40 CFR 112) is low due Facility inspections and the outfall is typically closed.

Scenario B (Tank): 0900 Hours: The terminal operator making rounds in the containment area discovers a leak from Tank 100-7. The product is leaking from a weld approximately 12 feet above the ground (Location of the material spilled - App. F, Sec. 1.5.1.2.5, to 40 CFR 112) into the vicinity of Barge Dock 3, which is connected to the Houston Ship Channel resulting in the discharge of 50-barrel of Ultra Low Sulfur Diesel (ULSD). The likelihood that the discharge will travel offsite (App. F, Sec. 1.5.1.2.4, to 40 CFR 112) is high because the location of the discharge is next to dock and Outfall-10. The probability of a chain reaction of failures (App. F, Sec. 1.5.1.2.9, to 40 CFR 112) is low due Facility inspections and the Facility would initiate emergency procedures to lower the product level below the level of the leaking tank weld.

B.2 DISCHARGE SCENARIOS (Cont'd)

Small/Average Most Probable Discharge = 50 Bbls (EPA)/10 Bbls (USCG) (Cont'd)

Estimated spill volume (App. F, Sec. 1.5.1.2.1, to 40 CFR 112)**:** 50 Bbls (2,100) gallons

Material discharged (App. F, Sec. 1.5.1.2.6, to 40 CFR 112): Scenario A: STAR-4; **Scenario B**: ULSD

Proximity to Downgradient wells and/or drinking water intakes (**App. F, Sec. 1.5.1.2.2, to 40 CFR 112):**

No downgradient wells and/or drinking water intakes were identified on the Houston Ship Channel (source: Texas Oil Spill Planning and Response Atlas).

Proximity to Downgradient waterways (Direction of spill pathway - App. F, Sec. 1.5.1.2.10, to 40 CFR 112):

The site drainage is towards the Houston Ship Channel, which flows into Galveston Bay.

Proximity to fish and wildlife and sensitive environments (App. F, Sec. 1.5.1.2.3, to 40 CFR 112):

The spill likely will reach the Ship Channel and impact fish and wildlife.

Time Event

Scenario A and B: 0900 Hours: Upon discovery, the operator notifies Facility management. The Terminal Manager initiates the Company's Emergency Response Line (ERL) Conference, activates the Facility's Integrated Contingency Plan, and contacts the Oil Spill Removal Organization (OSRO) to respond. The Terminal Manager functions as the Incident Commander (IC)/Qualified Individual (QI) until relieved by senior personnel. The OSRO, under the direction of the QI, will identify the location(s) and trajectory of the oil spill for deployment of containment, deflection, or exclusion booming downstream as appropriate (see App. A).

1000 Hours: The OSRO will mobilize to the potential boom location points (**Scenario A**: Panther Creek, near Ship Dock 1, 3, or 4 based on site conditions at the time; **Scenario B**: Barge Dock 3, Ship Dock 3, or Ship Dock 4, based on site conditions at the time) and initiate a deployment configuration that best supports the operating environment and available resources. The OSRO will place boom in the water using appropriate anchor system or mooring points.

1100 Hours: The OSRO will utilize vacuum trucks or appropriate recovery equipment to begin removal.

1130 Hours: The OSRO deploys additional boom downstream to capture any oil that may escape the primary boom or if the primary boom fails. If remediation equipment is required, it will be available from the OSRO during the cleanup operations (App. F, Sec. 1.5.1.2.8, to 40 CFR 112).

B.2 DISCHARGE SCENARIOS (Cont'd)

Small/Average Most Probable Discharge = 50 Bbls (EPA)/10 Bbls (USCG) (Cont'd)

Small Discharge Scenarios (Cont'd)

Response Requirement

The Facility shall identify sufficient resources, by contract or other approved means, to respond to a Small Discharge. The response resources shall, as appropriate, include:

- 1,000' of containment boom and a means of deploying it within one (1) hour of the discovery of a spill.
- Oil recovery devices with an effective daily recovery capacity (50 bbls/day) equal to the amount of oil discharged in a *Small Discharge* which is available at the Facility within two (2) hours of the detection of an oil discharge.
- Oil storage capacity (100 bbls) for recovered oily material equivalent to twice the effective daily recovery rate.

Facility Response Resources/Capability

The Facility will respond to a ***Small Discharge*** with the manpower detailed in Figures 3.1 – 3.4 as well as local contract resources as detailed in Figure 5.5.

Notes

- Equipment and personnel resources are detailed in Section 4.4, Figure 3.1 – 3.4, and Fig 5.5.
- Telephone notification and contact references are provided in Section 3.

Response personnel are trained for responding to small discharges through regularly scheduled tabletop exercises, discharge prevention/safety meetings, ICP reviews, and/or actual responses to spills.

B.2 DISCHARGE SCENARIOS (Cont'd)

Medium/Maximum Discharge = 857 Bbls (EPA)/95 Bbls (USCG)

DISCHARGE SCENARIOS (App. F, Sec. 1.5, to 40 CFR 112)

App. F, Sec. 1.5.1.1, to 40 CFR 112			
Operations	Small (App. F, Sec. 1.5.1.1)	Medium (App. F, Sec. 1.5.1.1)	Worst Case (App. F, Sec. 1.5.2.1)
Loading & Unloading of Surface Transportation	X	X	
Facility Maintenance	X	X	
Facility Piping	X	X	
Pumping Stations & Sumps	X	X	
Oil Storage Tanks	X	X	X
Vehicle Refueling			
Age & Condition of facility components	0.0267 spills/yr Note 1	0.0267 spills/yr Note 1	0.0267 spills/yr Note 1

Note 1: Spill frequencies based on Federal Emergency Management Agency. (1989). *Handbook of Chemical Hazard Analysis Procedures*.

MEDIUM DISCHARGE SCENARIO (App. F, Sec. 1.5.1.2, to 40 CFR 112)

Time: 0900

Weather conditions (App. F, Sec. 1.5.1.2.7, to 40 CFR 112): Thunderstorm with winds out of the west at 10 mph

Aquatic conditions (App. F, Sec. 1.5.1.2.7, to 40 CFR 112): 0.5 knots/hour.

NOTE: Although the scenario discussed will be limited to one of the above, the response steps and required action will be the same in all cases.

Scenario A (Pump): 0900 Hours: An operator at the Facility during his morning rounds hears a loud screeching sound and discovers a pump failure at Tank 100-9. The operator powers down the transfer but product has leaked from the pump and is rapidly filling up the earthen secondary containment (Location of the material spilled - App. F, Sec. 1.5.1.2.5, to 40 CFR 112) and there is a potential for the product to flow into the Ship Channel if Outfall 5 (Likelihood discharge will travel offsite - App. F, Sec. 1.5.1.2.4, to 40 CFR 112) through Outfall-15. The probability of a chain reaction (App. F, Sec. 1.5.1.2.9, to 40 CFR 112) is low due to facility inspections and routine equipment maintenance.

Scenario B (Tank Overfill): 0900 Hours: An operator making rounds sees product pooling at the base of Tank 50-1. The operator contacts dock PIC the tank has been overfilled and dock transfer is stopped but free product is within the earthen secondary containment (Location of the material spilled - App. F, Sec. 1.5.1.2.5, to 40 CFR 112). If through human error, Tank 50-1 containment valve is open and Tank 25-19 containment is being drained through Outfall-5, there is a potential for the product to escape to the Ship Channel (Likelihood discharge will travel offsite - App. F, Sec. 1.5.1.2.4, to 40 CFR 112). The probability of a chain reaction (App. F, Sec. 1.5.1.2.9, to 40 CFR 112) is low due to facility inspections, transfer procedures, and permitted discharges.

Estimated spill volume (**App. F, Sec. 1.5.1.2.1, to 40 CFR 112):** 36,000 gallons

B.2 DISCHARGE SCENARIOS (Cont'd)

Medium/Maximum Discharge = 857 Bbls (EPA)/95 Bbls (USCG) (Cont'd)

Material discharged (App. F, Sec. 1.5.1.2.6, to 40 CFR 112): Scenario A: Alkylate;
Scenario B: Distillate Blend

Proximity to Downgradient wells and/or drinking water intakes(App. F, Sec. 1.5.1.2.2, to 40 CFR 112):

No downgradient wells or drinking water intakes were identified within the planning distance (source: Texas Oil Spill Planning and Response Atlas.).

Proximity to Downgradient waterways(App. F, Sec. 1.5.1.2.10, to 40 CFR 112):

The site drainage is towards the Houston Ship Channel, which flows into Galveston Bay.

Proximity to fish and wildlife and sensitive environments(App. F, Sec. 1.5.1.2.3, to 40 CFR 112):

The spill likely will reach the Ship Channel and impact fish and wildlife.

Time Event

Scenario A and B: 0900 Hours: Upon discovery, the operator notifies Facility management. The Terminal Manager initiates the Company's Emergency Response Line (ERL) Conference, activates the Facility's Integrated Contingency Plan, and contacts the Oil Spill Removal Organization (OSRO) to respond. The Terminal Manager functions as the Incident Commander until relieved by senior personnel. The OSRO, under the direction of the QI, will identify the location(s) and trajectory of the oil spill for deployment of containment, deflection, or exclusion booming downstream as appropriate (see App. A).

1000 Hours: OSRO will mobilize to the identified locations (N. Richey St. or Shaver St.) and initiate a deployment configuration that best supports the operating environment and available resources. The OSRO will place boom in the water using appropriate anchor system or mooring points.

1100 Hours: The OSRO will utilize vacuum trucks or other appropriate recovery equipment to begin removal product.

1130 Hours: The OSRO deploys additional boom downstream to capture any oil that may escape the primary boom or if the primary boom fails. In addition all resources should arrive within 12 hours of activation of deployment. The oil recovery devices should be capable of recovering at least 50% of the product. However the secondary containments should be large enough to retain most of the product at the site. Due to the fact the product is diesel, there should not be the need for remediation equipment; however, if required, it will be available from the OSRO during the cleanup operations (App. F, Sec. 1.5.1.2.8, to 40 CFR 112).

B.2 DISCHARGE SCENARIOS (Cont'd)

Medium/Maximum Discharge = 857 Bbls (EPA)/95 Bbls (USCG) (Cont'd)

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Medium Discharge. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to 50% of the *Medium Discharge* volume that is capable of arriving on scene within the required time limits.
- Sufficient quantity of containment boom must arrive within the required time limits for oil collection and containment (see requirements in small discharge scenario above) and for protection of fish and wildlife and sensitive environments, as appropriate.
- Temporary storage capacity equal to twice the daily recovery capacity.

Facility Response Resources/Capability

- The Facility will initially respond to a ***Medium Discharge*** with a similar response to the Small Discharge. Additional response resources will be activated from an Oil Spill Removal Organization(s) (OSRO) as detailed in Figure 3.6.

Notes

- Equipment and personnel resources are detailed in Section 4.4, Figure 3.1 – 3.4, and Fig 5.5.
- Telephone notification and contact references are provided in Section 3.

Spill response personnel, including Facility members, are continually trained to respond to medium discharges through regularly scheduled tabletop exercises, discharge prevention/ safety meetings, ICP reviews, HAZWOPER training, and/or other PREP training.

B.2 DISCHARGE SCENARIOS (Cont'd)

EPA Worst Case Discharge = 167,142 Bbls (EPA)
(App. F, Sec. 1.5.2.1, to 40 CFR 112)

DISCHARGE SCENARIOS (App. F, Sec. 1.5, to 40 CFR 112)

App. F, Sec. 1.5.1.1, to 40 CFR 112

WORST CASE DISCHARGE SCENARIO

Time: 0530

Weather conditions (App. F, Sec. 1.5.2.1.1(7), to 40 CFR 112)**:** Severe thunderstorm develops and spawns tornado.

Aquatic conditions (App. F, Sec. 1.5.2.1.1(7), to 40 CFR 112)**:** 3 knots/hr.

NOTE: Although the scenario discussed will be limited to one of the above, the response steps and required action will be the same in all cases.

Day 1

0530 Hours During what appeared to be an ordinary storm, a tornado develops and destroys the integrity of Tank 187-1, a portion of the dike wall, and adjacent roadway. All 167,142 barrels of the tank and dock lines empty into the secondary containment and moves toward Houston Ship Channel slip. Conditions are rainy with strong winds.

0530 - An operator spotted the tornado that hit Tank 187-1

0530 - The operator immediately notifies his foreman of the situation by radio and informs the foreman he will head over to the area and meet the foreman there.

0534 - The foreman arrives at the scene.

0536 - The foreman who is the initial response Incident Commander (IC) calls for deployment of the response boat and begin booming across the slip

B.2 DISCHARGE SCENARIOS (Cont'd)

EPA Worst Case Discharge = 167,142 Bbls (EPA) (Cont'd)

Day 1 (Cont'd)

0536 - The foreman calls the marine scheduler to call the Incident Commander (IC) and Liaison Officer (LO) immediately and relay the incident.

0536 - The IC tells the marine scheduler to call-out the Galena Park ERT via the all-call.

0539 - The LO contacts the OSRO and informs them of the incident and minimum equipment and manpower needed.

0540 - The LO contacts the USCG (Houston) for an emergency shut-down of the channel and informs them of the incident.

0541 - The LO contacts HL&P of the incident and assists in response to protect the water intake if possible.

0545 - The LO notifies appropriate agencies in transit to the terminal.

0600 - Boom across Slip has been deployed and secured. The incoming tide is traveling at at rate of 2 ft / sec.

0620 - The IC arrives and relieves the foreman IC of command and establishes a command post at the Customer Service Center (CSC). The LO arrives and completes any agencies not called while in transit. SOFR arrives and establishes Site Safety Plan and decon procedures. The Spill Response Contractor arrives.

0625 - Containment of oil on land begins by laying absorbents and building a dike.

0630 - Kinder Morgan and the boat crew are instructed to assist the OSRO in deployment of deflection boom.

0645 - OSRO boats are in the water and ready.

0730 - Kinder Morgan and contractor equipment is used to begin recovery of the oil from the water.

0700 - Land response equipment is set-up and additional equipment dispatched. Clean-up of oil on the land begins.

0730 - Agency officials arrive and the Uniform Command System is put in place.

0800 - Clean-up activities are monitored by ICS/ERT members and continue throughout the night.

B.2 DISCHARGE SCENARIOS (Cont'd)

EPA Worst Case Discharge = 167,142 Bbls (EPA) (Cont'd)

Day 2

0730 - OSRO tailgate safety meeting conducted.

0800 - Clean-up of release is continued to be monitored.

0830 - Planning meeting in progress (salvageable oil, temporary storage, short term and long term goals, cost, etc.).

0900 - Operation meeting in progress (update, progress, recovery rate, etc.)

0945 - Shoreline Advisory Team evaluates shoreline area.

1015 - Liaison Officer completes HBU and Houston release notifications as well as claim information.

1600 - Follow-up reports are put together.

Day 3

0730 - OSRO tailgate safety meeting conducted. 0800 - Clean-up activities continued to be monitored.

0830 - Planning meeting in progress (salvageable oil, temporary storage, short term and long term goals, cost, etc.).

0900 - Operation meeting in progress (update, progress, recovery rate, etc.).

0945 - Shoreline Advisory Team evaluates shoreline area.

Day 4

0800 - Evaluation Team of Kinder Morgan and Agencies deemed clean-up completed.

1100 - Environmental Department begins disposal options investigations.

1600 - All reports required are completed to the extent practical.

Estimated spill volume(App. F, Sec. 1.5.2.1.1(1) , to 40 CFR 112): 167,142 barrels

Material discharged(App. F, Sec. 1.5.2.1.1(6) , to 40 CFR 112) - Group 1 Oil): Gasoline

B.2 DISCHARGE SCENARIOS (Cont'd)

EPA Worst Case Discharge = 167,142 Bbls (EPA) (Cont'd)

Proximity to Downgradient wells and/or drinking water intakes(App. F, Sec. 1.5.2.1.1(2), to 40 CFR 112)**:**

No downgradient wells and/or drinking water intakes were identified on the Houston Ship Channel (source: Texas Oil Spill Planning and Response Atlas).

Proximity to Downgradient waterways(Direction of spill pathway (App. F, Sec. 1.5.2.1.1(10), to 40 CFR 112):

The site drainage is towards the Houston Ship Channel, which flows into Galveston Bay.

Proximity to fish and wildlife and sensitive environments (App. F, Sec. 1.5.2.1.1(3) to 40 CFR 112):

The spill likely will reach the Ship Channel and impact fish and wildlife and sensitive environments.

Severe rain events associated with flooding would increase the chances of an oil spill leaving the property(Likelihood discharge will travel offsite - App. F, Sec. 1.5.2.1.1(4) to 40 CFR 112). The bad weather would hinder the response time of the response contractor. Other probable causes but not limited to are fires that can be caused by downed power lines. In event of such a tank failure, the product may escape the earthen containment and travel to the Houston Ship Channel. The probability of a chain reaction (App. F, Sec. 1.5.2.1.1(9) to 40 CFR 112) would be the collapse of the tank and the partial breach of the containment berm. The priority during larger spills is to contain the spill and prevent it from reaching the waterway. Contracted OSROs will be activated to respond. The booming will be done (See App. A) to minimize the flow of the product and impact to ecological sensitive areas. Due to the fact the product is gasoline, there should not be the need for remediation equipment; however, if required, it will be available from the OSRO during the cleanup operations (App. F, Sec. 1.5.2.1.1(8), to 40 CFR 112).

Response Requirement

The Facility shall identify sufficient response resources, by contract or other approved means, to respond to a Worst Case Discharge to the maximum extent practicable. The response resources shall, as appropriate, include:

- Oil recovery devices with an effective daily recovery capacity equal to the lesser of the WCD Response Planning Volume Calculation or the response caps. If the daily recovery rate exceeds the applicable contracting caps, then the Facility must identify additional resources equal to twice the cap or the amount necessary to reach the calculated planning volume.

B.2 DISCHARGE SCENARIOS (Cont'd)

EPA Worst Case Discharge = 167,142 Bbls (EPA) (Cont'd)

Response Requirement (Cont'd)

- Temporary storage capacity equal to twice the daily recovery capacity.
- At least 20% of the on-water response equipment should be capable of operating in water of 6 feet or less depth.
- Containment boom for oil collection and containment (see requirements of small discharge scenario above) for protection of areas of environmental sensitivity or economic importance.
- Identify resources capable of responding to a shoreline clean-up operation involving the calculated volume of oil and emulsified oil that might impact the affected shoreline.
- The above Response Planning Volume requirements, including response times, are based on Attachment E-1 of Appendix E to 40 CFR Part 112.

Notes

- Equipment and personnel resources are detailed in Section 4.4, Figure 3.1 – 3.4, and Fig 5.5.
- Telephone notification and contact references are provided in Section 3.

Spill response personnel, including Facility members, are continually trained to respond to worst case discharges through regularly scheduled PREP exercises (i.e. TTX, QI notification, equipment deployment), discharge prevention/safety meetings, ICP (i.e. FRP) reviews, and/or HAZWOPER training. A minimum of one tabletop exercise (TTX) in a triennial cycle will involve a Worst Case Discharge scenario.

B.2 DISCHARGE SCENARIOS (Cont'd)

PHMSA Worst Case Discharge = 15,941 Bbls

A worst case discharge for the Kinder Morgan Galena Park Terminal Response Zone is considered to be discharge that does not exceed 15,941 barrels.

Pipeline Worst Case Discharge = 15,941 Bbls

Description

The worst case discharge in the Kinder Morgan Galena Park Terminal Response Zone is expected to occur from the 20" KMET 3100 or KMET 3400 (2,112 feet).

Volume

Worst Case Discharge = (Rate of Flow x Maximum Time to Detect the Spill and Shut Down the Pipeline)+ Drainage Volume

Given:

Rate of flow = 15,000 bbls per hour

Maximum Discovery Time = 1.00 hr

Maximum shut down time = 0.008 hr

Drainage volume = 821 bbls

Pipeline Worst Case Discharge = (15,000 bbl/hr] x [1.00 hr + 0.008 hr] + [821 bbl] = 15,941bbls

The WCD is 15,941 bbls.

B.2 DISCHARGE SCENARIOS (Cont'd)

USCG - Worst Case Discharge = 5,351 Bbls

The worst-case discharge was calculated using the total volume of all associated dock lines for each oil group, i.e. Groups I and II.

The following planning assumptions are made in regards to time for discovery and shutdown:
- Discovery Time: 15 minutes (.25 hours)
- Shutdown Time: 1 minutes (.016 hours)

Volumes for all associated dock lines were calculated using the following formula:

V = A x L x F
Where: V = Volume (gals)
A = area (sq. ft.)
L = length (ft.)
F = conversion from feet to gallons = 7.48 gal/cu. ft.

Worst Case Discharge (WCD) = [(maximum time to discover + maximum time to shutdown flow) x maximum flow rate] + piping capacity
[(.25 hrs. + .016 hrs.) x 10,000 bbl./hr.] + Piping Capacity (see table below)

USCG WCD by Group of Oil

Oil Group	Max. Flow (bbl./hr.)	Pipe Length (Feet)	Pipe Diameter (Inches)	Piping Capacity (bbl.)	WCD (bbl.)
I	10,000	1. 260 from tank to 3300 pit	1. 24	1. 145	5,351
		2. 100 from 3300 pit to pump	2. 18	2. 31	
		3. 130 from pump to 3400 MFD	3. 16	3. 32	
		4. 2700 from 3400 MFD to Ship Dock #4	4. 20	4. 1043	
II	10,000	1. 530 from tank to branch to 7100 MFD	1. 16	1. 132	4,470
		2. 1700 from branch to Ship Dock #2	2. 12	2. 238	
III	10,000	900	8	462	4,562

B.3 RESPONSE REQUIREMENTS

The Facility has planned for, and is prepared to respond to spills of any size. In accordance with the regulations, resource requirements have been calculated (Figure B.1) to ensure that the Facility has access to, either by owning equipment or through contracted resources, an appropriate amount of response equipment to respond to spills of all sizes.

C.1 HAZARD IDENTIFICATION

Hazard Identification Tank Tables (App. F, Sec. 1.4.1(3)(a)-(e) and 1.4.1(5)(c), to 40 CFR 112) (Cont'd)

POTENTIAL SPILL SOURCES AND CONTAINER IDENTIFICATION (Any container that stores oil)						
Container I.D.	**Substance Stored** *(Oil & Haz. Substance)*	**Average Quantity Stored** *(Gallons)*	**Maximum Capacity** *(Gallons)*	**Container Type** *(i.e. floating roof, fixed roof, etc.)*	**Year Built**	**Secondary Containment Capacity** *(Volume - Gallons)*
MOBILE/PORTABLE STORAGE AREAS						
CONST. OIL # 9 DRUMS	MOTOR OIL	55	55	Drum	Unk	6,732
MOBILE/PORTABLE STORAGE AREAS – WEST CHEMICAL PLANT						
DRUM STORAGE WAREHOUSE	VARIOUS	55	>55	Drum	Unk	68,000
55-gal Drums (10)	Various	55	55	Sloped Berm	Unk	5,090,400

Notes:
1) Route of Drainage is towards Houston Ship Channel.
2) The bulk storage containment areas are earthen containment.
3) There are no weirs or booms pre-deployed.
4) See Figure4.2 and 5.5 for clean up materials.

C.1 HAZARD IDENTIFICATION (Cont'd)

Loading and Unloading of Transportation Vehicles

The loading and unloading of transportation vehicles at the Facility that may present a risk of discharging oil or releasing a hazardous substance are:

- Truck Transfers – Approx. 214.3 bbl (9,000 gal).
- Rail Transfers – Approx. 761.9 bbl (32,000 gal).
- Vessels – Ship 497,000 bbl.

Day-to-Day Operations

Day-to-day operations that may present a risk of discharging oil or releasing a hazardous substance include:

- Pipeline Maintenance – 200 bbl
- Pipeline Transfers to Tank – Approx. 70,000 – 168,000 bbl.
- Tank-to-Tank Transfers – 80,000 bbl

Secondary Containment Volume

The secondary containment volume associated with each tank or containment area is located in the Hazard Identification Tank tables (see C.1 Hazard Identification).

Normal Daily Throughput

The normal daily throughput for the Facility is 203,499 bbl/day.

Security

The Facility is fenced and manned 24 hours per day, seven days per week. See SPCC Plan maintained separately, for more details.

C.2 DISCHARGE DETECTION

The Facility has a discharge detection program which is intended to limit the effects of a hazardous material release.

Detection by Personnel

Facility personnel make daily visual inspections (including tanks, loading areas, secondary containment, aboveground piping, etc.) during operating rounds and are trained to detect discharges and respond. See SPCC Section 5.2, Inspections and Record Keeping for details of visual inspections and Appendix H, Monthly Tank Inspection Checklist, for written documentation. Initial response actions include stopping product flow, eliminating ignition sources, initiating containment, and notifications. See ICP Sec. 4.2, Initial Specific Response Actions, for more details. External notifications are identified in ICP Sec. 3, Figure 3.5.

C.2 DISCHARGE DETECTION (Cont'd)

Automated Detection Systems

- The large bulk storage tanks have high and/or high-high level alarms to prevent overfills. The smaller tanks do not have automated detection systems. Notifications/alarms will be both visual and auditory for high and high-high levels, but they will be received at the control room where controllers can either take immediate action or notify the field controller to take appropriate action.

C.3 FACILITY SELF-INSPECTIONS

Written procedures for and record of the Facility inspections of tanks and secondary containment are documented in this section. The Facility self-inspection requires two steps: 1) a checklist of items to inspect, and 2) a method of recording the actual inspection findings. All inspection records are maintained per agency/company requirement or industry standard, whichever is more stringent.

Tanks Inspections

Visual inspections of all tanks are by qualified personnel as defined by API 653. Personnel performing this inspection should be knowledgeable of the storage facility operations, the tank, and the characteristics of the product stored.

Containment Area Inspection

All containment areas are inspected during normal operating rounds. All containment areas are constructed of earthen material or concrete.

Inspection Reports

Inspection records are maintained as described in the SPCC Plan.

FIGURE C.1

TANK INSPECTION CHECKLIST

Facility Tanks are visually inspected against the following checklist at a minimum:

- Check tanks for leaks, specifically looking for:
  - Drip marks
  - Discoloration of tanks
  - Puddles containing spilled or leaked material
  - Corrosion
  - Cracks
  - Localized dead vegetation
- Check foundation for:
  - Cracks
  - Discoloration
  - Puddles containing spilled or leaked material
  - Settling
  - Gaps between tank and foundations
  - Damage caused by vegetation roots
- Check piping for:
  - Droplets of stored material
  - Discoloration
  - Corrosion
  - Bowing of pipe between supports
  - Evidence of stored material seepage from valves or seals
  - Localized dead vegetation

Records of the inspections are maintained at the Facility. These records are maintained for a period of five (5) years and are available for review at any time at the Facility Office.

FIGURE C.2

SECONDARY CONTAINMENT INSPECTION CHECKLIST

Facility Secondary Containment systems are visually inspected each time an employee is in the area and once each shift. The Secondary Containment systems are inspected against the following checklist:

- Dike or berm system
    - Level of precipitation in dike/available capacity
    - Operational status of drainage valves
    - Dike or berm permeability
    - Debris
    - Erosion
    - Permeability of the earthen floor of diked area
    - Location/status of pipes, inlets, drainage beneath tanks, etc.
- Secondary containment
    - Cracks
    - Discoloration
    - Presence of spilled or leaked material (standing liquid)
    - Corrosion
    - Valve conditions
- Retention and drainage ponds (as applicable)
    - Erosion
    - Available capacity
    - Presence of spilled or leaked material
    - Debris
    - Stressed vegetation

Records of the inspections are maintained at the Facility. These records are maintained for a period of five (5) years and are available for review at any time at the Administration Building.

C.4 ANALYSIS OF THE POTENTIAL FOR A SPILL

The potential for a spill has been analyzed and deemed to be present, but unlikely. The probability of tank failure for single-wall storage tanks is 1.0 x 10-4 spill/tank-year (U.S. DOT, FEMA, and U.S. EPA Handbook of Chemical Hazard Analysis Procedures). The facility has 267 single-wall tanks which gives a spill frequency of 0.0267 spills/year.

Oil Spill History

Refer to the Reportable Oil Spill History portion of this Appendix (see C.5) for details concerning spill history.

Horizontal Range of a Spill

The maximum horizontal overland spill range is approximately 0.5 mile from the Houston Ship Channel. Secondary containment dikes around the storage tanks will help retard the surface flow to the Ship Channel.

Vulnerability to a Natural Disaster

The area is prone to tropical storms and hurricanes. All storage tanks and ancillary piping are fabricated in compliance with nationally recognized design specifications.

Other Factors

Other factors such as unstable soils, earthquake zones, Karst topography, etc. are not of concern to this Facility.

C.5 REPORTABLE OIL SPILL HISTORY

Discharges subject to OPA 90 regulations as of the publication date of this Plan are summarized in the following table. Details obtained from Incident Reports are maintained on-site.

The reports contain the below listed information to the extent that such information is reasonably identifiable.

- Date of discharge.
- Location of discharge.
- Discharge cause(s)
- Material(s) discharged.
- Amount discharged.
- Amount of discharge that reached navigable waters.
- Amount recovered.
- Effectiveness and capacity of secondary containment.
- Clean-up actions taken.
- Steps taken to reduce possibility of recurrence.
- Total storage capacity of the tank(s) or impoundment(s) from which the material discharged.
- Enforcement actions.
- Effectiveness of monitoring equipment.
- Description of how spill was detected.

Note: No reportable spills as of the date of publication.

TABLE C-1

REPORTABLE OIL SPILL HISTORY

Date	Cause	Media	Product/ Material	Amount Gal.	Amt. (Gal.) In Navigable Water	Effectiveness & Capacity Of Secondary Containment	Clean-Up Actions	Corrective Actions	Capacity of Source	Enforcement Actions	Spill Detected

TABLE C-1

REPORTABLE OIL SPILL HISTORY (Cont'd)

Date	Cause	Media	Product/ Material	Amount Gal.	Amt. (Gal.) In Navigable Water	Effectiveness & Capacity Of Secondary Containment	Clean-Up Actions	Corrective Actions	Capacity of Source	Enforcement Actions	Spill Detected
5/23/2016			oil-containing product	84 gal		Land, Tank 25-2	Spill cleaned with vac trucks	Repairs, Training			
9/5/2016			oil-containing product	693gal		Land, Tank BO-11	Spill cleaned with vac trucks	Repairs			
9/8/2016			oil-containing product	0.015 gal		Ship Dock #1	Spill absorbed with spill pads	Retrain			
9/25/2016			oil-containing product	2 gal		Ship Dock #3	Spill contained with boom and absorbed with spill pads	Retrain			
9/27/2016			oil-containing product	0,008 gal		Product hose at 1 S/D developed pin hole leak that dripped Into the Ship Channel.	Spill contained with boom and absorbed with spill pads				
10/20/2016			oil-containing product	22 gal		Puddles of product found on floating roof of tank	Product cleaned off of roof.				
10/25/2016			oil-containing product	0.5 gal		Mystery sheen reported at docks In Galena Park	Spill contained with boom and absorbed with spill pads				
11/11/2016			oil-containing product	2 gal		Product release from stripping pumps and 3900 manifold	Spill contained with absorbent pads.				
11/21/2016			oil· containing product	1243.62 gal		Flange leak on pipeline from tank 25-29 to Shell	OSRO notified and clean spill				
12/4/2016			oil-containing product	42 gal		KM Event on 12-4-16 at 0900. Recent heavy rains caused one barrel of Shell's Star 4 product to leach out of the ground from the previous incident that occurred on 11-21-16 with tank 25-29's Shell line. Of the one barrel, one gallon drained to the Ship Channel and was contained with spill boom	Spill contained with spill boom				
1/27/2017			oil-containing product	0.5 gal		Third party spill of hydraulic fluid	Notification made, KM and BOMAC Boomed area				
3/23/2017			oil-containing product	0.01 gal		Mystery sheen found at #1 S/D	Notification only, non-KM				
5/8/2017			oil-containing product	196.95 gal		KM Event on 5-8-17, Liquid was Identified on top of the carbon steel pontoon Internal floating roof on tank 12-30 (Transmlx).	Repaired tank				
5/30/2017			oil-containing product	42 gal		Contractor AEG-While pigging an abandoned line (25-4) for demo, approximately 1 bbl of Aromatic Concentrate was released from the flange to the ground,	Used vacuum truck for liquids and flushed, Soils were excavated.				
1/18/2018			oil-containing product	0.001 gal		At #1 B/D product sprayed from 2" bleeder during pigging of line.	Notification	Operations team was retrained			
2/1/2018			oil containing product	8 gal		The vessel Marlin Adventurine released product thru vessel pressure relief valve	Notifications, vessel equipment failure				

TABLE C-1

REPORTABLE OIL SPILL HISTORY (Cont'd)

Date	Cause	Media	Product/ Material	Amount Gal.	Amt. (Gal.) In Navigable Water	Effectiveness & Capacity Of Secondary Containment	Clean-Up Actions	Corrective Actions	Capacity of Source	Enforcement Actions	Spill Detected
4/29/2018			oil containing product	420gal		Product spill from 16" WCP dock line	Vacuum truck used for liquids and flushed. Soils were excavated				
5/30/2018			oil containing product	0.13 gal		KM event on 5-30-18, While loading the SS High Valor at 1 Ship Dock the product transfer hose failed causing 1 pint of ULSD to be released Into the Houston Ship Channel.	Replaced hose which caused issue				
5/21/2018			oil containing product	5 gal		Effluent discharged from outfall 002 exceeded permit limits for ammonia nitrogen on 05/21/2018 discharge	Made required notification				
5/22/2018			oil-containing product	231 gal		Effluent discharged from outfall 001 exceeded permit limits for oil and grease on 05/22/2018.	Made required notification				
7/4/2018			oil-containing product	8 gal		Ship dock 4 sump pump over filled causing 1 cup of waste water to enter ship channel	Notifications made, absorbent pads and boom used to clean spill.				
7/19/2018			oil-containing product	0.0004 gal		KM Event on 7-19-18, While discharging the SS Sea Treasure approximately 20 drops of gasoline blendstock leaked from the transfer hose at 1s/d and contacted the ship channel.	Notifications made hose Issue determined as root cause and was repaired				
9/24/2018			oil-containing product	2184 gal		KM Event-Spill of 52 bbls. of Star-6 lube oil from tank 40-1	Notifications made vacuum truck used to clean liquid and flushed. Soil excavated				
10/17/2018			oil-containing product	0.001 gal		(3rd Party Event) Subcontractor (divers) using pneumatic Impact guns under water, when too much	Notifications made contractors notified to use hand wrenches				
12/8/2018			oil-containing product	1 gal		At 2100 hrs. on 12/8/18 a product spill of AGO at #1 ship dock occurred during the pressure testing of the dock hoses	Notifications made, OSRO was hired to conduct cleanup.				
2/9/2019			oil-containing product	0,001 gal		Small drip developed on load arm	Released to containment				
5/12/2019			oil-containing product	2 gal,		During Heavy Rain event containment overfilled	Notified OSRO to conduct cleanup				
8/20/2019			oil-containing product	1 gal		Product released through crack in secondary containment	Sealant used to repair crack, spill pads and boom deployed.				

TABLE C-1

REPORTABLE OIL SPILL HISTORY (Cont'd)

Date	Cause	Media	Product/ Material	Amount Gal.	Amt. (Gal.) In Navigable Water	Effectiveness & Capacity Of Secondary Containment	Clean-Up Actions	Corrective Actions	Capacity of Source	Enforcement Actions	Spill Detected
2/13/2020			oily residual	< 1 oz		During the rehabilitation of 1 ship dock3rd party contractor disturbs shoreline pile driving. Releasing less than one ounce of oily residual from behind old wooden bulkhead.	Work was halted agency notifications made. Absorbents pads and boom utilized for cleanup				
2/17/2020			petroleum product	22.4 gal		Maintenance performing work task around tank 80-12 discover leak from tank mixer	Notifications made (DOT) absorbent pads and boom utilized for cleanup				
5/5/2020			petroleum containing product	1 gal		During heavy rain event# 4 ship dock lost power allowing secondary containment to overfilled causing a sheen in the channel	Agency notifications made, due to wind and wave actions sheen quickly dispersed				
7/29/2020			oil containing product	< 1 bbl		Due to faulty equipment lift station #4 overfilled releasing oily water into ship channel	Agency notifications made ERT deployed use spill boat and hard boom to capture and contain released material. OSRO called for cleanup on water				
2/17/2021			contact water	< 1 gal		Due to freezing weather conditions and power outage safety shower water line ruptured filling secondary containment	Agency notifications made				
WEST CHEMICAL PLANT											
8/11/2016			Biodiesel	270 gal		HE, Land, Biodiesel		Training Review			
8/17/2016			Biodiesel	840 gal		H**E**, Land, Biodiesel		Training Review			
6/29/2020			oil containing product	< 1 gal		Fuel filter to #5 ship dock discovered leaking	Agency notifications made absorbent pads and boom used for cleanup

APPENDIX D

ICS ROLES AND RESPONSIBILITIES

ICS ROLES AND RESPONSIBILITIES

COMMON RESPONSIBILITIES

The following is a checklist applicable to all personnel in an ICS organization:

- Receive assignment, including:
  - Job assignment
  - Resource order number and request number
  - Reporting location
  - Reporting time
  - Travel instructions
  - Special communications instructions
- Upon arrival, check-in at designated check-in location.
- Receive briefing from immediate supervisor.
- Acquire work materials.
- Supervisors maintain accountability for assigned personnel.
- Organize and brief subordinates.
- Know your assigned radio frequency(s) and ensure communications equipment is operating properly.
- Use clear text and ICS terminology (no codes) in all communications.
- Complete forms and reports required of the assigned position and send to Documentation Unit.
- Maintain unit records, including Unit/Activity Log (ICS Form 214).
- Response to demobilization orders and brief subordinates regarding demobilization.

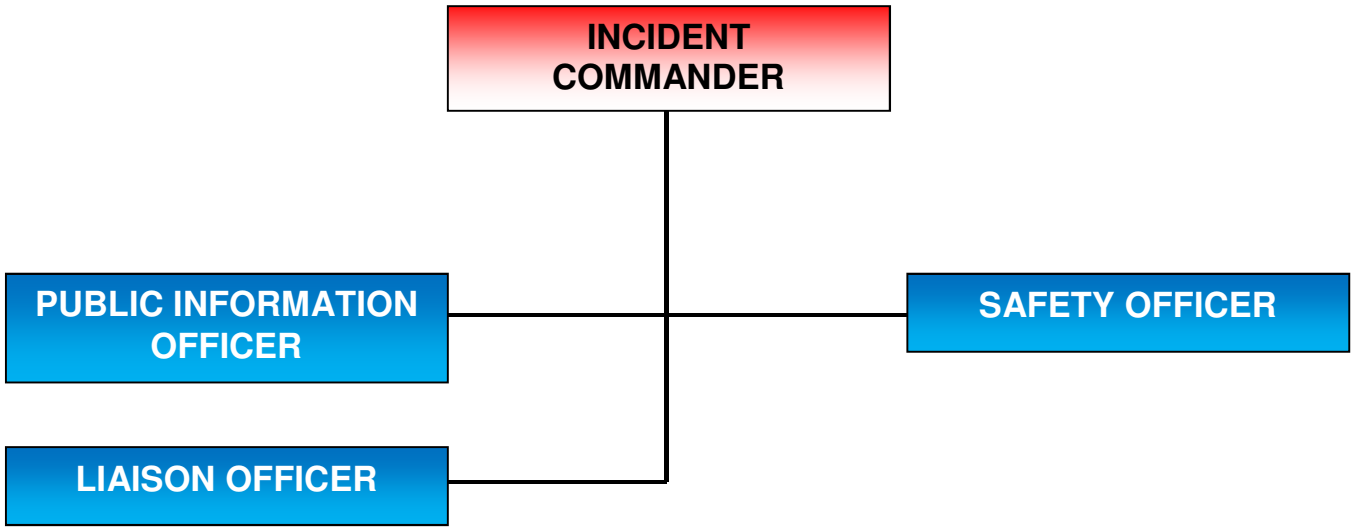
COMMAND STAFF

Incident Commander D-4

Public Information Officer D-4

Liaison Officer D-5

Safety Officer D-5



INCIDENT COMMANDER

- Assess the situation and/or obtain a briefing from the prior IC.
- Determine Incident Objectives and strategy.
- Establish the immediate priorities.
- Establish an ICP.
- Brief Command Staff and Section Chiefs.
- Review meetings and briefings.
- Establish an appropriate organization.
- Ensure planning meetings are scheduled as required.
- Approve and authorize the implementation of an IAP.
- Ensure that adequate safety measures are in place.
- Coordinate activity for all Command and General Staff.
- Coordinate with key people and officials.
- Approve requests for additional resources or for the release of resources.
- Keep agency administrator informed of incident status.
- Approve the use of trainees, volunteers, and auxiliary personnel.
- Authorize release of information to the news media.
- Ensure incident Status Summary (ICS Form 209) is completed and forwarded to appropriate higher authority.
- Order the demobilization of the incident when appropriate.

PUBLIC INFORMATION OFFICER

- Determine from the IC if there are any limits on information release.
- Develop material for use in media briefings.
- Obtain IC approval of media releases.
- Inform media and conduct media briefings.
- Arrange for tours and other interviews or briefings that may be required.
- Obtain media information that may be useful to incident planning.
- Maintain current information summaries and/or displays on the incident and provide information on the status of the incident to assigned personnel.

LIAISON OFFICER

- Be a contact point for Agency Representatives.
- Maintain a list of assisting and cooperating agencies and Agency Representatives. Monitor check-in sheets daily to ensure that all Agency Representatives are identified.
- Assist in establishing and coordinating interagency contacts.
- Keep agencies aware of incident status.
- Monitor incident operations to identify current or potential inter-organizational problems.
- Participate in planning meetings, providing current resource status, including limitations and capability of assisting agency resources.
- Coordinate response resource needs for Natural Resource Damage Assessment and Restoration (NRDAR) activities with the Operations Section (OPS) during oil and HAZMAT responses.
- Coordinate response resource needs for incident investigation activities with the OPS.
- Ensure that all required agency forms, reports, and documents are completed prior to demobilization.
- Coordinate activities of visiting dignitaries.

SAFETY OFFICER

- Participate in planning meetings.
- Identify hazardous situations associated with the incident.
- Review the IAP for safety implications.
- Exercise emergency authority to stop and prevent unsafe acts.
- Investigate accidents that have occurred within the incident area.
- Review and approve the Medical Plan.
- Develop the Site Safety Plan and publish Site Safety Plan summary (ICS Form 208) as required.

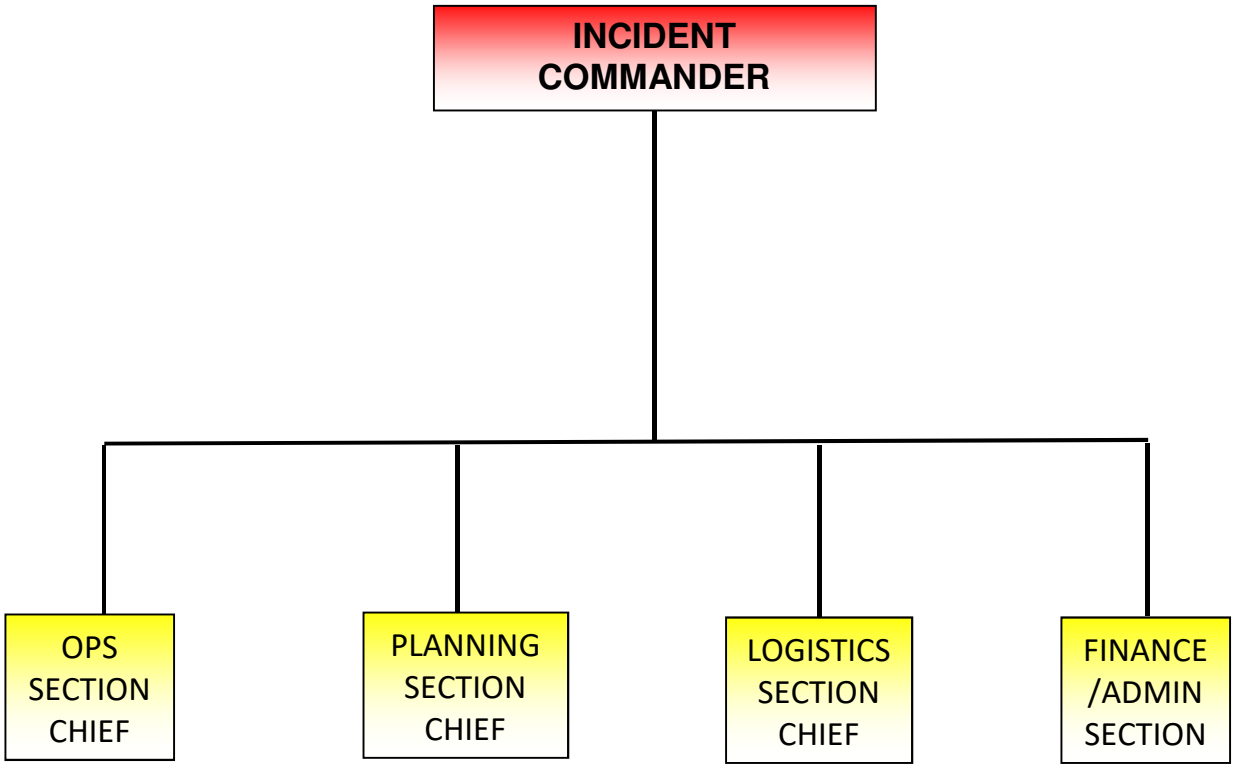
GENERAL STAFF

Operations Section Chief..... D-7

Planning Section Chief..... D-10

Logistics Section Chief..... D-14

Finance/Admin Section Chief..... D-19



OPERATIONS

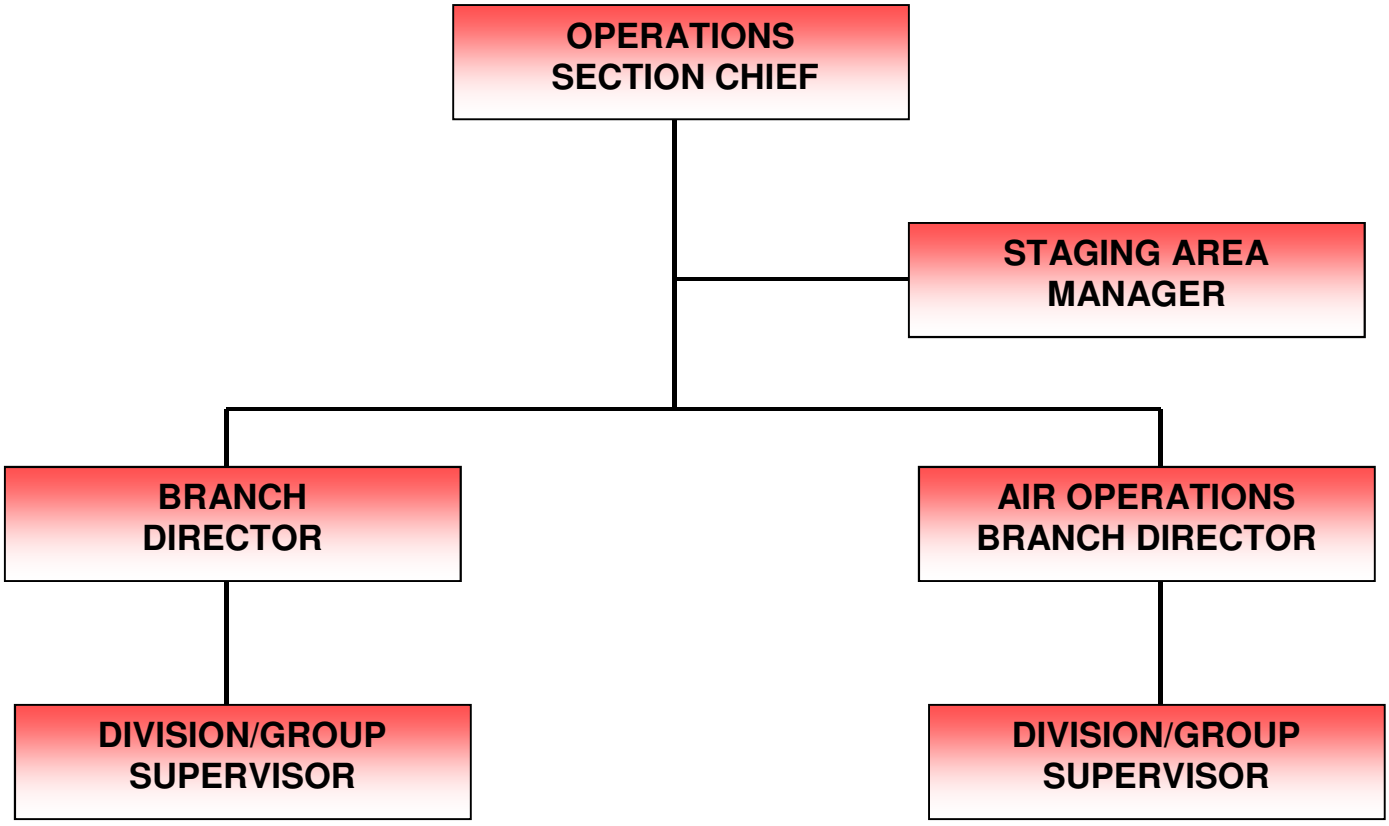
Operations Section Chief D-8

Branch Director D-8

Division/Group Supervisor D-8

Staging Area Manager D-9

Air Operations Branch Director D-9



OPERATIONS SECTION CHIEF

- Develop operations portion of IAP.
- Brief and assign Operations Section personnel in accordance with the IAP.
- Supervise Operations Section.
- Determine need and request additional resources.
- Review suggested list of resources to be released and initiate recommendation for release of resources.
- Assemble and disassemble strike teams assigned to the Operations Section.
- Report information about special activities, events, and occurrences to the IC.
- Respond to resource requests in support of NRDAR activities.

BRANCH DIRECTOR

- Develop with subordinates alternatives for Branch control operations.
- Attend planning meetings at the request of the OPS.
- Review Division/Group Assignment Lists (ICS Form 204) for Divisions/Groups within the Branch. Modify lists based on effectiveness of current operations.
- Assign specific work tasks to Division/Group Supervisors.
- Supervise Branch operations.
- Resolve logistic problems reported by subordinates.
- Report to OPS when: the IAP is to be modified; additional resources are needed; surplus resources are available; or hazardous situations or significant events occur.
- Approve accident and medical reports originating within the Branch.

DIVISION/GROUP SUPERVISOR

- Implement IAP for Division/Group.
- Provide the IAP to Strike Team Leaders, when available.
- Identify increments assigned to the Division/Group.
- Review Division/Group assignments and incident activities with subordinates and assign tasks.
- Ensure that the IC and/or Resources Unit are advised of all changes in the status of resources assigned to the Division/Group.
- Coordinate activities with adjacent Division/Group.
- Determine need for assistance on assigned tasks.
- Submit situation and resources status information to the Branch Director or the OPS.
- Report hazardous situations, special occurrences, or significant events (e.g., accidents, sickness, discovery of unanticipated sensitive resources) to the immediate supervisor.
- Ensure that assigned personnel and equipment get to and from assignments in a timely and orderly manner.
- Resolve logistics problems within the Division/Group.
- Participate in the development of Branch plans for the next operational period.

STAGING AREA MANAGER

- Establish Staging Area layout.
- Determine any support needs for equipment, feeding, sanitation and security.
- Establish check-in function as appropriate.
- Post areas for identification and traffic control.
- Request maintenance service for equipment at Staging Area as appropriate.
- Respond to request for resource assignments
- Obtain and issue receipts for radio equipment and other supplies distributed and received at Staging Area.
- Determine required resource levels from the OPS.
- Advise the OPS when reserve levels reach minimums.
- Maintain and provide status to Resource Unit of all resources in Staging Area.
- Demobilize Staging Area in accordance with the Incident Demobilization Plan.

AIR OPERATIONS BRANCH DIRECTOR

- Organize preliminary air operations.
- Request declaration {or cancellation) of restricted air space.
- Participate in preparation of the IAP through the OPS. Insure that the air operations portion of the IAP takes into consideration the Air Traffic Control requirements of assigned aircraft.
- Perform operational planning for air operations.
- Prepare and provide Air Operations Summary Worksheet (ICS Form 220) to the Air Support Group and Fixed-Wing Bases.
- Determine coordination procedures for use by air organization with ground Branches, Divisions, or Groups.
- Coordinate with appropriate Operations Section personnel.
- Supervise all air operations activities associated with the incident.
- Evaluate helibase locations.
- Establish procedures for emergency reassignment of aircraft.
- Schedule approved flights of non-incident aircraft in the restricted air space area.
- Coordinate with the Operations Coordination Center {OCC) through normal channels on incident air operations activities.
- Inform the Air Tactical Group Supervisor of the air traffic situation external to the incident.
- Consider requests for non-tactical use of incident aircraft.
- Resolve conflicts concerning non-incident aircraft.
- Coordinate with FAA.
- Update air operations plans.
- Report to the OPS on air operations activities.
- Report special incidents/accidents.
- Arrange for an accident investigation team when warranted.

PLANNING

Planning Section Chief D-11

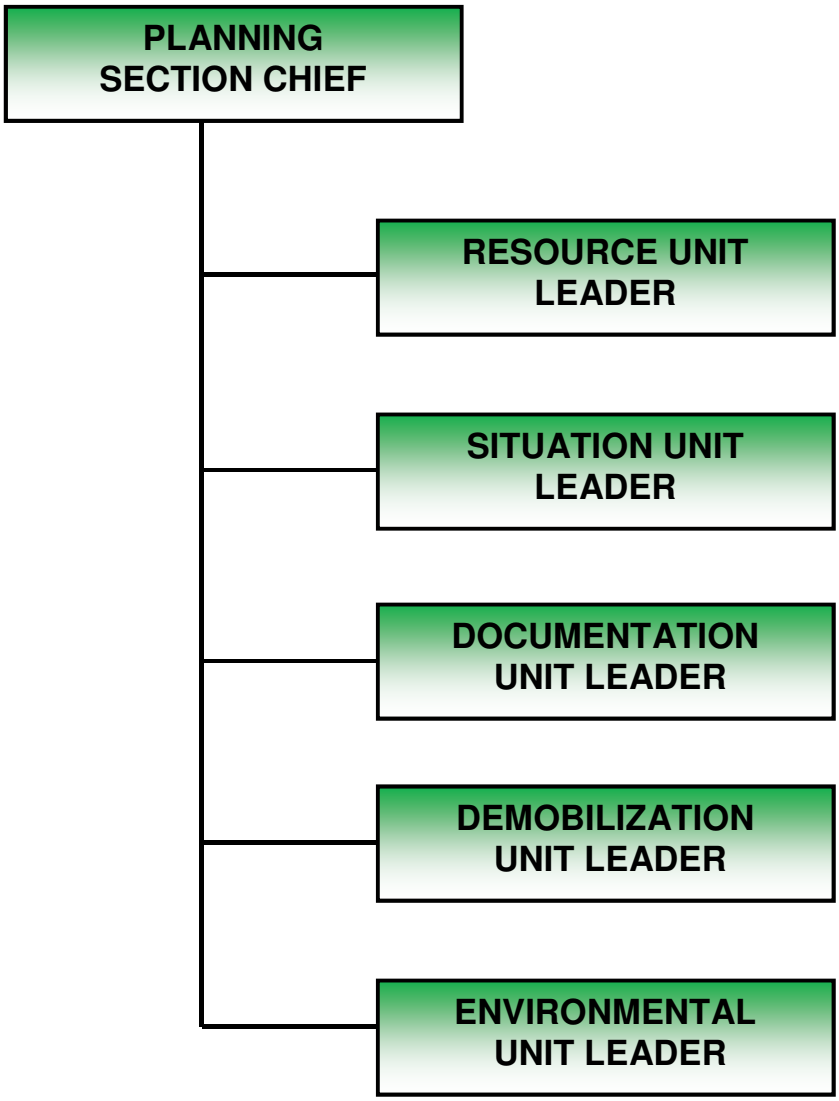
Resources Unit Leader D-11

Situation Unit Leader D-11

Documentation Unit Leader D-12

Demobilization Unit Leader D-12

Environmental Unit Leader D-13



PLANNING SECTION CHIEF

- Collect and process situation information about the incident.
- Supervise preparation of the IAP.
- Provide input to the IC and the OPS in preparing the IAP.
- Chair planning meetings and participate in other meetings as required.
- Reassign out-of-service personnel already on-site to ICS organizational positions as appropriate.
- Establish information requirements and reporting schedules for Planning Section Units (e.g., Resources, Situation Units).
- Determine the need for any specialized resources in support of the incident.
- If requested, assemble and disassemble Strike Teams and Task Forces not assigned to Operations.
- Establish special information collection activities as necessary (e.g., weather, environmental, toxics, etc.).
- Assemble information on alternative strategies.
- Provide periodic predictions on incident potential.
- Report any significant changes in incident status.
- Compile and display incident status information.
- Oversee preparation and implementation of the Incident Demobilization Plan.
- Incorporate plans (e.g., Traffic, Medical, Communications, Site Safety) into the IAP.

RESOURCES UNIT LEADER

- Establish the check-in function at incident locations.
- Prepare Organization Assignment List (ICS Form 203) and Organization Chart (ICS Form 207).
- Prepare appropriate parts of Division Assignment Lists (ICS Form 204).
- Prepare and maintain the ICP display (to include organization chart and resource allocation and deployment).
- Maintain and post the current status and location of all resources.
- Maintain master roster of all resources checked in at the incident.

SITUATION UNIT LEADER

- Begin collection and analysis of incident data as soon as possible.
- Prepare, post, or disseminate resource and situation status information as required, including special requests.
- Prepare periodic predictions or as requested by the PSC.
- Prepare the Incident Status Summary Form (ICS Form 209).
- Provide photographic services and maps if required.

DOCUMENTATION UNIT LEADER

- Set up work area; begin organization of incident files.
- Establish duplication service; respond to requests.
- File all official forms and reports.
- Review records for accuracy and completeness; inform appropriate units of errors or omissions.
- Provide incident documentation as requested.
- Store files for post-incident use.

DEMOBILIZATION UNIT LEADER

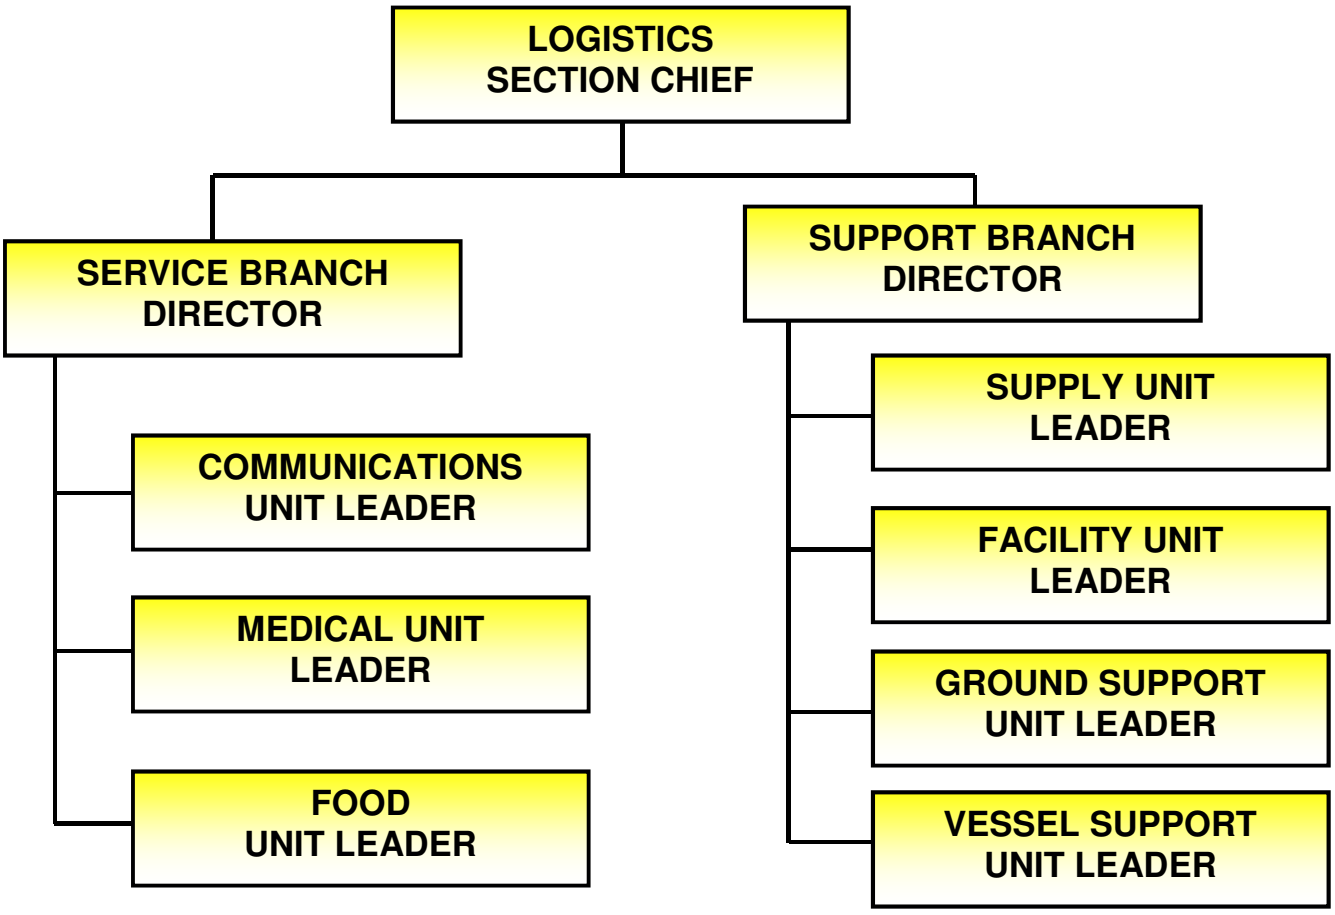
- Participate in planning meetings as required.
- Review incident resource records to determine the likely size and extent of demobilization effort.
- Based on the above analysis, add additional personnel, workspace, and supplies as needed.
- Coordinate demobilization with Agency Representatives.
- Monitor the on-going Operations Section resource needs.
- Identify surplus resources and probable release time.
- Develop incident check-out function for all units.
- Evaluate logistics and transportation capabilities to support demobilization.
- Establish communications with off-incident facilities, as necessary.
- Develop an Incident Demobilization Plan detailing specific responsibilities and release priorities and procedures.
- Prepare appropriate directories (e.g., maps, instructions, etc.) for inclusion in the Demobilization Plan.
- Distribute Demobilization Plan (on and offsite).
- Provide status reports to appropriate requestors.
- Ensure that all Sections/Units understand their specific demobilization responsibilities.
- Supervise execution of the Incident Demobilization Plan.
- Brief the PSC on demobilization progress.

ENVIRONMENTAL UNIT LEADER

- Participate in Planning Section meetings.
- Identify sensitive areas and recommend response priorities.
- Following consultation with natural resource trustees, provide input on wildlife protection strategies (e.g., pre-emptive capture, hazing, and/or capture and treatment).
- Determine the extent, fate, and effects of contamination.
- Acquire, distribute, and provide analysis of weather forecasts.
- Monitor the environmental consequences of cleanup actions.
- Develop shoreline cleanup and assessment plans. Identify the need for, and prepare any special advisories or orders.
- Identify the need for, and obtain, permits, consultations, and other authorizations including Endangered Species Act (ESA) provisions.
- Following consultation with the FOSC's Historical/Cultural Resources Technical Specialist identify and develop plans for protection of affected historical/cultural resources.
- Evaluate the opportunities to use various response technologies.
- Develop disposal plans.
- Develop a plan for collecting, transporting, and analyzing samples.

LOGISTICS

Logistics Section Chief D-15
Service Branch Director D-15
Communications Unit Leader D-16
Medical Unit Leader D-16
Food Unit Leader D-16
Support Branch Director D-17
Supply Unit Leader D-17
Facility Unit Leader D-17
Ground Support Unit Leader D-18
Vessel Support Unit Leader D-18



LOGISTICS SECTION CHIEF

- Plan the organization of the Logistics Section.
- Assign work locations and preliminary work tasks to Section personnel.
- Notify the Resources Unit of the Logistics Section units activated including names and locations of assigned personnel
- Assemble and brief Branch Directors and Unit Leaders.
- Participate in preparation of the IAP.
- Identify service and support requirements for planned and expected operations.
- Provide input to and review the Communications Plan, Medical Plan, and Traffic Plan.
- Coordinate and process requests for additional resources.
- Review the IAP and estimate Section needs for the next operational period.
- Advise on current service and support capabilities.
- Prepare service and support elements of the IAP.
- Estimate future service and support requirements.
- Receive Incident Demobilization Plan from Planning Section.
- Recommend release of Unit resources in conformity with Incident Demobilization Plan.
- Ensure the general welfare and safety of Logistics Section personnel.

SERVICE BRANCH DIRECTOR

- Determine the level of service required to support operations.
- Confirm dispatch of Branch personnel.
- Participate in planning meetings of Logistics Section personnel.
- Review the IAP.
- Organize and prepare assignments for Service Branch personnel.
- Coordinate activities of Branch Units.
- Inform the LSC of Branch activities.
- Resolve Service Branch problems.

COMMUNICATIONS UNIT LEADER

- Prepare and implement the Incident Radio Communications Plan (ICS Form 205).
- Ensure the Incident Communications Center and the Message Center is established.
- Establish appropriate communications distribution/maintenance locations within the Base/Camp(s).
- Ensure communications systems are installed and tested.
- Ensure an equipment accountability system is established.
- Ensure personal portable radio equipment from cache is distributed per Incident Radio Communications Plan.
- Provide technical information as required on:
  - Adequacy of communications systems currently in operation.
  - Geographic limitation on communications systems.
  - Equipment capabilities/limitations.
  - Amount and types of equipment available.
  - Anticipated problems in the use of communications equipment.
- Supervise Communications Unit activities.
- Maintain records on all communications equipment as appropriate.
- Ensure equipment is tested and repaired.
- Recover equipment from Units being demobilized.

MEDICAL UNIT LEADER

- Participate in Logistics Section/Service Branch planning activities.
- Prepare the Medical Plan (ICS Form 206).
- Prepare procedures for major medical emergency.
- Declare major emergency as appropriate.
- Respond to requests for medical aid, medical transportation, and medical supplies.
- Prepare and submit necessary documentation.

FOOD UNIT LEADER

- Determine food and water requirements.
- Determine the method of feeding to best fit each facility or situation.
- Obtain necessary equipment and supplies and establish cooking facilities.
- Ensure that well-balanced menus are provided.
- Order sufficient food and potable water from the Supply Unit.
- Maintain an inventory of food and water.
- Maintain food service areas, ensuring that all appropriate health and safety measures are being followed.
- Supervise caterers, cooks, and other Food Unit personnel as appropriate.

SUPPORT BRANCH DIRECTOR

- Determine initial support operations in coordination with the LSC and Service Branch Director.
- Prepare initial organization and assignments for support operations.
- Assemble and brief Support Branch personnel.
- Determine if assigned Branch resources are sufficient.
- Maintain surveillance of assigned units work progress and inform the LSC of their activities.
- Resolve problems associated with requests from the Operations Section.

SUPPLY UNIT LEADER

- Participate in Logistics Section/Support Branch planning activities.
- Determine the type and amount of supplies en route.
- Review the IAP for information on operations of the Supply Unit.
- Develop and implement safety and security requirements.
- Order, receive, distribute and store supplies, and equipment.
- Receive and respond to requests for personnel, supplies, and equipment.
- Maintain an inventory of supplies and equipment.
- Service reusable equipment.
- Submit reports to the Support Branch Director.

FACILITY UNIT LEADER

- Review the IAP.
- Participate in Logistics Section/Support Branch planning activities.
- Determine requirements for each facility, including the ICP.
- Prepare layouts of incident facilities.
- Notify Unit Leaders of facility layout.
- Activate incident facilities.
- Provide Base and Camp Managers and personnel to operate facilities.
- Provide sleeping facilities.
- Provide security services.
- Provide facility maintenance services (e.g., sanitation, lighting, cleanup).
- Demobilize Base and Camp facilities.
- Maintain facility records.

GROUND SUPPORT UNIT LEADER

- Participate in Support Branch/Logistics Section planning activities.
- Develop and implement the Traffic Plan.
- Support out-of-service resources.
- Notify the Resources Unit of all status changes on support and transportation vehicles.
- Arrange for and activate fueling, maintenance, and repair of ground resources.
- Maintain Support Vehicle Inventory and transportation vehicles {ICS Form 218).
- Provide transportation services, IAW requests from the LSC or Support Branch Director.
- Collect information on rented equipment.
- Requisition maintenance and repair supplies {e.g., fuel, spare parts, etc.).
- Maintain incident roads.
- Submit reports to Support Branch Director as directed.

VESSEL SUPPORT UNIT LEADER

- Participate in Support Branch/Logistics Section planning activities.
- Coordinate development of the Vessel Routing Plan.
- Coordinate vessel transportation assignments with the Protection and Recovery Branch or other sources of vessel transportation.
- Coordinate water-to-land transportation with the Ground Support Unit, as necessary.
- Maintain a prioritized list of transportation requirements that need to be scheduled with the transportation source.
- Support out-of-service vessel resources, as requested.
- Arrange for fueling, dockage, maintenance, and repair of vessel resources, as requested.
- Maintain inventory of support and transportation vessels.

FINANCE/ADMINISTRATION

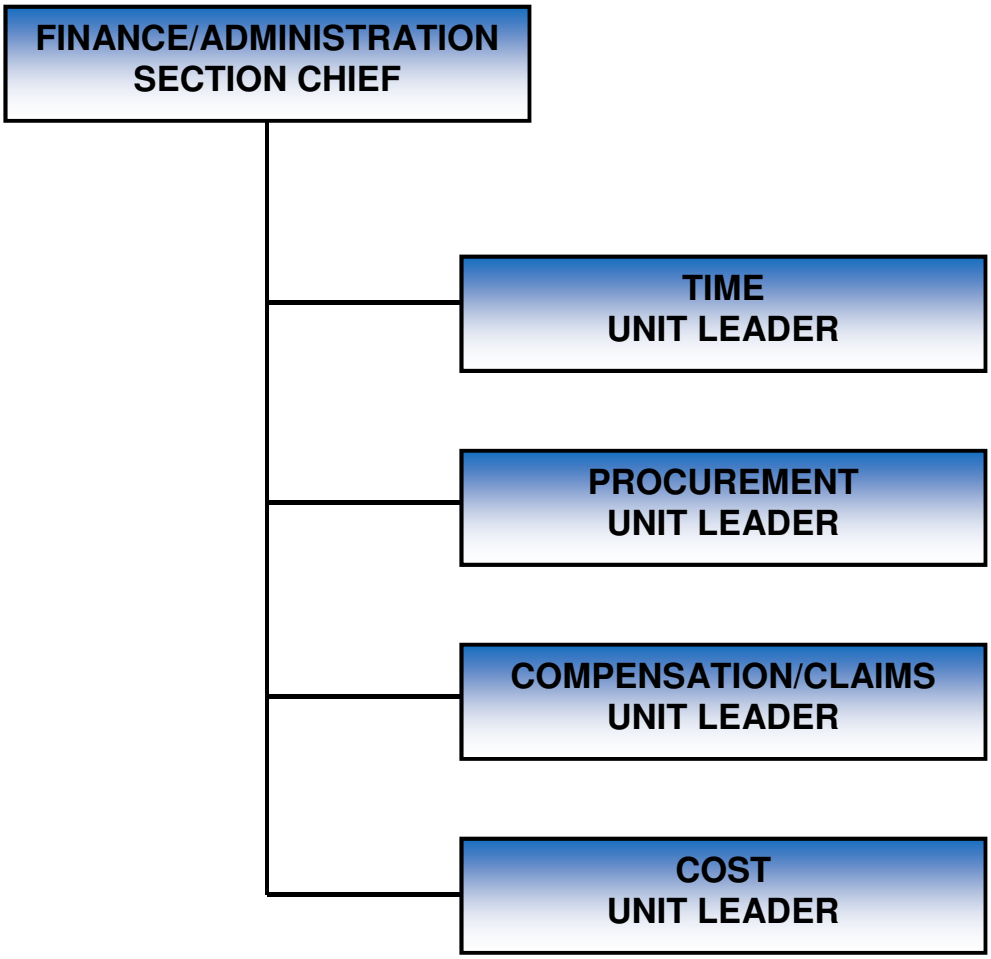
Finance/Administration Section Chief D-20

Time Unit Leader D-20

Procurement Unit Leader D-21

Compensation/Claims Unit Leader D-21

Cost Unit Leader D-22



FINANCE/ADMINISTRATION SECTION CHIEF

- Attend planning meetings as required.
- Manage all financial aspects of an incident.
- Provide financial and cost analysis information as requested.
- Gather pertinent information from briefings with responsible agencies.
- Develop an operating plan for the Finance/Administration Section; fill supply and support needs.
- Determine the need to set up and operate an incident commissary.
- Meet with Assisting and Cooperating Agency Representatives, as needed.
- Maintain daily contact with agency(s) administrative headquarters on Finance/ Administration matters.
- Ensure that all personnel time records are accurately completed and transmitted, according to policy.
- Provide financial input to demobilization planning.
- Ensure that all obligation documents initiated at the incident are properly prepared and completed.
- Brief administrative personnel on all incident-related financial issues needing attention or follow-up prior to leaving incident.

TIME UNIT LEADER

- Determine incident requirements for time recording function.
- Determine resource needs.
- Contact appropriate agency personnel/representatives.
- Ensure that daily personnel time recording documents are prepared and in compliance with policy.
- Establish time unit objectives.
- Maintain separate logs for overtime hours.
- Establish commissary operation on larger or long-term incidents as needed.
- Submit cost estimate data forms to the Cost Unit, as required.
- Maintain records security.
- Ensure that all records are current and complete prior to demobilization.
- Release time reports from assisting agency personnel to the respective Agency Representatives prior to demobilization.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

PROCUREMENT UNIT LEADER

- Review incident needs and any special procedures with Unit Leaders, as needed.
- Coordinate with local jurisdiction on plans and supply sources.
- Obtain the Incident Procurement Plan.
- Prepare and authorize contracts and land-use agreements.
- Draft memoranda of understanding as necessary.
- Establish contracts and agreements with supply vendors.
- Provide for coordination between the Ordering Manager, agency dispatch, and all other procurement organizations supporting the incident.
- Ensure that a system is in place that meets agency property management requirements. Ensure proper accounting for all new property.
- Interpret contracts and agreements; resolve disputes within delegated authority.
- Coordinate with the Compensation/Claims Unit for processing claims.
- Coordinate use of impress funds, as required.
- Complete final processing of contracts and send documents for payment.
- Coordinate cost data in contracts with the Cost Unit Leader.
- Brief the Finance/Administration Section Chief on current problems and recommendations, outstanding issues, and follow-up requirements.

COMPENSATION/CLAIMS UNIT LEADER

- Establish contact with the incident SO and LO (or Agency Representatives if no LO is assigned).
- Determine the need for Compensation for Injury and Claims Specialists and order personnel as needed.
- Establish a Compensation for Injury work area within or as close as possible to the Medical Unit.
- Review Incident Medical Plan (ICS Form 206).
- Ensure that Compensation/Claims Specialists have adequate workspace and supplies.
- Review and coordinate procedures for handling claims with the Procurement Unit.
- Brief the Compensation/Claims Specialists on incident activity.
- Periodically review logs and forms produced by the Compensation/Claims Specialists to ensure that they are complete, entries are timely and accurate, and that they are in compliance with agency requirements and policies.
- Ensure that all Compensation for Injury and Claims logs and forms are complete and routed appropriately for post-incident processing prior to demobilization.
- Keep the Finance/Administration Section Chief briefed on Unit status and activity.
- Demobilize unit in accordance with the Incident Demobilization Plan.

COST UNIT LEADER

- Coordinate cost reporting procedures.
- Collect and record all cost data.
- Develop incident cost summaries.
- Prepare resources-use cost estimates for the Planning Section.
- Make cost-saving recommendations to the Finance/Administration Section Chief.
- Ensure all cost documents are accurately prepared.
- Maintain cumulative incident cost records.
- Complete all records prior to demobilization.
- Provide reports to the Finance/Administration Section Chief.

APPENDIX E

TRAINING AND EXERCISES

E.1 GENERAL TRAINING

The Company provides training related to discharge prevention, testing, and response, including measures to repair and mitigate discharges. The training methods address oil discharges from several perspectives: human health and safety, rupture control and repair operations, pollution control, and overall (crisis) management of the emergency. The competency of each training program is closely monitored by the Training Section through observation of and/or participation in actual training sessions. PREP exercises should be viewed as an opportunity for continuous improvement of the response plans and the response system.

Training records and other applicable documentation items are maintained in the training department. ERT Personnel depending on their required responsibilities during a response go through HAZWOPER, rescue, and/or both trainings. These trainings and familiarization of the plan allow/give site personnel the ability to implement the plan as necessary.

All training records are maintained for as long as a person has response duties in this Plan.

E.2 HAZWOPER TRAINING

HAZWOPER (29 CFR 1910.120)

OSHA HAZWOPER training requirements are shown in the table below.

OSHA HAZWOPER TRAINING REQUIREMENTS		
Responder Classification	**Required Training**	**Refresher**
29 CFR 1910.120(q) Emergency Response		
First Responder - Employee Awareness Level	2-4 hrs demonstration of competency	Same
First Responder - Operations	8 hrs	8 hrs
Level Incident Commander	24 hrs plus competency	8 hrs

All personnel responding to an incident must satisfy the applicable HAZWOPER training requirements of 29 CFR 1910.120. Personnel are trained to the level of HAZWOPER necessary to perform their emergency response duties. Team members are required under state and federal regulations to have appropriate up-to-date HAZWOPER training necessary to function in their assigned positions. Refresher training or a demonstration of competency is required annually to maintain HAZWOPER qualifications.

First Responder/Operations: Personnel involved in the day to day operations within a specific unit receive continual instruction and experience in the proper handling and potential hazards associated with the materials that could be spilled in their area. Personnel are involved in protection and containment operations which do not involve contact with the spill (i.e., booming operations prior to arrival of the oil) must have at least 8 hours of HAZWOPER training or sufficient experience to demonstrate competency in their spill response duties.

E.3 RESPONSE TEAM TRAINING (App. F, Sec. 1.7.1.1(2) and 1.8.3 to 40 CFR 112)

Emergency Response Team

The Company provides training related to discharge prevention, testing, and response, including measures to repair and mitigate discharges. The training methods address oil discharges from the pipeline from several perspectives: human health and safety, rupture control and repair operations, pollution control, and overall (crisis) management of the emergency.

Hazardous Materials Incidents

Federal and State regulations require that Spill Response Team Members maintain up-to- date HAZWOPER training necessary to function in their assigned positions. At a minimum, Team members will receive "First Responder Awareness Level" training. All personnel responding to an incident must satisfy the applicable HAZWOPER training requirements of 29 CFR 1910.120. Training for HAZWOPER responder levels is documented by attendance sheets (see Appendix F). The signed attendance sheets are maintained at the Facility/Operations Office for five (5) years.

Qualified Individuals

Qualified Individuals (QI's) have received training in NIMS ICS and Hazardous Materials Response Training up to at least the OSHA Hazardous Materials Operations Level.

Incident Management Team

Assigned IMT team members will receive ICS training and may also receive supplemental training in other related general topics.

Incident Commander: IC is trained to assume control of an incident. Training includes the Company's Incident Command System, how to implement the Facility Response Plan, the associated risks of employees working in chemical protective clothing, decontamination procedures, how to implement the local emergency response plan, and knowledge of the state emergency response plan and of the Federal Regional Response Team.

Other Response Support

Personnel from other aspects of the Response Team (e.g., Hazmat, etc.) can be made available depending on the spill event.

Other personnel whose skills are needed temporarily to perform immediate emergency support work (such as dump truck drivers and crane operators) are not required to meet the training requirements discussed above. However, these personnel must be briefed on the potential hazards and the duties to be performed at the site before participating in response operations. They must also receive instruction in the use of any safety and personal protective equipment needed and on all other appropriate safety and health precautions.

E.3 RESPONSE TEAM TRAINING (App. F, Sec. 1.7.1.1(2) and 1.8.3 to 40 CFR 112) (Cont'd)

Company and Other Specialist Support

Experts would provide technical advice or guidance during response to a spill incident. Such persons must receive appropriate training or demonstrate competency in their specialty. There are no specific requirements on training content or hours of training for these persons. However, the training must be sufficient for the individuals to maintain competency in their specific area of expertise.

Contractor Training

The Company also recognizes that contract personnel must also have sufficient training in responding to emergency situations in accordance with HAZWOPER training requirements. The Company communicates this training need to its key contractors during contract negotiations.

Training Records and Maintenance

Training records for team members will be maintained at the Facility according to Federal, State, and local government requirements (three (3) years for the U.S. Coast Guard and five (5) years for the U.S. Environmental Protection Agency) and as long as an individual is assigned under the plan for the DOT PHMSA Office of Pipeline Safety.

E.4 RESPONSE TEAM EXERCISES

ERT/IMT members, government agencies, contractors, and other resources must participate in response exercises required by Federal, State, or local regulations and as detailed in the "National Preparedness for Response Exercise Program (PREP) Guidelines." The Company (through the Emergency Services Coordinator) will conduct announced and unannounced exercises to maintain compliance, and each plan-holder must participate in at least one exercise annually. The following table lists the triennial exercise cycle for facilities (see PREP Guidelines for full details).

E.4 RESPONSE TEAM EXERCISES (Cont'd)

TRIENNIAL CYCLE[1]		
Total Number	**Frequency**	**Exercise Type/Description**
12	Quarterly	QI Notification Exercise[2]
6	Semi-Annual	Equipment Deployment Exercise *(Facility-owned equipment)*
3	Annual	Equipment Deployment Exercise (facilities with OSRO-owned equipment)
3	Annual	Incident Management Team Tabletop Exercise
3	Annual	Unannounced Exercise *(not a separate exercise) May include:* *Emergency procedures, IMT Exercises or Facility equipment deployment exercises*

NOTES:

[1] All response plan components must be exercised at least once in the Cycle.

[2] Voice contact and confirmation must be made with a QI as detailed in the plan. Electronic messaging may be used only if communication by voice is not possible.

All individual drill and exercise information is kept separately, and is available upon request. All logs pertaining to the drills and exercises will be kept for a period of not less than 5 years.

Quarterly QI Notification Exercise

- **Scope:** Exercise the notification process between key facility personnel and the QI to demonstrate notification process and the accessibility of the QI.

- **Objective:** Voice contact and confirmation must be made with a QI as detailed in the plan. Electronic messaging may be used only if communication by voice is not possible.

- **General:** Quarterly QI Notification Exercises will be documented on the Notification Drill Form in the Miscellaneous Forms tab of this Plan. All personnel receiving notification shall respond to the notification and verify their receipt of the notification. Personnel who do not respond should be contacted to determine whether or not they received the notification. The Emergency Response Line (ERL) can be used for QI notifications.

Semi-Annual/Annual Equipment Deployment Exercise (for facilities with equipment)

- **Scope:** Deploy and operate facility response equipment identified in the response plan. The equipment to be deployed must include the following, at a minimum:

  - 1,000 feet of representative type of boom;
  - one of each type of skimming system; or
  - the equipment necessary to respond to the facility's Small/Average Most Probable Discharge (AMPD), whichever is less.

E.4 RESPONSE TEAM EXERCISES (Cont'd)

Semi-Annual/Annual Equipment Deployment Exercise (for facilities with equipment) (Cont'd)

- **Objective:** Demonstrate personnel's ability to deploy and operate response equipment. Ensure that the response equipment is in proper working order.

- **General:** The Facility may take credit for actual equipment deployment to a spill, or for training sessions, as long as the activities are properly documented.

Annual Equipment Deployment Exercise (OSRO-owned equipment)

- **Scope:** Demonstrate the ability to deploy response equipment identified in the FRP. The equipment may consist entirely of operator-owned equipment, or a combination of OSRO and operator equipment.

- **Objective:** Designated emergency response personnel should demonstrate the ability to:

  - Organize; and
  - Deploy and operate representative types of key response equipment as described in the response plan.

- **General:** The plan holder may claim credit for this exercise when conducted in conjunction with other exercises, as long as all the objectives are met, the exercise is evaluated, and a proper record is generated. Credit may be claimed for an actual response when these objectives are met, the response is evaluated, and a proper record is generated. Plan holders are encouraged to notify their DOT/PHMSA regional office at least one month in advance of conducting their PREP exercises. When possible, DOT/PHMSA will participate and evaluate their exercise.

Annual Response Team Tabletop Exercise

- **Scope:** Exercise the response team's organization, communication, and decision-making in managing a spill response. Each team identified within the plan must conduct an annual Response Team Tabletop Exercise.

- **Objective:** Exercise the response team in a review of the following:

  - Knowledge of the Plan.
  - Proper notifications.
  - Communications system.
  - Ability to access an OSRO.
  - Coordination of internal spill response personnel.
  - Review of the transition from a local team to a regional team.
  - Ability to effectively coordinate response activity with the National Response Framework (NRF) Infrastructure.
  - Ability to access information in the Area Contingency Plan.

E.4 RESPONSE TEAM EXERCISES (Cont'd)

Annual Response Team Tabletop Exercise (Cont'd)

- **General:** A minimum of one Response Team Tabletop Exercise in a triennial cycle will involve a Worst-Case Discharge scenario.

Government-Initiated Unannounced Exercise

- **Scope:** The Facility is required to participate in only one unannounced exercise every 36 months from the date of the last government-initiated unannounced exercise.
  - Exercises are limited to approximately four hours in duration.
  - Exercises would involve response to a Small/Average Most Probable Discharge scenario.
  - Exercise would involve equipment deployment to respond to a spill scenario.

- **Objective:** Conduct proper notifications to respond to unannounced scenario of a Small/Average Most Probable Discharge.
  - Demonstrate that the response is timely, conducted with an adequate amount of equipment for the scenario, and properly conducted.

- **General:** This exercise is only applicable to those facilities which are randomly chosen.

Area Exercises

- **Objective:** The purpose of the area exercise is to exercise the entire response community in a particular area. An area is defined as "that geographic area for which a separate and distinct Area Contingency Plan has been prepared, as described in OPA 90." The response community includes the federal, state, and local government and industry. The area exercises are designed to exercise the government and industry interface for spill response.

- **General:** The goal is to ensure that all areas of the country are exercised triennially. All of the area exercises will be developed by an exercise design team. The exercise design team is comprised of representatives from the federal, state, and local government and industry. A lead plan holder would lead each area exercise. The lead plan holder is the organization (government or industry) that holds the primary plan that is exercised in the area exercise. The lead plan holder would have the final word on designing the scope and scenario of the exercise.

Exercise Documentation

- All exercises should be documented and maintained at the facility; documentation should specify:
  - The type of exercise;
  - Date and time of the exercise;
  - A description of the exercise;

E.4 RESPONSE TEAM EXERCISES (Cont'd)

Exercise Documentation (Cont'd)

- The objectives met in the exercise;
- The components of the response plan exercised; and
- Lessons learned.

- Exercise documentation should be kept on file for the required length of time depending on the regulating agency (three (3) years for the U.S. Coast Guard and DOT PHMSA Office of Pipeline Safety and five (5) years for the U.S. Environmental Protection Agency).

E.5 PURPOSE OF REVIEW AND EVALUATION

This section provides procedures and information useful to responders for post incident/exercise review and evaluation. Post incident/exercise reviews should be conducted in a timely manner following an incident/exercise. The Plan should be evaluated to determine its usefulness during the incident/exercise and appropriate revisions should be made. All incident/exercise documentation should be included in the Plan evaluation process.

Outline of Review

Given below are items a team composed of outside people knowledgeable in spill response and key members of the response teams should examine. These questions are intended as guidelines only; many other questions are likely to be appropriate at each stage of a critique.

- ***Detection***

  - Was the spill detected promptly?
  - How was it detected?
  - By whom?
  - Could it have been detected earlier? How?
  - Are any instruments or procedures available to consider which might aid in spill detection?

- ***Notification***

  - Were proper procedures followed in notifying government agencies?
  - Were notifications prompt?
  - Was management notified promptly?
  - Was management response appropriate?
  - Was the Facility / Company notified promptly? If so, why, how, and who? If not, why not?

E.5 PURPOSE OF REVIEW AND EVALUATION (Cont'd)

- ***Assessment/Evaluation***

  - Was the magnitude of the problem assessed correctly at the start?
  - What means were used for this assessment?
  - Are any guides or aids needed to assist spill evaluation?
  - What sources of information were available on winds and on water currents?
  - Is our information adequate?
  - Was this information useful (and used) for spill trajectory forecasts? Were such forecasts realistic?
  - Do we have adequate information on product properties?
  - Do we need additional information on changes of product properties with time, i.e., as a result of weathering and other processes?

- ***Mobilization***

  - What steps were taken to mobilize spill countermeasures?
  - What resources were used?
  - Was mobilization prompt?
  - Could it have been speeded up or should it have been?
  - What about mobilization of manpower resources?
  - Was the local spill cooperative used appropriately?
  - How could this be improved?
  - Was it appropriate to mobilize the Facility/company resources and was this promptly initiated?
  - What other corporate resources are available and have they been identified and used adequately?

- ***Response - Strategy***

  - Is there an adequate spill response plan for the location?
  - Is it flexible enough to cope with unexpected spill events?
  - Does the plan include clear understanding of local environmental sensitivities?
  - What was the initial strategy for response to this spill?
  - Is this strategy defined in the spill plan?
  - How did the strategy evolve and change during this spill and how were these changes implemented?

- What caused such changes?
- Are there improvements needed? More training?

E.5 PURPOSE OF REVIEW AND EVALUATION (Cont'd)

- ***Response - Resources Used***

  - What resources were mobilized?
  - How were they mobilized?
  - How did resource utilization change with time? Why?
  - Were resources used effectively?

- Contractors
- Government agencies
- Company resources
- Cooperatives
- Volunteers
- Consultants
- Other (e.g., bird rescue centers)

  - What changes would have been useful?
  - Do we have adequate knowledge of resource availability?
  - Do we have adequate knowledge of waste disposal capabilities?

- ***Response - Effectiveness***

  - Was containment effective and prompt?
  - How could it have been improved?
  - Should the location or the local cooperative have additional resources for containment?
  - Was recovery effective and prompt?
  - How could it have been improved?
  - Should the location or the local cooperative have additional resources for recovery of spilled product?
  - Was contaminated equipment disposed of promptly and safely?
  - Was there adequate in-house product separation, recovery, and disposal?
  - How could it have been improved?
  - Was there adequate outside disposal resources available?

- ***Command Structure***

  - Who was initially in charge of spill response?
  - What sort of organization was initially set up?
  - How did this change with time? Why?
  - What changes would have been useful?
  - Was there adequate surveillance?
  - Should there be any changes?
  - Were communications adequate?
  - What improvements are needed? Hardware, procedures, etc.
  - Was support from financial services adequate? Prompt?
  - Should there be any changes?
  - Is more planning needed?
  - Should financial procedures be developed to handle such incidents?

E.5 PURPOSE OF REVIEW AND EVALUATION (Cont'd)

- ***Measurement***

  - Was there adequate measurement or estimation of the volume of product spilled?
  - Was there adequate measurement or estimation of the volume of product recovered?
  - Was there adequate measurement or estimation of the volume of product disposed of?
  - Should better measurement procedures be developed for either phase of operations?
  - If so, what would be appropriate and acceptable?

- ***Government Relations***

  - What are the roles and effects of the various government agencies which were involved?
  - Was there a single focal point among the government agencies for contact?
  - Were government agencies adequately informed at all stages?
  - Should there have been better focus of communications to the agencies?
  - Were government agencies adequately informed at all stages?
  - Were too many agencies involved?

- Are any changes needed in procedures to manage government relations?

  - Examples of affected U.S. agencies (there may be others):

- U.S. Coast Guard
- Environmental Protection Agency
- National Oceanic and Atmospheric Administration
- Dept of Fish and Wildlife
- State Parks
- Harbors and Marinas
- States
- Cities
- Counties

  - Was there adequate agreement with the government agencies on disposal methods?
  - Was there adequate agreement with the government agencies on criteria for cleanup?
  - How was this agreement developed?
  - Were we too agreeable with the agencies in accepting their requests for specific action items (e.g., degree of cleanup)?
  - Should there be advance planning of criteria for cleanup, aimed at specific local environmentally sensitive areas? (Such criteria should probably also be designed for different types of product.)

E.5 PURPOSE OF REVIEW AND EVALUATION (Cont'd)

- ***Public Relations***

  - How were relations with the media handled?
  - What problems were encountered?
  - Are improvements needed?
  - How could public outcry have been reduced? Was it serious?
  - Would it be useful to undertake a public information effort to "educate" reporters about product and effects to it if spilled?
  - These areas should be investigated shortly after the incident to assure that actions taken are fresh in people's minds.

4. Prepared By (Communications Unit) 5. Date/Time

The convention calls for frequency lists to show four digits after the decimal place, followed by either an "N" or a "W", depending on whether the frequency is narrow or wide band. Mode refers to either "A" or "D" indicating analog or digital (e.g. Project 25) or "M" indicating mixed mode. All channels are shown as if programmed in a control station, mobile or portable radio. Repeater and base stations must be programmed with the Rx and Tx reversed.

Site Safety and Health Plan ICS-208-CG (rev 4/15)

Incident Name: _____ **Date/Time Prepared: _____** **Operational Period: _____**

Purpose. The ICS Compatible Site Safety and Health Plan is designed for safety and health personnel that use the Incident Command System (ICS). It is compatible with ICS and is intended to meet the requirements of the Hazardous Waste Operations and Emergency Response regulation (Title 29, Code of Federal Regulations, Part 1910.120). The plan avoids the duplication found between many other site safety plans and certain ICS forms. It is also in a format familiar to users of ICS. Although primarily designed for oil and chemical spills, the plan can be used for all hazard situations. Changes: The only change to this form since 2006 is added Emergency Site Non-Hazardous Assessment form (SSP-A2).

Questions on the document should be addressed to the **Coast Guard Office of Contingency Preparedness and Exercise Policy (CG-CPE)**.

Table of Forms

FORM NAME	FORM #	USE	REQUIRED	OPTIONAL	ATTACHED
Emergency Safety and Response Plan	A	Emergency response phase (uncontrolled)	X		
Emergency Site Non-Hazardous Assessment Form	A2	Emergency response phase without Hazardous Materials present. Overall site assessment	X

EMERGENCY SAFETY AND RESPONSE PLAN (ICS-208-CG SSP-A)

Purpose: The Emergency Safety and Response Plan provides the Safety Officer and ICS personnel a plan for safeguarding personnel during the initial emergency phase of the response. *It is only used during the emergency phase of the response, which is defined as a situation involving an uncontrolled release.* It is also intended to meet the requirements of the Hazardous Waste Operations and Emergency Response (HAZWOPER) regulation, Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer or his/her designated staff starts the Emergency Site Safety and Response Plan. They initially address the hazards common to all operations involved in the response (initial site characterization). Outside support organizations must be contacted to ensure the plan is consistent with other plans (local, state, other federal plans). Form ICS-208-CG SSP-G need not be completed if this form is used. When the operation proceeds into the post-emergency phase (site stabilized and cleanup operations begun) forms ICS-208-CG SSP-B and ICS-208-CG SSP-G should be used. For large incidents, the Emergency Site Safety and Response Plan complements the Incident Action Plan. For smaller incidents, the Emergency Site Safety and Response Plan complements ICS-201.

Distribution: The Emergency Safety and Response Plan completed by the Safety Officer is forwarded to the Planning Section Chief. Copies are made and attached to the ICS 204 Assignment List(s). The Operations Section Chief, Directors, Supervisors or Leaders get a copy of the plan. They must ensure it is available on site for all personnel to review. The Safety Officer is responsible for ensuring that the Emergency Site Safety and Response Plan properly addresses the hazards of the operation. The Safety Officer accomplishes this through on site enforcement and feedback to the operational units.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Attachments	Enter attachments. Material Safety Data Sheets are mandatory under 1910.120. Safe Work Practices may also be attached.
5	Organization	List the personnel responsible for these positions. IC and Safety Officer are mandatory.
6	Physical Hazards & Protection	Check off the physical hazards at the site. Identify the major tasks involved in the response (skimming, lightering, overpacking, etc.). Check off the controls that would be used to safeguard workers from the physical hazards for each major task.
7	Chemical/Agent	List the chemicals involved in the response. Chemicals may be listed numerically. Check off the hazards, potential health effects, pathway of dispersion, and exposure route of the chemical. Numbers corresponding to the chemical may be entered into the check blocks to differentiate. Check off the PPE to be used. Identify the type of PPE selected (for example: gloves: butyl rubber).
8	Instruments	Indicate the instruments being used for monitoring. List the action levels adjacent to the instruments being used. Identify the chemicals being monitored (2). List the physical parameters of the chemicals. Use a separate form for additional chemicals monitored.

EMERGENCY SAFETY AND RESPONSE PLAN (FORM ICS-208-CG SSP-A) (Instructions Continued)

9	Decontamination	Check off the decontamination steps to be used. Numbers may be entered to indicate the preferred sequence. Identify any intervening steps necessary on the form or in a separate attachment.
10	Site Map	Draw a rough site map. Ensure all the information listed is identified on the map.
11	Potential Emergencies	Identify any potential emergencies that may occur. If none, so state. Check off the appropriate alarms that may be used. Identify emergency prevention and evacuation procedures in the space provided or on a separate attached sheet.
12	Communications	Indicate type of site communications (phone, radio). Indicate phone numbers or frequencies for the command, tactical and entry functions.
13	Site Security	Identify the personnel assigned. Identify security procedures in the space provided or on a separate attached sheet. Identify the equipment needed to support security operations.
14.	Emergency Medical	Identify the personnel assigned. Identify emergency medical procedures in the space provided or on a separate attached sheet. Identify the equipment needed to support security operations.
15.	Prepared by:	Enter the name and position of the person completing the worksheet.
16.	Date/time briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

EMERGENCY SITE NON-HAZARDOUS ASSESSMENT FORM	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Attachments: **Y** on **N**

EMERGENCY SITE NON-HAZARD ASSESSMENT FORM(ICS-208-CG SSP-A2)

Purpose: The Emergency Site Non-Hazard Assessment Form provides the Safety Officer and ICS personnel a plan for safeguarding personnel during the initial emergency phase of the response when an *uncontrolled release is **NOT present***. It is also intended to meet the requirements of the Hazardous Waste Operations and Emergency Response (HAZWOPER) regulation, Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer or his/her Assistant Safety Officer will start the Emergency Site Non-Hazard Assessment Form. They initially address the possibility for employee/worker exposure to safety and health hazards in all operations involved in the response (initial site characterization). Outside support organizations must be contacted to ensure the plan is consistent with other plans (local, state, other federal plans). When the operation proceeds into the post-emergency phase (site stabilized and cleanup operations begun) forms ICS-208-CG SSP-B and ICS-208-CG SSP-G should be used. For large incidents, the Emergency Site Non-Hazard Assessment Form will complement the Incident Action Plan. For smaller incidents, the Emergency Site Non-Hazard Assessment Form will complement ICS-201 form.

Distribution: The Emergency Site Non-Hazard Assessment Form completed by the Safety Officer is forwarded to the Planning Section Chief. Copies are made and attached to the Assignment List(s) (ICS Form 204). The Operations Section Chief, DIVS (Division/Group Supervisor), Supervisors or Leaders get a copy of the plan. They must ensure it is available on site for all personnel to review. The Safety Officer is responsible for ensuring that the Emergency Site Non-Hazard Assessment Form properly addresses the hazards of the operation. The Safety Officer accomplishes this through on site enforcement and feedback to the operational units.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Attachments	Enter attachments. Injury Logs or reports, Any required supplies or PPE (CG213RR), and any Safe Practices initiated.
5	Scene Contacts	Area Assessed. List the personnel responsible for these positions. IC and Safety Officer are mandatory.
6	Physical Hazards Onsite & Protection	Check off the physical hazards at the site. Identify the major tasks involved in the response (skimming, lightering, over packing, etc.). Check off the controls that would be used to safeguard workers from the physical hazards for each major task.
7	Comments	Other Physical Hazards seen. Suggested Control Measures. CG213RR order number assigned to a Control Measure to safeguard workers
8	Any Reported Illnesses or Injuries	Any Illnesses or Injuries in Assessed Area? If so, what was the Illness or Injury? Was an ICS CG209 (Incident Status Summary) filled out or updated? Was the persons Agency informed?
9	Site Map	Draw a rough site map. Ensure all the information listed is identified on the map.

10	Potential Emergencies	Identify any potential emergencies that may occur. If none, so state. Check off the appropriate alarms that may be used. Identify emergency prevention and evacuation procedures in the space provided or on a separate attached sheet.
11	Communications	Indicate type of site communications (phone, radio). Indicate phone numbers or frequencies for the command, tactical and entry functions.
12.	Emergency Medical	Identify the personnel assigned. Identify emergency medical procedures in the space provided or on a separate attached sheet. Identify the equipment needed to support security operations.
13.	Prepared by:	Enter the name and position of the person completing the worksheet.
14.	Date/time briefed:	Enter the date/time the document was briefed to the appropriate workers/IMT members and by whom.

SITE SAFETY PLAN (FORM ICS-208-CG SSP-B)

Purpose: The Site Safety Plan provides the Safety Officer and ICS personnel a plan for safeguarding personnel during the post-emergency phase of an incident. The post-emergency phase is when the situation is stabilized and cleanup operations have begun. ICS-208-CG SSP-B is intended to meet the requirements of the Hazardous Waste Operations and Emergency Response (HAZWOPER) regulation, Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer or his/her designated staff starts the Site Safety Plan. They initially address the hazards common to all operations involved in the response (initial site characterization). The plan is then reproduced and as a minimum sent to ICS Group/Division Supervisors. They amend it according to unique job or on-scene hazards with support from the Safety Officer and/or his/her staff (detailed site characterization). The plan is continuously updated to address changing conditions. During the first hours of the response, where most response functions are in the emergency phase, the Safety Officer may chose to use the Emergency Safety and Response Plan (ICS-208-CG SSP-A) in place of the Site Safety Plan. For large incidents, ICS-208-CG SSP-B compliments the Incident Action Plan (IAP). For smaller incidents, ICS-208-CG SSP-B compliments ICS Form 201. The Safety Officer is encouraged to use the HAZWOPER Compliance Checklist (Form ICS-208-CG SSP-K) to ensure the IAP and the 201 address the requirements and all other pertinent ICS forms (203, 205, 206, etc.) are completed.

Distribution: The initial Site Safety Plan completed by the Safety Officer is forwarded to the Planning Section Chief. Copies are made and attached to the Assignment List(s) (ICS Form 204). The Operations Section Chief, Directors, Supervisors or Leaders get a copy and make on site amendments specific to their operation. They must also ensure it is available on site for all personnel to review. The Safety Officer provides personnel from his/her staff to assist in the detailed site characterization. The Safety Officer is responsible for ensuring that the Site Safety Plan for each assignment properly addresses the hazards of the assignment. The Safety Officer must ensure that the safety plans on site are consistent. The Safety Officer accomplishes this through on site enforcement and feedback to the operational units.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Group/Division Supv Strike Team/TF Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Site Accessibility	Check the block(s) if the site is accessible by land, water, air, etc.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Attachments	Enter attachments. Material Safety Data Sheets are mandatory under 1910.120. Safe Work Practices may also be attached.
10	Job/Task Activity	Enter Job/Task & Activities, list hazards, list potential injury and health effects, check exposure routes and identify controls. If more detail is needed for controls, provided attachments.
11	Prepared by	Enter the name and position of the person completing the worksheet.
12	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

SITE MAP FOR SITE SAFETY PLAN (ICS-208-CG SSP-C)

Purpose: The Site Map for the Site Safety Plan is required by Title 29 Code of Federal Regulations Part 1910.120. It provides in 1 place a visual description of the site which can help ICS personnel locate hazards, identify evacuation routes and places of refuge.

Preparation: The Site Map for the Site Safety Plan can be completed by the Safety Officer, his/her staff or by ICS field personnel (Group Supervisors, Task Force/Strike Team Leaders) working at a site with unique and specific hazards. One or several maps may be developed, depending on the size of the incident and the uniqueness of the hazards. The key is to ensure that the workers using the map(s) can clearly identify the work zones, locations of hazards, evacuation routes and places of refuge.

Distribution: This form must be located with the Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Site Accessibility	Check the block(s) if the site is accessible by land, water, air, etc.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Include	Ensure the map includes the listed items provided in this block.
10	Sketch of Site	Sketch of site for work. May attach map or chart.
10	Prepared by	Enter the name and position of the person completing the worksheet.
11	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

EMERGENCY RESPONSE PLAN (ICS-208-CG SSP-D)

Purpose: The Emergency Response Plan provides information on measures to be taken in the event of an emergency. It is used in conjunction with the Site Safety Plan (Form ICS-208-CG SSP-B). It is also required by Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Safety Officer, his/her staff member or the Site Supervisor/Leader prepares the Emergency Response Plan. A copy of the Medical Plan (ICS Form 206) must always be attached to this form.

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
8	Attachments	Enter attachments. ICS Form 206 must be included.
9	Emergency Alarm	Enter a description of the sound of the emergency alarm and it's location.
10	Backup Alarm	Enter a description of the sound of the emergency alarm and it's location.
11	Emergency Hand Signals	Enter the emergency hand signals to be used.
12	Emergency Personal Protective Equipment Required	Enter the emergency personal protective equipment that may be needed in the event of an emergency.
13	Emergency Notification Procedures	Enter the procedures for notifying the appropriate personnel and organizations in the event of an emergency.
14	Places of Refuge	Enter by name the place of refuge personnel can go to in the event of an emergency.
15	Emergency Decon & Evacuation Steps	Enter emergency decontamination steps and evacuation procedures.
16	Site Security Measures	Enter site security measures needed for emergencies.
17	Prepared by	Enter the name and position of the person completing the worksheet.
18	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

Safety Officer Review:	Reporting: Monitoring results shall be logged in the ICS-208-CG SSP-E-1 form (Air Monitoring Log) and attached as part of a current Site Safety Plan and Incident Action Plan. Significant Exposures shall be immediately addressed to the IC and General Staff for immediate correction.	**ICS-208-CG SSP-E (rev 4/15)** Page _____ of _____

EXPOSURE MONITORING PLAN (FORM ICS-208-CG SSP-E)

Purpose: The Exposure Monitoring Plan provides plan of monitoring conducted during an incident. The plan is a supplement to the Site Safety Plan (ICS-208-CG SSP-B). It is only required when performing monitoring operations.

Preparation: The Safety Officer, his/her staff member or the Site Supervisor/Leader prepares the Exposure Monitoring Plan. If there is a decision not to monitor during a response, the reasons must be stated clearly in the Site Safety Plan (ICS-208-CG SSP-B).

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Specific Task / Operation	Enter specific task or operation.
6	Survey Location	Enter the location to be monitored.
7	Survey Date/Time	Enter the date/time for the monitoring teams to survey.
8	Monitoring Methodology	Enter/Check the monitoring method to be used.
9	Direct-Reading Instrument	Enter the instrument model, manufacturer, last calibration date.
10	Air Sampling	Enter Air Sampling analysis method
11	Hazards to Monitor	Enter the hazards to monitor
12	Monitoring Duration	Enter duration of monitoring
13	Reasons to Monitor	Enter Reasons to Monitor
14	Laboratory Support for Analysis	Enter Laboratory Support needed for analysis of samples
15	Prepared by	Enter the name and position of the person completing the worksheet.
16	Date/Time Briefed	Enter the date/time the document was briefed to the appropriate workers and by whom.
17	Safety Officer Review	The Safety Officer must review and sign the form.

DAILY AIR MONITORING LOG (FORM ICS-208-CG SSP-E-1)

Purpose: The Exposure Monitoring Log provides documentation of air monitoring conducted during a spill. The log is a supplement to the Site Safety Plan (ICS-208-CG SSP-B). It is only required when performing air monitoring operations. The information used from the log can help update the Site Safety Plan.

Preparation: Persons conducting monitoring complete the Daily Air Monitoring Log. Normally these are air monitoring units under the Site Safety Officer. If there is a decision not to monitor during a spill, the reasons must be stated clearly in the Site Safety Plan (ICS-208-CG SSP-B).

Distribution: The Daily Air Monitoring Log when completed is copied and forwarded to the Site Safety Officer who must review and sign the form. The original form must be available on site, readily available and briefed to all impacted ICS personnel.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Location & size of site	Enter the geographical location of the site and the approximate square area.
6	Hazards of Concern	Enter the hazards being monitored.
7	Action Levels	Enter the action levels/readings for the monitoring teams.
8	Weather	Enter weather information. Ensure units of measure are listed.
9	Air Monitoring Data	Enter the instrument type and number, persons monitoring, results with appropriate units, location of reading, time of reading and interferences and comments.
10	Safety Officer Review	The Safety Officer must review and sign the form.

CG ICS SSP: PERSONAL PROTECTIVE EQUIPMENT	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Safety Officer (include method of contact):

PERSONAL PROTECTIVE EQUIPMENT (ICS-208-CG SSP-F)

Purpose: The Personal Protective Equipment form is a list of personal protective equipment to be used in operations. The listing of personal protective equipment is required by Title 29 Code of Federal Regulations Part 1910.120.

Preparation: The Personal Protective Equipment form is completed by the Site Safety Officer, or his/her staff. Personal protective equipment common to all ICS Operations personnel is addressed first. Jobs with unique personal protective equipment requirements (fall protection) are addressed next. When the form is delivered on site, the ICS Director, Supervisor, or Leader may amend the list to ensure personnel are adequately protected from job hazards. It must be completed prior to the onset of any operations, unless addressed elsewhere by Standard Operating Procedures.

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	Hazard(s) Addressed:	Enter the hazards that need to be safeguarded.
8	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
9	Equipment	List the equipment needed to address the hazards. If pre-designed Safe Work Practices are used, indicate here and attach to form.
10	References consulted	List the references used in making the selection for PPE.
11	Inspection Procedures	Enter the procedures for inspecting the Personal Protective Equipment prior to donning. If pre-designed Safe Work Practices are used, indicate here and attach to form.
12	Donning Procedures	Enter the procedures for putting on the PPE. If pre-designed Safe Work Practices are used, indicate here and attach to form.
13	Doffing Procedures	Enter the information for removing the PPE. If pre-designed Safe Work Practices are used, indicate here and attach to form.
14	Limitations and Precautions	List the limitations and precautions when using PPE. Include the maximum time to be inside the PPE, Heat Stress concerns, psychomotor skill detraction and other factors.
15	Prepared by	Enter the name and position of the person completing the worksheet.
16	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

DECONTAMINATION (ICS-208-CG SSP-G)

Purpose: The Decontamination form provides information on how workers can avoid contamination and how to get decontaminated. It is a supplemental form to the Site Safety Plan.

Preparation: The Decontamination Form can be completed by the Site Safety Officer, a member of his/her staff or by the Group/Division Supervisor, Task Force/Strike Team Leader on the site

Distribution: This form must be located with Site Safety Plan (ICS-208-CG SSP-B). It therefore follows the same distribution route.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
8	Hazard(s) Addressed:	Enter the hazards that need to be safeguarded.
9	Equipment	Enter the decontamination equipment needed for the site. If pre-designed Safe Work Practices are used, indicate here and attach to this form.
10	References consulted	List the references used in making the selection for PPE.
11	Contamination Avoidance Practices	Enter procedures for personnel to avoid contamination. If pre-designed Safe Work Practices are used, indicate here and attach to form.
12	Decon Diagram	Draw a diagram for the decontamination operation. If pre-designed Safe Work Practices are used, indicate here and attach to form.
13	Decon Steps	List the decontamination steps.
14	Prepared by	Enter the name and position of the person completing the worksheet.
15	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

SITE SAFETY ENFORCEMENT LOG (ICS-208-CG SSP-H)

Purpose: The Site Safety Plan Enforcement Log is used to help enforce safety during an incident.

Preparation: The Safety Officer and/or his/her staff complete the Site Safety Plan Enforcement Log. The log is completed as Safety personnel are on scene reviewing the site. It should be completed at a minimum once per day. The number of enforcement logs to be completed depends on the size of the incident. Enough should be completed to ensure that site safety is being adequately enforced.

Distribution: The Site Safety Plan enforcement log when completed is delivered to the Safety Officer. The Safety Officer can use the form to amend the Site Safety Plan (ICS-208-CG SSP-A or B).

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
7	Attachments	List any attached supporting documentation.
8 a	Job/Task Activity	Enter only those Job Task/activities for which a deficiency is noted.
8 b	Hazards	Enter the hazard not being sufficiently addressed.
8 c	Deficiency	Enter the deficiency.
8 d	Action Taken	Enter the corrective action taken to address the deficiency.
8 e	Safety Plan Amended?	Enter whether the on site safety plan was amended.
8 f	Signature of Supervisor/Leader	Ensure the Supervisor/Leader signs the form to acknowledge the deficiency.
9	Prepared by	Enter the name and position of the person completing the worksheet.
10	Date/Time Briefed:	Enter the date/time the document was briefed to the appropriate workers and by whom.

* *By signing this document, I am stating that I have read and fully understand the plan and/or information provided to me.*

WORKER ACKNOWLEDGEMENT FORM (ICS-208-CG SSP-I)

Purpose: The Worker Acknowledgement form is used to document workers who have received safety briefings.

Preparation: Those personnel responsible for conducting safety briefings complete this form initially. Once the briefings are completed, workers who were briefed print their name, sign, date and indicate the time of the briefing.

Distribution: This form is returned to the Safety Officer or designated representative at the end of each operational period.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Site Location	Indicate the location where the briefings are held.
3	Attachments	Indicate any attachments used as part of the briefings.
4	Type of briefing	Check the block next to the type of briefing.
5	Presented by	Enter the name of the person conducting the briefing.
6	Date Presented	Enter the date of the briefing.
7	Time Presented	Enter the time of the briefing.
8	Worker Name, Signature, Date and Time	Workers receiving the briefing print their name, sign, date and enter the time they acknowledge the briefing.

(ii)	Were exposure limits addressed?	N/A	☐	Performance based
(ii)	Were hazardous substance handling procedures addressed?	N/A	☐	Performance based
(iii)	Is the PPE appropriate for the hazards identified?	N/A	☐	Performance based
(iv)	Is respiratory protection worn when inhalation hazards present?	N/A	☐	Performance based
(v)	Is the buddy system used in the hazard zone?	N/A	☐	Performance based
(vi)	Are backup personnel on standby?	N/A	☐	Performance based
(vi)	Are advanced first aid support personnel standing by?	N/A	☐	Performance based
(vii)	Has the ICS designated safety official been identified?	SSP-A	☐	
(vii)	Has the Safety Official evaluated the hazards?	N/A	☐	Performance based
(viii)	Can the Safety Official communicate with IC immediately?	N/A	☐	Performance based
(ix)	Are appropriate decontamination procedures implemented?	N/A	☐	Performance based

Emergency Safety & Response Plan Compliance Checklist Form A (ICS-208-CG SSP-J)

Purpose: The Emergency Safety and Response Plan 1910.120 Compliance Checklist is to ensure that incident response operations are in compliance with Title 29, Code of Federal Regulations Part 1910.120, Hazardous Waste Operations and Emergency Response. It also identifies how form ICS-208-CG SSP-J can be used to satisfy the HAZWOPER requirements. This checklist is an optional form.

Preparation: The Emergency Safety and Response Plan 1910.120 Compliance Checklist is completed by the Safety Officer or his/her staff as frequently as necessary whenever the Safety Officer wants to ensure regulatory compliance. It is best used in conjunction with the Site Safety Plan Enforcement Log (ICS-208-CG SSP-H). Many of the requirements are performance based and are best evaluated on scene by the Safety Officer or his/her staff.

Distribution: The Safety Officer should maintain The Emergency Safety and Response Plan (ERP) 1910.120 Compliance Checklist.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
5	Location of Site	Enter the site location.
6 a	Cites	These are the regulatory cites within 1910.120. The major headings are highlighted in bold. Informational cites or cites that are duplicative are not included.
6 b	Requirement	This lists the requirement in a question format. Some require documentation or some form of action.
6 c	ICS Form	Lists those requirements covered by ICS-208-CG SSP-A.
6 d	Check Block	Enter the check if the site satisfies the requirement.
6 f	Comments	This provides additional information on the requirement. The user may also enter comments.
7	Prepared by	Enter the name and position of the person completing the worksheet.

(iv)	Is a drinking cup receptacle available and clearly marked?	IAP	☐	
(**n**)(2)(i)	Are non-potable water containers clearly marked?	IAP	☐	
(**n**)(3)(i)	Are their sufficient toilets available?	IAP	☐	
(**n**)(4)	Have food handling issues been addressed?	IAP	☐	
(**n**)(6)	Have adequate wash facilities been provided outside hazard zone?	IAP	☐	
(**n**)(7)	If response is greater than 6 months, have showers been provided?	IAP	☐	

HAZWOPER 1910.120 COMPLIANCE CHECKLIST FORM B (ICS-208-CG SSP-K)

Purpose: The HAZWOPER 1910.120 Compliance Checklist is to ensure that incident response operations are in compliance with Title 29, Code of Federal Regulations Part 1910.120, Hazardous Waste Operations and Emergency Response. It also identifies how other ICS forms can be used to satisfy the HAZWOPER requirements. This is an optional form.

Preparation: The HAZWOPER 1910.120 Compliance Checklist is completed by the Safety Officer or his/her staff as frequently as necessary whenever the Safety Officer wants to ensure regulatory compliance. It is best used in conjunction with the Site Safety Plan Enforcement Log (ICS-208-CG SSP-H). The Site Safety Plan Forms (A-G) best meet some of the requirements. The Incident Action Plan is suited to address other requirements, and the Safety Officer should ensure the IAP addresses them. Other requirements are performance based and are best evaluated on scene by the Safety Officer or his/her staff.

Distribution: The HAZWOPER 1910.120 Compliance Checklist should be maintained by the Safety Officer.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
5	Location of Site	Enter the site location.
6.a.	Cites	These are the regulatory cites within 1910.120. The major headings are highlighted in bold. Informational cites or cites that are duplicative are not included.
6.b.	Requirement	This lists the requirement in a question format. Some require documentation or some form of action.
6.c.	ICS Form	Lists those ICS Forms that cover the requirement. **IAP designations means it should be covered in IAP, it does not guarantee it is covered. The Safety Officer must ensure this.**
6.d.	Check Block	Enter the check if the site satisfies the requirement.
6.e.	Comments	This provides information on where else the requirement may be met. The user may also enter comments.
7	Prepared by	Enter the name and position of the person completing the worksheet.

CG ICS SSP: 1910.120 DRUM COMPLIANCE CHECKSHEET	1. Incident Name	2. Date/Time Prepared	3. Operational Period	4. Safety Officer (include method of contact):
5. Supervisor/Leader	6. Location and Size of Site	7. For Emergencies Contact:	8. Note: tanks and vaults should also be treated in the same manner as described below [1910.120(j)(9)]. Many can also pose confined space hazards.	

9.a. Cite: 1910.120 (Cites that duplicate or explain requirements are omitted)	9.b. Requirement	9.c. Check	9.d. Comments
(**j**)(1)(ii)	Drums meet DOT, OSHA, EPA regs for waste they contain, including shipment?	☐	
(iii)	Drums inspected and integrity ensured prior to movement?	☐	
(iii)	Or drums moved to an accessible location (staging area) prior to movement?	☐	
(iv)	Unlabelled drums treated as unknown until properly identified and labeled?	☐	
(v)	Site activities organized to minimize drum handling?	☐	
(vi)	Employers properly warned about the hazards of moving and handling drums?	☐	
(vii)	Suitable overpack drums are available for addressing leaking and ruptured drums?	☐	
(viii)	Leaking materials from drums properly contained?	☐	
(ix)	Are drums that cannot be moved, emptied of contents with transfer equipment?	☐	
(x)	Are suspect buried drums surveyed with underground detection system?	☐	
(xi)	Are soil and covering material above buried drums removed with caution?	☐	
(xii)	Is the proper extinguishing equipment on scene to control incipient fires?	☐	
(**j**)(2)(i)	Are airlines on supplied air systems protected from leaking drums?	☐	
(ii)	Are employees at a safe distance, using remote equipment, when handling explosive drums?	☐	
(iii)	Are explosive shields in plane to protect workers opening explosive drums?	☐	
(iv)	Is response equipment positioned behind shields when shields are used?	☐	
(v)	Are non-sparking tools used in flammable or potentially flammable atmospheres?	☐	
(vi)	Are drums under extreme pressure opened slowly & workers protected by shields/distance?	☐	
(vii)	Are workers prohibited from standing and working on drums?	☐	
(**j**)(3)	Is the drum handling equipment positioned and operated to minimize sources of ignition?	☐	
(**j**)(5)(i)	For shock sensitive drums, have all non-essential employees been evacuated?	☐	
(ii)	For shock sensitive drums: is handling equipment provided with shields to protect workers?	☐	
(iii)	Are alarms that announce start/finish of explosive drum handling actions in place?	☐	
(iv)	Are continuous communications in place between the drum handling site & command post?	☐	
(v)	Are drums under pressure properly controlled for prior to handling?	☐	
(vi)	Are drums containing packaged laboratory wastes treated as shock sensitive?	☐	
(**j**)(6)(i)	Are lab packs opened by trained and experienced personnel?	☐	
(ii)	Are lab packs showing crystallization treated as shock sensitive?	☐	
(**j**)(8)(ii-iii)	Are drum staging areas manageable with marked access and egress?	☐	
(iv)	Is bulking of drums conducted only after drum contents have been properly identified?	☐

HAZWOPER 1910.120 DRUM COMPLIANCE CHECKLIST (ICS-208-CG SSP-L)

Purpose: The HAZWOPER 1910.120 Drum Compliance Checklist is to ensure that incident response operations are in compliance with Title 29, Code of Federal Regulations Part 1910.120, Hazardous Waste Operations and Emergency Response whenever drums are encountered during an incident. This is an optional form.

Preparation: The HAZWOPER 1910.120 Drum Compliance Checklist is completed by the Safety Officer or his/her staff as frequently as necessary whenever the Safety Officer wants to ensure regulatory compliance. It is best used in conjunction with the Site Safety Plan Enforcement Log (ICS-208-CG SSP-H). The Site Safety Plan Forms (A-G) best meet some of the requirements. Other requirements are performance based and are best evaluated on scene by the Safety Officer or his/her staff.

Distribution: The HAZWOPER 1910.120 Drum Compliance Checklist should be maintained by the Safety Officer.

Instructions:

Item #	Item Title	Instructions
1	Incident Name	Print the name assigned to the incident.
2	Date/Time Prepared	Enter date (month, day, year) prepared.
3	Operational Period	Enter the time interval for which the assignment applies.
4	Safety Officer	Enter the name of the Safety Officer and means of contact.
5	Supervisor/Leader	The Supervisor/Leader who receives this form will enter their name here.
6	Location & size of site	Enter the geographical location of the site and the approximate square area.
7	For Emergencies Contact	Enter the name and way to contact the individual who handles emergencies.
8	Note	Tanks and vaults should also be treated in the same manner as described in the checklist (1910.120((j)(9)).
9.a.	Cites	These are the regulatory cites within 1910.120. The major headings are highlighted in bold. Informational cites or cites that are duplicative are not included.
9.b.	Requirement	This lists the requirement in a question format. Some require documentation or some form of action.
9.c.	Check Block	Enter the check if the site satisfies the requirement.
9.d.	Comments	This provides information on where else the requirement may be met. The user may also enter comments.
10	Prepared by	Enter the name and position of the person completing the worksheet.

KINDER MORGAN

EMERGENCY RESPONSE SITE SPECIFIC HEALTH & SAFETY PLAN

Date / Time:_____/_____

1. Incident Information:

Incident Type:

- ❑ **Fire / Explosion**
- ❑ **Spill / Release**
- ❑ **Rescue**
- ❑ **Injury**

Date: _____

Location: _____

_____

Time of Incident: _____

Incident Name: _____

_____

2. Products / Chemical Involved:

❑ Gasoline ❑ Diesel ❑ Jet Fuel ❑ Methanol ❑ DRA
❑ Fuel Additive ❑ Ethanol ❑ Ethane ❑ Butane
❑ Natural Gas ❑ Isobutane ❑ MCC Lubricity
❑ Crude Oil ❑ Propane ❑ Ethyl Mercaptan
❑ Other _____

(see Table 1 on back for chemical & physical properties)

MSDS available and reviewed: ❑ Yes

3. Primary Hazards:

❑ Fire ❑ Vapor ❑ Respiratory ❑ Skin

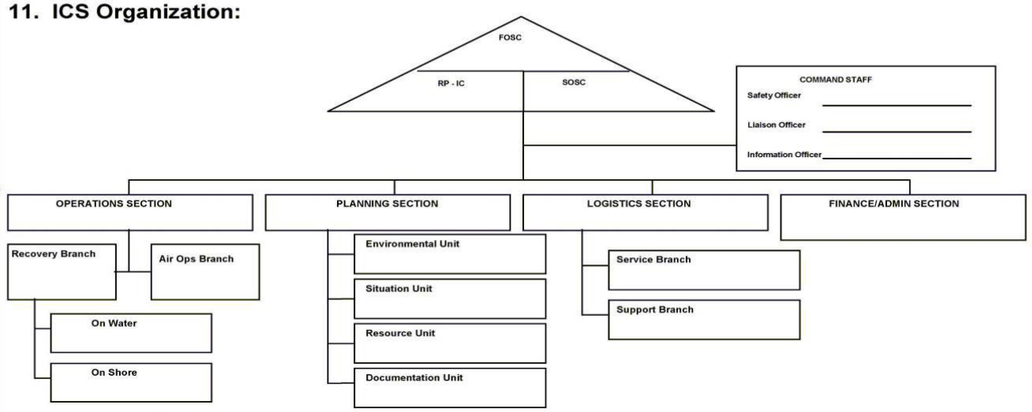
4. Personal Protective Equipment:

Cold Zone / Staging - ❑ Hardhat ❑ Safety Boots ❑ Traffic Vest
Warm Zone / Decon - Level ❑ A ❑ B ❑ C ❑ D
Hot Zone - Level ❑ A ❑ B ❑ C ❑ D
(see Table 2 on back for description of PPE by Level)

Incident Priority Checklist:

- ❑ 1. Evacuate self and others
- ❑ 2. Secure area/restrict access
- ❑ 3. Notification: Internal/External
- ❑ 4. Eliminate ignition sources
- ❑ 5. Initiate ICS
- ❑ 6. Conduct Site Assessment (H&S Plan)
- ❑ 7. Meet with arriving authorities
- ❑ 8. Mobilize response resources

11. ICS Organization:



5. Hot Zone Authorized Entrants:

❑ Fire Dept. ❑ KM
❑ Agency Reps. ❑ Contractors

6. Site Map:

Wind Direction (out of the ___)

❑ Weather Conditions: _____ ❑ Wind Direction ❑ Hazard Zones ❑ Staging
❑ Command Post ❑ Decon ❑ Cross streets ❑ Sensitive receptors (drainage, roadways, environmental sensitivity)

7. Secondary Hazards:

- ❑ Fire
- ❑ Heavy Equipment
- ❑ Excavations
- ❑ Noise
- ❑ Confined Spaces
- ❑ Heat Stress
- ❑ Cold Stress
- ❑ Rain/Lightning
- ❑ General (slip, trip, fall, established smoking area)
- ❑ Other: _____

(see Table 3 on back for secondary hazard precautions)

8. Evacuation Plan:

Evacuation signal : _____

Primary Evac. Area: _____

Secondary Evac. Area: _____

9. Nearest Hospital:

Notified: ❑ Yes ❑ No

Address: _____

_____

Phone #: _____

Directions: _____

_____

10. PROP 65 Notices: (California only)

- ❑ Incident is within Terminal or Station; notice(s) are posted at facility entrance(s).
- ❑ Incident of outside KM property; notice(s) are posted along incident site boundaries.

12. Enforcement / Regulatory Agencies (On Site):

Agency (Fed/State/Local)	Name	Contact Number	Time of Arrival

13. Contractors (On Site):

❑ Environ. _____ ❑ Clean up _____
❑ Repair _____ ❑ Consultant _____

14. Hot Zone Entry Objectives:

Objectives:

Why are people entering the Hot Zone? What is their objective?

_____

_____

_____

15. Decon Checklist:

- ❑ Establish and communicate location
- ❑ Plastic tarps and trash bags provided
- ❑ Supervision of decon provided
- ❑ Entrant log maintained
- ❑ Container of absorbent material provided
- ❑ Boot brush provided
- ❑ Folding chairs provided
- ❑ Lighting provided (if needed)

16. Atmospheric Monitoring:

Completed by - ❑ KM ❑ Fire Dept. ❑ Contractor ❑ Other: _____

Results: %LEL _____ PPM _____ Time: _____ Location: _____

Results: %LEL _____ PPM _____ Time: _____ Location: _____

17. Authorization Signatures:

Incident Commander:

Safety Officer:

INCIDENT COMMANDER PRIORITIES - SAFETY of ❑ KMEP PERSONNEL ❑ SURROUNDING COMMUNITY ❑ ENVIRONMENT

Table 1. Chemical & Physical Properties

Chemical Hazards	Flammability Range		Toxicity	Chemical / Physical Properties				NFPA 704
	LEL	UEL	PEL[a]/TLV[b]	Flash Pt.	Vapor Pressure	Vapor Density	Specific Gravity	Health/Flammable/Reactive
❑ Gasoline	1.3%	7.6%	300 ppm[a]	-45°F	~300 mmHg	5	0.74	1 / 3 / 0
❑ Diesel	0.9%	7.0%	NA	~150°F	~1 mmHg	>5	0.86	1 / 2 / 0
❑ Jet Fuel	~0.8%	~6.0%	500 ppm[a]	~110°F	5	>5	0.81	1 / 2 / 0
❑ Ethanol	3.3%	19.0%	1,000 ppm[b]	48°F	44 mmHg	>1	0.79	0 / 3 / 0
❑ Fuel Additive*								
❑ Drag Reducing Agent (DRA)*								2 / 2 / 0
❑ MCC Lubricity	Not Available	Not Available		>140°F	1.37 mmHg	>1	.93 - .94	2 / 2 / 0
❑ Natural Gasoline	1.4%	7.6%	--	-50 °F	12-26 psi	2.7	0.66-0.75	1 / 3 / 0
❑ Butane	1.6%	8.4%	800 ppm[a]	-101°F	43 psi	2.05	.58	1 / 4 / 0
❑ Ethane	2.9%	13.0%	not established	-275°F	800 psi	1.1	0.36	
❑ Isobutane	1.8%	8.4%	800 ppm[a]	-126°F	62 psi	2.0	0.563	1 / 4 / 0
❑ Propane	2.1%	9.5%	1000 ppm[a]	-156 °F	288 psi	1.53	0.51	1 / 4 / 0
❑ Crude Oil								
❑ Methanol	6.0%	36%	200 ppm	52°F	96 mm HG	1.1	.792	1 / 3 / 0
❑ Ethyl Mercaptan	2.8%	18%	10 ppm[a]/ .5 ppm[b]	-55 °F	16.2 psi	2.1	.845	2 / 4 / 0
❑ Other*								

* Describe:

1 atm = 760 mmHg = 14.7 psi

Table 2. PPE Levels

LEVEL A	LEVEL B	LEVEL C	LEVEL D
Respiratory Protection ❑ SCBA or Air Line ❑ Positive pressure full face piece supplied air w/ escape SCBA Required Equipment ❑ Totally encapsulating, gas tight chemical resistant suit ❑ Inner chemical resistant gloves ❑ Chemical resistant safety boots Optional Equipment ❑ Hearing protection ❑ Hard Hat ❑ Disposable glove & boot covers	Respiratory Protection ❑ SCBA or Air Line ❑ Positive pressure full face piece supplied air w/ escape SCBA Required Equipment ❑ Non-encapsulating chemical resistant suit (Tyvek/Nomex) ❑ Inner & outer chemical resistant gloves ❑ Chemical resistant safety boots ❑ Hard Hat Optional Equipment ❑ Hearing protection ❑ Coveralls ❑ Disposable boot covers ❑ Face shield/safety glasses	Respiratory Protection ❑ Full / Half Face respirator w/: ❑ cartridge (gas/vapor): _____ ❑ filter (particulate): _____ Required Equipment ❑ Non-encapsulating chemical resistant suit ❑ Tyvek ❑ Nomex ❑ Inner & outer chemical resistant gloves ❑ Chemical resistant safety boots ❑ Hard Hat Optional Equipment ❑ Hearing protection ❑ Coveralls ❑ Disposable boot covers ❑ Face shield/safety glasses	Respiratory Protection ❑ None Required Equipment ❑ Coveralls ❑ Safety Boots ❑ Safety Glasses ❑ Hard Hat Optional Equipment ❑ Hearing protection ❑ Gloves ❑ Face shield/safety glasses

Table 3. Secondary Hazards

Hazards	Recommended Precaution(s)
❑ Fire (potential)	• Remain safe distance away • Eliminate ignition sources • Keep upwind of vapor/smoke • Provide vapor suppression (if safe) • Do not impede Fire Dept. efforts
❑ Heavy Equipment	• Qualified operators only • Hardhats and safety boots needed around heavy equip. • Minimum 10ft. clearance from power lines • Make "one call" if excavating • Proper machine guarding in place
❑ Excavations	• Trenches/excavations equal to or greater than 5ft. deep must meet OSHA requirements • No one allowed to enter excavation > 5ft. unless shored, sloped or protected • Excavations < 5ft. and judged by competent person as cave-in hazard must also follow OSHA requirements
❑ Noise	• Portable generators & heavy equip. can generate potentially high noise levels • Hearing protection available to workers • Hearing protection must be worn in area with noise levels above 85dBA.
❑ Confined Spaces	• Site Safety Officer will determine whether confined space will be entered • All confined space entries must meet OSHA requirements (permits, atmospheric monitoring, attendants, etc.)
❑ Heat Stress	• Potential hazard when temp >80°F • Workers should take more breaks and drink plenty of appropriate liquids • More PPE = higher risk • Be aware of heat cramps (stomach cramps), heat exhaustion (excessive sweating, flushed/clammy skin) – treat with rest and liquids. Heat stroke (dry, hot, pale skin; no sweating) can be deadly – get medical help immediately, reduce core body temp by applying cold water to body & fanning.
❑ Cold Stress	• Skin takes on gray-glossy look • Appendages become non-responsive • Blisters or sores may appear • Do not rub • Submerse affected areas in warm water or wrap in warm cloth.
❑ Rain / Lightning	• Stop excavation activities during excessive rainfall • Avoid shock hazards by stopping work during thunderstorm or lightening • Prevent & control erosion & transport of soils out of incident area.
❑ General	• Slip, trip & fall hazards • Keep work area clear of debris • Smoking not permitted in work areas • Use hand tools safely
❑ Other:	

Qualified Individual (QI) Notification Exercise

Internal Exercise Documentation

1. Date performed: _____
2. Company: _____
3. Exercise or actual response: _____
4. Person initiating exercise: _____
5. Name of person notified: _____
   Is this person identified in the response plan as the: ☐ QI ☐ AQI
6. Time initiated: _____
   Time QI or AQI responded: _____
7. Method used to contact:
   ☐ Telephone ☐ Pager ☐ Radio
   ☐ Other _____
8. Description of emergency scenario:

   _____

   _____
9. Evaluation:

   _____

   _____
9. Changes to be implemented and provide timetable for implementation of those items:

   _____

   _____
10. Identify which components of your response plan were exercised during this particular exercise:

Organizational Design

- ☐ Notifications
- ☐ Staff mobilization
- ☐ Ability to operate within the response management system described in the plan

Operational Response

- ☐ Discharge control
- ☐ Assessment of discharge
- ☐ Containment of discharge
- ☐ Recovery of spilled material
- ☐ Protection of economically and environmentally sensitive areas
- ☐ Disposal of recovered product

Response Support

- ☐ Communications
- ☐ Transportation
- ☐ Personnel support
- ☐ Equipment maintenance and support
- ☐ Procurement
- ☐ Documentation

Certifying Signature: _____ Name (Printed): _____
Date: _____

Response Team Tabletop Exercise

Internal Exercise Documentation

1. Date(s) performed: _____
2. Company: _____
3. Exercise or actual response: _____
   Exercise type: ☐ Announced ☐ Unannounced
4. Location of exercise: _____
5. Time started: _____
   Time completed: _____
6. Response plan scenario used (check one):
   ☐ Small ☐ Medium ☐ Worst case discharge
   Size of (simulated) spill _____ Bbls
7. Describe how the following objectives were exercised:
   a) Response Team's knowledge of oil spill response plan:

   b) Proper notifications:

   c) Communications System:

   d) Response Team's ability to access contracted OSRO:

Response Team Tabletop Exercise

Internal Exercise Documentation (Cont'd)

e) Response Team's ability to coordinate spill response with OSC, state and applicable agencies:

_____

_____

_____

f) Response Team's ability to access sensitive site and resource information in Area Contingency Plan:

_____

_____

_____

_____

_____

_____

8. Identify which components of your response plan were exercised:

_____

_____

_____

_____

9. Changes to be implemented and timetable for implementation of those changes:

_____

_____

_____

_____

10. Attach description of lesson(s) learned and person(s) responsible for follow up of corrective measures.

Certifying Signature: _____ Name (Printed): _____

Date: _____

RE: Galena Park Terminal, FRP-06-TX-00024

Dear Mr. Cotie:

This letter is to notify you that the United States Environmental Protection Agency (EPA) has approved your Facility Response Plan. All appropriate liability requirements set forth in the Clean Water Act (CWA) 311(j)(5), as amended by the Oil Pollution Act of 1990 are still applicable. This regulatory approval was based upon technical review of the plan submissions. Please be advised that the EPA will continue to monitor your facility's approval status through site inspections and information validation.

If the EPA determines during its next review, or during field verification, that the response plan is inadequate, or if the EPA acquires information which indicates your response plan is inadequate to manage potential discharges, the EPA will require appropriate revisions to your plan. Failure to make such revisions may affect your plan's approved status.

If you have any questions concerning this letter, please contact my office at (214) 665-7368.

Sincerely,

Bryant Smalley
Oil Spill & Response Team Leader
Federal On-Scene Coordinator
USEPA R6 (6SF-EO)

APPENDIX I

REGULATORY CERTIFICATIONS

Certification of the Applicability of the EPA Substantial Harm Criteria

FACILITY NAME: Kinder Morgan Galena Park Terminal
FACILITY ADDRESS: 906 Clinton Drive, Galena Park, Texas 77547

(Detailed Facility information, including data required for the Response Plan Cover Sheet, follows this certification page)

1. Does the facility transfer oil over water to or from vessels ***and*** does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?	Yes		No	
	X			
2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area?	Yes		No	
			X	
3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to 40 CFR Part 112 or a comparable formula[1]) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? For further description of fish and wildlife and sensitive environments, see Appendices I, II, and III to DOC/NOAA's "Guidance for Facility and Vessel Response Plans: Fish and Wildlife and Sensitive Environments" (59 FR 14713, March 29, 1994) and the applicable Area Contingency Plan.	Yes		No	
	X			
4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to 40 CFR Part 112 or a comparable formula[1]) such that a discharge from the facility would shut down a public drinking water intake[2]?	Yes		No	
			X	
5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons ***and*** has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?	Yes		No	
			X	

[1] If a comparable formula is used, documentation of the reliability and analytical soundness of the comparable formula must be attached to this form.

[2] For the purposes of 40 CFR part 112, public drinking water intakes are analogous to public water systems as described at 40 CFR 143.2(c).

CERTIFICATION

I hereby certify the following:

- Under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information, I believe that the submitted information is true, accurate, and complete.
- The information and procedures contained herein are considered to be accurate as of this date and are consistent with the National Contingency Plan (NCP) and applicable Area Contingency Plans (ACP) as detailed in Section 1.5.

Operator's Statement for DOT PHMSA Significant and Substantial Harm

FACILITY NAME: Kinder Morgan Galena Park Terminal
FACILITY ADDRESS: 906 Clinton Drive,
Galena Park, Texas 77547

Is the pipeline greater than 6 5/8 inches (168 millimeters) in outside nominal diameter, greater than 10 miles (16 kilometers) in length?

YES _____ NO X

If Yes, **and** if the line section meets one (1) or more of the following criteria:--

(1) Has experienced a release greater than 1,000 barrels (159 cubic meters) within the previous five years,

YES _____ NO X

(2) Has experienced two or more reportable releases, as defined in Sec. 195.50, within the previous five years,

YES _____ NO X

(3) Containing any electric resistance welded pipe, manufactured prior to 1970, operates at a maximum operating pressure established under Sec. 195.406 that corresponds to a stress level greater than 50 percent of the specified minimum yield strength of the pipe,

YES _____ NO X

(4) Is located within a 5 mile (8 kilometer) radius of potentially affected public drinking water intakes and could reasonably be expected to reach public drinking water intakes, or

YES _____ NO X

(5) Is located within a 1 mile (1.6 kilometer) radius of potentially affected environmentally sensitive areas, and could reasonably be expected to reach these areas.

YES X NO _____

Then the pipeline is considered a substantial harm facility.

CERTIFICATION

Based on the following criteria per 49 CFR 194, the Facility can be classified as substantial harm but not significant and substantial harm because the facility is less than 10 miles in length.

2.1 PLAN SCOPE AND GENERAL INFORMATION

2.1.1 DESCRIPTION OF Galena Park Terminal

The Galena Park terminal is a storage terminal on the Houston Ship Channel. Kinder Morgan Terminals is the terminal operator and is responsible for the day-to-day operation of the facility.

2.1.2 WHAT IS THE PURPOSE OF THIS PLAN?

This Emergency Action Plan is to be utilized by the Galena Park Terminal in the event of a fire, explosion, accidental release, or other natural or man-made emergency at this terminal. The purpose of this plan is to minimize hazards to human health, the environment, and property. The intent of this plan is to protect the work force, the surrounding community, the environment, and property from fire, explosion, or any unplanned sudden or non-sudden accidental release of hazardous or flammable commodities at this location, or other natural disasters. This plan is intended to meet the requirements of OSHA, 29 CFR 1910.38- Emergency Action Plan.

2.1.3 WHEN IS THE PLAN TO BE IMPLEMENTED?

In the event that one or more of the following emergencies occur, this contingency plan will be implemented immediately.

- Fire & Explosion: Any fire or potential fire that involves a commodity has the potential to spread, or has the potential to release toxic fumes. Any explosion or potential explosion that occurs in, on, or near the facility. This includes any fires of explosions involving hazardous waste operations or materials.

- Uncontrolled release of materials: Any release or potential release of hazardous material, petroleum-based material, hazardous waste or other material that may cause undesirable environmental damage.

- Vapor Release: Any release of toxic fumes and/or vapors, which may be hazardous to the personnel of the facility or the surrounding community.

- Acts of God: Any incidents related to weather or acts of God, which cause the facility to be in imminent danger.

- Security Incidents: Including terminal break-ins and bomb threats.

2.2 FACILITY OWNER / OPERATOR INFORMATION

Facility Name & Address:
Galena Park Terminal
906 Clinton Dr.
Galena Park, TX 77547

Phone: 713.703.9047
Fax:
County: Harris

Ownership ofFacility Kinder Morgan

Operator of Facility
Kinder Morgan
1001 Louisiana St, Suite 1000
Houston, TX 77002

Terminal Manager:
Robert Hammons
Office number: 713-654-6046
Mobile number: 281-844-0552
Ops Manager:
Corey McGuire
Office number: 832-690-5515
Mobile number: 832-963-4373

General Manager
Jeff Hersperger
Office Number: 832.900.5061
Mobile number: 713.202.9183

2.3 AUTHORZATION FOR NECESSARY RESOURCES

In the event of an emergency the first person on-scene is the Incident Commander (IC) until relieved by a more qualified individual. I hereby authorize the Incident Commander at this facility to commit the necessary resources in order to prevent and minimize harm to human health, the environment, and property in the event of an emergency at the facility.

Jeff Hersperger

Jeff Hersperger
Gulf Liquids General Manager
Kinder Morgan Terminals

Date

2.4 Command Structure and Key Personnel

As the emergency escalates, the following persons are trained and empowered to act as the IC. The Kinder Morgan IC will act as the IC until relieved by municipal response agencies or participate in a Unified Command structure for the incident. The IC is responsible for directing facility personnel and resources to safely mitigate any facility emergencies.

INCIDENT COMMANDER				
TITLE	**NAME**	**TITLE**	**HOME PHONE**	**CELL PHONE**
Incident Commander	Robert Hammons	Terminal Manager	NA	281-844-0552
Incident Commander Alternate	Corey McGuire	Operations Manager	NA	832-963-4373

During ANY emergency condition the Incident Commander's actions must be based upon the following decision factors:

1. **LIFE SAFETY** - Protection of life, health and safety of terminal employees, contractors, visitor and the general public.
2. **INCIDENT STABILIZATION** - Protection of the environment including surface water, air and land receptors.
3. **PROPERTY CONSERVATION** - Protection of property, equipment and customer products.
4. **SYSTEM AND BUSINESS RESTORATION –** In no case will business restoration take priority over the protection of human health and safety, the environment, or property protection

If the Incident Commander determines that the threat may extend to outside the facility, the Incident Commander will notify, or cause to be notified, the proper authorities for evacuation (Emergency Services). Only the proper emergency services (Police and Fire Departments) will direct evacuation of persons outside this facility. The Incident Commanders duties include but are not limited to:

1. Activating the appropriate Plan.
2. Identifying hazards and risks involved in the situation.
3. Activating internal facility alarms or communication systems to notify all applicable personnel.
4. Establishing a staging area for equipment, resources and personnel.
5. Setting up an initial perimeter for security and entrance.
6. Notifying, if needed, the Police Department, Fire Department, and any applicable State and Federal organizations.
7. Assuming overall authority for managing the emergency unless higher command arrives (e.g., Fire Department Chief).
8. Performing emergency response termination procedures.
9. Conducting emergency response critique and arranging follow-up procedures.
10. Stopping an activity if a safety concern arises.

If an emergency escalates additional roles may be required to manage equipment & resources, establish additional support facilities, and maintain communication during the incident. The following key personnel at this facility have been trained to fill the following roles:

INCIDENT COMMAND SYSTEM - KEY PERSONNEL		
TITLE	**NAME**	**CELL PHONE**
Site Safety Officer	Greg Allen	713.447.8856
Ops Section Chief	Field Controller	713.703.9047
Logistics/Planning Section Chief	Gary Tredup Allen Rhodes	713-248-3078 713-201-8762
Financial/Administrative Section Chief	Andy Wu	281-620-8735
FIRST AID / MEDICAL PERSONNEL:		
ERT Members	ERT Members	Radio Channel – GP Ops 1
AREA/REGION SAFETY COORDINATOR:		
Regional EHS Manager	Tony Bundick	713-208-9795

During some emergency situations, it will be necessary for some specially assigned personnel to remain at the work areas to perform critical operations. Critical Operations Personnel are trained annually on the following procedures:

- T-O&M 1101-Response to Notice of Emergency or Abnormal Operations
- T-O&M 11002-Response to Abnormal Operation (Pressure & Flow Control)

Personnel involved in critical operations may remain on the site upon the permission of the Incident Commander or the site designated official. The following are the assigned critical operations personnel:

Critical Operations Personnel		
Work Area	**Job Title**	**Description of Assignment**
Control Room	Controller	Pipeline Controller

2.4.1 EMERGENCY OPERATIONS CENTER (EOC)

The Emergency Operations Center (EOC) shall be activated during an emergency that has overwhelmed the normal day to day functions of the onsite first responders/ERT members or when the Incident Commander determines EOC activation is necessary. In addition to the EOC if additional support is needed, the Crisis Support Team (CST) shall be activated. The following defines the levels of incidents and at which the EOC should be activated:

- ***Level "0" First Responder (No danger)***
- ***Level "1" ERT Activation (Minimal)***
- ***Level "2" EOC/ERT Activation (Moderate)***
- ***Level "3" EOC/ERT/CST Activation (Extreme)***

The HBU Training Room will serve as the EOC for any emergency affecting the terminal. If the HBU Training Room is untenable due to fire, vapor release or terminal evacuation a temporary EOC will be established off site at the gathering point.

2.4.2 Employee Responsibilities

- When an evacuation is ordered the designated employee will take the visitors log to the rally point unless recovering the log threatens injury or life.
- The EAP Grab Binder(s) should be taken to the rally point.
- When possible, within the first five minutes of the evacuation the designated employee will take a roll call listing all visitors on the roll call sheet located in Appendix A of the EAP Grab Binder and verify all employees and visitors are present.

2.4.3 Emergency Points of Contact (POC)

The Emergency POCs are maintained in Appendix B of the EAP Grab Binder. The Emergency POCs are to be up to date at all times.

2.4.4 Off Site EOC

In case the emergency situation does not permit any of the personnel to remain at the facility, the IC or other site designated official shall notify the appropriate offices to initiate backups.
The following offices should be contacted (if applicable):

Name/Location: **Park 225**

An offsite EOC should be established at the above listed location. The role of the Off Site EOC is to coordinate support with external agencies during terminal emergency evacuation operations and provide a communication link to senior management. The IC has the responsibility to report their incident status and necessary resource requests, to manage the incident, to outside agencies and Kinder Morgan EOC.
The following materials should be taken to ensure continuity of communications and response:

1. Emergency Response Grab Binder(s)
2. Copy of facility SDS
3. Customer Contact List
4. Means of communication (cellular telephone, terminal portable radio).

2.5 FACILITY EMERGENCY NOTIFICATION CODE SYSTEM

The terminal uses portable radios for normal operating communications. These radios operate on a designated private frequency. The terminal emergency notification system will use these portable radios for notification of both initial emergency on the terminal and personnel notification of emergency type. Prior to being allowed on the terminal yard, all employees, contractors and visitors will be provided with a safety briefing. In addition to radio communication, the Whelen alarm will be sounded and given direction.

Employees are trained and will receive periodic re-training on incident reporting and the notification code system. Records of this training will be maintained as part of the terminal safety training procedures.

- EVACUATE ALARM - Shut down all equipment and all personnel assemble at evacuation points
- MUSTER ALARM - Shut down all equipment and all personnel assemble at muster points
- SHELTER IN PLACE – Seek shelter if working outside
- ALL CLEAR – The emergency situation is fully resolved and return to normal operations
- LIGHTNING ALARM- Shut down all work and seek shelter

Incident Termination: The IC will have the sole authority and responsibility to sound the all-clear based upon incident conditions, local responders or other authority.
Upon notification or realization of an emergency condition, the IC will use the appropriate action guides to take protective actions and notifications necessary of-site resources and internal chain of command contacts listed in Appendix B. If the IC judges that the threat may extend to outside the facility, the IC will notify, or cause to be notified, the proper authorities for evacuation (Emergency Services). Only the proper emergency services (Police and Fire Departments) will direct evacuation of persons outside this facility.

Upon hearing an Emergency Notification Alarm, all office, yard and shop personnel will do the following unless otherwise instructed by the IC or his/her designee:

1. Sound Whelen Alarm
2. Shut down all on-going systems (valves, vehicles, motors, pumps, etc.)
3. Clear aisles and drives for emergency traffic/vehicles
4. Report to the assembly area. The assembly area for this facility is:
   Muster Area # 5: Fire house
   Muster Area # 6: 5-9 Building
   Muster Area # 7: Contractor Gate
   Muster Area # 8: HBU North Fence
5. The IC will ensure that all persons and personnel, outside vendors, and visitors are present and accounted for.

2.6 SAFE SEARCH TEAMS

In some emergency situations a safe search team, comprised of Kinder Morgan ERT members, (minimum of two persons per team) may be needed to locate missing employees or visitors. Safe search teams are limited to conducting searches that do not impose any threat to the searcher and are to be conducted utilizing voice and visual techniques. Constant contact must be maintained with the Incident Commander.

2.7 FACILTY MAPS

Facility map(s) are placed in strategic locations throughout the terminal and Appendix D of this plan. The facility map(s) contain the following information:

1. Rally Points/Muster locations and evacuation routes for the Terminal are located in the following areas as noted in the site map(s):
   Muster Area # 5: Fire house
   Muster Area # 6: 5-9 Building
   Muster Area # 7: Contractor Gate
   Muster Area # 8: HBU North Fence
2. Building Emergency Exits/Evacuation Routes
3. Emergency Shutdown Devices (ESDs) **Appendix D**
4. Evacuation Routes
5. First Aid Stations
6. Eye washes/showers
7. Fire extinguishing equipment
8. Meeting Location

MEDIA INTERACTION

No person at the facility is authorized to speak or respond to the media when this plan is enacted. All inquiries by the media shall be referred to Kinder Morgan Corporate Communications:

Kinder Morgan
Corporate Communications
1001 Louisiana St, Suite 1000
Houston, TX 77002

Phone:
1. 713-369-8060
2. 713-369-9176
3. 713-420-6828

The only appropriate response to the media is as follows:

No one at this facility, including myself, is authorized to respond to a media inquiry. Any request for information should be addressed to Media Communications of Kinder Morgan. The address and phone number for that person is:

Corporate Communications
1000 Louisiana Street, Suite 1000
Houston, TX 77002

1. 713-369-8060
2. 713-369-9176
3. 713-420-6828

The media should be kept as far away as possible. The security forces at the facility should be in charge to keep all spectators, including the media, at a safe distance.

Unless specifically authorized by the Media Communications, at no time will the media be allowed on the facility property, to take photographs, video or audio recordings. If the media requests to take photographs, video or audio recordings, they may only do so if Media Communications specifically permits and controls the media.

3 Emergency Procedures

Emergency equipment at the facility is listed in Appendix

3.1 Rescue and Medical Aid

3.1.1 Immediate Emergency Response

Search and Rescue efforts, as part of any EAP, inherently have safety risk associated with the activities. In the event of an emergency there will not be time for a JHA, but as part of drilling & preparation safety issues must be addressed. A JHA should be prepopulated for rescue activities prior to an emergency.

3.1.2 Safe Search Team

In some emergency situations a safe search team (minimum of two persons per team) may be needed to locate missing employees, contractors or visitors. Safe search teams are limited to conducting searches that do not impose any threat to the searchers and are to be conducted utilizing voice and visual techniques. Constant contact must be maintained with the Terminal/Facility Manager or Incident Commander.

3.1.3 Rescue and Medical Aid

If it is necessary to rescue personnel and/or perform medical aid treatment, only trained assigned personnel should perform these functions. All personnel assigned these functions are required to keep their training current. The administering of First Aid/CPR is strictly voluntary “Good Samaritan”. Any person administering First Aid/CPR on a voluntary basis who feels that they may have come in contact with blood or other potentially infectious material will accompany the injured to the clinic or hospital for treatment and/or evaluation

MOB Technical Rescue

If it becomes necessary to conduct Man Overboard (MOB) rescue, only properly trained personnel with the correct equipment should attempt retrieval of a MOB victim from the water. Personnel attempting rescue must be adequately trained on the unique circumstances of water rescue, and practice with the equipment used for water rescue. Emphasis on Rescuer Safety is paramount in these cases to avoid the Rescuer from becoming a victim. The primary goal of water rescue is to (1) get the victim out of the water and (2) keep the victim warm & transport where 1st Aid can be adequately administered. Refer to Section 5 of the EAP for details on MOB Response & Rescue.

3.2 Emergency Shutdown

When an emergency shutdown is determined to be necessary, the Terminal/Facility Manager or Incident Commander will assign properly trained personnel to shut down critical operations to assure proper emergency control.

3.3 After Action Review

After each incident, the incident and Emergency Response Plan shall be reviewed and revised as necessary. This review shall involve answering the following questions:

1) What caused the emergency?
2) Was it preventable? If so, how?
3) Were inadequate or incorrect orders given or actions taken?
4) Were these the result of bad judgment, wrong or insufficient information, or poor procedures?
5) Can procedures or training be improved?

See appendix Z for template

3.4 Fire

3.4.1 Fire Reporting and Response

In some instances, immediate action can be taken to eliminate the emergency condition prior to further notification. Employees must use their own judgment, experience, and training to make this decision. Fire/Explosions Emergency Checklist is located in Appendix G of the EAP Grab Binder. When required perform notification as follows:

1. Notify Kinder Morgan ERT, Police if necessary, and the Terminal Manager in all incidents, giving the following information:
    - Name and Title
    - The nature of the emergency
    - Any known injuries
    - The exact location and best entry point
2. An ERL (Emergency Response Line) may be required per T-O&M 159 Incident Reporting and Investigation.

3.4.2 Fire Types

3.4.2.1 Contained

These are small fires that are easily extinguishable. The following steps should occur for contained fires:

- Trained personnel should extinguish fire with fire extinguishers.
- As soon as a fire is detected, the Terminal Manager and ERT, if necessary, are to be notified immediately.
- The Incident Commander will determine the appropriate response and whether evacuation is necessary.
- Confine fire by closing doors and windows to area involved.
- Clean up and sanitation procedures should not commence until directed by the Incident Commander to ensure any required investigation and reporting evidence is gathered.
- Terminal Manager will file a report in accordance with T-O&M 159 Incident Reporting and Investigation.

3.4.2.2 Uncontrollable

These are fires that cannot be easily contained and extinguished with fire extinguishers. This includes fires close to the building that are possible threats. The following steps should occur for uncontrollable fires:

- The alarm should be sounded for a full evacuation and Terminal Manager notified.
- The Terminal Manager will determine whether to conduct an emergency or controlled shutdown.
- All non-essential employees will evacuate through the nearest and safest route to the Primary Rally Point unless otherwise directed.
- Employees should close all windows, doors and turn off equipment and lights if it does not pose a threat to their safety. All doors should remain unlocked.
- Roll call will be held in accordance with section 2.4.2 of this plan. If there are any missing employees or visitors a safe search will be conducted in accordance with section 2.6 of this plan.
- Any missing persons that cannot be accounted for should be communicated to the ERT for search and rescue with their name and last known location.
- Personnel are not to return to the evacuated area until given the all clear by the Incident Commander after the scene has been deemed safe.

3.4.3 Fire Evacuation

In the event of a fire evacuation employees should practice "RACE"

R	Remain calm
A	Alarm, activate nearest alarm pull, verbally inform employees
C	Contain fire at point of origin by closing windows and doors
E	Evacuate

In addition to following the guidelines of this plan you should:

- Prepare to evacuate by way of nearest exit (see facility map(s)).
- Close, but do not lock doors as you leave.
- Before exiting through any close door, check for heat and the presence of fire behind the door.
- In the event you are unable to exit the building:
  - Remain calm.
  - Remain low, crawl if necessary.
  - Place a cloth, wet if possible, over your mouth to serve as a filter
  - Signal for help from a window and/or call 911 or employee on site by cell phone or office phone.
- Upon exiting building go to primary rally point unless otherwise directed by the Incident Commander.
- Cessation of an alarm or departure of the ERT is not an "all clear" only re-enter the building when given the all clear to return by the Incident Commander.
- Assist Visitors during the emergency situation.

3.4.4 Flammable and Combustible Control

Flammable and Combustible Control will be accomplished in accordance with T-O&M 119 Flammable/Combustible Liquid Storage

3.4.5 Petroleum, Oil and Lubricants (POL) Fuel Source Hazards

Only limited quantities of POL will be maintained at this terminal.

3.4.6 New Employee/Visitor Fire Hazards Brief

New employees and visitors are to be given a safety brief upon initial arrival to the terminal that includes fire safety.

3.5 Spill/Vapor Release

3.5.1 Incident Notification

If a spill or release occurs the IC shall be established and the Terminal Manager shall be immediately notified. The Terminal Manager will gather information pertaining to the incident and contact the EHS and initiate reporting procedures in accordance with T-O&M 159 Incident Reporting and Investigation. The Spill Response Checklist is located in Appendix H and shall be used in the event of a spill. The Vapor Release Checklist is located in Appendix I and shall be used in the event of a vapor release.

3.5.2 Spill Control

For small Spills and Leaks

- ELIMINATE all ignition sources (no smoking, flares, sparks or flames in immediate area).
- All equipment used when handling the product must be grounded.
- Do not touch or walk through spilled material.
- Stop leak if you can do it without risk.
- If possible, turn leaking containers so that gas escapes rather than liquid.
- Use water/foam spray to reduce vapors or divert vapor cloud drift. Avoid allowing water runoff to contact spilled material.
- Do not direct water at spill or source of leak.
- Prevent spreading of vapors through sewers, ventilation systems and confined areas.
- Isolate area until gas has dispersed.

3.5.2.1 Basic Control

Basic control is the first step taken to prevent further release of the spill. Basic control may include shutting off a valve or shutting down a piece of machinery.

3.5.2.1.1 Containment

There are four types of procedures that can be taken to keep the involved material in its container.

1. Shut-off Valves: Shut-off valves may cause spills or releases. Ensure that all shut-off valves on the affected cylinder and/or drums are properly closed and secured.
2. Plugging: Plugging devices may be placed or pounded into a penetration to stop a leak. Pieces of wood, golf tees, soap or stakes wrapped with cloth may be used. Metal objects shall not be used for plugging purposes due to the possibility of sparking.
3. Patching: Materials like clay or putty may be used to patch a leak. Look for decomposition of the patching compound as well as the possibility of the build-up of internal pressure, which could cause the patch to fail.
4. Over-packing: Over-packing is accomplished by placing a damaged container into a larger undamaged container.

3.5.2.1.2 Confinement

There are three types of procedures which can be used to keep a material in a confined area.

1. Diking: Materials like sand, earth, straw or absorbent material can be placed around the perimeter of the leak. The type of diking material used shall be compatible with the spilled hazardous material.
2. Blocking: Drains, ditches or storm sewers shall be covered or a dike built to prevent run-off of spilled materials. Blocking can be accomplished with absorbent pads or a heavy piece of plastic.
3. Absorption: Run-off can sometimes be absorbed with dirt, sand, soda ash, saw dust, vermiculite or other absorbent materials. The absorbent material shall be positioned so that the spilled material runs into it. Care shall be taken to ensure that the absorbent is compatible with the spill.

3.6 Medical Emergencies

In the event of a Medical Emergency, including those from accidental exposures, the supervisor shall notify Kinder Morgan ERT for medical assessment of the individual. If the emergency is life threatening, call 911 immediately. For a list of medical clinics, refer to Appendix B.

3.7 Severe Weather

The purpose of this Severe Weather Plan is to provide a course of action to be used during a severe weather event to minimize the potential for injury and loss of life that can result during a severe weather event. This plan should be reviewed at least annually by all employees to ensure that everyone knows where the severe weather shelter area is and what to do when the severe weather siren activate. Tornadoes develop from high winds associated with thunderstorm activity or in conjunction with hurricanes. Typically spring and late summer thru early fall seasons provide the best conditions conducive to tornado formation, although, a tornado can form during any season.

3.7.1 Hurricanes

See the Gulf Liquids Hurricane Plan.

3.7.2 Tornadoes

The National Weather Service has defined four severe weather alerts that are of concern. The actions recommended are intended to be the minimum responses necessary for this severe weather plan. The Tornado Checklist in Appendix K will be used.

3.7.3 Severe Thunderstorm Watch

A severe thunderstorm watch means weather conditions are such that a severe thunderstorm could develop, but has not at this time. This alert usually lasts for five or six (5 or 6) hours.

3.7.4 Severe Thunderstorm Warning

A severe thunderstorm warning means a severe thunderstorm has developed and will probably affect those areas stated in the alert message.

3.7.5 Tornado Watch

A tornado watch means weather conditions are such that a tornado could develop, but has not at this time. This alert usually lasts for five or six (5 or 6) hours.

3.7.6 Tornado Warning

A tornado warning means a tornado has formed and was indicated by weather radar or sighted, and may affect those areas stated in the alert. This alert usually lasts for one (1) hour.

3.7.6.1 Tornado Danger Signs

- Dark, often greenish clouds- a phenomenon caused by hail
- Wall cloud—an isolated lowering of the base of a thunderstorm
- Cloud of debris
- Large hail
- Funnel cloud—a visible rotating extension of the cloud base
- Roaring noise

3.7.7 Effects of High Winds

The causes of damage to buildings by a tornado may be classified in one of three categories which include: extreme winds, missiles, collapse. All buildings have at least one undesirable structural feature relating to the effects of a tornado. Examples are: large areas of glass, long roof/ceiling spans, wind tunnels, and load-bearing wall construction. If you should be trapped in a building and cannot evacuate, you should observe the following:

- Avoid glass
- Avoid interior and exterior doors
- Utilize interior spaces with short spans
- Keep occupants as far away as possible from entrances
- Avoid areas expected to become wind tunnels
- Put as many walls as possible between you and the exterior of the building

3.7.8 Emergency Notification System

Severe weather alerts are transmitted by three means: via severe weather radios, Whelen alarm, and internet located within the terminal office.

3.7.9 Minimum Actions to Be Take Based on Specific Severe Weather Alerts

- SEVERE THUNDERSTORM WATCH-Be aware that conditions may be ripe for the development of a tornado.
- SEVERE THUNDERSTORM WARNING-Review your severe weather action plan. Usual activities can continue but be prepared to seek shelter. Avoid going outside if possible.
- TORNADO WATCH-Review your severe weather action plan. Usual activities can continue but be prepared to seek shelter.
- TORNADO WARNING-When a tornado warning is issued, activating the sirens and broadcasting a tornado warning via the severe weather radios, all supervisors shall immediately lead their employees to the tornado shelter. Persons responsible for severe weather radios in the building should unplug them and take them to the shelter area to monitor for additional warnings. The designated employee should bring the visitors log.

Roll call should be taken within 3 minutes. The tornado shelter door should not be opened. Under no circumstances should persons leave the shelter during a warning.

The warnings will last for an hour from the last siren unless a shorter time is indicated by the National Weather Service. Building occupants should remain in the shelter area for at least that long unless a new warning is issued and the sirens activate again, or the National Weather Service issues a release.

Remember, you typically have only three minutes to reach a shelter so do not delay. Waiting can mean the difference between life and death. Everyone must be familiar with the location of the severe weather shelter area. Persons in the shelter should tune to local radio stations, their severe weather radio, and/or a NOAA weather radio for additional information.

3.7.9.1 Severe Weather Kits

The tornado shelter should have a Severe Weather Kit. The kit should include the following items:

- Flashlight(s), with extra batteries
- Battery operated Radio, with extra batteries
- NOAA Weather Radio if available
- First-aid Kit
- An A-B-C-type fire extinguisher

3.7.9.2 Floor Plan & Shelter Area Identification

Floor plans and tornado shelter area are located along with the facility map of this plan as well as posted throughout the terminal.

3.7.9.3 Measures to Be Taken for a Tornado Touchdown at the Terminal

In the event of a touchdown on the premises all employees should assume the tornado position if they are unable to reach the tornado shelter. After contact all employees not in the tornado shelter should move to the tornado shelter area to be accounted for by the Activities Coordinator. The Terminal Manager or designated employees should assess the situation and contact the appropriate emergency response units. First Aid responders will administer first aid to those in need. Appropriate measures should be taken to extinguish any fires as detailed in section 5 of this plan.

3.8 Flooding

The following plan has been developed to establish appropriate procedures for responding to a flood emergency that affects terminal operations. A flood emergency exists if floodwater is uncontrolled and flowing beyond the area where the source of water is normally contained or controlled.

3.8.1 Response

When flooding is expected in the terminal area the Incident Command Team will meet to evaluate the potential to flood. After evaluation, if it is determined that it is very likely that buildings will flood or flooding is actually occurring the following preventive action shall be taken:

- Terminal Manager will notify the IC to initiate response utilizing the Flood Checklist Appendix L.
- The Incident Command Team shall check drainage to ensure it is functioning properly
- Supplies such as sand bags, flash lights, submersible pumps, hoses and emergency generators shall be obtained to prevent the flow of water into buildings and water sensitive product areas.

- Incident Command Team shall wear PPE as designated by EHS
- If flooding occurs and water begins accumulating EHS and the Terminal Manager shall conduct a hazard assessment of flooded areas prior to entry by response personnel. If EHS is not yet on site the Terminal Manager may conduct an assessment over the phone with EHS. EHS shall assess the following hazards:
    - health hazards (e.g., contaminated water either hazardous or bio-hazardous)
    - physical hazards (e.g., building design, existence of submerged office)
    - energized water, rushing water
- If safe to do so Incident Command Team shall de-energize any electrical equipment and outlets in the affected area. If flood occurs, maintain all safe and reasonable efforts to protect, buildings, products and equipment
- The Incident Command Team shall designate personnel to move any equipment, supplies or products to higher areas
- All non-essential personnel shall be evacuated
- Activities coordinator shall restrict access to the affected area by appropriate means

3.8.2 Recovery for Floods

Recovery for floods shall be handled as follows:

- Incident Command Team shall determine if any building systems (e.g., fire alarm, fire suppression), building equipment or building materials have been affected and the extent of the damage.
- If the water is not considered hazardous Incident Command Team shall initiate water removal activities.
- Terminal Manager or EHS shall immediately contact remediation professionals if damaged building materials need to be removed or dried and disinfected or when the water is hazardous.
- The affected areas shall be evaluated for safety hazards (e.g., open walls building materials, tools left out in the area) or any health concerns (e.g., mold/fungal growth due to the flood or contaminated materials). Once those concerns have been addressed and resolved, EHS shall declare areas safe for re-occupancy

3.8.3 Re-Occupancy

EHS shall be responsible for assessing areas affected by a flood for re-occupancy. The affected areas shall be declared ready for re-occupancy when the construction work is complete or near complete and no longer poses a hazard to the occupants. The area shall be assessed to ensure that all wall and floor openings are closed up, tools and equipment have been removed from the area, and building systems (e.g., ventilation, fire alarm) have been restored.

3.8.4 Infection Control

When there is a possibility that water from flooding is hazardous or bio-hazardous, a remediation contractor shall complete the entire clean-up. The remediation contractor shall coordinate with EHS to determine appropriate remediation procedures, including infection control. EHS shall ensure that those remediation procedures are followed. The remediation contractor shall use appropriate disinfecting agents to clean affected areas when drying of or removal of building materials is complete. The remediation contractor shall decontaminate any equipment that is in the affected area during flooding from hazardous or bio-hazardous water.

3.9 Power Outages

The terminal may experience a power outage with or without severe weather in the area. Whenever a loss of power occurs, the emergency lighting units will be activated. If the power is soon restored, no significant action should be taken.

If the power is not restored immediately, all employees must shut down any equipment they are using that might cause damage or injury when the power is restored. After securing the work area, all employees are to go immediately to the main break area where they can be accounted for and remain there until power is restored or they are released by the Terminal Manager. After roll call is taken, the Incident Commander will send search teams in accordance with section 1.15.1 of this plan.

The Terminal Manager should contact the utility company as well as emergency services as needed.

Note: In some circumstances, the handset on a fax machine can be used to make phone calls when the main phone system is not working.

The Terminal Manager should gather information and make a determination of the magnitude of the outage to take appropriate action.

3.10 Bomb Threat

The purpose of responding to a bomb threat is to minimize injuries, damage to property, and disruption of terminal operations. When responding to a bomb threat the Terminal Manager or Incident Commander will order buildings secured, control traffic and employee/visitor movement, and obtain as much initial information as possible.

This section will cover bomb threat and evacuation. It describes the actions to take when a bomb threat is received.

Bomb threats are usually received by telephone or mail. Or they may be discovered by noticing a suspicious item. Each method requires special procedures to effectively obtain the maximum amount of information from the threat source.

The most popular method of making bomb threats is by telephone. It is important that as much information as possible be received from the caller. All bomb threats should be taken seriously. However, experience has shown that most anonymous threat calls are a hoax, intended to create an atmosphere of anxiety and panic in order to interrupt normal activities. Therefore, absent positive target identification (PTI) indicators or other credible information, an evacuation may not be considered appropriate.

3.10.1 Telephone Bomb Threats

When a telephone bomb threat is received, someone has actual knowledge that a device has been planted or a prankster wishes to disrupt an operation. Noting what is said and how it is said during a bomb threat call can help determine which of these reasons is true. The person receiving the call may be the only person to ever have contact with the potential bomber. When a bomb threat is received, the receiver must know what to do and how to do it, or valuable information will be lost. The Bomb Threat Checklist in Appendix M will be used if a bomb threat call is received.

Signaling another employee to listen in on the call is worked out in advance where working arrangements allow observation. The second person concentrates on the characteristics of the caller and any background

noises. The receiver of the call concentrates on the exact words of the caller. The receiver must try to keep the caller on the phone as long as possible to allow time to recognize background noises and gain additional information.

The receiver asks the caller for specific information as shown on the Bomb Threat Checklist. If the caller describes what it looks like, how it operates, and its general characteristics, this is known as a descriptive bomb threat. A descriptive bomb threat is probably real. The receiver documents the exact wording of the threat. For example, if the caller says, "Mary Jones, there is a bomb planted at your terminal. You and your coworkers have 20 minutes to clear out," the receiver must note all of that information.

Recording the exact date and time of the telephone phone call is important. By determining the time of the bomb threat, identification of the bomb site by background sounds may be possible.

The bomb threat checklist was developed to be placed near telephones. The Bomb Threat Checklist should be placed under telephones when possible for easy access.

The person receiving the bomb threat call immediately reports to the designated supervisor or security person with the completed bomb threat checklist. This action will facilitate proper emergency notifications and help lessen the possibility of panic. The receiver does NOT spread the word about the bomb threat before notifying the supervisor who then notifies the proper authorities and makes the decision to evacuate.

3.10.2 Mail Bombs

A small number of explosive devices have been mailed over the years resulting in death, injury, and destruction of property. A bomb can be enclosed in either a parcel or an envelope, its outward appearance limited only by the imagination of the sender. However, past mail bombs have exhibited some unique characteristics which can assist in identifying a suspect mailing.

A recipient of mail, who is suspicious of a letter or parcel and cannot verify the contents with the addressee or sender, must not open the article or put it in water or a confined space like a desk drawer or a filing cabinet. Recipients must isolate the suspected mail and evacuate the immediate area. If possible, windows are opened in the immediate area to help vent potential explosive gases. The proper authorities are immediately contacted to report the suspected mail bomb.

The following are some characteristics of mail bombs:

- Mail bombs may bear restricted endorsements such as "personal" or "private" when the addressee does not normally receive personal mail at the office
- Addressee's name and/or title may be inaccurate
- Mail may reflect distorted handwriting
- The name and address may be prepared with homemade labels or cut-and-paste lettering
- Mail may have protruding wires, aluminum foil, visible oil stains, and/or they may emit a peculiar odor
- Mail may have and excessive amount of postage stamps affixed
- Mail may feel rigid or appear uneven or lopsided
- Parcel bombs may be unprofessionally wrapped with several combinations of tape used to secure the package and may be marked "Fragile--Handle With Care" or "Rush--Do Not Delay"

- Parcel bombs may be an irregular shape or have soft spots or bulges
- Parcel bombs may make a buzzing or ticking noise or a sloshing sound
- Pressure or resistance may be noted when removing contents from an envelope or parcel

3.10.3 Management Responsibility

In all cases of bomb threats, the Terminal Manager will assess the seriousness of the threat using the following bomb threat assessment and bomb threat response guidelines. The manager should also notify law enforcement authorities.

3.10.4 Bomb Threat Assessment

When receiving a bomb threat the Terminal Manager should determine the credibility of the threat by considering:

- Time of day and day of week the threat is received
- Mode of the threat- telephone or mail
- Identity of the caller- child, male/female, young/old, drunk, foul language
- Specificity of the threat- time, location, type of explosive device
- Possibility of access to allow placing of the device

Did the caller identify any of the following PTIs?

- Time bomb is to detonate
- Target to be destroyed
- Bomb's construction, shape, or description
- Bomb's location

3.10.5 Bomb Threat Response Guidelines

3.10.5.1 Response

- Searches will normally be the most appropriate choice and should generally be the chosen response, if no PTIs or only one PTI was given in the threat.
- Evacuations should be ordered only when the call is judged to be serious, the threat credible, there is insufficient time to conduct a thorough search, and the judgment is made that employees will be at less risk evacuating or moving to a safe haven than remaining in place and seeking cover. If two or more PTIs are given in the bomb threat call, an evacuation is to be ordered.

3.10.5.2 Execution

- Initiate notification to employees and visitors
- Determine who is to search and in what area. In general, employees should search their own area to determine if there are any suspicious objects. Common areas should be searched by those most familiar with the areas.
- Notify public law enforcement and emergency services as appropriate; notify immediately if a suspicious object is found.
- If appropriate, determine who is to be evacuated and to what location.

- If evacuation is ordered before a search is done, determine for how long. Consider inclement weather and possible effect on operations if evacuation occurs at or near shift change.
- Ensure that roll call is held to account for all persons ordered to evacuate and determine that they have in fact evacuated and there is an orderly shutdown of operations, if required.
- Coordinate with local authorities to determine if the area needs to be searched and when operations can resume and people can return to their work stations.

3.10.5.3 Bomb Explosion

If there is a bomb explosion, the Terminal Manager should take these steps:

- Initiate the on-site emergency plan for fire and medical response if necessary.
- Determine if there are any injuries and attend to them immediately in accordance with section 3.4.2 of this document.
- Evacuate the surrounding area.
- Ensure no one goes near the scene of the explosion except to remove the injured.
- Control access to the area as other bombs may have been set to detonate at intervals.
- Advise police who will take charge of the situation.

3.10.5.4 Communication

Reliable communication from the bomb scene is essential. The Activities Coordinator will continually keep the Terminal Manager updated and informed of ongoing actions. However, radios will not be used within 100 meters of the affected area. The following are communications to be used to maintain contact with teams:

- Runners
- Whistles
- Voice

3.10.5.5 Bomb Threat Evacuation

Evacuation is not necessary for all bomb threats. Evacuation is determined by the Terminal Manager only after a thorough evaluation of all available information. The results of the bomb threat checklist will be a determining factor for evacuation. If the bomber describes in detail the type of device, its location, and/or the placing of the device, then the Terminal Manager will order an evacuation. When evacuation has been ordered the following should occur:

- All persons will make a preliminary search around their immediate areas for suspicious items.
- All persons, as they leave, will remove those items that they brought in (briefcases, thermos bottles, and lunch bags), turn off radios, and unplug office machines.
- Windows and doors will be left open to help dissipate any explosive force.
- All cabinets and drawers will be left unlocked to make it easier for the searchers.

When evacuation of a building is accomplished, only authorized personnel are permitted entry until the threat is resolved.

3.11 Emergency Drill

To ensure that the plan will meet current conditions and that all involved individuals will respond properly the plan shall be tested a minimum of annually. The drill evaluation shall include at a minimum the following:

- Evacuation and accountability of personnel
- Personnel familiarity with evacuation routes and rally points
- Proper functioning of alarm system
- Response time of personnel
- Adherence to plan procedures
- The drill must be evaluated as satisfactory by trained personnel from outside the facility (Environmental, Health & Safety Representative, a Subject Matter Expert, or an Operations Manager).

3.12 Documentation

All drills and exercises of the plan will be documented, indicating the results of the exercise and any problems that were encountered, along with recommendations for plan modifications. The Terminal Manager will complete the EAP Evaluation in Appendix R after drills and exercises and Form# 1900.004 EAP After Action Report after an event and maintain copies for review.

4 Post Incident Activity

4.1 INCIDENT DOCUMENTATION

4.1.1 REQUIRED REPORTS

4.1.1.1 TELEPHONIC NOTIFICATION

Immediately after the occurrence of a significant event such as those outlined in this plan, terminal personnel shall notify their Director of Operations **or** Assistant Director of Operations **and** the EHS Department to inform them of the event. This notification is crucial. The EHS Department is required to submit an Emergency Response List (ERL) notification for significant events which occur within KM. This system notifies Corporate Communications, Management, EHS, Legal and other pertinent staff of an occurrence within the network, giving them the advance notice necessary to begin gathering information needed when informing outside agencies of events at our terminals.

Kinder Morgan utilizes IMPACT as an event tracking system. Information input into the system tracks occurrences, events, root causes and corrective actions and assigns action items to the appropriate personnel to enact the corrective actions. This information is utilized throughout the company for environmental compliance, safety, medical, insurance and many other purposes.

4.1.1.2 WRITTEN NOTIFICATION

Within 24 hours of the incident, an initial written report will be forwarded to KM and will be distributed internally with-in ten (10) days after an incident necessitating implementation of the contingency plan. Appendix F can be utilized as part of the initial written report. The IC shall submit a written summary of the incident to Kinder Morgan Terminals management.

Written reports will be filed to State and Federal government agencies as required. Copies of the report will be maintained with the facility operating record. The report shall include:

1. Name, Address and Telephone number for KM management;
2. Name, Address and Telephone number of the facility;
3. Date, Time and Type of incident (for example; fire, spill, explosion etc.);
4. Name and quantity of materials involved;
5. Extent of injuries, if any;
6. An assessment of actual or potential hazards to human health of the environment, where applicable;
7. Estimated quantity and disposition of recovered material that resulted from the incident; and
8. A report of all notifications that were made including who was called, time of calls, and any other information obtained or derived from the notification calls.

4.1.1.3 HAZARDOUS WASTE INCIDENT REPORTING

Incidents involving hazardous waste must be reported to local, state and federal

regulatory agencies.

4.2 RESPONSE CRITIQUE AND PLAN REVIEW AND MODIFICATION PROCESS

After all response and mitigation activities have been completed the terminal and associated owner/operator management should complete an incident response critique to identify elements of the response system that fail, were ineffective or worked well.

Key baseline rules for any critique:

1. To be effective as learning tools critiques must be honest.
2. A clear review of the facts leading to the incident must be established.
3. A step-by-step review of response actions or timeline should be established.
4. Critical control points such as incident discovery, reporting, communication/notification and response activities need to identified and measured for timeliness, completeness and effectiveness.
5. Critical control points that were not effective should be flagged for review and modification as necessary.
6. Corrective action plans and responsibility for implementing corrective action are established and tracked until completed.
7. Applicability to other terminals or facilities should be identified and implement.
8. All participant interaction must be done to find ways to make improvements, not to find fault or blame those persons who performed incident management roles.

5.0 MOB RESPONSE

MOB Scenarios

Listed below are scenarios applicable to the Galena Park terminal MOB rescues.

- Worst case scenario: a facedown unresponsive victim in water
- Face up, unconscious victim in water
- Face up, conscious victim who is unable to self-rescue
- Face up, conscious victim who is able to self-rescue

How we react to a Man Overboard event depends on how well we have prepared for this type of emergency. Teammates conducting marine dock and water side operations, as well as designated rescuers, are to be familiar with and follow this plan in the event of a MOB emergency. Trained Gulf Area ERT members will assume command and perform rescue operations. **911 should be considered for all MOB rescues.**

What To Do If You Go Overboard

- Do not panic.
- Get someone's attention. Yell, wave your hands, use your rescue whistle, etc.
- Stay afloat and position yourself with your feet to the front.

- If possible, swim towards the dock or land (Self Rescue). Remember, your PFD is designed to keep you floating face-up. Trying to swim chest down may lead to exhaustion.
- PFDs are required when within 3 feet of an unguarded edge. In the event that you are not wearing a PFD and have gone overboard, tread water or float.
- If possible, steer yourself away from the barge/vessel rakes and permanent hollow based structures. Currents can push you under obstructions.
- If pulled under an object such as barge or dock, keep your hand(s) up to protect yourself and avoid coming into contact with the object.
- Avoid large piles of driftwood.

If man overboard involves cold conditions, it is important to realize physical exertion causes the body to lose heat.

.

5.1 Main Types Of Water Rescue

Self – Rescue: The MOB victim is conscious and alert but may be injured. S/he is able to grasp and hold on to a floatation device (i.e. life ring, PFD, etc.), communicate with observers / rescuers, swim to shore, climb a ladder, affix a lifting harness or otherwise extract himself from the water without assistance to land based assets. This is the preferred option in every MOB situation, provided the victim can mentally and physically perform the necessary actions.

Dockside / Landside Rescue: Observers & Gulf Area ERT members are able to assist the victim from land-based assets (docks, shoreline, gangway, pier, etc.) without use of watercraft or without entering the water. The MOB victim may be fully conscious & alert, or may be confused but alert enough to understand and follow basic instruction from observers & rescuers. S/he requires assistance from others using tools & aids (life ring with rope, rescue pole, etc.), coaching, and encouraging with some or all of the self-rescue methods. This person may have mental or physical impairments (trauma or medical conditions) which limit their ability to fully self-rescue, but can partially help themselves in the rescue effort. This option limits the risk to observers and rescuers while remaining effective in assisting the MOB victim.

Water Rescue: Trained Gulf Area ERT members are required to locate and extract the MOB victim from the water using a spill boat. The MOB victim may be: (1) fully conscious and alert, and simply cannot return to land due to distance from shore or swift currents, or (2) s/he may be confused but alert enough to understand and follow basic instruction from observers & rescuers, or (3) unconscious and mentally/physically unable to help themselves at all, and requires assistance from others to get out of the water. This person may have mental or physical impairments (trauma or medical conditions) which make them unable to self-rescue, or limit their ability to assist with rescue. Risk to rescuers is high, and rescuer safety is paramount. This is the least desirable, but sometimes only option for MOB victim rescue. Worst case scenario water rescue would be an unconscious/face down victim.

WARNING: Do not attempt to rescue a MOB victim by entering the water as you may become a second victim. Always call for help and assist the victim by throwing life rings.

MOB Initial Response Actions

- Remain calm. When someone goes in the water immediately yell “Man Overboard” to alert other crewmembers that someone has fallen in the water.
- If available, assign a person to keep the MOB in sight and clearly point towards them.
- If no other crew members are available, continue to yell “Man Overboard” until additional help arrives. This would include persons such as the PIC, Dock Watch and Line Watch teammates as well as the vessel POC, if available.

- Utilize radios to alert ERT, other teammates, crew leaders, safety, and others needed to assist in MOB rescue. Initiate Incident Command System, Form 201, and perform scene size up.
- Eye contact is crucial. Choppy water and strong channel currents can cause you to lose sight of the MOB victim. If the MOB victim is not on the surface, make note of the last place they were seen.
- If the rescue is at night, a spotlight will be required to assist with victim location. If the water activated strobe light on the employees PFD cannot be seen, illuminate the area.
- Throw a floatation device to the victim, such as a life ring, personal flotation device, buoy, etc.
- Throw more than one flotation device.
- If a search becomes necessary, emergency responders will have an immediate visual reference on the direction of drift, which can benefit the search operation.

Take note of all conditions, such as wind and current. Notify proper personnel to help with the rescue, such as the supervisor, Terminal Manager, Coast Guard, etc.

Water Rescue Response Objectives

- **Arrival:** The initial rescuers size-up the situation by obtaining information from witnesses & teammates who first observed the MOB. The location of the victim is determined. They assess the immediate hazards, assess the on-scene capabilities, and determine the need for additional resources. Any additional safety hazards and controls are quickly evaluated and implemented.
- **Pre-Rescue Preparation:** Water body characteristics are evaluated (velocity and direction of current, debris, local marine traffic, structures (bridges, water intakes/discharges, etc.) that can affect rescue techniques. Night time operational considerations are implemented, as applicable. Rescuers don PPE specific for water rescue in accordance with a pre-written JHA and/or safety plan.
- **Rescue Operations:** Rescue operations should be conducted with as little risk to the rescuers as necessary to affect the rescue. Low-risk operations may not always be possible but should be considered first.
- **Response Termination:** Consider decontamination of victim(s) and rescuer(s), as needed. Recover all tools and equipment used in the rescue/recovery. In cases of a fatality, consider leaving everything in place until the investigative process has been completed. Ensure personnel accountability and terminate the Incident Command System. A post-incident review must be completed.

Rescue Fundamentals

MOB within Arm's Reach:

Use for Self-Rescue and Dockside / Landside Rescue situations**.** If the MOB victim is within reaching distance, as in one arm's length or less, and it is safe to do so, remain on the dock and reach for him/her (by the PFD, if worn,) pulling the victim onto the dock. It is safer for two people to pull the MOB victim onto the dock rather than one. If the victim is conscious, calm, and able to do so, they may also use the dock ladder to pull themselves out of the water. Ensure the victim is covered with an emergency blanket and moved to a warm environment and administer first aid as necessary.

CAUTION: Use caution when extracting a victim from the water by grasping the PFD. If the PFD is not worn & attached such that it could come off during the extraction process, the victim could slide out of the PFD while in the water, leaving the victim more prone to drowning.

MOB within Rope or Pole Reach:

Use for self-rescue, dockside/landside rescue or water rescue situations. Toss a lifeline/rope with a loop tied into the end to the MOB victim and have them hook the loop around their body under the armpits, or extend a pole to the MOB victim to grab. Tow the person in slowly. Once the victim is within arm's reach, two people (if available) should grab them by the PFD and pull to safety. If the MOB victim is conscious, calm and able to do so, they may also use the dock ladder to pull themselves out of the water. A medical evaluation is required for all employees who are a victim of a man overboard. Ensure the victim is covered with an emergency blanket and moved to a warm environment and administer first aid as necessary.

MOB Outside Of Life Line's Reach:

Use for water rescue situations. If a reach-rescue is not safe or possible, continue to keep the MOB victim in sight and note all conditions until water rescue capability arrives. Continue to deploy life rings, PFD's or other floatation devices to the victim. The terminal spill boat shall be launched in effort to retrieve the MOB. Consideration should be given to alerting the "Captain of the Port" (USCG) so that vessel traffic can be shut down. A medical evaluation is required for all employees who are a victim of a man overboard. Ensure the victim is covered with an emergency blanket and moved to a warm environment and administer first aid as necessary.

MOB Is Unresponsive: Face-up/Face-down:

If the victim is unconscious, The Gulf Region ERT spill boat shall be launched in effort to retrieve the MOB. Consideration should be given to alerting the "Captain of the Port" (USCG) so that vessel traffic can be shut down. A minimum of 3 ERT members shall be on the boat for extraction. Carefully pull the person aboard the boat. If required, have personnel support the rescuers for increased safety. Be mindful of boat stability for two people plus the victim on the same side. Bear in mind that a wet person is very heavy. Unconscious victims or victims with trauma should be extracted from the water and handled with a stokes basket/back board if possible. Ensure the victim is covered with an emergency blanket and moved to a warm environment. A medical evaluation is required for all employees who are a victim of a man overboard. Call 911. If the victim is not breathing, perform CPR until professional medical help arrives and administer first aid as necessary.

Site Specific Tools and Equipment

The Galena Park terminal has the following tools and equipment available for use doing a MOB rescue. All equipment is located on each dock (*) and is inspected to ensure performance during a rescue.

- Spill Boat (Could be used in the event of a MOB)
- Pole hook*
- Life rings w/ 90' of rope*
- PFD with water activated strobe and whistle*
- Beacon buoy*
- 1st Aid Kit*
- Spot light*
- Emergency blanket*
- Radio/Phone*
- Rescue vehicle with various ropes, rigging, and haul systems
- Stokes basket with rigging*
- Fixed ladders

APPENDIX G: FIRE EMERGENCY CHECKLIST

Incident Start Time:	**Start Date:**		
Incident End Time:	**Checklist Initiated by:**		
Fire Emergency Checklist			
Incident Command	**Yes**	**No**	**NA**
IC Established			
Initiated the appropriate Emergency Employee Notification system throughout the Terminal, Initiated or delegated ERL and agency notifications as required.			
Kinder Morgan ERT was notified if required.			
Assessed extent of emergency			
Requests trained Terminal First Aid/CPR personnel to assess and assist injured (if applicable).			
Made outside Responder notification to obtain assistance in emergency and made other necessary calls to sensitive receptors, as required.			
Secured perimeter during response. If necessary, obtained security. (Restrict access to the area to prevent non-emergency response personnel from entering the affected area)			
Monitor situation, provide updates as necessary to KMT management.			
Terminate Incident/Issue All Clear			
Terminal Manager			
Terminal Manager completes Incident Investigation & ensures the incident has been entered into IMPACT.			
After Action Review - Incident Conference Call.			
Containment of Fire			
All doors were closed but not locked.			
Fire extinguisher was taken to the fire location.			
Evacuation			
Employees and visitors reported to respective rally point(s) roll call taken.			
Employees carried out assigned duties.			
Status report given after relocation.			
Utilities			
Electrical appliances were shut off.			
Lights were left on.			
Ventilation system was shut down.			
Hazardous Material List			
SDS List for all applicable products on site given to fire department.			
Comments:			
Completed by:	Signature:		Date:

APPENDIX H: SPILL RESPONSE CHECKLIST

Incident Start Time:	**Start Date:**
Incident End Time:	**Checklist Initiated by:**

Spill Checklist

Incident Command	Yes	No	N/A
Terminal office is notified via radio or in person. Establish Incident Command (IC).			
IC initiates the appropriate Emergency Employee Notification system throughout the Terminal. Initiate or delegate ERL and agency notifications as required. ***ALL TRANSFERS MUST BE STOPPED UNTIL NOTIFIED BY TERMINAL MANAGER.*** The warning should include type and the amount of product spilled/leaked.			
Accountability: Ensure all personnel on site are accounted for. If necessary, evacuate site personnel to the nearest muster point and ensure everyone on site is accounted for.			
Secure all outfalls/drains downstream from the affected area if it is safe to do so to prevent spilled material from leaving the site.			
IC assesses extent of emergency. >Direct personnel to appropriately respond, >Restrict access to the area to prevent non-emergency response personnel from entering the affected area.			
IC requests trained Terminal First Aid/CPR personnel to assess and assist injured (if applicable). The administering of First Aid/CPR is strictly voluntary "good Samaritan". Any person administering First Aid/CPR on a voluntary basis who feels that they may have come in contact with blood or other potentially infectious material will accompany the injured to the clinic or hospital for treatment and/or evaluation.			
After damage is assessed, and the spill is contained the IC makes outside Responder Notification to obtain assistance and makes other necessary calls to sensitive receptors, as required.			
Secure perimeter during response. If necessary, obtain security. (Restrict access to the area to prevent non-emergency response personnel from entering the affected area).			
Monitor situation, provide updates as necessary to KMT management.			
Terminate Incident, issue all clear, and conduct investigation.			
Terminal Manager completes incident report and ensures the incident has been entered into IMPACT.			
Perform After Action Review/Incident Conference Call.			

NOTE: The terminal's spill control valves will remain closed until water testing confirms it is safe to release any collected surface water.

APPENDIX I: VAPOR RELEASE CHECKLIST

Incident Start Time:	**Start Date:**
Incident End Time:	**Checklist Initiated by:**

Vapor Checklist

Incident Command	Yes	No	N/A
Terminal office is notified via radio or in person. Establish Incident Command (IC).			
IC initiates the appropriate Emergency Employee Notification system throughout the Terminal. Initiate or delegate ERL and agency notifications as required. ALL TRANSFERS MUST BE STOPPED UNTIL NOTIFIED BY TERMINAL MANAGER. The warning should include type and the amount of product spilled/leaked.			
Accountability: Ensure all personnel on site are accounted for. If necessary, evacuate site personnel to the nearest muster point and ensure everyone on site is accounted for.			
IC assesses extent of emergency. > Direct personnel to appropriately respond, or > Direct Evacuation and account for all personnel > Restrict access to the area to prevent non-emergency response personnel from entering the affected area.			
IC requests trained Terminal First Aid/CPR personnel to assess and assist injured (if applicable). The administering of First Aid/CPR is strictly voluntary “good Samaritan”. Any person administering First Aid/CPR on a voluntary basis who feels that they may have come in contact with blood or other potentially infectious material will accompany the injured to the clinic or hospital for treatment and/or evaluation.			
After damage is assessed, and the vapor release is contained the IC makes outside Responder Notification to obtain assistance and makes other necessary calls to sensitive receptors, as required.			
Secure perimeter during response. If necessary, obtain security. (Restrict access to the area to prevent non-emergency response personnel from entering the affected area).			
Monitor situation, provide updates as necessary to KMT management.			
Terminate Incident, issue all clear, and conduct investigation.			
Terminal Manager completes incident report and ensures the incident has been entered into IMPACT.			
Perform After Action Review/Incident Conference Call.

APPENDIX J: MOB Checklist (see next page)

Incident Start Time: **Start Date:**
Incident End Time: **Checklist Initiated by:**

Man Overboard (MOB) Response Guidance / Training Checklist

Reference		Yes	No	N/A
1.16.3	Person observing MOB situation notifies terminal office via radio or in person of emergency MOB situation and loudly announces "MAN OVERBOARD!". IF IN DOUBT ASSUME THE WORST CASE AND NOTIFY. Teammates on dock / landside throw life ring(s) & floatation devices to victim(s) where possible.			
1.16.3	Teammate observing MOB visually identifies victim in the water and STAYS ON POINT, KEEPING EYES ON THE VICTIM, or the last spot where the victim was seen. Teammate continually observes victim while pointing to where victim is located, even if victim is carried up/down stream with current. Teammate observing victim DOES NOT LEAVE HIS POST unless or until relieved by Terminal Manager or leadership person.			
1.16.3	Terminal Manager or assigned leadership person: 1. Alerts all trained rescue personnel to respond to XXX location for a MOB rescue situation via radio or PA system. Consider installation of an alarm system to rapidly notify the facility of a MOB incident. 2. Alerts vessel crew (if manned vessel) of MOB situation & request response assistance (throw additional life rings, etc). In most cases, active vessel transfers & dockside work should be immediately stopped. 3. S/he then notifies additional non-rescue teammates for response assistance and assigns duties as needed (helping responders launch watercraft, retrieving rescue equipment, clearing traffic from entrances & roadways for emergency vehicles, notifying site security about incoming emergency traffic, etc). 4. Make an immediate accounting of all personnel, including visitors.			
1.16.3	Terminal Manager or assigned leadership person designates an individual to: 1. Call 911, local USCG, state wildlife dept., and/or site rescue team to request MOB response assistance. Specifically state situation specifics (body of water, direction of current, wearing PFD, # of victims, etc). 2. Calls company management for notification. 3. ERL / ERL+ is generated & sent as soon as possible.			
1.16.3	For nighttime rescue, activate additional landside lighting as needed but be cautious that lighting does not blind or impede on-water rescue teammates from seeing the victim on the water. Be prepared to turn off lighting facing the water if needed.			
1.16.3	• If victim is within reach of rescuers - assist victim with self-rescue or extricate victim from water using two person lift. Admininster first aid / CPR as needed. • If victim is within reach of a rope or pole - assist the victim with self-rescue or extricate from the water using two or more persons. Admininster first aid / CPR as needed. • If the victim is beyond reach - on-water rescue team visually verifies equipment & supplies before launching watercraft in the direction of the victim. Once the victim is located, approach with watercraft in a safe manner, extricate from the water and wrap the victim in a themal blanket(s) to keep them warm. Admininster first aid / CPR as needed while returning to land-based assets. **In all cases, immediately provide dry clothes and/or blankets to keep the victim warm once onboard or on land, even in warm weather months. The victim should be immediately transported to a clinic or hospital for medical evaluation.**			
1.16.3	Terminal Manager or assigned leadership person coordinates response with inbound/arriving outside Rescue Services (local rescue squads, fire dept, etc.) for deployment of additional on-water rescue assets.			
1.16.3	Terminal Manager establishes Incident or Unified Command System, invoking the location's ICS structure, and to the appropriate size/scale. Terminal Manager assigns a specific teammate to oversee the rescue operations. If TM oversees the rescue operations directly, assign a Deputy IC to run ICS.			
1.16.3	When the victim is rescued and returned to land, assess their medical condition from on-site first aid trained persons, site healthcare professionals (EMT's, occupational medicine nurse, etc.) or public EMS crew regarding medical status & transport to Emergency Dept as needed.			
1.16.3	Issue a follow-up ERL as necessary with conference calls as needed to provide an update.			
1.16.3	Monitor situation, provide updates as necessary to KMT management.			
1.16.3	TerminateiIncident, issue an all clear, and conduct an investigation.			
1.16.3	Terminal Manager completes incident report and ensures the incident has been entered into IMPACT.			
1.16.3	Perform After Action Review or incident conference call.			

Reference	Communications	Yes	No	NA
O&M 159	ERL / ERL+ initial & follow up broadcasts for situation updates			
EAP 006	Incident Command System staffing / management POC's / periodic briefings

APPENDIX K: SEVERE WEATHER CHECKLIST

Incident Start Time:	Incident Start Date:
Incident End Time:	Checklist Initiated by:

Tornado Checklist			
Incident Command	Yes	No	NA
When a **TORNADO WATCH** is issued an IC will be established when it has been determined it is necessary to do so.			
The IC sounds the appropriate Emergency Employee notification System throughout the Terminal; initiate the ERL and agency Notifications as required.			
Spotters are to look for approaching storms.			
The IC is to be tuned to radio, such as a NOAA Weather Radio, or television for additional advisories.			
IC makes appropriate contacts for community emergency response.			
Monitor situation, provide updates as necessary to KMT management.			
When a **TORNADO WARNING** is issued a tornado has been sighted in the area and or is indicated by radar. IC will be established when it has been determined it is necessary to do so.			
The IC will sound appropriate warning and personnel will take shelter onsite immediately.			
Thunderstorm Watch/Warning			
Monitor NOAA radio, Internet and/or local news			
Prepare for high winds by removing diseased and damaged limbs on trees			
Move or secure equipment and articles subject to movement in high winds			
Watch for tornado danger signs			
Tornado Watch			
Review plan with employees			
Continue usual activities, be prepared to take shelter			
Tornado Warning			
Evacuate to tornado shelter, bring weather radios			
Roll call within 3 minutes of evacuation			
Post Tornado Touchdown			
Identify immediate Hazards			
Control ignition sources if leakage from flammables is detected			
Barricade any areas with downed power lines			
Assess damage and report			
Notify outside agencies as needed			
Begin salvage operations			
Cover openings in buildings			
Clean up debris			
Inspect electrical and process systems for damage

APPENDIX M: BOMB THREAT CHECKLIST

Questions to Ask	Caller's Voice
When is the bomb going to explode?	☐ Calm ☐ Crying ☐ Raspy ☐ Angry ☐ Normal ☐ Deep
Where is the bomb right now?	☐ Excited ☐ Distinct ☐ Ragged ☐ Slow ☐ Slurred ☐ Clearing Throat
What does the bomb look like?	☐ Rapid ☐ Whispered ☐ Cracking Voice ☐ Soft ☐ Nasal ☐ Disguised
What kind of bomb is it?	☐ Loud ☐ Stutter ☐ Accent ☐ Laughter ☐ Lisp ☐ Familiar
What will cause it to explode?	☐ Man ☐ Woman Approx. Age_____
Did you place the bomb?	Nationality:_____ If voice is familiar, who did it sound like?
Why?	**Background Sounds**
Where are you now?	☐ Street ☐ House Noises ☐ Clear ☐ Traffic ☐ Motor ☐ Static ☐ Voices ☐ Office Machinery ☐ Local
What is your name?	☐ PA System ☐ Factory Machine ☐ Long Distance ☐ Music ☐ Animal Noises ☐ Booth
What is your Address?	Other:

Remarks:

Exact Wording of Threat:

Time Threat Received:	Date:	Number that received call:
Terminal:	Received by:	Reported to:

APPENDIX N: EMERGENCY EQUIPMENT

The following is a list of emergency equipment maintained by this facility. Locations of equipment are noted. A site plan located in plan as Figure 1 identifies all major buildings at the facility. Any response equipment that is utilized in an emergency must be replenished as quickly as possible.

Personal Protective Equipment

The maximum level of personal protective clothing employees are trained to use is EPA and OSHA Level C (as per 1910.120 HAZWOPER regulations). The personal protective equipment used at this facility is:

- Hard Hat
- Safety Glasses with side shields
- Steel Toe Boots
- Hearing protection (optional)
- Gloves
- Flame Retardant Clothing with reflective

Facility Spill and Response Materials

- Windsocks
- Safety Data Sheet Book(s)
- Chemical Inventory list
- A current DOT Emergency Response Guidebook
- Computer located in the office.

First Aid Kit(s)

To provide care for sick or injured personnel prior to transportation for treatment (if required). First Aid Kit(s) can be found in the Control Room.

Fire Extinguishers (Dry Chemical)

To provide protection against Class A, B, and C fires. Fire extinguishers are located:

APPENDIX O: EMPLOYEE EMERGENCY RESPONSIBILITIES

Incident IC & Alternate:

- Conduct and document an annual exercise
- Communications systems checked monthly with documentation
- Training all employees with documentation of training, including new employees or those with new responsibilities

Terminal Employees:

- Know the initial action to be taken
- Track and maintain adequate stocks of response materials
- Check all safety showers daily
- Check all release containment devices monthly
- Know the evacuation routes and command post locations

First Responder (ERT members):

- Will understand what to do when an unintentional release occurs
- Will manage response activities by other agencies
- Will maintain adequate stocks of response materials
- Will know the location of the command post
- Will know evacuation routes
- Will participate in an annual emergency response exercise
- Will be available to respond during operations hours
- Will contact EMS or 911 in case of injury or potential for catastrophic release

Operations Terminal Manager:

- Will ensure loaders are sufficiently trained to perform the transfer
- Will ensure that adequate stocks of response material are available
- Will contact appropriate agencies identified in response plan contact list
- Will conduct post emergency review (develop a documented timeline of events)
- Will initiate emergency response exercise at least annually
- Will ensure remediation is completed, this includes the disposal of wastes generated
- Will be available during routine operating hours
- Will report all findings to the Regional Manager within two workdays
- Will perform the functions of the Regional Manager in their absence
- Will ensure all necessary reporting (EPA, DOT, State & Local) is completed in the prescribed time
- Will be the primary contact for the First Responder

Regional Operations Manager:

- Will be able to be contacted during the normal operations hours
- Will perform the functions of the Manager in his/her absence
- Will contact the customer and primary contact for the customer
- Will participate in the annual emergency response exercise

APPENDIX P: Reserved

APPENDIX Q: SDS VAULT INSTRUCTIONS

1. Go to www.sdsvault.com. or you can go to KMONLINE/Common Resources/EHS and click on SDS Vault.com under “EHS Hot Links”. (No login will be required if going through KMONLINE).

APPENDIX R: EAP EVALUATION

Emergency Response Exercise/Evacuation Evaluation

Terminal: _____ Date: _____

Start Time of Exercise/Drill_____ End Time of Exercise/Drill: _____

Type of Drill/Exercise Conducted:

☐ Fire ☐ Severe Weather ☐ Medical Emergency ☐ Chemical Release

☐ Bomb Threat ☐ Power Outage ☐ Other _____

Performance Objective	Yes	No	N/A	Comments
All employees received/heard alarm				
All employees arrived at designated rally point				
Visitor log and Grab Binder present at roll call				
Roll call held within designated time [1]				
All employees/visitors accounted for				
Emergency Communication Tested				
Emergency Kit(s) Inventoried and complete				
Emergency Checklist used				
Teams Functioned Effectively				
Personnel Understood Individual Tasks				
Post Brief Held for Employee Observations and Recommendations				
After Action Report Completed				

Observed By:_____ Title:_____

[1] 5 minutes except for tornado warning which is 3 minutes.

APPENDIX S: DEFINITIONS

Incident Commander

The Incident Commander is the on-scene KM employee or representative in charge of emergency response. Typically, it is the most senior employee with operational responsibility (a supervisor, crew leader operations coordinator, foreman, manager, engineer, etc.) who has received the required Emergency Response (Hazwoper) operations level training, training in the ICS, emergency response or local training per the site-specific ERP. However, the Incident Commander role will always be filled with the most qualified individual, not necessarily most senior or highest ranked individual available.

Incident Safety Officer

The Incident Safety Officer (ISO) reports directly to the Incident Commander, is typically the second role filled within the ICS, and commonly filled by an EHS representative. The ISO is the only role within the ICS who has the authority to override the IC in situations that jeopardize the safety of responders or community.

Operations Section Chief

The Operations Section Chief (OSC) reports directly to the Incident Commander and is best suited to manage the resources required to perform tactical operations in order to achieve the objectives/goals outlined in the Incident Action Plan (IAP).

Area/Facility Manager

The Area/Facility Manager can be the Incident Commander in the action plans for the three types of emergencies or can delegate the responsibility to another trained individual.

Area/Facility Personnel

Area/facility personnel are responsible for providing initial on-scene response commensurate with their training and capabilities to contain the emergency.

Crisis Support Team

In the event of a major emergency, the Crisis Support Team (CST) may send support personnel to the site to provide assistance. Additionally, an Accident Investigation Team may be dispatched to the scene to begin the investigation, which will allow the on-site Incident Commander, to focus on resolving operating problems and returning the facility to service.

APPENDIX T: RESERVED

APPENDIX U: RESERVED

APPENDIX V: RESERVED

APPENDIX X: RESERVED

APPENDIX Y: RESERVED

APPENDIX Z: DOCUMENTS

Exercise/Incident Name

Exercise/Incident Date

After Action Report

Date Published

Emergency Response After Action Report

Summary

[When writing the Summary, keep in mind that this section may be the only part of the that some people will read. Introduce this section by stating the full name of the exercise/Emergency Response and providing a brief overview of the exercise/response. This brief overview should discuss why the exercise/response was conducted; the exercise/response objectives; and what capabilities, activities, and scenario(s) were used to achieve those objectives. All of these areas will be discussed in more detail in the subsequent sections.]

The following should be used for Drills/Exercises:

The [exercise] was developed to test [terminal]'s [Capability 1], [Capability 2], and [Capability 3] capabilities. The exercise planning team was composed [list of employees participating in planning team]. The exercise planning team discussed [include a brief overview of the major issues encountered, discussed, and resolved during the exercise planning process. Topics to address in this section could include the length of the planning process, the reasoning behind the planning team's choice of objectives to exercise, etc.]

Based on the exercise planning team's deliberations, the following objectives were developed for [exercise name]:

- Objective 1: [Insert 1 sentence description of the exercise objective]
- Objective 2: [Insert 1 sentence description of the exercise objective]
- Objective 3: [Insert 1 sentence description of the exercise objective]

The following should be used for an emergency response. In this paragraph answer the following questions:

6) What caused the emergency?
7) Was it preventable? If so, how?
8) Were inadequate or incorrect orders given or actions taken?
9) Were these the result of bad judgment, wrong or insufficient information, or poor procedures?
10) Can procedures or training be improved?

The purpose of this report is to analyze exercise/emergency action results, identify strengths to be maintained and built upon, identify potential areas for further improvement, and support development of corrective actions.

[In general, the major strengths and primary areas for improvement should be limited to three each to ensure the Executive Summary is high-level and concise.]

Major Strengths

The major strengths identified during this exercise/emergency action are as follows:

- [Use complete sentences to describe each major strength.]
- [Additional major strength]
- [Additional major strength]

Primary Areas for Improvement

Throughout the exercise/emergency, several opportunities for improvement in [terminal]'s ability to respond to the incident were identified. The primary areas for improvement, including recommendations, are as follows:

- [Use complete sentences to state each primary area for improvement and its associated key recommendation(s).]
- [Additional key recommendation]
- [Additional key recommendation]

[End this section by describing the overall exercise/incident as successful or unsuccessful, and briefly state the areas in which subsequent exercises/incidents conducted/occurring by this terminal should focus.]

Exercise/Incident Overview

Exercise/Incident Details

Exercise/Incident Name

[Insert a name of exercise/incident, which should match the name in the header.]

Exercise/Incident Start Date

[Insert the month, day, and year that the exercise began.]

Exercise/Incident End Date

[Insert the month, day, and year that the exercise ended.]

Duration

[Insert the total length of the exercise/incident, in day or hours, as appropriate.]

Mission

[Insert the appropriate mission areas of the exercise (e.g. Prevent, Protect, Response, and/or Recovery).]

Capabilities

[Insert a list of the capabilities addressed within the exercise/incident.]

Scenario/Incident Type

[Name the exercise scenario type (e.g. chemical release).]

Exercise Planning Incident Team Leadership

[The name of each member of the planning/incident team(s) leadership should be listed along with their role in the exercise/incident and job title.]

Participating Organizations

[Insert a list of the individual participating organizations or agencies, including Federal, State, local and international agencies, and contract support companies as applicable.]

Analysis of Capabilities

This section of the report reviews the performance of the exercised capabilities, activities, and tasks.

Capability 1: [Capability Name]

Capability Summary: [Include a detailed overview of the capability, and a description of how the capability was performed during an exercise/incident. The exact length of this summary will depend on the scope of the exercise/incident.]

Observation 1.1: [Begin this section with a heading indicating whether the observation is a "Strength" or an "Area for Improvement." A strength is an observed action, behavior, procedure, and/or practice that is worthy of recognition and special notice. Areas for improvement are those areas that a necessary task was not performed or that a task was performed with notable problems. Following this heading, insert a short, complete sentence that describes the general observation.]

References: [List relevant plans, policies, procedures, laws, and/or regulations, or sections of these plans, policies, procedures, laws, and/or regulations. If no references apply to the observation, it is acceptable to simply list "N/A" or "Not Applicable."]

1. [Name of the task and the applicable plans, policies, procedures, laws, and/or regulations and 1-2 sentences describing their relation to the task]
2. [Name of the task and the applicable plans, policies, procedures, laws, and/or regulations and 1-2 sentences describing their relation to the task]
3. [Name of the task and the applicable plans, policies, procedures, laws, and/or regulations and 1-2 sentences describing their relation to the task]

Analysis: [The analysis section should be the most detailed section. Include a description of the behavior or actions at the core of the observation, as well as a brief description of what happened and the consequence(s) (positive or negative) of the action or behavior. If an action was performed successfully, include any relevant innovative approaches utilized by the exercise participants. If an action was not performed adequately, the root-causes contributing to the shortcoming must be identified.]

Recommendations: [Insert recommendations to address identified areas for improvement, based on the judgment and experience. If the observation was identified as a strength, without corresponding recommendations, insert "None.]

1. [Complete description of recommendation]
2. [Complete description of recommendation]
3. [Complete description of recommendation]

[Continue to add additional observations, references, analyses, and recommendations for each capability as necessary. Maintain numbering convention to allow for easy reference.]

Conclusion

[This section is a conclusion for the entire document. It provides an overall summary to the report. It should include the demonstrated capabilities, lessons learned, major recommendations, and a summary of what steps should be taken to ensure that the concluding results will help to further refine plans, policies, procedures, and training for this type of incident.

Lessons Learned to be Shared

Following are revealed lessons learned which should be shared with the broader KM audience.

- **Lesson Learned:** Knowledge and experience, positive or negative, derived from actual incidents as well as those derived from observations and historical study of operations, training, and exercises.
- **Best Practices:** Exemplary, peer-validated techniques, procedures, good ideas, or solutions that work and are solidly grounded in actual operations, training, and exercise experience.
- **Good Stories:** Exemplary, but non-peer-validated, initiatives that have shown success in their specific environments and that may provide useful information to other terminals.
- **Practice Note:** A brief description of innovative practices, procedures, methods, programs, or tactics that an terminal uses to adapt to changing conditions or to overcome an obstacle or challenge.

GLOSSARY OF TERMS AND ACRONYMS

GLOSSARY OF TERMS

This glossary contains definitions of terms that will be used frequently during the course of response operations.

Activate: The process of mobilizing personnel and/or equipment within the response organization to engage in response operations.

Activator: An individual in the response organization whose responsibilities include notifying other individuals or groups within the organization to mobilize personnel and/or equipment.

Adverse Weather: The weather conditions that will be considered when identifying response systems and equipment in a response plan for the applicable operating environment. Factors to consider include significant wave height, ice, temperature, weather - related visibility, and currents within the Captain of the Port (COTP) zone in which the systems or equipment are intended to function.

Agency Representative: Individual assigned to an incident from an agency who has been delegated full authority to make decisions on all matters affecting that agency's participation in response operations.

Area Committee: As defined by Sections 311(a)(18) and (j)(4) of CWA, as amended by OPA, means the entity appointed by the President consisting of members from Federal, State, and local agencies with responsibilities that include preparing an Area Contingency Plan for the area designated by the President. The Area Committee may include ex-officio (i.e., non-voting) members (e.g., industry and local interest groups).

Area Contingency Plan: As defined by Sections 311(a)(19) and (j)(4) of CWA, as amended by OPA, means the plan prepared by an Area Committee, that in conjunction with the NCP, shall address the removal of a discharge including a worst-case discharge and the mitigation or prevention of a substantial threat of such a discharge from a vessel, offshore facility, or onshore facility operating in or near an area designated by the President.

Average Most Probable Discharge: A discharge of the lesser of 50 barrels or 1% of the volume of the worst case discharge.

Barrel (bbl): Measure of space occupied by 42 U.S. gallons at 60 degrees Fahrenheit.

Bioremediation Agents: Means microbiological cultures, enzyme additives, or nutrient additives that are deliberately introduced into an oil discharge and that will significantly increase the rate of biodegradation to mitigate the effects of the discharge.

Boom: A piece of equipment or a strategy used to either contain free floating oil to a confined area or protect an uncontaminated area from intrusion by oil.

Booming Strategies: Strategic techniques which identify the location and quantity of boom required to protect certain areas. These techniques are generated by identifying a potential spill source and assuming certain conditions which would affect spill movement on water.

Bulk: Material that is stored or transported in a loose, unpackaged liquid, powder, or granular form capable of being conveyed by a pipe, bucket, chute, or belt system.

Chemical Agents: Means those elements, compounds, or mixtures that coagulate, disperse, dissolve, emulsify, foam, neutralize, precipitate, reduce, solubilize, oxidize, concentrate, congeal, entrap, fix, make the pollutant mass more rigid or viscous, or otherwise facilitate the mitigation of deleterious effects or the removal of the oil pollutant from the water. Chemical agents include biological additives, dispersants, sinking agents, miscellaneous oil spill control agents, and burning agents, but do not include solvents.

Cleanup: For the purposes of this document, cleanup refers to the removal and/or treatment of oil, hazardous substances, and/or the waste or contaminated materials generated by the incident. Cleanup includes restoration of the site and its natural resources.

Clean-up Contractor: Persons contracted to undertake a response action to clean up a spill.

Coastal Waters: For the purpose of classifying the size of discharges, means the waters of the coastal zone except for the Great Lakes and specified ports and harbors on inland rivers.

Coastal Zone: As defined for the purpose of the NCP, means all United States waters subject to the tide, United States waters of the Great Lakes, specified ports and harbors on inland rivers, waters of the contiguous zone, other waters of the high seas subject to the NCP, and the land surface or land substrata, ground waters, and ambient air proximal to those waters. The term coastal zone delineates an area of federal responsibility for response action. Precise boundaries are determined by EPA/USCG agreements and identified in federal regional contingency plans.

Coast Guard District Response Group (DRG): As provided for by CWA sections 311(a)(20) and (j)(3), means the entity established by the Secretary of the department in which the USCG is operating within each USCG district and shall consist of: the combined USCG personnel and equipment, including firefighting equipment, of each port within the district; additional prepositioned response equipment; and a district response advisory team.

Command: The act of controlling manpower and equipment resources by virtue of explicit or delegated authority.

Command Post: A site located at a safe distance from the spill site where response decisions are made, equipment and manpower deployed, and communications handled. The Incident Commander and the On-Scene Coordinators may direct the on-scene response from this location.

Communications Equipment: Equipment that will be utilized during response operations to maintain communication between the Company employees, contractors, Federal/State/Local agencies. (Radio/ telephone equipment and links)

Containment Boom: A flotation/freeboard device, made with a skirt/curtain, longitudinal strength member, and ballast unit/weight designed to entrap and contain the product for recovery.

Contingency Plan: A document used by (1) federal, state, and local agencies to guide their planning and response procedures regarding spills of oil, hazardous substances, or other emergencies; (2) a document used by industry as a response plan to spills of oil, hazardous substances, or other emergencies occurring upon their vessels or at their facilities.

Contract or Other Approved Means: For OPA 90, a written contract with a response contractor; certification by the facility owner or operator that personnel and equipment are owned, operated, or under the direct control of the facility, and available within the stipulated times; active membership in a local or regional oil spill removal organization; and/or the facility's own equipment.

Critical Areas to Monitor: Areas which if impacted by spilled oil may result in threats to public safety or health.

Cultural Resources: Current, historic, prehistoric and archaeological resources which include deposits, structures, ruins, sites, buildings, graves, artifacts, fossils, or other objects of antiquity which provide information pertaining to the historical or prehistorical culture of people in the state as well as to the natural history of the state.

Damage Assessment: The process of determining and measuring damages and injury to the human environment and natural resources, including cultural resources. A Damages include differences between the conditions and use of natural resources and the human environment that would have occurred without the incident, and the conditions and use that ensued following the incident. A Damage assessment includes planning for restoration and determining the costs of restoration.

Decontamination: The removal of hazardous substances from personnel and their equipment necessary to prevent adverse health effects.

Discharge: Any spilling, leaking, pumping, pouring, emitting, emptying, or dumping.

Dispersants: Means those chemical agents that emulsify, disperse, or solubilize oil into the water column or promote the surface spreading of oil slicks to facilitate dispersal of the oil into the water column.

Diversion Boom: A floatation/freeboard device, made with a skirt/curtain, longitudinal strength member, and ballast unit/weight designed to deflect or divert the product towards a pick up point, or away from certain areas.

Drinking Water Supply: As defined by Section 101(7) of CERCLA, means any raw or finished water source that is or may be used by a public water system (as defined in the Safe Drinking Water Act) or as drinking water by one or more individuals.

Economically Sensitive Areas: Those areas of explicit economic importance to the public that due to their proximity to potential spill sources may require special protection and include, but are not limited to: potable and industrial water intakes; locks and dams; and public and private marinas.

Emergency Management: The personnel identified to staff the organizational structure identified in a response plan to manage response plan implementation.

Emergency Response Team: Designated Facility individuals who will fulfill the roles determined in the oil spill response plan in the event of an oil or hazardous substance spill. They will supervise and control all response and clean-up operations.

Emergency Service: Those activities provided by state and local government to prepare for and carry out any activity to prevent, minimize, respond to, or recover from an emergency.

Environmentally Sensitive Areas: Streams and water bodies, aquifer recharge zones, springs, wetlands, agricultural areas, bird rookeries, endangered or threatened species (flora and fauna) habitat, wildlife preserves or conservation areas, parks, beaches, dunes, or any other area protected or managed for its natural resource value.

Facility: Either an onshore facility or an offshore facility and includes, but is not limited to structures, equipment, and appurtenances thereto, used or capable of being used to transfer oil to or from a vessel or a public vessel. A facility includes federal, state, municipal, and private facilities.

Facility Operator: The person who owns, operates, or is responsible for the operation of the facility.

Federal Fund: The spill liability trust fund established under OPA.

Federal Regional Response Team: The federal response organization (consisting of representatives from selected federal and state agencies) which acts as a regional body responsible for planning and preparedness before an oil spill occurs and providing advice to the FOSC in the event of a major or substantial spill.

Federal Response Plan (FRP): Means the agreement signed by 25 federal departments and agencies in April 1987 and developed under the authorities of the Earthquake Hazards Reduction Act of 1977 and the Disaster Relief Act of 1974, as amended by the Stafford Disaster Relief Act of 1988.

First Responders, First Response Agency: A public health or safety agency (e.g., fire service or police department) charged with responding to a spill during the emergency phase and alleviating immediate danger to human life, health, safety, or property.

Handle: To transfer, transport, pump, treat, process, store, dispose of, drill for, or produce.

Harmful Quantity Of Oil: The presence of oil from an unauthorized discharge in a quantity sufficient either to create a visible film or sheen upon or discoloration of the surface of the water or a shoreline, tidal flat, beach, or marsh, or to cause a sludge or emulsion to be deposited beneath the surface of the water or on a shoreline, tidal flat, beach, or marsh.

Hazardous Material: Any non-radioactive solid, liquid, or gaseous substance which, when uncontrolled, may be harmful to humans, animals, or the environment. Including but not limited to substances otherwise defined as hazardous wastes, dangerous wastes, extremely hazardous wastes, oil, or pollutants.

Hazardous Substance: Any substance designed as such by the Administrator of the EPA pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act; regulated pursuant to Section 311 of the Federal Water Pollution Control Act, or discharged by the SERC.

Hazardous Waste: Any solid waste identified or listed as a hazardous waste by the Administrator of the EPA pursuant to the federal Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act (RCRA), 42 U.S.C., Section 6901,et seq as amended. The EPA Administrator has identified the characteristics of hazardous wastes and listed certain wastes as hazardous in Title 40 of the Code of Federal Regulations, Part 261, Subparts C and D respectively.

HAZMAT: Hazardous materials or hazardous substances, exposure to which may result in adverse effects on health or safety of employees.

HAZWOPER: Hazardous Waste Operations and Emergency Response Regulations published by OSHA to cover worker safety and health aspects of response operations.

Heat Stress: Dangerous physical condition caused by over exposure to extremely high temperatures.

Hypothermia: Dangerous physical condition caused by over exposure to freezing temperatures.

Incident: Any event that results in a spill or release of oil or hazardous materials. Action by emergency service personnel may be required to prevent or minimize loss of life or damage to property and/or natural resources.

Incident Briefing Meeting: Held to develop a comprehensive, accurate, and up-to-date understanding of the incident, nature of status of control operations, and nature and status of response operations; ensure the adequacy of control and response operations; begin to organize control and response operations; and prepare for interactions with outside world.

Incident Command Post (ICP): That location at which all primary command functions are executed.

Incident Command System (ICS): The combination of facilities, equipment, personnel, procedures, and communications operating within a common organizational structure, with responsibility for the management of assigned resources at an incident.

Incident Commander (IC): The one individual in charge at any given time of an incident. The Incident Commander will be responsible for establishing a unified command with all on-scene coordinators.

Indian Tribe: As defined in OPA section 1001, means any Indian tribe, band, nation, or other organized group or community, but not including any Alaska Native regional or village corporation, which is recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians and has governmental authority over lands belonging to or controlled by the Tribe.

Initial Cleanup: Remedial action at a site to eliminate acute hazards associated with a spill. An initial clean-up action is implemented at a site when a spill of material is an actual or potentially imminent threat to public health or the environment, or difficulty of cleanup increases significantly without timely remedial action. All sites must be evaluated to determine whether initial cleanup is total cleanup, however, this will not be possible in all cases due to site conditions (i.e., a site where overland transport or flooding may occur).

Initial Notification: The process of notifying necessary the Company personnel and Federal/ State/Local agencies that a spill has occurred, including all pertinent available information surrounding the incident.

Initial Response Actions: The immediate actions that are to be taken by the spill observer after detection of a spill.

Inland Area: The area shoreward of the boundary lines defined in 46 CFR part 7, except that in the Gulf of Mexico, it means the area shoreward of the lines of demarcation (COLREG lines) as defined in §80.740 through 80.850 of this chapter. The inland area does not include the Great Lakes.

Inland Waters: State waters not considered coastal waters; lakes, rivers, ponds, streams, underground water, et. al.

Inland Zone: Means the environment inland of the coastal zone excluding the Great Lakes, and specified ports and harbors on inland rivers. The term inland zone delineates an area of federal responsibility for response action. Precise boundaries are determined by EPA/USCG agreements and identified in federal regional contingency plans.

Interim Storage Site: A site used to temporarily store recovered oil or oily waste until the recovered oil or oily waste is disposed of at a permanent disposal site. Interim storage sites include trucks, barges, and other vehicles, used to store waste until the transport begins.

Lead Agency: The government agency that assumes the lead for directing response activities.

Lead Federal Agency: The agency which coordinates the federal response to incident on navigable waters. The lead federal agencies are:

- **U.S. Coast Guard:** Oil and chemically hazardous materials incidents on navigable waters.
- **Environmental Protection Agency:** Oil and chemically hazardous materials incidents on inland waters.

Lead State Agency: The agency which coordinates state support to federal and/or local governments or assumes the lead in the absence of federal response.

Loading: Transfer from Facility to vehicle.

Local Emergency Planning Committee (LEPC): A group of local representatives appointed by the State Emergency Response Commission (SERC) to prepare a comprehensive emergency plan for the local emergency planning district, as required by the Emergency Planning and Community Right-to-know Act (EPCRA).

Lower Explosive Limit: Air measurement utilized to determine the lowest concentration of vapors that support combustion. This measurement must be made prior to entry into a spill area.

Marinas: Small harbors with docks, services, etc. for pleasure craft.

Medium Discharge: Means a discharge greater than 2,100 gallons (50 Bbls) and less than or equal to 36,000 gallons (85+ Bbls) or 10% of the capacity of the largest tank, whichever is less and not to exceed the WCD.

National Contingency Plan: The plan prepared under the Federal Water Pollution Control Act (33 United State Code §1321 et seq) and the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (42 United State Code § 9601 et seq), as revised from time to time.

National Pollution Funds Center (NPFC): Means the entity established by the Secretary of Transportation whose function is the administration of the Oil Spill Liability Trust Fund (OSLTF). Among the NPFC's duties are: providing appropriate access to the OSLTF for federal agencies and states for removal actions and for federal trustees to initiate the assessment of natural resource damages; providing appropriate access to the OSLTF for claims; and coordinating cost recovery efforts.

National Response System (NRS): Is the mechanism for coordinating response actions by all levels of government in support of the OSC. The NRS is composed of the NRT, RRTs, OSC, Area Committees, and Special Teams and related support entities.

National Strike Force (NSF): Is a special team established by the USCG, including the three USCG Strike Teams, the Public Information Assist Team (PIAT), and the National Strike Force Coordination Center. The NSF is available to assist OSCs in their preparedness and response duties.

National Strike Force Coordination Center (NSFCC): Authorized as the National Response Unit by CWA section 311(a)(23) and (j)(2), means the entity established by the Secretary of the department in which the USCG is operating at Elizabeth City, North Carolina, with responsibilities that include administration of the USCG Strike Teams, maintenance of response equipment inventories and logistic networks, and conducting a national exercise program.

Natural Resource: Land, fish, wildlife, biota, air, water, ground water, drinking water supplies, and other such resources belonging to, managed by, held in trust by, appertaining to or otherwise controlled by the state, federal government, private parties, or a municipality.

Navigable Waters: As defined by 40 CFR 110.1 means the waters of the United States, including the territorial seas. The term includes:

All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters that are subject to the ebb and flow of the tide;

Interstate waters, including interstate wetlands;

All other waters such as interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, and wetlands, the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:

- that are or could be used by interstate or foreign travelers for recreational or other purposes;
- from which fish or shellfish are or could be taken and sold in interstate or foreign commerce; and
- that are used or could be used for industrial purposes by industries in interstate commerce.

All impoundments of waters otherwise defined as navigable waters under this section;

Tributaries of waters identified in paragraphs (a) through (d) of this definition, including adjacent wetlands; and

Wetlands adjacent to waters identified in paragraphs (a) through (e) of this definition: Provided, that waste treatment systems (other than cooling ponds meeting the criteria of this paragraph) are not waters of the United States.

Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act jurisdiction remains with EPA.

Nearshore Area: For OPA 90, the area extending seaward 12 miles from the boundary lines defined in 46 CFR Part 7, except in the Gulf of Mexico. In the Gulf of Mexico, it means the area extending seaward 12 miles from the line of demarcation defined in §80.740 - 80.850 of title 33 of the CFR.

Non-persistent or Group I Oil: A petroleum-based oil that, at the time of shipment, consists of hydrocarbon fractions:

1. At least 50% of which by volume, distill at a temperature of 340 degrees C (645 degrees F);

2. At least 95% of which volume, distill at a temperature of 370 degrees C (700 degrees F).

Ocean: The open ocean, offshore area, and nearshore area as defined in this subpart.

Offshore area: The area up to 38 nautical miles seaward of the outer boundary of the nearshore area.

Oil or Oils: Naturally occurring liquid hydrocarbons at atmospheric temperature and pressure coming from the earth, including condensate and natural gasoline, and any fractionation thereof, including, but not limited to, crude oil, petroleum gasoline, fuel oil, diesel oil, oil sludge, oil refuse, and oil mixed with wastes other than dredged spoil. Oil does not include any substance listed in Table of 40 CFR Part 302 adopted August 14, 1989, under Section 101(14) of the federal comprehensive environmental response, compensation, and liability act of 1980, as amended by P. L. 99-499.

Oil Spill Liability Trust Fund: Means the fund established under section 9509 of the Internal Revenue Code of 1986 (26 U.S.C. 9509).

Oily Waste: Product contaminated waste resulting from a spill or spill response operations.

On-Scene Coordinator (OSC): Means the federal official predesignated by the EPA or the USCG to coordinate and direct response under subpart D.

On-site: Means the area extent of contamination and all suitable areas in very close proximity to the contamination necessary for implementation of a response action.

Open Ocean: means the area from 38 nautical miles seaward of the outer boundary of the nearshore area, to the seaward boundary of the exclusive economic zone.

Owner or Operator: Any person, individual, partnership, corporation, association, governmental unit, or public or private organization of any character.

Persistent Oil: A petroleum-based oil that does not meet the distillation criteria for a non-persistent oil. For the purposes of this Appendix, persistent oils are further classified based on specific gravity as follows:

1. Group II specific gravity less than .85

2. Group III specific gravity between .85 and less than .95

3. Group IV specific gravity .95 and including 1.0

4. Group V specific gravity greater than 1.0

Plan Holder: The plan holder is the industry transportation related facility for which a response plan is required by federal regulation to be submitted by a vessel or facility's owner or operator.

Post Emergency Response: The portion of a response performed after the immediate threat of a release has been stabilized or eliminated and cleanup of the sites has begun.

Post Emergency: The phase of response operations conducted after the immediate threat of the release has been stabilized, and cleanup operations have begun.

Primary Response Contractors or Contractors: An individual, company, or cooperative that has contracted directly with the plan holder to provide equipment and/or personnel for the containment or cleanup of spilled oil.

Qualified Individual (QI): That person or entity who has authority to activate a spill cleanup contractors, act as liaison with the "On-Scene Coordinator" and obligate funds required to effectuate response activities.

Regional Response Team (RRT): The Federal response organization (consisting of representatives from selected Federal and State agencies) which acts as a regional body responsible for overall planning and preparedness for oil and hazardous materials releases and for providing advice to the OSC in the event of a major or substantial spill.

Remove or Removal: As defined by section 311(a)(8) of the CWA, refers to containment and removal of oil or hazardous substances from the water and shorelines or the taking of such other actions as may be necessary to minimize or mitigate damage to the public health or welfare (including, but not limited to, fish, shellfish, wildlife, public and private property, and shorelines and beaches) or to the environment. For the purpose of the NCP, the term also includes monitoring of action to remove discharge.

Response Activities: The containment and removal of oil from the water and shorelines, the temporary storage and disposal of recovered oil, or the taking of other actions as necessary to minimize or mitigate damage to public health or welfare, or the environment.

Response Contractors: Persons/companies contracted to undertake a response action to contain and/or clean up a spill.

Response Guidelines: Guidelines for initial response that are based on the type of product involved in the spill, these guidelines are utilized to determine clean-up methods and equipment.

Response Plan: A practical manual used by industry for responding to a spill. Its features include:
(1) identifying the notifications sequence, responsibilities, response techniques, etc. in an easy to use format; (2) using decision trees, flowcharts, and checklists to insure the proper response for spills with varying characteristics; and (3) segregating information needed during the response from data required by regulatory agencies to prevent confusion during a spill incident.

Response Priorities: Mechanism used to maximize the effective use of manpower and equipment resources based upon their availability during an operational period.

Response Resources: All personnel and major items of equipment available, or potentially available, for assignment to incident tasks on which status is maintained.

Responsible Party: Any person, owner/operator, or facility that has control over an oil or hazardous substance immediately before entry of the oil or hazardous substance into the atmosphere or in or upon the water, surface, or subsurface land of the state.

Restoration: The actions involved in returning a site to its former condition.

Rivers and Canals: A body of water confined within the inland area that has a project depth of 12 feet or less, including the Intracoastal Waterway and other waterways artificially created for navigation.

Securing the Source: Steps that must be taken to stop discharge of oil at the source of the spill.

Sinking Agents: Means those additives applied to oil discharges to sink floating pollutants below the water surface.

Site Characterization: An evaluation of a cleanup site to determine the appropriate safety and health procedures needed to protect employees from identified hazards.

Site Conditions: Details of the area surrounding the facility, including shoreline descriptions, typical weather conditions, socioeconomic breakdowns, etc.

Site Safety and Health Plan: A site specific plan developed at the time of an incident that addresses:

- Safety and health hazard analysis for each operation.
- Personal protective equipment to be used.
- Training requirements for site workers.
- Medical surveillance requirements.
- Air monitoring requirements.
- Site control measures.
- Decontamination procedures.
- Emergency response procedures.
- Confined space entry procedures.

Site Security and Control: Steps that must be taken to provide safeguards needed to protect personnel and property, as well as the general public, to ensure an efficient clean-up operation.

Skimmers: Mechanical devices used to skim the surface of the water and recover floating oil. Skimmers fall into four basic categories (suction heads, floating weirs, oleophilic surface units, and hydrodynamic devices) which vary in efficiency depending on the type of oil and size of spill.

Snare Boom: Oil will adhere to the material of which this boom is made of and thus collect it.

Sorbents: Materials ranging from natural products to synthetic polymeric foams placed in confined areas to soak up small quantities of oil. Sorbents are very effective in protecting walkways, boat decks, working areas, and previously uncontaminated or cleaned areas.

Spill: An unauthorized discharge of oil or hazardous substance into the waters of the state.

Spill Observer: The first Facility individual who discovers a spill. This individual must function as the first responder and person-in-charge until relieved by an authorized supervisor.

Spill of National Significance (SONS): Means a spill which due to its severity, size, location, actual or potential impact on the public health and welfare or the environment, or the necessary response effort, is so complex that it requires extraordinary coordination of federal, state, local, and responsible party resources to contain and cleanup the discharge.

Spill Management Team: The personnel identified to staff the organizational structure identified in a response plan to manage response plan implementation.

Spill Response: All actions taken in responding to spills of oil and hazardous materials, e.g.: receiving and making notifications; information gathering and technical advisory phone calls; preparation for and travel to and from spill sites; direction of clean -up activities; damage assessments; report writing, enforcement investigations and actions; cost recovery; and program development.

Spill Response Personnel: Federal, state, local agency, and industry personnel responsible for participating in or otherwise involved in spill response. All spill response personnel will be pre- approved on a list maintained in each region.

Staging Areas: Designated areas near the spill site accessible for gathering and deploying equipment and/or personnel.

State Emergency Response Commission (SERC): A group of officials appointed by the Governor to implement the provisions of Title III of the Federal Superfund Amendments and Re-authorization Act of 1986 (SARA). The SERC approves the State Oil and Hazardous Substance Discharge Prevention and Contingency Plan and Local Emergency Response Plans.

Surface Collecting Agents: Means those chemical agents that form a surface film to control the layer thickness of oil.

Surface Washing Agent: Is any product that removes oil from solid surfaces, such as beaches and rocks, through a detergency mechanism and does not involve dispersing or solubilizing the oil into the water column.

Tanker: A self-propelled tank vessel constructed or adapted primarily to carry or hazardous material in bulk in the cargo spaces.

Tidal Current Tables: Tables which contain the predicted times and heights of the high and low waters for each day of the year for designated areas.

Trajectory Analysis: Estimates made concerning spill size, location, and movement through aerial surveillance or computer models.

Transfer: Any movement of oil to, from, or within a vessel by means of pumping, gravitation, or displacement.

Trustee: Means an official of a federal natural resources management agency designated in subpart G of the NCP or a designated state official or Indian tribe or, in the case of discharges covered by the OPA, a foreign government official, who may pursue claims for damages under section 1006 of the OPA.

Underwriter: An insurer, a surety company, a guarantor, or any other person, other than an owner or operator of a vessel or facility, that undertakes to pay all or part of the liability of an owner or operator.

Unified Command: The method by which local, state, and federal agencies and the responsible party will work with the Incident Commander to:

- Determine their roles and responsibilities for a given incident.
- Determine their overall objectives for management of an incident.
- Select a strategy to achieve agreed-upon objectives.
- Deploy resources to achieve agreed-upon objectives.

Unified or Coordinated Command Meeting: Held to obtain agreement on strategic objectives and response priorities; review tactical strategies; engage in joint planning, integrate response operations; maximize use of resources; and minimize resolve conflicts.

Volunteers: An individual who donates their services or time without receiving monetary compensation.

Waste: Oil or contaminated soil, debris, and other substances removed from coastal waters and adjacent waters, shorelines, estuaries, tidal flats, beaches, or marshes in response to an unauthorized discharge. Waste means any solid, liquid, or other material intended to be disposed of or discarded and generated as a result of an unauthorized discharge of oil. Waste does not include substances intended to be recycled if they are in fact recycled within 90 days of their generation or if they are brought to a recycling facility within that time.

Wetlands: Those areas that are inundated or saturated by surface or groundwater at a frequency or duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include playa lakes, swamps, marshes, bogs, and similar areas such as sloughs, prairie potholes, wet meadows, prairie river overflows, mudflats, and natural ponds (40 CFR 112.2(y)).

Wildlife Rescue: Efforts made in conjunction with Federal and State agencies to retrieve, clean, and rehabilitate birds and wildlife affected by an oil spill.

Worst Case Discharge: The largest foreseeable discharge under adverse weather conditions. For facilities located above the high water line of coastal waters, a worst case discharge includes those weather conditions most likely to cause oil discharged from the facility to enter coastal waters.

ACRONYMS

AC	Area Committee
AOR	Area of Review
AQI	Alternate Qualified Individual
ACP	Area Contingency Plan
ACPs	Area Contingency Plans

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1026	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(a)	The response plan must identify a qualified individual and at least one alternate that meet the requirements of this section.	ERAP, 5.2, Fig 1.1
(c)	The owner or operator shall provide each qualified individual and alternate qualified individual identified in the plan with a document designating them as a qualified individual and specifying their full authority to...(1)...contract with OSRO, (2) act as liaison with FOSC; and (3) obligate funds...	Fig 1.1
33 CFR 154.1028		
(a)	When required in this subpart, the availability of response resources must be ensured...	Fig 5.6
33 CFR 154.1029		
(a)	The response plan must use the appropriate criteria in this section to develop the worst case discharge.	App B.2
33 CFR 154.1030		
(a)	The plan must be written in English.	Entire Plan
(b)	A response plan must be divided into the sections listed in this paragraph and formatted in the order specified herein unless noted otherwise. It must also have some easily found marker identifying each section listed below. The following are the sections and subsections of a facility response plan:	ERAP, TOC, Tabs and Cross Reference
(b)(1)	Introduction and plan contents.	1.0
(b)(2)	Emergency response action plan:	-----
(b)(2)(i)	Notification procedures.	ERAP, 3.0, 3.1, 3.2, Fig 3.1 - 3.9
(b)(2)(ii)	Facility's spill mitigation procedures.	ERAP, 4.2,4.3
(b)(2)(iii)	Facility's response activities.	ERAP, 4.2, 4.3, 4.4
(b)(2)(iv)	Fish and wildlife and sensitive environments.	ERAP, App A, Fig A.1, Fig A.2
(b)(2)(v)	Disposal plan.	6.4
(b)(3)	Training and Exercises:	-----
(b)(3)(i)	Training procedures.	App E.1 – E-3
(b)(3)(ii)	Exercise procedures.	App E.4- E.5
(b)(4)	Plan review and update procedures.	1.4
(b)(5)	Appendices.	-----
(b)(5)(i)	Facility-specific information.	Fig 1.1
(b)(5)(ii)	List of contacts.	Fig 3.1 -3.9

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1030	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(b)(5)(iii)	Equipment lists and records.	4.4, Fig 5.5
(b)(5)(iv)	Communications plan.	2.8
(b)(5)(v)	Site-specific safety and health plan.	5.1, App F
(b)(5)(vi)	List of acronyms and definitions.	Glossary of Terms/Acronyms
(b)(5)(vii)	A geographic-specific Appendix for each zone in which a mobile facility operates.	N/A
(c)	The required contents for each section and subsection of the plan are contained in 154.1035, 154.1040, and 154.1041, as appropriate.	-----
(d)	The sections and subsections of response plans submitted to the COTP must contain at a minimum all the information required in 154.1035, 154.1040, and 154.1041, as appropriate. It may contain other appropriate sections, subsections, or information that are required by other Federal, State, and local agencies.	See Cross Reference
(e)	For initial and subsequent submission, a plan that does not follow the format specified in paragraph (b) of this section must be supplemented with a detailed cross-reference section to identify the location of the applicable sections required by this subpart.	See Cross Reference
(f)	The information contained in a response plan must be consistent with the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (40 CFR part 300) and the Area Contingency Plan(s) (ACP) covering the area in which the facility operates. Facility owners or operators shall ensure that their response plans are in accordance with the ACP in effect 6 months prior to initial plan submission or the annual plan review required under 154.1065(a). Facility owners or operators are not required to, but may at their option, conform to an ACP which is less than 6 months old at the time of plan submission.	1.4, 1.5
33 CFR 154.1035		
(a)	*Introduction and plan content.* This section of the plan must include facility and plan information as follows:	-----
(a)(1)	The facility's name, street address, city, county, state, ZIP code, facility telephone number, and tele-facsimile number, if so equipped. Include mailing address if different from street address.	Fig 1.1

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(a)(2)	The facility's location described in a manner that could aid both a reviewer and a responder in locating the specific facility covered by the plan, such as, river mile or location from a known landmark that would appear on a map or chart.	Fig 1.1
(a)(3)	The name, address, and procedures for contacting the facility's owner or operator on a 24-hour basis.	Fig 1.1
(a)(4)	A table of contents.	TOC
(a)(5)	During the period that the submitted plan does not have to conform to the format contained in this subpart, a cross index, if appropriate.	Cross Reference
(a)(6)	A record of change(s) to record information on plan updates.	Foreword (Record of Revisions)
(b)	Emergency Response Action Plan. This section of the plan must be organized in the subsections described in this paragraph:	-----
(b)(1)	*Notification procedures.* (i) This subsection must contain a prioritized list identifying the person(s), including name, telephone number, and their role in the plan, to be notified of a discharge or substantial threat of a discharge of oil. The telephone number need not be provided if it is listed separately in the list of contacts required in the plan. This Notification Procedures listing must include --	3.0
(b)(1)(A)	Facility response personnel, the spill management team, oil spill removal organizations, and the qualified individual(s) and the designated alternate(s); and	Fig 1.1, Fig 3.1 - 3.4
(b)(1)(B)	Federal, State, or local agencies, as required.	Fig 3.5 -3.9
(b)(1)(B)(ii)	This subsection must include a form, which contains information to be provided in the initial and follow-up notifications to Federal, State, and local agencies.	Fig 3.10
(b)(2)	*Facility's spill mitigation procedures.* (i) This subsection must describe the volume(s) and oil groups that would be involved in the --	-----
(b)(2)(A)	Average most probable discharge from the MTR facility;	App B
(b)(2)(B)	Maximum most probable discharge from the MTR facility;	App B
(b)(2)(C)	Worst case discharge from the MTR facility; and	App B

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(b)(2)(D)	Where applicable, the worst case discharge from the non-transportation-related facility. This must be the same volume provided in the response plan for the non-transportation-related facility.	App B
(b)(2)(D)(ii)	This subsection must contain prioritized procedures for facility personnel to mitigate or prevent any discharge or substantial threat of a discharge of oil resulting from operational activities associated with internal or external facility transfers including specific procedures to shut down affected operations. Facility personnel responsible for performing specified procedures to mitigate or prevent any discharge or potential discharge shall be identified by job title. A copy of these procedures shall be maintained at the facility operations center. These procedures must address actions to be taken by facility personnel in the event of a discharge, potential discharge, or emergency involving the following equipment and scenarios:	-----
(b)(2)(D)(ii)(A)	Failure of manifold, mechanical loading arm, other transfer equipment, or hoses, as appropriate;	4.2, App B.2
(b)(2)(D)(ii)(B)	Tank overfill;	4.2, App B.2
(b)(2)(D)(ii)(C)	Tank failure;	4.2, App B.2
(b)(2)(D)(ii)(D)	Piping rupture;	4.2, App B.2
(b)(2)(D)(ii)(E)	Piping leak, both under pressure and not under pressure, if applicable;	4.2, App B.2
(b)(2)(D)(ii)(F)	Explosion or fire; and	4.2
(b)(2)(D)(ii)(G)	Equipment failure (e.g. pumping system failure, relief valve failure, or other general equipment relevant to operational activities associated with internal or external facility transfers.)	4.2, App B.2
(b)(2)(D)(iii)	This subsection must contain a listing of equipment and the responsibilities of facility personnel to mitigate an average most probable discharge.	4.4, B.2
(b)(3)	*Facility's response activities.* (i) This subsection must contain a description of the facility personnel's responsibilities to initiate a response and supervise response resources pending the arrival of the qualified individual.	4.2
(b)(3)(ii)	This subsection must contain a description of the responsibilities and authority of the qualified individual and alternate as required in 154.1026.	5.2
(b)(3)(iii)	This subsection must describe the organizational structure that will be used to manage the response actions. This structure must include the following functional areas.	App D
(b)(3)(iii)(A)	Command and control;	App D
(b)(3)(iii)(B)	Public information;	App D

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(b)(3)(iii)(C)	Safety;	App D
(b)(3)(iii)(D)	Liaison with government agencies;	App D
(b)(3)(iii)(E)	Spill Operations;	App D
(b)(3)(iii)(F)	Planning;	App D
(b)(3)(iii)(G)	Logistics support; and	App D
(b)(3)(iii)(H)	Finance.	App D
(b)(3)(iv)	This subsection must identify the oil spill removal organizations and the spill management team to:	5.3
(b)(3)(iv)(A)	Be capable of providing the following response resources:	-----
(b)(3)(iv)(A)(*1*)	Equipment and supplies to meet the requirements of 154.1045, 154.1047 or subparts H or I of this part, as appropriate; and	Fig 5.5
(b)(3)(iv)(A)(*2*)	Trained personnel necessary to continue operation of the equipment and staff of the oil spill removal organization and spill management team for the first 7 days of the response.	Fig 5.5
(b)(3)(iv)(B)	This section must include job descriptions for each spill management team member within the organizational structure described in paragraph (b)(3)(iii) of this section. These job descriptions should include the responsibilities and duties of each spill management team member in a response action.	App D
(b)(3)(v)	For mobile facilities that operate in more than one COTP zone, the plan must identify the oil spill removal organization and the spill management team in the applicable geographic-specific Appendix The oil spill removal organization(s) and the spill management team discussed in paragraph (b)(3)(iv)(A) of this section must be included for each COTP zone in which the facility will handle, store, or transport oil in bulk.	N/A
(b)(3)(vi)	For facilities that handle, store, or transport group II through group IV petroleum oils, and that operate in waters where dispersant use in pre-authorized, this subsection of the plan must also separately list the resource providers and specific resources, including appropriately trained dispersant-application personnel, necessary to provide the dispersant capabilities required in the subpart. All resources providers and resources must be available by contract or other approved means as described in §154.1028(a). The dispersant resources to be listed within this section must include the following:	Fig 5.5
(b)(3)(vi)(A)	Identification of each primary dispersant staging site to be used by each dispersant-application platform to meet the requirements of this subpart.	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(b)(3)(vi)(B)	Identification of the platform type, resource-providing organization, location, and dispersant payload for each dispersant-application platform identified. Location data must identify the distance between the platform's home base and the identified primary dispersant staging site for this section.	Fig 5.5
(b)(3)(vi)(C)	For each unit of dispersant stockpile required to support the effective daily application capacity (EDAC) of each dispersant-application platform necessary to sustain each intended response tier of operation, identify the dispersant product resource provider, location, and volume. Location data must include the stockpile's distance to the primary staging sites where the stockpile would be loaded onto the corresponding platforms.	Fig 5.5
(b)(3)(vi)(D)	If an oil spill removal organization has been evaluated by the Coast Guard, and its capability is equal to or exceeds the response capability needed by the owner or operator, the section may identify only the oil spill removal organization, and not the information required in paragraphs (b)(3)(vi)(A) through (b)(3)(vi)(C) of this section.	Fig 5.5
(b)(3)(vii)	This subsection of the plan must also separately list the resource providers and specific resources necessary to provide aerial oil tracking capabilities requir4ed in this subpart. The oil tracking resources to be listed within this section must include the following:	Fig 5.5
(b)(3)(vii)(A)	The identification of a resource provider; and	Fig 5.5
(b)(3)(vii)(B)	Type and location of aerial surveillance aircraft that are ensured available, through contract or other approved means, to meet the oil tracking requirements of §154.1045(j).	Fig 5.5
(b)(3)(viii)	For mobile facilities that operate in more than one COTP zone, the plan must identify the oil spill removal organization and the spill management team in the applicable geographic-specific appendix. The oil spill removal organization(s) and the spill management team discussed in paragraph (b)(3)(iv) or this section must be included for each COTP zone in which the facility will handle, store, or transport oil in bulk.	N/A
(b)(3)(ix)	For mobile facilities that operate in more than one COTP zone, the plan must identify the oil spill removal organization and the spill management team in the applicable geographic-specific appendix. The oil spill removal organization(s) and the spill management team discussed in paragraph (b)(3)(iv)(A) of this section must be included for each COTP zone in which the facility will handle, store, or transport oil in bulk.	N/A

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(b)(4)	*Fish and wildlife and sensitive environments.* (i) This section of the plan must identify areas of economic importance and environmental sensitivity, as identified in the ACP, which are potentially impacted by a worst case discharge. ACPs are required under section 311(j)(4) of the FWPCA to identify fish and wildlife and sensitive environments. The applicable ACP shall be used to designate fish and wildlife and sensitive environments in the plan. Changes to the ACP regarding fish and wildlife and sensitive environments shall be included in the annual update of the response plan, when available.	App A
(b)(4)(ii)	For a worst case discharge from the facility, this section of the plan must --	-----
(b)(4)(ii)(A)	List all fish and wildlife and sensitive environments identified in the ACP which are potentially impacted by a discharge of persistent oils, non-persistent oils, or non-petroleum oils.	Fig A.1
(b)(4)(ii)(B)	Describe all the response actions that the facility anticipates taking to protect these fish and wildlife and sensitive environments.	App A.6
(b)(4)(ii)(C)	Contain a map or chart showing the location of those fish and wildlife and sensitive environments which are potentially impacted. The map or chart shall also depict each response action that the facility anticipates taking to protect these areas. A legend of activities must be included on the map page.	Fig A.2
(b)(4)(iii)	For a worst case discharge, this section must identify appropriate equipment and required personnel, available by contract or other approved means as described in 154.1028, to protect fish and wildlife and sensitive environments which fall within the distances calculated using the methods outlined in this paragraph as follows:	-----
(b)(4)(iii)(A)	Identify the appropriate equipment and required personnel to protect all fish and wildlife and sensitive environments in the ACP for the distances, as calculated in paragraph (b)(4)(iii)(B) of this section, that the persistent oils, non-persistent oils, or non-petroleum oils are likely to travel in the noted geographic area(s) and number of days listed in Table 2 of Appendix C of this part;	Fig 5.5
(b)(4)(B)	Calculate the distances required by paragraph (b)(4)(iii)(A) of this section by selecting one of the methods described in this paragraph;	-----
(b)(4)(B)(*1*)	Distances may be calculated as follows:	-----
(b)(4)(B)(*1*)(*i*)	For persistent oils and non-petroleum oils discharged into non-tidal waters, the distance from the facility reached in 48 hours at maximum current.	B.4, C.4

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(b)(4)(B)(*1*)(*ii*)	For persistent and non-petroleum oils discharged into tidal waters, 15 miles from the facility down current during ebb tide and to the point of maximum tidal influence or 15 miles, whichever is less, during flood tide.	App B.4
(b)(4)(B)(*1*)(*iii*)	For non-persistent oils discharged into non-tidal waters, the distance from the facility reached in 24 hours at maximum current.	N/A
(b)(4)(B)(*1*)(*iv*)	For non-persistent oils discharged into tidal waters, 5 miles from the facility down current during ebb tide and to the point of maximum tidal influence or 5 miles, whichever is less, during flood tide.	N/A
(b)(4)(B)(*2*)	A spill trajectory or model may be substituted for the distances calculated under paragraph (b)(4)(iii)(B)(*l) of this section.* The spill trajectory or model must be acceptable to the COTP.	N/A
(b)(4)(B)(*3*)	The procedures contained in the Environmental Protection's Agency's regulations on oil pollution prevention for non-transportation-related onshore facilities at 40 CFR part 112, Appendix C, Attachment C-III may be substituted for the distances listed in non-tidal and tidal waters; and	App B.4
(b)(4)(C)	Based on historical information or a spill trajectory or model, the COTP may require the additional fish and wildlife and sensitive environment's also be protected.	-----
(b)(5)	*Disposal Plan.* This subsection must describe any actions to be taken or procedures to be used to ensure that all recovered oil and oil contaminated debris produced as a result of any discharge are disposed according to Federal, state, or local requirements	6.4
(c)	*Training and exercises.* This section must be divided into the following two subsections:	-----
(c)(1)	*Training procedures.* This subsection must describe the training procedures and programs of the facility owner or operator to meet the requirements in 154.1050.	E.1 – E.3
(c)(2)	*Exercise procedures.* This subsection must describe the exercise program to be carried out by the facility owner or operator to meet the requirements in 154.1055.	E.4
(d)	*Plan review and update procedures.* This section must address the procedures to be followed by the facility owner or operator to meet the requirements of 154.1065 and the procedures to be followed for any post-discharge review of the plan to evaluate and validate its effectiveness.	1.4
(e)	*Appendices.* This section of the response plan must include the appendices described in this paragraph.	-----
(e)(1)	*Facility-specific information.* This Appendix must contain a description of the facility's principal characteristics.	-----

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(e)(1)(i)	There must be a physical description of the facility including a plan of the facility showing the mooring areas, transfer locations, control stations, locations of safety equipment, and the location and capacities of all piping and storage tanks.	Fig 1.1, App G
(e)(1)(ii)	The Appendix must identify the sizes, types, and number of vessels that the facility can transfer oil to or from simultaneously.	Fig 1.1
(e)(1)(iii)	The Appendix must identify the first valve(s) on facility piping separating the transportation-related portion of the facility from the non-transportation-related portion of the facility, if any. For piping leading to a manifold located on a dock serving tank vessels, this valve is the first valve inside the secondary containment required by 40 CFR part 112.	Fig 1.2, App G
(e)(1)(iv)	The Appendix must contain information on the oil(s) and hazardous material handled, stored, or transported at the facility in bulk. A material safety data sheet meeting the requirements of 29 CFR 1910.1200, 33 CFR 154.310(a)(5) or an equivalent will meet this requirement. This information can be maintained separately providing it is readily available and the Appendix identifies its location. This information must include --	Fig 1.1, 4.3 (maintained separately at the Facility)
(e)(1)(iv)(A)	The generic or chemical name;	4.3 (maintained separately at the Facility)
(e)(1)(iv)(B)	A description of the appearance and odor;	4.3 (maintained separately at the Facility)
(e)(1)(iv)(C)	The physical and chemical characteristics;	4.3 (maintained separately at the Facility)
(e)(1)(iv)(D)	The hazards involved in handling the oil(s) and hazardous materials. This shall include hazards likely to be encountered if the oil(s) and hazardous materials come in contact as a result of a discharge; and	4.3 (maintained separately at the Facility)
(e)(1)(iv)(E)	A list of firefighting procedures and extinguishing agents effective with fires involving the oil(s) and hazardous materials.	4.3 (maintained separately at the Facility)
(e)(1)(iv)(E)(v)	The Appendix may contain any other information which the facility owner or operator determines to be pertinent to an oil spill response.	-----

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(e)(2)	*List of contacts.* This Appendix must include information on 24-hour contact of key individuals and organizations. If more appropriate, this information may be specified in a geographic-specific Appendix The list must include --	-----
(e)(2)(i)	The primary and alternate qualified individual(s) for the facility;	Fig 1.1
(e)(2)(ii)	The contact(s) identified under paragraph (b)(3)(iv) of this section for activation of the response resources; and	Fig 3.1 -3.3
(e)(2)(iii)	Appropriate Federal, State, and local officials.	Fig 3.5 – 3.9
(e)(3)	*Equipment list and records.* This Appendix must include the information specified in this paragraph.	-----
(e)(3)(i)	The Appendix must contain a list of equipment and facility personnel required to respond to an average most probable discharge, as defined in 154.1020. The Appendix must also list the location of the equipment.	4.4, Fig 5.5
(e)(3)(ii)	The Appendix must contain a detailed listing of all the major equipment identified in the plan as belonging to an oil spill removal organization(s) that is available, by contract or other approved means as described in 154.1028(a), to respond to a maximum most probable or worst case discharge, as defined in 154.1020. The detailed listing of all major equipment may be located in a separate document referenced by the plan. Either the Appendix or the separate document referenced in the plan must provide the location of the major response equipment.	N/A
(e)(3)(iii)	It is not necessary to list response equipment from oil spill removal organization(s) when the organization has been classified by the Coast Guard and their capacity has been determined to equal or exceed the response capability needed by the facility. For oil spill removal organization(s) classified by the Coast Guard, the classification must be noted in this section of the plan. When it is necessary for the Appendix to contain a listing of response equipment, it shall include all of the following items that are identified in the response plan: Skimmers; booms; dispersant application, in-situ burning, bioremediation equipment and supplies, and other equipment used to apply other chemical agents on the NCP Product Schedule (if applicable); communications, firefighting, and beach cleaning equipment; boats and motors; disposal and storage equipment; and heavy equipment. The list must include for each piece of equipment --	Fig. 5.5
(e)(3)(iii)(A)	The type, make, model, and year of manufacture listed on the nameplate of the equipment;	N/A
(e)(3)(iii)(B)	For oil recovery devices, the effective daily recovery rate, as determined using section 6 of Appendix C of this part;	N/A

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1035	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(e)(3)(iii)(C)	For containment boom, the overall boom height (draft and freeboard) and type of end connectors;	N/A
(e)(3)(iii)(D)	The spill scenario in which the equipment will be used for or which it is contracted;	N/A
(e)(3)(iii)(E)	The total daily capacity for storage and disposal of recovered oil;	N/A
(e)(3)(iii)(F)	For communication equipment, the type and amount of equipment intended for use during response activities. Where applicable, the primary and secondary radio frequencies must be specified.	N/A
(e)(3)(iii)(G)	Location of the equipment; and	N/A
(e)(3)(iii)(H)	The date of the last inspection by the oil spill removal organization(s).	N/A
(e)(4)	*Communications plan.* This Appendix must describe the primary and alternate method of communication during discharges, including communications at the facility and at remote locations within the areas covered by the response plan. The Appendix may refer to additional communications packages provided by the oil spill removal organization. This may reference another existing plan or document.	2.8
(e)(5)	*Site-specific safety and health plan.* This Appendix must describe the safety and health plan to be implemented for any response location(s). It must provide as much detailed information as is practicable in advance of an actual discharge. This Appendix may reference another existing plan requiring under 29 CFR 1910.120.	5.1.2, App F Site Safety Plan
(e)(6)	*List of acronyms and definitions.* This Appendix must list all acronyms used in the response plan including any terms or acronyms used by Federal, State, or local governments and any operational terms commonly used at the facility. This Appendix must include all definitions that are critical to understanding the response plan.	Glossary of Terms/Acronyms
33 CFR 154.1045		
(a)	The owner or operator of a facility that handles, stores, or transports Group I through Group IV petroleum oils shall use the criteria in this section to evaluate response resources identified in the response plan for the specified operating environment.	Fig 5.5
(a)(1)	The criteria in Table 1 of appendix C of this part are to be used solely for identification of appropriate equipment in a response plan. These criteria reflect conditions used for planning purposes to select mechanical response equipment and are not conditions that would limit response actions or affect normal facility operations.	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1045	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(a)(2)	The response resources must be evaluated considering limitations for the COTP zones in which the facility operates, including but not limited to--	Fig 5.5
(a)(2)(i)	Ice conditions;	
(a)(2)(ii)	Debris;	
(a)(2)(iii)	Temperature ranges;	
(a)(2)(iv)	Weather-related visibility; and	
(a)(2)(v)	Other appropriate environmental conditions as determined by the COTP.	
(a)(3)	The COTP may reclassify a specific body of water or location within the COTP zone. Any reclassifications will be identified by the COTP in the applicable ACP. Reclassifications may be to--	Fig 5.5
(a)(3)(i)	A more stringent operating environment if the prevailing wave conditions exceed the significant wave height criteria during more than 35 percent of the year; or	Fig 5.5
(a)(3)(ii)	A less stringent operating environment if the prevailing wave conditions do not exceed the significant wave height criteria for the less stringent operating environment during more than 35 percent of the year.	Fig 5.5
(b)	Response equipment must--	----
(b)(1)	Meet or exceed the operating criteria listed in Table 1 of appendix C of this part;	Fig 5.5
(b)(2)	Function in the applicable operating environment; and	Fig 5.5
(b)(3)	Be appropriate for the petroleum oil carried.	Fig 5.5
(c)	The response plan for a facility that handles, stores, or transports Group I through Group IV petroleum oils must identify response resources that are available, by contract or other approved means as described in Sec. 154.1028(a)(1)(4), to respond to the facility's average most probable discharge. The response resources must include, at a minimum--	Fig 5.5
(c)(1)	1,000 feet of containment boom or two times the length of the largest vessel that regularly conducts petroleum oil transfers to or from the facility, whichever is greater, and the means of deploying and anchoring the boom available at the spill site within 1 hour of the detection of a spill; and	Fig 5.5
(c)(2)	Oil recovery devices and recovered oil storage capacity capable of being at the spill site within 2 hours of the discovery of a petroleum oil discharge from a facility.	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1045	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(d)	The response plan for a facility that handles, stores, or transports Group I through Group IV petroleum oils must identify response resources that are available, by contract or other approved means as described in Sec. 154.1028(a)(1)(4), to respond to a discharge up to the facility's maximum most probable discharge volume.	Fig 5.5
(d)(1)	The response resources must include sufficient containment boom, oil recovery devices, and storage capacity for any recovery of up to the maximum most probable discharge planning volume, as contained in Appendix C.	Fig 5.5
(d)(2)	The response resources must be appropriate for each group of petroleum oil identified in Sec. 154.1020 that is handled, stored, or transported by the facility.	Fig 5.5
(d)(3)	These response resources must be positioned such that they can arrive at the scene of a discharge within the following specified times:	Fig 5.5
(d)(3)(i)	The equipment identified in paragraphs (c)(1) and (c)(2) of this section or in Sec. 154.1040(d) must arrive within the times specified in those paragraphs or that section, as appropriate.	Fig 5.5
(d)(3)(ii)	In higher volume port areas and the Great Lakes, response resources must be capable of arriving on scene within 6 hours of the discovery of a petroleum oil discharge from a facility.	Fig 5.5
(d)(3)(iii)	In all other locations, response resources must be capable of arriving on scene within 12 hours of the discovery of a petroleum oil discharge from a facility.	Fig 5.5
(d)(4)	The COTP may determine that mobilizing response resources to an area beyond the response times indicated in this paragraph invalidates the response plan. In this event, the COTP may impose additional operational restrictions (e.g., limitations on the number of transfers at a facility), or, at the COTP's discretion, the facility may operate with temporarily modified response plan development and evaluation criteria (e.g., modified response times, alternate response resources, etc.).	Fig 5.5
(e)	The response plan for a facility that handles, stores, or transports Group I through Group IV petroleum oils must identify the response resources that are available, by contract or other approved means as described in Sec. 154.1028(a)(1)(4), to respond to the worst case discharge volume of petroleum oil to the maximum extent practicable.	Fig 5.5
(e)(1)	The location of these response resources must be suitable to meet the response times identified in paragraph (f) of this section for the applicable geographic area(s) of operation and response tier.	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1045	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(e)(2)	The response resources must be appropriate for--	-----
(e)(2)(i)	The volume of the facility's worst case discharge;	App B
(e)(2)(ii)	Group(s) of petroleum oil as identified in Sec. 154.1020 that are handled, stored, or transported by the facility; and	Fig 1.1
(e)(2)(iii)	The geographic area(s) in which the facility operates.	Fig 1.1
(e)(3)	The response resources must include sufficient boom, oil recovery devices, and storage capacity to recover the worst case discharge planning volumes.	Fig 5.5
(e)(4)	The guidelines in appendix C of this part must be used for calculating the quantity of response resources required to respond at each tier to the worst case discharge to the maximum extent practicable.	Fig 5.5
(e)(5)	When determining response resources necessary to meet the requirements of this section, a portion of those resources must be capable of use in close-to-shore response activities in shallow water. The following percentages of the response equipment identified for the applicable geographic area must be capable of operating in waters of 6 feet or less depth.	Fig 5.5
(e)(5)(i)	Offshore--10 percent.	Fig 5.5
(e)(5)(ii)	Nearshore/inland/Great Lakes/rivers and canals--20 percent.	Fig 5.5
(e)(6)	The COTP may determine that mobilizing response resources to an area beyond the response times indicated in this paragraph invalidates the response plan. In this event, the COTP may impose additional operational restrictions (e.g., limitations on the number of transfers at a facility), or, at the COTP's discretion, the facility may be permitted to operate with temporarily modified response plan development and evaluation criteria (e.g., modified response times, alternate response resources, etc.).	Fig 5.5
(f)	(f) Response equipment identified in a response plan for a facility that handles, stores, or transports Group I through Group IV petroleum oils must be capable of arriving on scene within the times specified in this paragraph for the applicable response tier in a higher volume port area, Great Lakes, and in other areas. Response times for these tiers from the time of discovery of a discharge are...	Fig 5.5
(g)	For the purposes of arranging for response resources for a facility that handles, stores, or transports Group I through Group IV petroleum oils, by contract or other approved means as described in Sec. 154.1028(a)(1)-(4), response equipment identified for Tier 1 plan credit must be capable of being mobilized and en route to the scene of a discharge within 2 hours of notification. The notification procedures identified in the plan must provide for notification and authorization of mobilization of identified Tier 1 response resources--	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1045	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(g)(1)	Either directly or through the qualified individual; and	Fig 5.5
(g)(2)	Within 30 minutes of a discovery of a discharge or substantial threat of discharge.	Fig 5.5
(h)	Response resources identified for Tier 2 and Tier 3 plan credit must be capable of arriving on scene within the time specified for the applicable tier.	Fig 5.5
(i)	The owner or operator of a facility that handles, stores, or transports groups II through IV petroleum oils within the inland, nearshore, or offshore areas where pre-authorization for dispersant use exists must identify in their response plan, and ensure the availability of, through contract or other approved means, response resources capable of conducting dispersant operations within those areas.	Fig 5.5
(i)(1)	Dispersant response resources must be capable of commencing dispersant-application operations at the site of a discharge within 7 hours of the decision by the Federal On-Scene Coordinator to use dispersants.	Fig 5.5
(i)(2)	Dispersant response resources must include all of the following:	Fig 5.5
(i)(2)(i)	Sufficient volumes of dispersants for application as required by paragraph (i)(3) of this section. Any dispersants identified in a response plan must be of a type listed on the National Oil and Hazardous Substances Pollution Contingency Plan Product Schedule (which is contained in 40 CFR part 300, and available online from the U.S. Government Printing Office).	Fig 5.5
(i)(2)(ii)	Dispersant-application platforms capable of delivering and applying the dispersant on a discharge in the amounts as required by paragraph (i)(3) of this section. At least 50 percent of each EDAC tier requirement must be achieved through the use of fixed-wing, aircraft-based application platforms. For dispersant-application platforms not detailed within the DMP2, adequacy of performance criteria must be documented by presentation of independent evaluation materials (e.g., field tests and reports of actual use) that record the performance of the platform.	Fig 5.5
(i)(2)(iii)	Dispersant-application systems that are consistent in design with, and are capable of applying dispersants within, the performance criteria in ASTM F1413-07 (incorporated by reference, see Sec. 154.106). For dispersant-application systems not fully covered by ASTM F1413-07, such as fire monitor-type applicators, adequacy of performance criteria must be documented by presentation of independent evaluation materials (e.g., laboratory tests, field tests, and reports of actual use) that record the design of performance specifications.	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1045	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(i)(2)(iv)	Dispersant-application personnel trained in and capable of applying dispersants according to the recommended procedures contained within ASTM F1737-07 (incorporated by reference, see Sec. 154.106).	Fig 5.5
(i)(3)	Dispersant stockpiles, application platforms, and other supporting resources must be available in a quantity and type sufficient to treat a facility's worst-case discharge (as determined by using the criteria in appendix C, section 8) or in quantities sufficient to meet the requirements in Table 154.1045 (i) of this section, whichever is the lesser amount.	Fig 5.5
(j)	The owner or operator of a facility handling Groups I through IV petroleum oil as a primary cargo must identify in the response plan, and ensure the availability through contract or other approved means, of response resources necessary to provide aerial oil tracking to support oil spill assessment and cleanup activities. Facilities operating exclusively on inland rivers are not required to comply with this paragraph. Aerial oil tracking resources must:	Fig 5.5
(j)(1)	Be capable of arriving at the site of a discharge in advance of the arrival of response resources identified in the plan for tiers 1, 2, and 3 Worst-Case Discharge response times, and for a distance up to 50 nautical miles from shore (excluding inland rivers);	Fig 5.5
(j)(2)	Be capable of supporting oil spill removal operations continuously for three 10-hour operational periods during the initial 72 hours of the discharge;	Fig 5.5
(j)(3)	Include appropriately located aircraft and personnel capable of meeting the response time requirement for oil tracking from paragraph (j)(1) of this section; and	Fig 5.5
(j)(4)	Include sufficient numbers of aircraft, pilots, and trained observation personnel to support oil spill removal operations, commencing upon initial assessment, and capable of coordinating on-scene cleanup operations, including dispersant and mechanical recovery operations. Observation personnel must be trained in:	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1045	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(j)(4)(i)	The protocols of oil-spill reporting and assessment, including estimation of slick size, thickness, and quantity; and	Fig 5.5
(j)(4)(ii)	The use of assessment techniques in ASTM F1779-08 (incorporated by reference, see Sec. 154.106), and familiar with the use of other guides, such as NOAA's "Open Water Oil Identification Job Aid for Aerial Observation," and NOAA's "Characteristic Coastal Habitats" guide (available on the Internet at http://response.restoration.noaa.gov/use the following links in the order presented: Home[bond]Emergency Response[bond] Responding to Oil Spills).	Fig 5.5
(k)	A response plan for a facility that handles, stores, or transports Group I through Group IV petroleum oils must identify response resources with firefighting capability. The owner or operator of a facility that does not have adequate firefighting resources located at the facility or that can not rely on sufficient local firefighting resources must identify and ensure, by contract or other approved means as described in Sec. 154.1028(a)(1)-(4), the availability of adequate firefighting resources. The response plan must also identify an individual located at the facility to work with the fire department for petroleum oil fires. This individual shall also verify that sufficient well-trained firefighting resources are available within a reasonable time to respond to a worst case discharge. The individual may be the qualified individual as defined in Sec. 154.1020 and identified in the response plan or another appropriate individual located at the facility.	Fig 5.5
(l)	The response plan for a facility that handles, stores, or transports Groups I through IV petroleum oils must identify equipment and required personnel available, by contract or other approved means as described in Sec. 154.1028(a) (1)-(4), to protect fish and wildlife and sensitive environments.	Fig 5.5
(l)(1)	Except as set out in paragraph (k)(2) of this section, the identified response resources must include the quantities of boom sufficient to protect fish and wildlife and sensitive environments as required by Sec. 154.1035(b)(4).	Fig 5.5
(l)(2)	The resources and response methods identified in a facility response plan must be consistent with the required resources and response methods to be used in fish and wildlife and sensitive environments, contained in the appropriate ACP. Facility owners or operators shall ensure that their response plans are in accordance with the ACP in effect 6 months prior to initial plan submission or the annual plan review required under Sec. 154.1065(a). Facility owners or operators are not required to, but may at their option, conform to an ACP which is less than 6 months old at the time of plan submission.	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1045	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(m)	The response plan for a facility that handles, stores, or transports Groups I through IV petroleum oils must identify an oil spill removal organization(s) with response resources that are available, by contract or other approved means as described in Sec. 154.1028(a) (1)-(4), to effect a shoreline cleanup operation commensurate with the quantity of emulsified petroleum oil to be planned for in shoreline cleanup operations.	Fig 5.5
(m)(1)	Except as required in paragraph (l)(2) of this section, the shoreline cleanup response resources required must be determined as described in appendix C of this part.	Fig 5.5
(m)(2)	The resources and response methods identified in a facility response plan must be consistent with the required shoreline cleanup resources and methods contained in the appropriate ACP. Facility owners or operators shall ensure that their response plans are in accordance with the ACP in effect 6 months prior to initial plan submission or the annual plan review required under Sec. 154.1065(a). Facility owners or operators are not required to, but may at their option, conform to an ACP which is less than 6 months old at the time of plan submission.	Fig 5.5
(n)	Appendix C of this part describes the procedures to determine the maximum extent practicable quantity of response resources that must be identified and available, by contract or other approved means as described in Sec. 154.1028(a) (1)-(4), for the maximum most probable discharge volume, and for each worst case discharge response tier.	Fig 5.5
(n)(1)	Included in appendix C of this part is a cap that recognizes the practical and technical limits of response capabilities that an individual facility owner or operator can be expected to contract for in advance.	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1045	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(n)(2)	Table 5 in appendix C of this part lists the caps that apply in February 18, 1993, and February 18, 1998. Depending on the quantity and type of petroleum oil handled by the facility and the facility's geographic area of operations, the resource capability caps in this table may be reached. The owner or operator of a facility whose estimated recovery capacity exceeds the applicable contracting caps in Table 5 shall identify sources of additional equipment equal to twice the cap listed in Tiers 1, 2, and 3 or the amount necessary to reach the calculated planning volume, whichever is lower. The identified resources must be capable of arriving on scene not later than the Tier 1, 2, and 3 response times in this section. No contract is required. While general listings of available response equipment may be used to identify additional sources, a response plan must identify the specific sources, locations, and quantities of equipment that a facility owner or operator has considered in his or her planning. When listing Coast Guard classified oil spill removal organization(s) which have sufficient removal capacity to recover the volume above the response capability cap for the specific facility, as specified in Table 5 in appendix C of this part, it is not necessary to list specific quantities of equipment.	Fig 5.5
(o)	The Coast Guard will continue to evaluate the environmental benefits, cost efficiency and practicality of increasing mechanical recovery capability requirements. This continuing evaluation is part of the Coast Guard's long term commitment to achieving and maintaining an optimum mix of oil spill response capability across the full spectrum of response modes. As best available technology demonstrates a need to evaluate or change mechanical recovery capacities, a review of cap increases and other requirements contained within this subpart may be performed. Any changes in the requirements of this section will occur through a public notice and comment process. During this review, the Coast Guard will determine if established caps remain practicable and if increased caps will provide any benefit to oil spill recovery operations. The review will include, at least, an evaluation of: 1. Best available technologies for containment and recovery; 2. Oil spill tracking technology; 3. High rate response techniques; 4. Other applicable response technologies; and 5. Increases in the availability of private response resources.	Fig 5.5

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1050	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
33 CFR 154.1050		
(a)	A response plan submitted to meet the requirements of Sec. 154.1035 or Sec. 154.1040, as appropriate, must identify the training to be provided to each individual with responsibilities under the plan. A facility owner or operator must identify the method to be used for training any volunteers or casual laborers used during a response to comply with the requirements of 29 CFR 1910.120.	E.1 –E.3
(b)	A facility owner or operator shall ensure the maintenance of records sufficient to document training of facility personnel; and shall make them available for inspection upon request by the U.S. Coast Guard. Records for facility personnel must be maintained at the facility for 3 years.	E.3
(c)	Where applicable, a facility owner or operator shall ensure that an oil spill removal organization identified in a response plan to meet the requirements of this subpart maintains records sufficient to document training for the organization's personnel and shall make them available for inspection upon request by the facility's management personnel, the qualified individual, and U.S. Coast Guard. Records must be maintained for 3 years following completion of training.	E.3
(d)	The facility owner or operator remains responsible for ensuring that all private response personnel are trained to meet the Occupational Safety and Health Administration (OSHA) standards for emergency response operations in 29 CFR 1910.120.	E.2
33 CFR 154.1055		
(a)(1)	Qualified individual notification exercises (quarterly).	E.4
(a)(2)	Spill management team tabletop exercises (annually). In a 3-year period, at least one of these exercises must include a worst case discharge scenario.	E.4
(a)(3)(i)	Equipment deployment exercises: Semiannually for facility owned and operated equipment.	E.4
(a)(3)(ii)	Equipment deployment exercises: Annually for oil spill removal organization equipment.	E.4
(a)(4)	Emergency procedures exercises (optional)	E.4

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1057	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
33 CFR 154.1057 Inspection and maintenance of response resources.		
(a)	A facility owner or operator required to submit a response plan under this part must ensure that--	-----
(a)(1)	Containment booms, skimmers, vessels, and other major equipment listed or referenced in the plan are periodically inspected and maintained in good operating condition, in accordance with manufacturer's recommendations, and best commercial practices; and	4.4
(a)(2)	All inspection and maintenance is documented and that these records are maintained for 3 years.	4.4
(b)	For equipment which must be inspected and maintained under this section the Coast Guard may--	4.4
(b)(1)	Verify that the equipment inventories exist as represented;	-----
(b)(2)	Verify the existences of records required under this section;	-----
(b)(3)	Verify that the records of inspection and maintenance reflect the actual condition of any equipment listed or referenced; and	-----
(b)(4)	Inspect and require operational tests of equipment.	-----
(c)	This section does not apply to containment booms, skimmers, vessels, and other major equipment listed or referenced in the plan and ensured available from an oil spill removal organization through the written consent required under Sec. 154.1028(a)(5).	N/A
33 CFR 154.1060 Submission and approval procedures.		
(a)	The owner or operator of a facility to which this subpart applies shall submit one copy of a facility response plan meeting the requirements of this subpart to the COTP for initial review and, if appropriate, approval.	1.5, Distribution List
(b)	The owner or operator of a facility to which this subpart applies shall include a statement certifying that the plan meets the applicable requirements of subparts F, G, H, and I of this part, as appropriate.	Fig 1-1, App I
(c)	For an MTR facility that is located in the inland response zone where the EPA Regional Administrator is the predesignated Federal On- Scene Coordinator, the COTP may consult with the EPA Federal On-Scene Coordinator prior to any final approval.	-----
(d)	For an MTR facility identified in Sec. 154.1015(c) of this subpart that is also required to prepare a response plan under 40 CFR part 112, if the COTP determines that the plan meets all applicable requirements and the EPA Regional Administrator raises no objection to the response plan contents, the COTP will notify the facility owner or operator in writing that the plan is approved.	Whole Document

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1060	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(e)	The plan will be valid for a period of up to 5 years. The facility owner or operator must resubmit an updated plan every 5 years as follows:	1.4
(e)(1)	For facilities identified in only Sec. 154.1015(b)of this subpart, the 5-year period will commence on the date the plan is submitted to the COTP.	1.4
(e)(2)	For facilities identified in Sec. 154.1015(c) of this subpart, the 5-year period will commence on the date the COTP approves the plan.	1.4
(e)(3)	All resubmitted response plans shall be accompanied by a cover letter containing a detailed listing of all revisions to the response plan.	1.4
(f)	For an MTR facility identified in Sec. 154.1015(c)(2) the COTP will notify the facility owner or operator in writing that the plan is approved.	-----
(g)	If a COTP determines that a plan does not meet the requirements of this subpart either upon initial submission or upon 5-year resubmission, the COTP will return the plan to the facility owner or operator along with an explanation of the response plan's deficiencies. The owner or operator must correct any deficiencies in accordance with Sec. 154.1070 and return the plan to the COTP within the time specified by the COTP in the letter describing the deficiencies.	-----
(h)	The facility owner or operator and the qualified individual and the alternative qualified individual shall each maintain a copy of the most current response plan submitted to the COTP. One copy must be maintained at the facility in a position where the plan is readily available to persons in charge of conducting transfer operations.	Distribution List
33 CFR 154.1065 Plan review and revision procedures.		
(a)	A facility owner or operator must review his or her response plan (s) annually. This review shall incorporate any revisions to the plan, including listings of fish and wildlife and sensitive environments identified in the ACP in effect 6 months prior to plan review.	1.4
(a)(1)	For an MTR facility identified in Sec. 154.1015(c)of this subpart as a "significant and substantial harm facility," this review must occur within 1 month of the anniversary date of COTP approval of the plan. For an MTR facility identified in Sec. 154.1015(b) of this subpart, as a "substantial harm facility" this review must occur within 1 month of the anniversary date of submission of the plan to the COTP.	1.4
(a)(2)	The facility owner or operator shall submit any revision(s) to the response plan to the COTP and all other holders of the response plan for information or approval, as appropriate.	1.4

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1065	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(a)(2)(i)	Along with the revisions, the facility owner or operator shall submit a cover letter containing a detailed listing of all revisions to the response plan.	1.4
(a)(2)(ii)	If no revisions are required, the facility owner or operator shall indicate the completion of the annual review on the record of changes page.	1.4
(a)(2)(iii)	The COTP will review the revision(s) submitted by the owner or operator and will give written notice to the owner or operator of any COTP objection(s) to the proposed revisions within 30 days of the date the revision(s) were submitted to the COTP. The revisions shall become effective not later than 30 days from their submission to the COTP unless the COTP indicates otherwise in writing as provided in this paragraph. If the COTP indicates that the revision(s) need to be modified before implementation, the owner or operator will modify the revision(s) within the time period set by the COTP.	-----
(3)	Any required revisions must be entered in the plan and noted on the record of changes page.	Foreword
(3)(b)	The facility owner or operator shall submit revisions to a previously submitted or approved plan to the COTP and all other holders of the response plan for information or approval within 30days, whenever there is--	1.4
(3)(b)(1)	A change in the facility's configuration that significantly affects the information included in the response plan;	1.4
(3)(b)(2)	A change in the type of oil (petroleum oil group)handled, stored, or transported that affects the required response resources;	1.4
(3)(b)(3)	A change in the name(s) or capabilities of the oil spill removal organization required by Sec. 154.1045;	1.4
(3)(b)(4)	A change in the facility's emergency response procedures;	1.4
(3)(b)(5)	A change in the facility's operating area that includes ports or geographic area(s) not covered by the previously approved plan. A facility may not operate in an area not covered in a plan previously submitted or approved, as appropriate, unless the revised plan is approved or interim operating approval is received under Sec. 154.1025; or	N/A
(3)(b)(6)	Any other changes that significantly affect the implementation of the plan.	1.4

USCG OPA 90 FINAL RULE *33 CFR Part 154*		
33 CFR 154.1065	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(3)(c)	Except as required in paragraph (b) of this section, revisions to personnel and telephone number lists included in the response plan do not require COTP approval. The COTP and all other holders of the response plan shall be advised of these revisions and provided a copy of the revisions as they occur.	1.4
(3)(d)	The COTP may require a facility owner or operator to revise a response plan at any time as a result of a compliance inspection if the COTP determines that the response plan does not meet the requirements of this subpart or as a result of inadequacies noted in the response plan during an actual pollution incident at the facility.	-----

(a)(1)	The name and address of the operator.	Fig 1.1
(a)(2)	For each response zone which contains one or more line sections that meet the criteria for determining significant and substantial harm as described in § 194.103, a listing and description of the response zones, including county(s) and state(s).	Fig 1.1
(b)	The information summary for the response zone appendix, required in § 194.107, must include:	----
(b)(1)	The information summary for the core plan.	Fig 1.1
(b)(2)	The names or titles and 24-hour telephone numbers of the qualified individual(s) and at least one alternate qualified individual(s);	Fig 1.1
(b)(3)	The description of the response zone, including county(s) and state(s), for those zones in which a worst case discharge could cause substantial harm to the environment.	Fig 1.1
(b)(4)	A list of line sections for each pipeline contained in the response zone, identified by milepost or survey station number, or other operator designation.	Fig 1.1
(b)(5)	The basis for the operator's determination of significant and substantial harm.	App. I
(b)(6)	The type of oil and volume of the worst case discharge.	Fig 1.1, App. B

DOT/PHMSA 49 CFR PART 194 CROSS REFERENCE (Cont'd)		
§ 194.115	**BRIEF DESCRIPTION**	**LOCATION in PLAN**
(a)	Each operator shall identify and ensure, by contract or other approved means, the resources necessary to remove, to the maximum extent practicable, a worst case discharge and to mitigate or prevent a substantial threat of a worst case discharge.	§ 5.0
(b)	An operator shall identify in the response plan the response resources which are available to respond within the time specified, after discovery of a worst case discharge, or to mitigate the substantial threat of such a discharge.	§ 5.0, App. B
§ 194.117	**BRIEF DESCRIPTION**	**LOCATION in PLAN**
(a)	Each operator shall conduct training to ensure that:	----
(a)(1)	All personnel know --	----
(a)(1)(i)	Their responsibility under the response plan	§ 4.0, App D
(a)(1)(ii)	The name and address of, and the procedure for contacting, the operator on a 24-hour basis	Fig 1.1 § 3.0, Fig 3.2, App. D
(a)(2)	Reporting personnel know --	----
(a)(2)(i)	The content of the information summary of the response plan.	Fig 1.1, App. D
(a)(2)(ii)	The toll-free telephone number of the National Response Center	Fig 3.5
(a)(2)(iii)	The notification process	§ 3.0
(a)(3)	Personnel engaged in response activities know --	----
(a)(3)(i)	The characteristics and hazards of the oil discharged	Fig. 4.1
(a)(3)(ii)	The conditions that are likely to worsen emergencies, including the consequences of facility malfunctions or failures, and the appropriate corrective actions.	§ 2.0, App. A.6
(a)(3)(iii)	The steps necessary to control any accidental discharge of oil and to minimize the potential for fire, explosion, toxicity, or environmental damage	§ A.6, App. B
(a)(3)(iv)	The proper firefighting procedures and use of equipment, fire suits, and breathing apparatus	§ 1.2, 4.0
(b)	Each operator shall maintain a training record for each individual that has been trained as required by this section. These records must be maintained in the following manner as long as the individual is assigned duties under the response plan	----
(b)(1)	Records for operator personnel must be maintained at the operator's headquarters	App. E
(b)(2)	Records for personnel engaged in response, other than operator personnel, shall be maintained as determined by the operator.	App. E
(c)	Nothing in this section relieves an operator from the responsibility to ensure that all response personnel are trained to meet the OSHA standards for emergency response operations in 29 CFR 1910.120	App. E

DOT/PHMSA 49 CFR PART 194 CROSS REFERENCE (Cont'd)		
§ 194.119	**BRIEF DESCRIPTION**	**LOCATION in PLAN**
(a)	Each owner shall submit two copies...electronic format is preferred	Foreword (List of Plan Holders)
(b)	...PHSMA will notify the operator of any alleged deficiencies...	----
(c)	The operator...may petition PHSMA for reconsideration within 30 days...	----
(d)	...PHSMA will approve the Response Plan...	----
(e)	...The operator may submit a certification to PHSMA... that the operator has obtained, through contract or other approved means, the necessary private personnel and equipment to record, to the maximum extent practicable, to a worst case discharge...	App. I (Operator's Statement)
(f)	...PHSMA may require an operator to provide a copy of the response plan to the FOSC...	----

TGLO DISCHARGE PREVENTION AND RESPONSE PLAN *31 TAC §19.13* *CROSS REFERENCE*		
§ 19.13	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(c)	Required elements of discharge prevention and response plans for all facility classifications.	-----
(1)	The owner and operator of the facility;	Fig. 1.1
(2)	The person or persons in charge of this facility….	Fig. 1.1
(3)	The name and address (both physical and mailing) of the facility;	Fig. 1.1
(4)	A description of the facility, including:	-----
(A)	The location of the facility by latitude and longitude;	Fig. 1.1
(B)	The facility's primary activity;	Fig. 1.1
(C)	The types of oil handled, whether material safety data sheets (MSDS) have been prepared for them, and the location where the MSDS are maintained;	Fig. 1.1, 4.3
(D)	The storage capacity of each tank used for storing oil;	App. C
(E)	The diameter of all lines through which oil is transferred;	App C.1
(F)	The average daily throughput of oil at the facility; and	App C.1
(G)	The dimensions and capacity in barrels of the largest oil-handling vessel which docks at the facility	Fig. 1.1
(5)	For a facility which normally does not have personnel on-site...	N/A
(6)	A general description of measures taken by the facility to prevent unauthorized discharges of oil;	§4.0, App. C
(7)	A plan to conduct an annual oil spill drill that entails notifying the GLO and National Response Center and keeping a log…	App. E
(8)	If oil is transferred at the facility, emergency transfer procedures to be implemented if an actual or threatened unauthorized discharge of oil occurs at the facility;	§4 .0
(9)	Strategic plans to contain and clean up unauthorized discharges of oil from the facility;	§ 4.0, 6.0
(10)	A statement that all facility personnel who might be involved in an oil spill response have been informed that detergents or other surfactants are prohibited from being used on an oil spill in the water, and that dispersants can only be used with the approval of the Regional Response Team…	App. A.8
(11)	A description of any secondary containment or diversionary structures or equipment at the facility to prevent discharged oil from reaching coastal waters…	App C
(e)	Additional requirements for facilities classified as large	-----
(1)	Maps showing vehicular access to the facility, pipelines to and from the facility, and nearby residential or other populous areas;	Fig 1.3, A.2
(2)	A site plan of the facility showing:	-----
(A)	The location of all structures in which oil is stored;	Fig 1.3, App C
(B)	The location of all areas where oil is transferred at the facility; and	Fig 1.3, App C
(C)	Drainage and diversion systems at the facility…	Fig 1.3, App C
(3)	A plan to conduct an annual oil spill drill that includes the following elements:	-----
(A)	Notifying the GLO and National Response Center;	Fig 3.5
(B)	Notifying any third parties, such as discharge cleanup organizations	Fig 3.3

TGLO DISCHARGE PREVENTION AND RESPONSE PLAN 31 TAC §19.13 CROSS REFERENCE (Cont'd)		
§ 19.13	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
(C)	If the facility has spill response equipment stored on-site, deployment of a representative portion of the equipment which would be used to respond	Fig 4.2, App. E
(D)	A log documenting when the annual drill was conducted and the facility personnel who participated in it;	App. F
(4)	A detailed description of the facility's discharge prevention and response capability, including:	----
(A)	Leak detection and safety systems to prevent accidental discharges	App. C
(B)	Schedules, methods, and procedures for testing, maintaining, and inspecting storage tanks, pipelines, and other equipment used for handling oil;	App. C
(C)	Schedules, methods, and procedures for conducting accidental discharge response drills;	App. E
(D)	Whether the facility's oil spill response capability will primarily be based on contracts or agreements with third parties or on the facility's own personnel and equipment;	Fig 3.4, 4.2, 5.5
(E)	Planned response actions, the chain of command, lines of communication, and procedures for notifying the GLO, emergency response and public safety entities;	§2.0, 3.0, 4.0
(F)	Oil spill response equipment and supplies located at the facility;	Fig 4.2
(G)	If the facility owns and maintains oil spill response equipment, the schedules, methods, and procedures for maintaining the equipment;	App. E
(H)	If the operator has entered into any oil spill response or cleanup contracts or basic ordering agreements with a discharge cleanup organization, copies of the contracts or agreements or a narrative description of their terms;	Fig 5.5
(I)	The worst case unauthorized discharge of oil reasonably likely to occur at the facility and the rationale used to determine the worst case unauthorized discharge;	App. B
(J)	A description and map of environmentally sensitive areas that would be impacted by the worst case unauthorized discharge;	App. A
(K)	A description of response strategies that would be implemented to contain and clean up worst case unauthorized discharge;	App. A, B
(L)	Information on the facility's program for training facility personnel;	App. E
(M)	Information on facility personnel who have been specifically designated to respond to an oil spill, including any training they have received and where the training records are maintained;	Fig. 3.1, 3.2, App. E
(N)	Plans for transferring oil during an emergency; plans for recovering, storing, separating, transporting, and disposing of oily waste materials generated during an oil spill response; and	App. B
(O)	Plans for providing emergency medical treatment, site safety, and security during an oil spill	§4.0

OSHA EMERGENCY ACTION PLANS *(29 CFR Part 1910.38) and Employee Alarm Systems (29 CFR Part 1910.165)*		
29 CFR	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
1910.38	***Emergency action plan:***	
(a)	Application	1.0
(b)	Written and Oral Emergency Plans	Entire Plan
(c)	Elements:	-----
(c)(1)	Procedures for reporting a fire or other emergency;	3.0
(c)(2)	Procedures for emergency evacuation, including type of evacuation and exit route assignments;	2.4
(c)(3)	Procedures to be followed by employees who remain to operate critical plant operations before they evacuate;	2.0
(c)(4)	Procedures to account for all employees after emergency evacuation has been completed.	2.4
(c)(5)	Procedures to be followed by employees performing rescue and medical duties;	2.4
(c)(6)	The name or job titles of every employee who may be contacted by employees who need more information about the plan or an explanation of their duties under the plan.	3.0
(d)	Alarm system	2.4, 3.1
(e)	Training	App E
(f)	Review of Emergency Action Plan	1.4
1910.165	***Employee alarm systems:***	
(b)	General requirements	3.1
(b)(1)	Purpose of alarm system	2.4, 3.1
(b)(4)	Preferred means of reporting emergencies	3.1
(d)	Maintenance and testing	2.4

OSHA HAZWOPER *29 CFR Part 1910.120*		
29 CFR	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
1910.120(q)	***Emergency response to hazardous substance releases:***	
(1)	Emergency response plan	Entire Plan
(2)	Elements of an emergency response plan:	-----
(i)	Pre-emergency planning and coordination with outside parties	2.0, 3.0
(ii)	Personnel roles, lines of authority, training, and communication	2.0, 3.0, 4.0, App E
(iii)	Emergency recognition and prevention	2.0
(iv)	Safe distances and places of refuge	2.4
(v)	Site security and control	App C.1
(vi)	Evacuation routes and procedures	2.4
(vii)	Decontamination procedures	4.6
(viii)	Emergency medical treatment and response procedures	2.4
(ix)	Emergency alerting and response procedures	2.0, 3.0
(x)	Critique of response and follow-up	App E.5
(xi)	PPE and emergency equipment	4.0
(xii)	Emergency response plan coordination and integration	1.2
(3)	Procedures for handling emergency response:	-----
(i)	The senior emergency response official responding to an emergency shall become the individual in charge of a site-specific Incident Command System (ICS).	2.0, 4.0, 5.0, App F
(ii)	The individual in charge of the ICS shall identify, to the extent possible, all hazardous substances or conditions, present and shall address as appropriate site analysis, use of engineering controls, maximum exposure limits, hazardous substance handling procedures, and use of any new technologies.	2.0, 4.0, 5.0, App F
(iii)	Implementation of appropriate emergency operations and use of PPE.	2.0, 4.0, 5.0, App F
(iv)	Employees engaged in emergency response and exposed to hazardous substances presenting an inhalation hazard or potential inhalation hazard shall wear positive pressure self-contained breathing apparatus while engaged in emergency response.	2.0, 4.0, 5.0, App F
(v)	The individual in charge of the ICS shall limit the number of emergency response personnel at the emergency site, in those areas of potential or actual exposure to incident or site hazards, to those who are actively performing emergency operations.	2.0, 4.0, 5.0, App F
(vi)	Backup personnel shall stand by with equipment ready to provide assistance or rescue.	2.0, 4.0, 5.0, App F

OSHA HAZWOPER *29 CFR Part 1910.120*		
29 CFR	**BRIEF DESCRIPTION**	**LOCATION IN PLAN**
1910.120(q)	***Emergency response to hazardous substance releases (Cont'd):***	
(vii)	The individual in charge of the ICS shall designate a safety official, who is knowledgeable in the operations being implemented at the emergency response site.	2.0, 4.0, 5.0, App F
(viii)	When activities are judged by the safety official to be an IDLH condition and/or to involve an imminent danger condition, the safety official shall have authority to alter, suspend, or terminate those activities.	2.0, 4.0, 5.0, App F
(ix)	After emergency operations have terminated, the individual in charge of the ICS shall implement appropriate decontamination procedures.	2.0, 4.0, 5.0, App F
(x)	When deemed necessary for meeting the tasks at hand, approved self-contained compressed air breathing apparatus may be used with approved cylinders from other approved self-contained compressed air breathing apparatus provided that such cylinders are of the same capacity and pressure rating.	2.0, 4.0, 5.0, App F
(4)	Skilled support personnel	5.0
(5)	Specialist employees	5.0
(6)	Training	App E
(7)	Trainers	App E
(8)	Refresher training	App E
(9)	Medical surveillance and consultation	App E
(10)	Chemical protective clothing	App E
(11)	Post-emergency response operations	2.0, 4.0, App E

U.S. EPA – RCRA Contingency Plan 40 CFR § 265.52 – 265.56		
40 CFR § 265	**BRIEF DESCRIPTION**	**SECTION**
§265.52	**Content of contingency plan.**	-----
(a)	The contingency plan must describe the actions facility personnel must take to comply with §§265.51 and 265.56 in response to fires, explosions, or any unplanned sudden or non-sudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water at the facility.	Whole Plan
(b)	If the owner or operator has already prepared a Spill Prevention, Control, and Countermeasures (SPCC) Plan in accordance with Part 112 of this chapter, or some other emergency or contingency plan, he need only amend that plan to incorporate hazardous waste management provisions that are sufficient to comply with the requirements of this Part. The owner or operator may develop one contingency plan which meets all regulatory requirements. EPA recommends that the plan be based on the National Response Team's Integrated Contingency Plan Guidance ("One Plan"). When modifications are made to non-RCRA provisions in an integrated contingency plan, the changes do not trigger the need for a RCRA permit modification.	SPCC Plan
(c)	The plan must describe arrangements agreed to by local police departments, fire departments, hospitals, contractors, and State and local emergency response teams to coordinate emergency services, pursuant to §265.37.	Foreword, Agency Correspondence
(d)	The plan must list names, addresses, and phone numbers (office and home) of all persons qualified to act as emergency coordinator (see §265.55), and this list must be kept up to date. Where more than one person is listed, one must be named as primary emergency coordinator and others must be listed in the order in which they will assume responsibility as	Fig. 1.1
(e)	The plan must include a list of all emergency equipment at the facility (such as fire extinguishing systems, spill control equipment, communications and alarm systems (internal and external), and decontamination equipment), where this equipment is required. This list must be kept up to date. In addition, the plan must include the location and a physical description of each item on the list, and a brief outline of its capabilities.	Fig. 4.2
(f)	The plan must include an evacuation plan for facility personnel where there is a possibility that evacuation could be necessary. This plan must describe signal(s) to be used to begin evacuation, evacuation routes, and alternate evacuation routes (in cases where the primary routes could be blocked by releases of hazardous waste or fires).	§ 2.4

U.S. EPA – RCRA Contingency Plan 40 CFR § 265.52 – 265.56 (Cont'd)		
40 CFR § 265	**BRIEF DESCRIPTION**	**SECTION**
§265.53	**Copies of contingency plan.**	-----
	A copy of the contingency plan and all revisions to the plan must be:	-----
(a)	Maintained at the facility; and	Foreword
(b)	Submitted to all local police departments, fire departments, hospitals, and State and local emergency response teams that may be called upon to provide emergency services.	Foreword (Distribution)
§265.54	**Amendment of contingency plan.**	-----
	The contingency plan must be reviewed, and immediately amended, if necessary, whenever:	-----
(a)	Applicable regulations are revised;	§ 1.4
(b)	The plan fails in an emergency;	§ 1.4
(c)	The facility changes—in its design, construction, operation, maintenance, or other circumstances—in a way that materially increases the potential for fires, explosions, or releases of hazardous waste or hazardous waste constituents, or changes the response necessary in an emergency;	§ 1.4
(d)	The list of emergency coordinators changes; or	§ 1.4
(e)	The list of emergency equipment changes.	§ 1.4
§265.55	**Emergency coordinator.**	-----
	At all times, there must be at least one employee either on the facility premises or on call (i.e., available to respond to an emergency by reaching the facility within a short period of time) with the responsibility for coordinating all emergency response measures. This emergency coordinator must be thoroughly familiar with all aspects of the facility's contingency plan, all operations and activities at the facility, the location and characteristics of waste handled, the location of all records within the facility, and the facility layout. In addition, this person must have the authority to commit the resources needed to carry out the contingency plan.	Fig. 3.1
§265.56	**Emergency procedures.**	-----
(a)	Whenever there is an imminent or actual emergency situation, the emergency coordinator (or his designee when the emergency coordinator is on call) must immediately:	§ 5.2
(a)(1)	Activate internal facility alarms or communication systems, where applicable, to notify all facility personnel; and	§ 5.2
(a)(2)	Notify appropriate State or local agencies with designated response roles if their help is needed.	§ 5.2
(b)	Whenever there is a release, fire, or explosion, the emergency coordinator must immediately identify the character, exact source, amount, and areal extent of any released materials. He may do this by observation or review of facility records or manifests and, if necessary, by chemical analysis.	§ 5.2

U.S. EPA – RCRA Contingency Plan 40 CFR § 265.52 – 265.56 (Cont'd)		
40 CFR § 265	**BRIEF DESCRIPTION**	**SECTION**
(c)	Concurrently, the emergency coordinator must assess possible hazards to human health or the environment that may result from the release, fire, or explosion. This assessment must consider both direct and indirect effects of the release, fire, or explosion (e.g., the effects of any toxic, irritating, or asphyxiating gases that are generated, or the effects of any hazardous surface water run-offs from water or chemical agents used to control fire and heat-induced explosions).	§ 5.2
(d)	If the emergency coordinator determines that the facility has had a release, fire, or explosion which could threaten human health, or the environment, outside the facility, he must report his findings as follows:	§ 5.2
(d)(1)	If his assessment indicates that evacuation of local areas may be advisable, he must immediately notify appropriate local authorities. He must be available to help appropriate officials decide whether local areas should be evacuated; and	§ 5.2
(d)(2)	He must immediately notify either the government official designated as the on-scene coordinator for that geographical area, or the National Response Center (using their 24-hour toll free number 800/424-8802). The report must include:	§ 5.2
(d)(2)(i)	Name and telephone number of reporter;	Fig. 3.10
(d)(2)(ii)	Name and address of facility;	Fig. 3.10
(d)(2)(iii)	Time and type of incident (e.g., release, fire);	Fig. 3.10
(d)(2)(iv)	Name and quantity of material(s) involved, to the extent known;	Fig. 3.10
(d)(2)(v)	The extent of injuries, if any; and	Fig. 3.10
(d)(2)(vi)	The possible hazards to human health, or the environment, outside the facility.	Fig. 3.10
(e)	During an emergency, the emergency coordinator must take all reasonable measures necessary to ensure that fires, explosions, and releases do not occur, recur, or spread to other hazardous waste at the facility. These measures must include, where applicable, stopping processes and operations, collecting and containing released waste, and removing or isolating containers.	§ 4.2
(f)	If the facility stops operations in response to a fire, explosion or release, the emergency coordinator must monitor for leaks, pressure buildup, gas generation, or ruptures in valves, pipes, or other equipment, wherever this is appropriate.	§ 4.2
(g)	Immediately after an emergency, the emergency coordinator must provide for treating, storing, or disposing of recovered waste, contaminated soil or surface water, or any other material that results from a release, fire, or explosion at the facility.	§ 6.4

U.S. EPA – RCRA Contingency Plan 40 CFR § 265.52 – 265.56 (Cont'd)		
40 CFR § 265	**BRIEF DESCRIPTION**	**SECTION**
(h)	The emergency coordinator must ensure that, in the affected area(s) of the facility:	-----
(h)(1)	No waste that may be incompatible with the released material is treated, stored, or disposed of until cleanup procedures are completed; and	§ 6.4
(h)(2)	All emergency equipment listed in the contingency plan is cleaned and fit for its intended use before operations are resumed.	§ 4.6
(i)	The owner or operator must note in the operating record the time, date, and details of any incident that requires implementing the contingency plan. Within 15 days after the incident, he must submit a written report on the incident to the Regional Administrator.	Fig. 3.10, App. C.5
