Plain Language Summary

Industrial and Hazardous Waste Permit Applications

Instructions: Complete this form and submit with any industrial hazardous waste, or industrial solid waste, permit application that is subject to 30 Texas Administrative Code §39.405(k) [applications for a Class 3 permit modification, permit amendment, permit renewals, and for a new permit]. Please be concise.

Application Information

Purpose of application: ☐New ☒Renewal ☒Modification/Amendment	
Date Submitted to TCEQ: August 9, 2024	
Customer Name: KM Liquids Terminals LLC	
Facility Name: Galena Park Terminal	
CN: 603254707	**RN:** 100237452
Permit Number: 50054	**Solid Waste Registration Number:** 30573
Facility Street Address: 906 Clinton Drive, Galena Park, TX 77547	
Weblink to Street Address: https://www.bing.com/search?pglt=41&q=906+Clinton+Drive%2C+Galena+Park%2C	

Facility Information *(check all that apply)*

What is the primary type of business?	☐Chemical manufacturing ☐ Oil refinery ☒ Treatment, storage or disposal facility plant ☐Other **If other, enter description:**
What does the facility produce?	☐Chemicals ☐Fuels / lubricants ☒No products ☐Other **If other, enter description:**

Waste Management Information *(check all that apply)*

What types of wastes are managed?	☒Nonhazardous industrial ☒Hazardous ☐Other **If other, enter description:**
Where does the waste come from?	☒Off-site source ☒On-site source
How is the waste managed?	☒Storage ☒Process / Treatment ☒Disposal ☐Other **If other, enter description:**
What type of units manage the waste?	☒Active ☒Post-Closure **Type and count:**
What happens to waste managed at the facility?	☒Transported off-site ☒Disposed on-site ☐Other **If other, enter description:**

Pollution Control Methods *(check all that apply)*	
How will the facility prevent spills, leaks, and releases?	☒Routine inspections ☒Engineered liner systems ☒Spill containment ☒Proper waste handling ☐Operations in enclosed buildings ☒Groundwater monitoring ☐Other **If other, enter description:**
How will the facility clean up spills, leaks, and releases?	☒Spill clean-up supplies ☐Decontamination equipment ☐Other **If other, enter description:**
How will the facility prevent / minimize air emissions?	☒Air monitoring / control systems ☐Filters / scrubbers ☐Routine inspections ☒Proper waste handling ☐Operations in enclosed buildings ☐Other **If other, enter description:**

Description of Update *(for Class 3 Modifications and Amendments only)*

List and explain any changes this modification or amendment would make to the two sections above—**Waste Management Information** and **Pollution Control Methods**.

No changes to above information in proposed amendments to permit.

	☐Otro **Si es otro, introduzca la descripción:** Introduzca la descripción		

Descripción de la Actualización (*solo para Modificaciones y Enmiendas de Clase 3)*

Liste y explique cualquier cambio que esta modificación o enmienda haría a las dos secciones anteriores: **Información de Gestión de Desechos** y **Métodos de Control de la Contaminación**.

No hay cambios a la información anterior en las enmiendas propuestas para el permiso.

Texas Commission on Environmental Quality

Public Involvement Plan Form for Permit and Registration Applications

The Public Involvement Plan is intended to provide applicants and the agency with information about how public outreach will be accomplished for certain types of applications in certain geographical areas of the state. It is intended to apply to new activities; major changes at existing plants, facilities, and processes; and to activities which are likely to have significant interest from the public. This preliminary screening is designed to identify applications that will benefit from an initial assessment of the need for enhanced public outreach.

All applicable sections of this form should be completed and submitted with the permit or registration application. For instructions on how to complete this form, see TCEQ-20960-inst.

Section 1. Preliminary Screening

☐ New Permit or Registration Application

☒ New Activity – modification, registration, amendment, facility, etc. (see instructions)

If neither of the above boxes are checked, completion of the form is not required and does not need to be submitted.

Section 2. Secondary Screening

☒ Requires public notice,

☐ Considered to have significant public interest, **and**

☒ Located within any of the following geographical locations:

- Austin
- Dallas
- Fort Worth
- Houston
- San Antonio
- West Texas
- Texas Panhandle
- Along the Texas/Mexico Border
- Other geographical locations should be decided on a case-by-case basis

If all the above boxes are not checked, a Public Involvement Plan is not necessary. Stop after Section 2 and submit the form.

☒ Public Involvement Plan not applicable to this application. Provide **brief** explanation.

Significantly low public interest for past permit renewal application public meetings and notices.

Section 3. Application Information

Type of Application (check all that apply):

Air ☐ Initial ☐ Federal ☐ Amendment ☐ Standard Permit ☐ Title V

Waste ☐ Municipal Solid Waste ☐ Industrial and Hazardous Waste ☐ Scrap Tire
☐ Radioactive Material Licensing ☐ Underground Injection Control

Water Quality

☐ Texas Pollutant Discharge Elimination System (TPDES)

- ☐ Texas Land Application Permit (TLAP)
- ☐ State Only Concentrated Animal Feeding Operation (CAFO)
- ☐ Water Treatment Plant Residuals Disposal Permit

☐ Class B Biosolids Land Application Permit

☐ Domestic Septage Land Application Registration

Water Rights New Permit

☐ New Appropriation of Water

☐ New or existing reservoir

Amendment to an Existing Water Right

☐ Add a New Appropriation of Water

☐ Add a New or Existing Reservoir

☐ Major Amendment that could affect other water rights or the environment

Section 4. Plain Language Summary

Provide a brief description of planned activities.

Section 5. Community and Demographic Information

Community information can be found using EPA's EJ Screen, U.S. Census Bureau information, or generally available demographic tools.

Information gathered in this section can assist with the determination of whether alternative language notice is necessary. Please provide the following information.

(City)

(County)

(Census Tract)
Please indicate which of these three is the level used for gathering the following information.

☐ City ☐ County ☐ Census Tract

(a) Percent of people over 25 years of age who at least graduated from high school

(b) Per capita income for population near the specified location

(c) Percent of minority population and percent of population by race within the specified location

(d) Percent of Linguistically Isolated Households by language within the specified location

(e) Languages commonly spoken in area by percentage

(f) Community and/or Stakeholder Groups

(g) Historic public interest or involvement

Section 6. Planned Public Outreach Activities

(a) Is this application subject to the public participation requirements of Title 30 Texas Administrative Code (30 TAC) Chapter 39?

☐ Yes ☐ No

(b) If yes, do you intend at this time to provide public outreach other than what is required by rule?

☐ Yes ☐ No

If Yes, please describe.

If you answered "yes" that this application is subject to 30 TAC Chapter 39, answering the remaining questions in Section 6 is not required.

(c) Will you provide notice of this application in alternative languages?

☐ Yes ☐ No

Please refer to Section 5. If more than 5% of the population potentially affected by your application is Limited English Proficient, then you are required to provide notice in the alternative language.

If yes, how will you provide notice in alternative languages?

☐ Publish in alternative language newspaper

☐ Posted on Commissioner's Integrated Database Website

☐ Mailed by TCEQ's Office of the Chief Clerk

☐ Other (specify)

(d) Is there an opportunity for some type of public meeting, including after notice?

☐ Yes ☐ No

(e) If a public meeting is held, will a translator be provided if requested?

☐ Yes ☐ No

(f) Hard copies of the application will be available at the following (check all that apply):

☐ TCEQ Regional Office ☐ TCEQ Central Office

☐ Public Place (specify)

Section 7. Voluntary Submittal

For applicants voluntarily providing this Public Involvement Plan, who are not subject to formal public participation requirements.

Will you provide notice of this application, including notice in alternative languages?

☐ Yes ☐ No

What types of notice will be provided?

☐ Publish in alternative language newspaper

☐ Posted on Commissioner's Integrated Database Website

☐ Mailed by TCEQ's Office of the Chief Clerk

☐ Other (specify)

KINDER MORGAN
KM Liquids Terminals LLC

August 9, 2024

FedEx Tracking No. 777894309652

Ms. Elizabeth Slone
Texas Commission on Environmental Quality
Waste Permits Division (MC-130)

Dear Ms. Slone:

KM Liquids Terminals LLC (Kinder Morgan) is submitting this Permit Renewal Application in accordance with 30 Texas Administrative Code (TAC) §305.65. The following is included:

1) the original Part A permit application plus one (1) full copy and electronic copy;
2) the original Part B application plus one (1) full copy and an electronic copy;
3) notification of check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division (check # 2269, dated 7/3/2024 for $2,884); and
4) an electronic mailing list on Compact Disk (CD) in MS Word format.

If you have any questions regarding this permit renewal application or require additional information, please feel free to contact me at 713-654-6035, or if you wish you can e-mail me at [redacted]

Sincerely,
KM Liquids Terminals LLC

Johnny Kennedy, P.G.
Remediation Manager

Texas Commission on Environmental Quality
Instructions and Procedural Information
for Filing a Permit Application for a
Hazardous Waste Storage, Processing, or Disposal Facility

Part A

[**Form Availability**: This form, as well as other Industrial and Hazardous Waste documents, is available on the Internet World Wide Web, Industrial and Hazardous Waste home page at address https://www.tceq.texas.gov/permitting/waste_permits/ihw_permits]

General Instructions

1. A person (individual, corporation or other legal entity) who stores, processes or disposes of hazardous waste (except where such storage and/or processing is excluded from permit requirements in accordance with 30 Texas Administrative Code (TAC) Section 335.2) must obtain a permit pursuant to the Texas Health and Safety Code. In applying to the Texas Commission on Environmental Quality, hereafter referred to as the Commission, the applicant shall follow the procedures outlined below, on the application and in the Rules of the Commission.

2. The application (one original plus three (3) complete copies[1]) should be mailed to:

   Texas Commission on Environmental Quality
   Attention: Waste Permits Division, MC126
   P. O. Box 13087
   Austin, Texas 78711-3087

3. Signature on Application [30 TAC 305.44]. The application shall be signed by the owner and operator or by a duly authorized agent, employee, officer, or representative of the owner or operator and shall be verified before a notary public. When another person signs on behalf of the owner and operator, this person's title or relationship to the owner or operator should be shown. In all cases, the person signing the form should be authorized to do so by the owner or operator (the Commission may require a person signing on behalf of an owner or operator to provide proof of authorization). An application submitted for a corporation must be signed by (or the signatory must be authorized by) a responsible corporate officer such as a president, secretary, treasurer, vice-president, or designated manager; or for a partnership or sole proprietorship, by a general partner or the proprietor, respectively. In the case of a municipal, state, federal, or other public facility, the application shall be signed by either a principal executive

[1] The third copy may optionally consist of paper copies of all plans and maps and a computer diskette of the remaining document. The document should be formatted in Word processing software up to and including version 6.1 or a 100% compatible format. Files may be compressed using PKZIP Ver. 2 or a 100% compatible program.

officer or ranking elected official.

4. An application will not be processed until all information required to properly evaluate the application has been obtained. When an application is severely lacking in detail and/or the applicant fails to submit additionally requested information in a timely manner, the application will not be considered to be "filed in accordance with the rules and regulations of the Commission."

   Please submit any application revisions with a revised date and page numbers at the bottom of the page(s).

5. Fees and Costs

   a. The fee for filing an application is discussed in Section XII of Part B, form number TCEQ-0376.

   b. The applicant for a permit is required to bear the cost of publication of notice of the application in a newspaper as prescribed by 30 TAC Section 39.405(f).

6. A person may not commence operation of a hazardous waste management facility until the Commission has issued a permit to authorize the storage, processing, or disposal of hazardous waste, except with the approval of the Commission.

7. Designation of Material as Confidential

   The designation of material as confidential is frequently carried to excess. The Commission has a responsibility to provide a copy of each application to other review agencies and to interested persons upon request and to safeguard confidential material from becoming public knowledge. Thus, the Commission requests that the applicant (1) be prudent in the designation of material as confidential and (2) submit such material only when it might be essential to the staff in their development of a recommendation.

   The Commission suggests that the applicant NOT submit confidential information as part of the permit application. However, if this cannot be avoided, the confidential information should be described in non-confidential terms throughout the application, and submitted as a document or binder, and conspicuously marked "CONFIDENTIAL."

   Reasons of confidentiality include the concept of trade secrecy and other related legal concepts which give a business the right to preserve confidentiality of business information to obtain or retain advantages from its right in the information. This includes authorizations under 18 U.S.C. 1905 and special rules cited in 40 CFR Chapter I, Part 2, Subpart B.

   Section 361.037 of the Texas Health and Safety Code does not allow an applicant for an industrial and hazardous waste permit to claim as confidential any record pertaining to the characteristics of the industrial solid waste.

   The applicant may elect to withdraw any confidential material submitted with the application. However, the permit cannot be issued, amended, or modified if the application is incomplete.

Part II

Procedural Information

After the submittal of Parts A and B of the application, the TCEQ will provide public notice of receipt of the application. The Executive Director's staff will review the application for completeness of information submitted. During the review, the applicant may be contacted for clarification or additional information. When all pertinent information is present, the application or a summary of its contents will be forwarded for review by other state agencies and local governmental entities interested in water quality control and solid waste management. After technical evaluation, opportunity for public hearing will be afforded.

Note that for facilities which had "commenced on-site storage, processing, or disposal of hazardous waste" [see 30 TAC Section 335.43(b)] on or before the date such waste is identified or listed as hazardous by EPA, the Texas Health and Safety Code provides in Section 361.082(f) that these facilities may continue to manage hazardous waste until such time as the Commission approves or denies the application, provided that the applicant has filed the permit application in accordance with the rules and regulations of the Commission.

The Commission may act upon an application for a permit, permit amendment, permit modification, or renewal of a permit without the necessity of holding a public hearing:

1. (a) When notice of the application has been mailed to persons possibly affected by the proposed permit; and

   (b) When notice has been published at least once in a newspaper regularly published or circulated within each county where the proposed facility is located; and

   (c) Within forty-five (45) days following publication of the Commission's notice, a Commissioner, the Executive Director or an affected person has not requested a public hearing; or

2. For a Class 1 or a Class 2 permit modification or a minor amendment to a permit. The Commission may, in certain cases, hold a public hearing for a Class 2 permit modification or a minor amendment.

A public hearing may be scheduled on an application for a RCRA hazardous waste permit when requested by a Commissioner, the Executive Director, or an affected person within forty-five (45) days following the newspaper publication.

Requirements of Giving Notice of the Application:

1. By the Applicant: Every applicant for a permit, permit amendment, permit modification, or permit renewal shall publish notice (see note below) of the application at least once in a newspaper regularly published or circulated within each county where the proposed facility is located. Where a public hearing has been requested, notice will be mailed to the applicant in ample time for publication, which shall be not less than thirty (30) days prior to the date set for the hearing. Except in the case of a notice of a permit modification request, the Commission will mail the appropriate notice and instructions for publication to the applicant.

   NOTE: Additional publication and direct mail notice to affected persons will result if a public hearing is requested following newspaper publication of the notice of application. The cost of providing this additionally required publication and service of notice to affected persons will be assumed by the applicant.

2. By the Texas Commission on Environmental Quality: The Commission will mail notice of the application (except for permit modifications) to affected persons and certain governmental entities. The notice will be mailed at the same time instructions for newspaper publications are mailed to the applicant.

3. Bilingual Notice Instructions:

   For certain permit applications, public notice in an alternate language is required. If an elementary school or middle school nearest to the facility offers a bilingual program, notice may be required to be published in an alternative language. The Texas Education Code, upon which the TCEQ alternative language notice requirements are based, requires a bilingual education program for an entire school district should the requisite alternative language speaking student population exist. However, there may not be any bilingual-speaking students at a particular school within a district which is required to offer the bilingual education program. For this reason, the requirement to publish notice in an alternative language is triggered if the nearest elementary or middle school, as part of a larger school district, is required to make a bilingual education program available to qualifying students and either the school has students enrolled at such a program on-site, or has students who attend such a program at another location to satisfy the school's obligation to provide such a program.

   If it is determined that a bilingual notice is required, the applicant is responsible for ensuring that the publication in the alternate language is complete and accurate in that language. Electronic versions of the Spanish template examples are available from the TCEQ to help the applicant complete the publication in the alternative language.

Bilingual Notice Application Form:

Bilingual notice confirmation for this application:

1. Is the school district of the elementary or middle school nearest to the facility required by the Texas Education Code to have a bilingual program?

   ☒YES ☐ NO

   (**If NO**, alternative language notice publication not required)

2. **If YES** to question 1, are students enrolled in a bilingual education program at either the elementary school or the middle school nearest to the facility?

   ☒ YES ☐ NO

   (**If YES** to questions 1 and 2, alternative language publication is required; **If NO** to question 2, then consider the next question)

3. **If YES** to question 1, are there students enrolled at either the elementary school or the middle school nearest to the facility who attend a bilingual education program at another location?

   ☐ YES ☐ NO

   (**If Yes** to questions 1 and 3, alternative language publication is required; **If NO** to question 3, then consider the next question)

4. **If YES** to question 1, would either the elementary school or the middle school nearest to the facility be required to provide a bilingual education program but for the fact that it secured a waiver from this requirement, as available under 19 TAC 89.1205(g)?

☐ YES ☐ NO

(**If Yes** to questions 1 and 4, alternative language publication is required; **If NO** to question 4, alternative language notice publication not required)

If a bilingual education program(s) is provided by either the elementary school or the middle school nearest to the facility, which language(s) is required by the bilingual program? _Spanish_____

Consideration of the Permit Application by the Commission:

The applicant will be notified by the Commission when the application is set for final consideration. If the Commission issues the permit, the applicant will be mailed a copy of the permit by the TCEQ Office of the Chief Clerk within one (1) month following Commission approval. (NOTE: Only one copy is mailed to the applicant and that copy will be sent to the official mailing address of the applicant as shown on the permit application form.)

Texas Commission on Environmental Quality
Permit Application for a Hazardous Waste Storage/Processing/Disposal Facility
Part A - Facility Background Information

I. General Information

A. Facility Name: KM Liquids Terminals LLC – Galena Park Terminal

(Individual, Corporation, or Other Legal Entity Name)

TCEQ Solid Waste Registration No: 30573 EPA I.D. No.: TXD026481523

Street Address (If Available): 906 Clinton Drive

City: Galena Park, State: TX Zip Code: 77547

County: Harris

Telephone Number: (346) 352-5923 Charter Number: 80038036

If the application is submitted on behalf of a corporation, please identify the Charter Number as recorded with the Office of the Secretary of State for Texas.

B. Facility Contact

1. List those persons or firms who will act as primary contact for the applicant during the processing of the permit application. Also indicate the capacity in which each person may represent the applicant (engineering, legal, etc.). The person listed first will be the primary recipient of correspondence regarding this application. Include the complete mailing addresses and phone numbers.

Director-EHS
300 Beltway Green Blvd.
Pasadena, Texas 77053
Office: (713) 450-0416
[redacted]

2. If the application is submitted by a corporation or by a person residing out of state, the applicant must register an Agent in Service or Agent of Service with the Texas Secretary of State's office and provide a complete mailing address for the agent. The agent must be a Texas resident.

Not Applicable

C. Operator[1]: Identify the entity who will conduct facility operations.

[1] The operator has the duty to submit an application if the facility is owned by one person and operated by another [30 TAC 305.43(b)]. The permit will specify the operator and the owner who is listed on this

Operator Name KM Liquids Terminals LLC

Address: 906 Clinton Drive

City: Galena Park, State Texas Zip Code 77547-0486

Telephone Number: (346) 352-5923 Charter Number 80038036

application [Section 361.087 Texas Health and Safety Code].

D. Owner

1. Indicate the ownership status of the facility:

   a. Private ____ X_____

      (1) ____X_____Corporation
      (2) _____Partnership
      (3) _____Proprietorship
      (4) _____Non-profit organization

   b. Public _____

      (1) _____Federal
      (2) _____Military
      (3) _____State
      (4) _____Regional
      (5) _____County
      (6) _____Municipal
      (7) _____Other (specify)

2. Does the operator own the facility units and facility property?

   ☒ Yes ☐ No

   If you checked "no",

   a. Submit as "Attachment A" a copy of the lease for use of or the option to buy said facility units and/or facility property, as appropriate; and

   b. Identify the facility units' owner(s) and/or facility property owner(s). Please note that the owner(s) is/are required to sign the application on page 5.

E. Type of Application Submittal:

Initial _____ or Revision ____X_____

F. Registration and Permit Information

Indicate (by listing the permit number(s) in the right-hand column below) all existing or pending State and/or Federal permits or construction approvals which pertain to pollution control or industrial solid waste management activities conducted by your plant or at your location. Complete each blank by entering the *permit number*, or the *date of application*, or *"none"*.

	Relevant Program and/or Law	Permit No.	Agency*
1.	Texas Solid Waste Disposal Act	None	
2.	Wastewater disposal under the Texas Water Code	None	
3.	Underground injection under the Texas Water Code	None	
4.	Texas Clean Air Act	3875	TCEQ
		110945	TCEQ
		2193	TCEQ
5.	Texas Uranium Surface Mining & Reclamation Act	None	
6.	Texas Surface Coal Mining & Reclamation Act	None	
7.	Hazardous Waste Management program under the Resource Conservation and Recovery Act	HW-50054	TCEQ
8.	UIC program under the Safe Drinking Water Act	5X2600543	TCEQ
		5X2600696	TCEQ
9.	TPDES program under the Clean Water Act	TXG670089	TCEQ
10.	PSD program under the Clean Air Act	HGPSDTX14	EPA/TCEQ
11.	Nonattainment program under the Clean Air Act	N232	EPA
12.	National Emission Standards for Hazardous Pollutants (NESHAP) Pre-construction approval under the Clean Air Act	None	
13.	Ocean dumping permits under the Marine		

Protection Research and Sanctuaries Act	None	
14. Dredge or fill permits under section 404 of the Clean Water Act	15714	CORPS
15. Other relevant environmental Permits (Title V Permits)	988	EPA/TCEQ

*Use the following acronyms for each agency as shown below:

TCEQ	= Texas Commission on Environmental Quality
TRC	= Texas Railroad Commission
TDH	= Texas Department of Health
TDA	= Texas Department of Agriculture
EPA	= U.S. Environmental Protection Agency
CORPS	= U.S. Army Corps of Engineers

G. Give a brief description of the nature of your business.

KM Liquids Terminals – Galena Park Facility is a contract liquid storage terminal for bulk quantities of diverse chemical products. The bulk terminal includes tank truck, rail, barge, and ship loading/unloading facilities.

H. TCEQ Core Data Form

The TCEQ requires that a Core Data Form (Form 10400) be submitted on all incoming applications. For more information regarding the Core Data Form, call (512) 239-1575 or go to the TCEQ website at http://www.tceq.texas.gov/permitting/central_registry/guidance.html.

A Core Data Form is included with this Part A application.

Notary Public in and for Harris County, Texas

II. Facility Background Information

A. Location of Facility for which the application is submitted

1. Give a description of the location of the facility site with respect to known or easily identifiable landmarks.

The KM Liquids Terminals – Galena Park Facility is located approximately nine (9) miles south of downtown Houston, Texas. The facility is located on the north side of the Houston Ship Channel approximately 0.75 miles west of the intersection of Federal Road and Clinton Drive.

2. Detail the access routes from the nearest U.S. or State Highway to the facility.

From State Highway 225 (LaPorte Freeway) go north on Shaver Street approximately 1.5 miles to the intersection of Clinton Drive and Federal Road (Note: Shaver Street turns into Federal Road after passing through the Washburn Tunnel). From the intersection of Clinton Drive and Federal Road go west approximately 0.75 miles to the facility.

3. Enter the geographical coordinates of the facility:

Latitude: ____29__ deg ___43__ min __56.62__ sec

Longitude: ___95__ deg ___13__ min __32.16__ sec

4. Is the facility located on Indian lands?

☐ Yes ☒ No

B. Legal Description of Facility

Submit as "Attachment B" a legal description(s) of the tract or tracts of land upon which the waste management operations referred to in this permit application occur or will occur. Although a legal description is required, a metes and bounds description is not necessary for urban sites with appropriate "lot" description(s). A survey plat or facility plan drawing which shows the specific points referenced in the survey should also be included in Attachment B.

C. SIC Codes

List, in descending order of significance, the four digit standard industrial classification (SIC) codes which best describe your facility in terms of the principal products or services you produce or provide. Also, specify each classification in words. These classifications may differ from the SIC codes describing the operation generating the hazardous wastes.

4-digit SIC Code	Description
4226	SPECIAL WAREHOUSING AND STORAGE, NOT ELSEWHERE CLASSIFIED

SIC code numbers are descriptions which may be found in the Standard Industrial

Classification Manual prepared by the Executive Officer of the President, Office of Management and Budget, which is available from the Government Printing Office, Washington, D.C. Use the current edition of the manual.

III. Wastes and Waste Management

A. Waste Generation and Management Activities

Is any hazardous waste [see Title 40, Code of Federal Regulations (CFR), Part 261] presently or proposed to be generated or received at your facility?

☒ Yes ☐ No

If no, skip to question Number 2 below.

If yes, answer the following question.

1. Are you presently registered with TCEQ as a solid waste generator?

   ☒ Yes ☐ No ☐ Pending

   If no, contact the Industrial and Hazardous Waste Division of TCEQ in Austin, Texas to obtain registration information. Also, continue with the application form (go to Number 2 below).

   If yes, go to Section I of your TCEQ Notice of Registration, determine which of your wastes are hazardous, and list these wastes (and mixtures) in Table III-1 (see Number 2 below).

2. Complete Table III-1, Hazardous Wastes and Management Activities, below, listing all hazardous wastes, all mixtures containing any hazardous wastes, and hazardous debris which were, are presently, or are proposed to be handled at your facility in interim status or permitted units. See 40 CFR 261 and 268.2, attaching additional copies as necessary.

   Guidelines for the Classification & Coding of Industrial Wastes and Hazardous Wastes, TCEQ publication RG-22, contains guidance on how to properly classify and code industrial waste and hazardous waste in accordance with 30 TAC 335.501-335.515 (Subchapter R).

   If you are not registered with TCEQ, enter "NA" for TCEQ Waste Code Number.

   For the EPA Hazardous Waste Numbers, see 40 CFR 261.20-33. For annual quantity, provide the amount in units of pounds (as generated and/or received) for each waste and/or waste mixture.

B. Waste Management Units Summary

1. For each waste and waste mixture listed in Table III-1 that is stored, processed, and/or disposed on-site (except where such storage and/or processing is excluded from permit requirements in accordance with Texas Administrative Code (TAC) Section 335), complete Table III-2, Hazardous Waste Management Unit Checklist, and enter the name of each hazardous waste management unit (Note: Please make copies of Table III-2 if necessary).

Give the design capacity of each hazardous waste management unit in any of the units of measure shown. In the case of inactive or closed units for which design details are unavailable, an estimate of the design capacity is sufficient.

Please provide a description for each waste management unit described in your own words on the line provided for "Waste Management Unit."

2. Has the applicant at any time conducted the on-site disposal of industrial solid waste now identified or listed as hazardous waste?

   ☒ Yes ☐ No

   If yes, complete Table III-2 indicating the hazardous waste management units which were once utilized at your plant site but are no longer in service (i.e., inactive or closed facility units).

   If no, and if no hazardous waste is presently or proposed to be stored [for longer than 90 days (see 30 TAC Section 335.53)], processed, or disposed of at your facility, then you need not file this permit application. Otherwise proceed with the application form.

3. Provide an estimate of the total weight (lbs) of hazardous waste material that has been disposed of and/or stored within your site boundaries and not removed to another site.

   Approximately 114.4 million pounds

C. Location of Waste Management Units

1. Submit as "Attachment C" a drawn-to-scale topographic map (or other map if a topographic map is unavailable) extending one mile beyond the facility boundaries, depicting the following:

   a. The approximate boundaries of the facility (described in Section II.B) and within these boundaries, the location and boundaries of the areas occupied by each active, inactive, and proposed hazardous waste management unit (see Table III-2). Each depicted area should be labeled to identify the unit(s), unit status (i.e., active, inactive, or proposed), and areal size in acres.

   b. The overall facility and all surface intake and discharge structures;

   c. All on-site injection wells where liquids are injected underground;

   d. All known monitor wells and boreholes within the property boundaries of the facility; and

   e. All wells, springs, other surface water bodies, and drinking water wells listed in public records or otherwise known to the applicant within the map area and the purpose for which each water well is used (e.g., domestic, livestock, agricultural, industrial, etc.).

2. Submit as "Attachment D" photographs which clearly delineate all hazardous waste management storage, processing, and disposal units, as well as sites of future storage, processing and disposal units.

D. Flow Diagram/Description

Show as "Attachment E" process flow diagrams and step-by-step word descriptions of the process flow, depicting the handling, collection, storage, processing, and/or disposal of each of the hazardous wastes previously listed in this application.

The flow diagrams or descriptions should include the following information:

1. Originating point of each waste and waste classification code;

2. Means of conveyance utilized in every step of the process flow;

3. Name and function of each facility component through which the waste passes;

4. The ultimate disposition of all wastes (if off-site, specify "off-site") and waste residues.

IV. Index Of Attachments

List and index below all attachments to this application and indicate if included or not included:

Item	Attachments	Attachment	Included	Not Included
I.D.2.a	Lease/Option to buy	A		X
II.B	Site legal description	B	X	
III.C.1	Facility boundaries and adjacent waters map	C	X	
III.C.2	Photographs	D	X	
III.D	Process flow diagram/description	E	X	

Table III-1 – Hazardous Wastes and Management Activities

Verbal Description of Waste	TCEQ Waste for Code and Classification Code	EPA Hazardous Waste Number	Storage[1] of Wastes Received from Off-Site	Processing[2] of Wastes Received from Off-Site	Disposal of Wastes Received from Off-Site	Storage[1] of Wastes Generated On-Site	Processing[2] of Wastes Generated On-Site	Disposal of Wastes Generated On-Site	Annual Quantity Generated and/or Received

Tank 100-5 Bottoms	Form Code 301 Class H	D001, D002, D016, D018, D022, D023, D024, D025, D026, D028, D035, D039, D043, U002, U003, U009, U012, U019, U031, U043, U051, U052, U055, U056, U077, U112, U120, U125,	No	No	No	Yes	Yes	Yes	No longer generated

[1] "Storage" means the holding of solid waste for a temporary period, at the end of which the waste is processed, disposed of, or stored elsewhere.

[2] "Processing" means the extraction of materials, transfer, volume reduction, conversion to energy, or other separation and preparation of solid waste for reuse or disposal, including the treatment or neutralization of hazardous waste, designed to change the physical, chemical, or biological character or composition of any hazardous waste so as to neutralize such waste, or so as to recover energy or material from the waste or so as to render such waste non-hazardous or less hazardous; safer for transport, store or dispose of; or amenable for recovery, amenable for storage, or reduced in volume. The "transfer" of solid waste for reuse or disposal as used above, does not include the actions of a transporter in conveying or transporting solid waste by truck, ship, pipeline, or other means. Unless the Executive Director determines that regulation of such activity is necessary to protect human health or the environment, the definition of "processing" does not include activities relating to those materials exempted by the Resource Conservation and Recovery Act, 42 U.S.C. 6901 et seq., as amended.

TCEQ Core Data Form

For detailed instructions on completing this form, please read the Core Data Form Instructions or call 512-239-5175.

SECTION I: General Information

1. Reason for Submission (*If other is checked please describe in space provided.*)

☐ New Permit, Registration or Authorization (*Core Data Form should be submitted with the program application.*)

☒ Renewal *(Core Data Form should be submitted with the renewal form)* ☐ Other

2. Customer Reference Number *(if issued)*	Follow this link to search for CN or RN numbers in Central Registry**	3. Regulated Entity Reference Number *(if issued)*
CN 603254707		RN 100237452

SECTION II: Customer Information

4. General Customer Information | **5. Effective Date for Customer Information Updates** (mm/dd/yyyy) 9/5/2024

☐ New Customer ☒ Update to Customer Information ☐ Change in Regulated Entity Ownership
☐ Change in Legal Name (Verifiable with the Texas Secretary of State or Texas Comptroller of Public Accounts)

The Customer Name submitted here may be updated automatically based on what is current and active with the Texas Secretary of State (SOS) or Texas Comptroller of Public Accounts (CPA).

6. Customer Legal Name *(If an individual, print last name first: eg: Doe, John)* *If new Customer, enter previous Customer below:*

KM Liquids Terminals LLC

7. TX SOS/CPA Filing Number	8. TX State Tax ID (11 digits)	9. Federal Tax ID (9 digits)	10. DUNS Number *(if applicable)*
0800838036	12604497227	760561780	048101364

11. Type of Customer: ☒ Corporation ☐ Individual Partnership: ☐ General ☐ Limited
Government: ☐ City ☐ County ☐ Federal ☐ Local ☐ State ☐ Other ☐ Sole Proprietorship ☐ Other:

12. Number of Employees
☐ 0-20 ☐ 21-100 ☐ 101-250 ☐ 251-500 ☒ 501 and higher

13. Independently Owned and Operated?
☒ **Yes** ☐ **No**

14. Customer Role (Proposed or Actual) – *as it relates to the Regulated Entity listed on this form. Please check one of the following*

☐ Owner ☐ Operator ☒ Owner & Operator
☐ Occupational Licensee ☐ Responsible Party ☐ VCP/BSA Applicant ☐ Other:

15. Mailing Address:

Johnny Kennedy
1500 Clinton Drive

City	State	ZIP	ZIP + 4
Galena Park	TX	77547	

16. Country Mailing Information *(if outside USA)*

17. E-Mail Address *(if applicable)*

ATTACHMENT B

Site Legal Description

KINDER MORGAN LIQUID TERMINALS LLC
PROPERTIES DESCRIPTION
Galena Park, Texas

FIELD NOTES

373.721 acres of land situated in the Ezekiel Thomas Survey, A-73 Harris County, Texas, being located on the North shore of the Houston Ship Channel and extending Northward to the Southwest side of Hunting Bayou, and being more particularly described in nine (9) tracts, with respect to the "Texas Coordinate System", South Central Zone, NAD27, South Central Zone, said lands being described as follows:

TRACT 1

114.23 acres of land, out of that certain 123.5686 acre tract described in Deed conveying 463.8705 acres of land from Texaco, Inc. to South States Terminals Company recorded under Harris County Clerk's File No. G 867916, and being described as follows:

BEGINNING at the Northeast corner of said 123.5686 acre tract on the South line of the T&NO RR 40 foot wide R.O.W., and having coordinates: X=3,200,372.11 and Y=709,442.27;

THENCE South 3° 28' 30" East, 2334.00 feet to the Southeast corner of said 123.5686 acre tract in the waters of the Houston Ship Channel;

THENCE in a Northwesterly direction with the Southerly lines of said 123.5686 acre tract and along the Northerly waters of said ship channel with the following three (3) courses and distances:

1. South 88° 17' 37" West, 769.90 feet to an angle corner;
2. North 75° 09' 23" West, 1039.00 feet to an angle corner;
3. North 72° 13' 55" West, 904.52 feet to the Southwest corner of said 120.00 acre tract;

THENCE North 3° 30' 10" West, with the West line of said 123.5686 acre tract, 1334.37 feet to a point for corner at its intersection with the South line of said T&NO RR 40 foot wide R.O.W.;

THENCE in an Easterly direction with the South lines of said railroad R.O.W. with the following five (5) courses and distances;

1. North 86° 31' 10" East, 1083.22 feet to a point of curve;
2. With said curve to the left having a radius of 478.59 feet, a central angel of 43° 33' 00" and an arc length of 363.77 feet to its point of tangency;
3. North 43° 58' 10" East, 100.00 feet to another point of curve;
4. With said curve to the right having a radius of 438.59 feet, a central angel of 43° 33' 00" and an arc length of 333.37 feet to its point of tangency;
5. North, 86° 31' 10" East, 812.00 feet to the POINT OF BEGINNING and containing 114.23 acres of land.

TRACT 2

36.75 Acres of land being described as follows:

BEGINNING at a point for the northeast corner, on the west line of that certain 123.5686 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc., to South States Terminals Company recorded under Harris County Clerk's File No. G 867916, and the south line of the 80-foot wide right-of-way of the T&NO RR, and having coordinates: X=3,197,198.14 and Y=708,941.83;

THENCE South 3° 30' 10" East, with the west line of said 123.5686 acre tract 1312.45 feet to its southwest corner within the waters of the Houston Ship Channel;

THENCE South 76° 22' 54" West, along the northerly waters of said ship channel an approximate distance of 1141.58 feet to the southeast corner of a 16-foot wide Texas Pipeline Company right-of-way;

THENCE North 3° 26' 35" West, with the east line of said pipeline right-of-way 1538.71 feet to its intersection with the south line of said T&NO RR right-of-way;

THENCE North 87° 48' 43" East, with the south line of said railroad right-of-way 1122.53 feet to the POINT OF BEGINNING, and containing 36.75 acres of land.

TRACT 3

71.02 Acres of land being described as follows:

BEGINNING at a point for the northeast corner on the south line of the 80-foot wide right-of-way of the T&NO RR at its intersection with the west line of the Arco Pipeline Company 25-foot wide fee strip, and having coordinates: X=3,196,352.59 and Y=708,886.60;

THENCE South 3° 26' 35" East, with the west line of said Arco fee strip 1606.00 feet to the southwest corner of said Arco strip within the waters of the Houston Ship Channel;

THENCE South 63° 01' 16" West, along the north side of said ship channel an approximate distance of 1764.41 feet to a point for corner;

THENCE North 1° 18' 10" West, 2345.72 feet to a point for corner on the south line of said 80-foot wide railroad right-of-way;

THENCE North 87° 48' 43" East, with the south line of said right-of-way 1530.39 feet to the POINT OF BEGINNING and containing 71.02 acres of land.

TRACT 4

0.53 Acres of land being known as a "Pipeline Alley" lying adjacent to and on the east side of a 16-foot wide Texas Pipeline Company right-of-way and being described as follows:

BEGINNING at the northwest corner of a 7.2143 acre tract leased to CXI on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,106,663.42 and Y=709,670.91;

THENCE South 3° 26’ 35” East, with the west line of said CXI tract, 692.04 feet to its southwest corner on the north line of the 80-foot wide T&NO RR right-of-way;

THENCE South 87° 48’ 43” West, with the north line of said railroad right-of-way 33.38 feet to its intersection with the east line of said Texas Pipeline Company right-of-way;

THENCE North 3° 26’ 35” West, with the east lines of said pipeline right-of-way, 692.12 feet to its intersection with the south right-of-way line of Clinton Drive;

THENCE North 87° 56’ 52” East, with said south right-of-way line, 33.38 feet to the POINT OF BEGINNING and containing 0.53 acres of land.

TRACT 4

10.03 Acres of land being described as follows:

BEGINNING at the northwest corner of that certain 24.2862 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc. to South States Terminals Company recorded under Harris County Clerk’s File No. G 876916, on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,197,751.08 and Y=709,710.64’

THENCE South 3° 30’ 10” East, with the west line of said 24.2862 acre tract, 668.98 feet to its intersection with the curved north line of the T&NO RR right-of-way, generally 80 feet wide;

THENCE in a westerly direction with the north lines of said railroad right-of-way with the following two (2) courses and distances:

1. With a curve to the right having a radius of 246.48 fee, a central angle of 23° 57’ 51” and an arc length of 103.09 feet, (the chord of said arc bears South 75° 49’ 53” West,
2. South 87° 48’ 43” West, 789.72 feet to the most southerly southeast corner of the 7.2143 acre tract leased to CXI;

THENCE in a northeasterly direction with the irregular southeast boundary of said CXI tract with that following five (5) courses and distances:

1. North 3° 04’ 30” West, 182.57 feet to an interior corner,
2. North 84° 50’ 40” East, 197.27 feet to another southeast corner,
3. North 3° 04’ 30” West, 343.91 feet to another interior corner,
4. North 87° 56’ 52” East, 490.97 feet to its most easterly southeast corner,
5. North 1° 56’ 57” West, 154.29 feet to its northeast corner on the south right-of-way line of Clinton Drive;

THENCE North 87° 43’ 30” East, with said south right-of-way line, 194.01 feet to the POINT OF BEGINNING and containing 10.03 acres of land.

TRACT 5

0.53 Acres of land being known as “Pipeline Alley” lying adjacent to and on the east side of a 16-foot wide Texas Pipeline Company right-of-way and being described as follows:

BEGINNING at the northwest corner of a 7.2143 acre tract leased to CXI on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,106,663.42 and Y=709,670.91;

THENCE South 3° 26’ 35” East, with the west line of said CXI tract, 692.04 feet to its southwest corner on the north line of the 80-foot wide T&NO RR right-of-way;

THENCE South 87° 48’ 43” West, with the north line of said railroad right-of-way 33.38 feet to its intersection with the east line of said Texas Pipeline Company right-of-way;

THENCE North 3° 26’ 35” West, with the east lines of said pipeline right-of-way, 692.12 feet to its intersection with the south right-of-way line of Clinton Drive;

THENCE North 87° 56’ 52” East, with said south right-of-way line, 33.38 feet to the POINT OF BEGINNING and containing 0.53 acres of land.

TRACT 6

10.03 Acres of land being described as follows:

BEGINNING at the northwest corner of that certain 24.2862 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc. to South States Terminals Company recorded under Harris County Clerk’s File No. G 867916, on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X= 3,197,751.08 and Y=709,710.64;

THENCE South 3° 30’ 10” East, with the west line of said 24.2862 acre tract, 668.98 feet to its intersection with the curved north line of the T&NO RR right-of-way, generally 80 feet wide;

THENCE in a westerly direction with the north lines of said railroad right-of-way with the following two (2) courses and distances:

1. With a curve to the right having a radius of 246.48 fee, a central angle of 23° 57’ 51” and an arc length of 103.09 feet, (the chord of said arc bears South 75° 49’ 53” West, 102.34 feet), to its point of tangency,
2. South 87° 48’ 43” West, 789.72 feet to the most southerly southeast corner of the 7.2143 acre tract leased to CXI;

THENCE in a northeasterly direction with the irregular southeast boundary of said CXI tract with that following five (5) courses and distances:

1. North 3° 04’ 30” West, 182.57 feet to an interior corner,
2. North 84° 50’ 40” East, 197.27 feet to another southeast corner,
3. North 3° 04’ 30” West, 343.91 feet to another interior corner,
4. North 87° 56’ 52” East, 490.97 feet to its most easterly southeast corner,

5. North 1° 56’ 57” West, 154.29 feet to its northeast corner on the south right-of-way line of Clinton Drive;

THENCE North 87° 43’ 30” East, with said south right-of-way line, 194.01 feet to the POINT OF BEGINNING and containing 10.03 acres of land.

TRACT 7

1.48 Acres of land being, in part out of that certain 24.2862 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc., to South States Terminals Company recorded under Harris County Clerk’s File No. G-867916, and being described as follows:

BEGINNING at the northwest corner of said 24.2862 acre tract leased on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,197,751.08 and Y=709,710.64;

THENCE North 86° 31’ 10” East, with said south right-of-way line, 91.00 feet to the northwest corner of a 20.0000 acre tract conveyed to Lubripac;

THENCE North 3° 30’ 10” East, with the west line of said Lubripac tract, 708.33 feet to its southwest corner on the north line of a 40 foot wide T&NO RR right-of-way;

THENCE South 86° 31’ 10” West, with said north line, 91.00 feet to a point for corner;

THENCE North 3° 30’ 10” West, in part with the west line of said 24.2862 acre tract, 708.33 feet to the POINT OF BEGINNING and containing 1.48 acres of land.

TRACT 8

1.83 Acres of land being the residue of a 12.16 acre tract of land, in part out of that certain 24.2862 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc., to South States Terminals Company recorded under Harris County Clerk’s File No. G 867916, and being described as follows:

BEGINNING at the northeast corner of said 24.2862 acre tract leased on the south right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,200,346.23 and Y=709,868.49;

THENCE South 3° 30’ 10” East, with the east line of said 24.2862 acre tract, 387.00 feet to its southeast corner on the north line of the 40 foot wide T&NO RR right-of-way;

THENCE South 86° 31’ 10” West, with said north line, 812.00 feet to a point of curve;

THENCE 32.30 feet in a westerly direction along the arc of said curve to the left having a radius of 478.59 feet, a central angle of 3° 51’ 59” and a long chord that bears South 84° 35’ 10” West, 32.29 feet to the southwest corner of this 7.478 acre tract;

THENCE North 2° 43’ 25” West, with the east line of 4.686 acre tract of land sold to Texaco, 388.12 feet to its intersection with the south right-of-way line of Clinton Drive;

THENCE North 86° 31’ 10” East, with said south right-of-way line of Clinton Drive, 839.18 feet to the POINT OF BEGINNING and containing 7.48 acres of land.

Save and except the following 5.649 acre tract as described below:

Being a 5.649 acre tract of land out of the Ezekiel Thomas Survey, Abstract Number 73 and situated in Harris County, Texas, being out of and a portion of the residue of a called 24.2862 acre tract of land conveyed to GATX Terminals Corporation (also known as KM Liquids Terminals, L.P.) as described in deed recorded under Harris County Clerk’s File Number (H.C.C.F. No.) G867917, said 5.649 acre tract of land being more particularly described as follows (Bearings shown heron are based on the south line of said residue of a called 24.2862 acre tract of land, being South 86° 31’ 10” West);

COMMENCING, for reference at a 1/8-inch pin inside a 6-inch iron pipe found in the south Right-of-Way (R.O.W.) line of Clinton Drive (100 feet R.O.W.) and marking the northeast corner of said residue of a called 24.2862 tract;

THENCE, South 86° 29’ 11” West, along the south R.O.W. line of said Clinton Drive and the north line of said residue of a called 24.2862 acre tract, a distance of 154.00 feet;

THENCE, South 03° 28’ 41” East, departing the south R.O.W. line of said Clinton Drive and the north line of said residue of a called 24.2862 acre tract, crossing a pipeline corridor and over and across said residue of a called 24.2862 acre tract, a distance of 30.00 feet to a 5/8-inch iron rod with cap stamped “Terra Surveying” set in the south line of said pipeline corridor, marking the northeast corner and the POINT OF BEGINNING of the herein described tract, from which a ½-inch iron rod with cap stamped “Gullett Assoc” bears South 03° 28’ 41” East, 0.59 feet;

THENCE, South 03° 28’ 41” East, a distance of 358.25 feet to a 1/2 –inch iron rod with cap stamped “Gullett Assoc” found in the south line of said residue of a called 24.2862 acre tract and the north line of a called 2.4947 acre tract (40-foot wide Right-of-Way) as described in a deed to Texas and New Orleans Railroad Company recorded under Volume (Vol.) 2501, Page (Pg.) 242 of the Harris County Deed Records (H.C.D.R.) and marking the southeast corner of the herein described tract;

THENCE, South 86° 31’ 10” West, along the south line of said residue of a called 24.2862 acre tract and the north line of said 2.4947 acre tract, at a distance of 561.89 feet (called 561.9 feet) passing a ½-inch iron rod with cap stamped “Gullett Assoc” found, continuing a total distance of 689.32 feet to a 5/8-inch iron rod with cap stamped “Terra Surveying” set marking the southeast corner of a called 4.607 acre tract of land conveyed to Texaco Refining and Marketing Inc., as described in deed recorded under H.C.C.F. No. S836081 and marking the southwest corner of the herein described tract;

THENCE, North 02° 45’ 24” West, departing the south line of said residue of a called 24.2862 acre tract and the north line of said 2.4947 acre tract, along the east line of said 4.607 acre tract, at a distance of 338.12 feet passing the most northeasterly corner of said 4.607 acre tract, continuing over and across said residue of a called 24.2862 acre tract, a total distance of 358.10 feet to a 5/8-inch iron rod with cap stamped “Terra Surveying” set in the south line of the aforesaid pipeline corridor, being South 02° 45’ 24” East, 29.79 feet from the aforesaid south R.O.W. line of Clinton Drive, marking the northwest corner of the herein described tract;

THENCE, North 86° 30’ 15” East, continuing over and across said residue of a called 24.2862 acre tract and along said south line of the pipeline corridor, at a distance of 122.93 feet passing a ½-inch iron rod with cap stamped “Gullett Assoc” which bears South 07° 02’ 30” West, 0.59

feet, continuing a total distance of 684.82 feet to the POINT OF BEGINNING and containing 5.649 acres of land.

TRACT 9

120.36 Acres of land being the residue of a 191.43 acre tract of land, in part out of that certain 316.0457 acre tract described in a deed conveying 463.8705 acres of land from Texaco, Inc., to South States Terminals Company recorded under Harris County Clerk's File No. G 867916, and in part out of those certain 43.328 acre and 49.301 acre tracts described in a deed to General American Transportation Company recorded in Volume 2433, Page 332, Harris County Deed Records, said 130.361 acres of land being described as follows:

BEGINNING at the southeast corner of said 316.0157 acre tract leased on the north right-of-way line of Clinton Drive, 100 feet wide, and having coordinates: X=3,200,339.61 and Y= 709,968.27;

THENCE South 86° 31' 10" West, with said north right-of-way line, 64.62 feet to the southeast corner of a 50 foot by 100 foot tract conveyed to Entex, Inc.;

THENCE in a counterclockwise direction with the east, north and west lines of said Entex tract with the following three (3) courses and distances:

1. North 3° 31' 20" West, 100.00 feet,
2. South 86° 31' 10" West, 50.00 feet,
3. South 3° 31' 20" East, 100.00 feet to its southwest corner on the north right-of-way line of Clinton Drive;

THENCE in a westerly direction with the South lines of said 316.0157 acre tract and with said north right-of-way line with the following two (2) courses and distances:

1. South 86° 31' 10" West, 2510.70 feet to an angle point,
2. South 88° 04' 16" West, 46.38 feet to the southwest corner of said 316.0157 acre tract, and the southeast corner of said 43.328 acre tract, being the southeast corner of Tract 4-A of seven parcels totaling 107.5551 acres conveyed to Arco Pipeline Company;

THENCE generally in a northerly direction with the easterly and northerly lines of Tract 4-A, Tract 3, Tract E, Tract D, Tract C-2 and Tract C-1 of said seven Arco Pipeline Company parcels, with the following twelve (12) courses and distances:

1. North 3° 24' 05" West, with the west line of said 316.0157 acre tract and the east line of said 43.328 acre tract 1243.39 feet,
2. South 86° 35' 55" West, 300.00 feet to a point within said 43.328 acre tract,
3. North 3° 24' 05" West, 300.00 feet,
4. North 86° 35' 55" East, 300.00 feet to a point on the common line between said 43.328 acre and said 316.0157 acre tracts,
5. South 3° 24' 05" East, with said common line 100.00 feet,

6. North 86° 31’ 10” East, entering said 316.0157 acre tract, 884.30 feet, to the southeast corner of Tract 3,
7. North 3° 24’ 05” West, 161.57 feet,
8. North 86° 29’ 39” East, 735.70 feet to the southeast corner of Tract E,
9. North 3° 24’ 05” West, 1062.41 feet to the northeast corner of said Tract D,
10. South 83° 50’ West, 187.96 feet to a point of curve,
11. With said curve to the right having a radius of 484.28 feet, a central angle of 45° 07’ 31” and an arc length of 381.41 feet to its point of tangency,
12. North 51° 02’ 29” West, 254.36 feet to the lower southwest corner of a 60.57 acre tract surveyed by G.P. Surveyors in October, 1995,

THENCE North 86° 31’ 10” East, 262.45 feet to the center of Hunting Bayou and in the northeasterly line of said 191.43 acre tract;

THENCE in a southeasterly direction down Hunting Bayou with the meanders of its centerline and with the westerly and southerly lines of said 102.1255 acre tract with the following six (6) courses and distances:

1. South 57° 41’ East, 93.94 feet,
2. South 72° 25’ East, 180.00 feet,
3. North 81° 10’ East, 315.00 feet,
4. North 89° 30’ East, 190.00 feet,
5. North 82° 45’ East, 580.00 feet,
6. South 79° 10’ East, 188.00 feet to the southeast corner of said 102.1255 acre tract on the east line of said 316.0157 acre tract;

THENCE South 3° 31’ 20” East, with the east line of said 316.0157 acre tract, 2849.65 feet to the POINT OF BEGINNING and containing 130.36 acres of land.

Also included is following 10.000 acres as described below:

ALL that certain 10.0000 acres (435,600 square feet) of land situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, and being out of the residue of that certain 316.0157 acre tract described as Parcel One in instrument to GATX Terminals Corporation recorded under File Number G867917 of the Harris County Official Public Records of Real Property (H.C.O.P.R.R.P.); said 10.0000 acres (435,600 square feet) of land being more particularly described by metes and bounds as follows (all bearings are referenced to the westerly line of said 316.0157 acre tract, having a bearing of North 03° 24’ 05” West):

COMMENCING at a ½ inch iron rod found for the southwesterly corner of said 316.0157 acre tract, the southeasterly corner of a called 19.396 acre tract described in instrument to ARCO MIDCON, LLC, recorded under File Number V904204, H.C.O.P.R.R.P., from which a concrete monument found with a “TEXACO” star on top bears S67° 28’W, 0.71 feet, said point also being in the northerly right-of-way of Clinton Drive (100 feet wide), as described in instruments

recorded in Volume 704, Page 216, and Volume 1011, Page 47, of the Harris County Deed Records, (H.C.D.R.);

THENCE North 03° 24’ 05” West, 184.69 feet, leaving the northerly right-of-way of said Clinton Drive, with the westerly line of said 316.0157 acre tract, the easterly line of said 19.396 acre tract, to a 5/8 inch iron rod with cap stamped “A.L. SIKES RPLS 2914” set for the POINT OF BEGINNING of the herein described tract;

THENCE North 03° 24’ 05” West, with the westerly line of said 316.0157 acre tract, the easterly line of said 19.396 acre tract, at 818.69 feet, passing the most easterly northeast corner of said 19.396 acre tract, at 1,058.69 feet passing the most southerly northeast corner of the residue of a called 38.1524 acre tract described as Tract-A in instrument to Four Corners Pipe Line Company, recorded under File Number R276485, H.C.O.P.R.R.P., said corner being the southeasterly corner of the residue of a called 40.2186 acre tract described in instrument to GATX Terminals Corporation, recorded in Volume 2433, Page 332, H.C.D.R., in all a distance of 1,089.00 feet, to a 5/8 inch iron rod with cap stamped “A.L.SIKES RPLS 2914” set for the northwesterly corner of this tract;

THENCE North 86° 35’ 55” East, 400.00 feet to 5/8 inch iron rod with cap stamped “A.L. SIKES RPLS 2914” set for the northeasterly corner of this tract;

THENCE South 03° 24’ 05” East, 1eet to 5/8 inch iron rod with cap stamped “A.L. SIKES RPLS 2914” set for the southeasterly corner of this tract;

THENCE South 86° 35’ 55” West, 400.00 feet, to the PLACE OF BEGINNING and containing 10.0000 acres (435,600 square feet) of land.

Total Lands of Kinder Morgan Liquid Terminals LLC: 383.721 Acres

West Chemical Plant Property Description
Galena Park, Texas

THAT CERTAIN TRACT OR PARCEL OF LAND CONTAINING THIRTY SEVEN (37) ACRES MORE OR LESS OUT OF THE EAST HALF OF THE EZEKIEL THOMAS LEAGUE A-73 IN HARRIS COUNTY, TEXAS, AS CONVEYED TO C. D. KEEN AND W. C. WOOLF BY OSCEOLA E. TOD, AS INDEPENDENT EXECUTRIX OF THE ESTATE OF JOHN G. TOD, DECEASED, BY DEED DATED AUGUST 16TH, 1919, AND RECORDED IN VOLUME 431, PAGE 44 OF THE DEED RECORDS OF HARRIS COUNTY, TEXAS; INCLUDING ANY LAND ALONG THE WESTERN BOUNDARIES OF SAID TRACT CONVEYED TO KEEN & WOOLF OIL COMPANY BY CLARION OIL COMPANY BY DEED DATED FEBRUARY 6, 1928, AND RECORDED IN VOLUME 730, PAGE 710 OF THE DEED RECORDS OF HARRIS COUNTY, TEXAS, AND EXCEPTING HEREFROM ANY LANDS RELEASED TO SAID CLARION OIL COMPANY BY KEEN & WOOLF OIL COMPANY ALONG THE WESTERN BOUNDARY LINE BY SAID DEED DATED FEBRUARY 6TH, 1923, THE TRACT OF LAND HEREBY CONVEYED BEING FURTHER DESCRIBED BY METES AND BOUNDS AS FOLLOWS:

BEGINNING AT AN 8 INCH IRON PIPE MARKING THE EXISTING NORTHWEST CORNER OF THE AFORESAID KEEN AND WOOLF OIL COMPANY 37 ACRE TRACT OF LAND AT THE NORTHEAST CORNER OF THE CLARION OIL COMPANY TRACT OF LAND ON THE SOUTH LINE OF CLINTON DRIVE, 100 FEET WIDE;

THENCE SOUTH 0° 01' 52" WEST, ALONG THE WEST LINE OF THE SAID KEEN AND WOOLF OIL COMPANY 37 ACRE TRACT OF LAND, ON THE EAST LINE OF THE AFORESAID CLARION OIL COMPANY TRACT OF LAND, A DISTANCE OF 3698.06 FEET TO A POINT MARKING THE SOUTH-WESTERLY CORNER OF THE SAID KEEN AND WOOLF 37 ACRE TRACT OF LAND ON THE ORIGINAL NORTH BANK OF THE HOUSTON SHIP CHANNEL;

THENCE NORTH 55° 23' 04" EAST, ALONG THE ORIGINAL NORTH BANK OF THE HOUSTON SHIP CHANNEL, A DISTANCE OF 563.37 FEET TO THE SOUTHEASTERLY CORNER OF THE SAID KEEN AND WOOLF OIL COMPANY 37 ACRE TRACT OF LAND;

THENCE NORTH 0° 02' 12" EAST, ALONG THE EAST LINE OF THE SAID KEEN AND WOOLF OIL COMPANY 37 ACRE TRACT OF LAND ON THE WEST LINE OF THE A. M. BAKER, W. G. PRIESTER, IKE EDWARDS, M. TOD, AND J. EDWARDS TRACTS OF LAND, A DISTANCE OF 3381.39 FEET TO A 6 INCH IRON PIPE FOR CORNER ON THE SOUTH LINE OF CLINTON DRIVE;

THENCE SOUTH 89° 35' WEST, ALONG THE SOUTH LINE OF CLINTON DRIVE, 100 FEET WIDE, A DISTANCE OF 231.30 FEET TO A 1 INCH IRON PIPE FOR CORNER;

THENCE SOUTH 0° 25' EAST, A DISTANCE OF 150.00 FEET TO A 1 INCH IRON PIPE FOR CORNER;

THENCE SOUTH 89° 35' WEST ALONG A LINE PARALLEL TO AND 150 FEET SOUTH OF THE SOUTH LINE OF CLINTON DRIVE, A DISTANCE OF 200.00 FEET TO A 1 INCH IRON PIPE FOR CORNER;

CONTINUED ON ATTACHMENT

THENCE SOUTH 89° 35' WEST, ALONG THE SOUTH LINE OF CLINTON DRIVE, 100 FEET WIDE, A DISTANCE OF 32.50 FEET TO THE PLACE OF BEGINNING; SAVE AND EXCEPT AN 80 FOOT STRIP CONVEYED BY JOHN G. TOD TO THE TEXAS AND NEW ORLEANS RAILROAD COMPANY BY DEED DATED SEPTEMBER 28, 1916, RECORDED IN VOLUME 371, PAGE 245 OF THE DEED RECORDS OF HARRIS COUNTY, TEXAS.

COUNTY CLERK
HARRIS COUNTY, TEXAS

Being part of and out of 30,000 square foot tract or land referred to in the deed recorded in volume 431 at page 44 of the deed records of Harris County Texas, in the Ezekiel Thomas Survey, abstract 73 in Galena Park Harris County Texas and being more particular described as follows:

BEGINNING at a 1-inch iron pipe marking the northeast corner of the aforesaid 30,000 square foot tract of land, on the south line of Clinton Drive, 100 feet wide, said beginning corner being located N 89° 35' E, a distance of 232.50 feet from a iron pipe marking the northwest corner of that tract of land described in deed recorded in Volume 431, Page 44 of the Deed Records of Harris County, Texas;

THENCE S 89° 35' W, along the north line of the aforesaid 30,000 square foot tract of land, on the south line of Clinton Drive, 100 feet wide, a distance of 48.40 feet to a point for corner, in a 6 foot chain link fence line;

THENCE S 0° 21' W, along the said chain link fence line, a distance of 111.96 feet to a fence post for corner;

THENCE S 89° 08' W, along the said fence line, a distance of 150.10 feet to a point for corner, on the west line of the said 30,000 square foot tract of land;

THENCE S 0° 25' E, along the west line of the said 30,000 square foot tract of land, a distance of 36.87 feet to a 1-inch iron pipe marking the southwest corner of the said 30,000 square foot tract of land;

THENCE N 89° 35' E, along the south line of the said 30,000 square foot tract of land, a distance of 200.00 feet to a 1-inch iron pipe marking the southeast corner of the said 30.000 square foot tract of land;

THENCE N 0° 25' W, along the east line of the said 30,000 square foot tract of land, a distance of 150.00 feet to the PLACE OF BEGINNING.

Texas Commission on Environmental Quality
Permit Application for
Industrial and Hazardous Waste
Storage/Processing/Disposal Facility
with Compliance Plan

Part B

Form Availability:

This form, as well as other Industrial and Hazardous Waste documents, Part B electronic checklist, and pertinent rules, is available on the Internet. The TCEQ Home Page is at: http://www.tceq.texas.gov. Once you have accessed the home page, select "Forms and Publications" and follow the system prompts. The number for this form is 00376. Questions may be e-mailed to ihwper@tceq.texas.gov.

Introduction:

This permit application is generally a reorganized summary of the Part B information requirements of 40 CFR Part 270 and 30 Texas Administrative Code (TAC) Chapter 305 Subchapters C and D and Chapter 335. The TCEQ may request additional information before a permit is issued, if regulatory requirements change.

The original application plus all copies for New, Renewals, Major Amendments and Class 3 Modifications should be submitted to:

Texas Commission on Environmental Quality
Attention: Waste Permits Division, MC 126
P. O. Box 13087
Austin, Texas 78711-3087

The original application plus all copies for Class 1, Class 1[1], Class 2 Modifications and Minor Amendments should be submitted to:

Texas Commission on Environmental Quality
Attention: Industrial and Hazardous Waste Permits Section, MC 130
Waste Permits Division
P. O. Box 13087
Austin, Texas 78711-3087

Telephone Inquiries:

(512) 239 - 2335 (For RCRA permit application) - Industrial & Hazardous Waste Permits

Section, Waste Permits Division

(512) 239 - 6412 (For industrial and hazardous waste classification) - Technical Analysis Team, Industrial & Hazardous Waste Permits Section, Waste Permits Division

(512) 239 - 6413 (For solid waste registration number, EPA identification number, and notice of registration) - Registration and Reporting Section, Permitting and Registration Support Division

(512) 239 - 0272 (For non-combustion units) - Chemical New Source Review Permits Section, Air Permits Division

(512) 239 - 1583 (For combustion units) - Energy/Combustion New Sources Review Permits Section, Air Permits Division

(512) 239 - 0600 (For legal) - Environmental Law Division

(512) 239 - 6150 (For financial assurance) - Financial Assurance Unit, Revenue Operations Section, Financial Administration Division

(512) 239 - 0300 (For payment of permit application fees) - Cashier's Office, Revenue Operations Section, Financial Administration Division

(512) 239 - 2201 (For compliance plan or corrective action) - Voluntary Cleanup Program/Corrective Action Section, Remediation Division

Application Review Prohibition:

The Texas Commission on Environmental Quality (TCEQ) shall not review an application for a new commercial hazardous waste facility, and the application shall be deemed not to have been received, until the emergency response information required by Section III.F. of the application has been reviewed and declared by TCEQ staff to be complete and satisfactory. [30 TAC 281.26, 30 TAC 305.50(a)(12)(C) and (D)]

Permit Issuance Prohibited [30 TAC 335.205]:

The TCEQ shall not issue a permit for:

1. a new hazardous waste management facility or an areal expansion of an existing facility if the facility or expansion does not meet the requirements of 30 TAC 335.204 (relating to Unsuitable Site Characteristics);
2. a new hazardous waste landfill or the areal expansion of an existing hazardous waste landfill if there is a practical, economic, and feasible alternative to such a landfill that is reasonably available to manage the types and classes of hazardous waste which might be disposed of at the landfill;
3. a new commercial hazardous waste management facility as defined in 30 TAC 335.202 (relating to Definitions) or the subsequent areal expansion of such a facility or unit of that facility if the owner/operator proposes to locate the boundary of the unit within 0.5 of a mile (2,640 feet) of an established residence, church, school, day care center, surface water body used for a public drinking water supply, or dedicated public park;
4. a new commercial hazardous waste management facility that is proposed to be located at a distance greater than 0.5 mile (2,640 feet) from an established residence, church, school, day care center, surface water body used for a public drinking water supply, or dedicated public park unless the applicant demonstrates to the satisfaction of the commission that the facility will be

operated so as to safeguard public health and welfare and protect physical property and the environment, at any distance beyond the facility's property boundaries;

5. a proposed hazardous waste management facility, or a capacity expansion of an existing hazardous waste management facility if a fault exists within 3,000 feet of the proposed hazardous waste management facility or of the capacity expansion of an existing hazardous waste management facility unless the applicant performs the demonstration found in 30 TAC 305.50(a)(4)(D) and 305.50(a)(10)(E) ; and

6. A proposed solid waste facility for the processing or disposal of municipal hazardous waste or industrial solid waste which is located within an area of a municipality or county in which the processing or disposal of municipal hazardous waste or industrial solid waste is prohibited by an ordinance or order. [Texas Health and Safety Code Section 363.112]

See 30 TAC 335 Subchapter G: Location Standards for Hazardous Waste Storage, Processing, or Disposal for additional details and information regarding items 1 through 5 above.

Completing The Application and Electronic Checklist:

Prior to submitting a new permit application, please contact the TCEQ Permitting and Registration Support Division to obtain a Solid Waste Registration Number and an EPA Identification Number for inclusion in Section I.A. of this application. The facility's Solid Waste Registration Number may be proposed in Section I.A. as the Permit Number

This permit application form has been designed to solicit specific information, with reports to be attached or inserted. A response must be made for each informational request in the application form. If an item is not applicable please state "not applicable" and explain. All information included in the application must be listed by the format of the application. For example, if an engineering report is attached to the application to fulfill the requirements of Section V, then each subsection of the engineering report must correlate with the corresponding subsection in the application form (e.g., Subsection V.A.3. of the report would be proposed construction schedules). If information is provided which does not correspond with the application form, the specific rule or regulation which requires submittal of the information must be cited. Each report should be attached behind the summary form or table for the report and submitted as one document with the pages sequentially numbered at the bottom. Maps, bluelines, and drawings that cannot be folded to 8-1/2" x 11" may be submitted as separate documents. Engineering plans and specifications submitted with an application must be approved and sealed by a licensed Professional Engineer, with current license and designating the Registered Engineering Firm's name and Registration Number as required by the Texas Engineering Practice Act. Geology reports, geologic maps, and geologic cross-sections submitted with an application must be approved and sealed by a licensed Professional Geologist, with current license required by the Texas Geoscience Practice Act. Complete the tables in this application rather than substituting.

Facilities which will receive industrial and hazardous wastes from off-site sources must also provide information on these wastes and associated waste management units in accordance with 30 TAC 335.2.

In addition, the electronic checklist has been designed to facilitate the application preparation and review process, and should be completed and submitted along with applicable applications (see "Submittal" below).

For those who pre-filed a Part A application, certain items may have been omitted. These

omissions must be addressed at this time. Additionally, if hazardous waste management methods have changed since the filing of the Part A, please provide an updated Part A.

Pursuant to Section 361.067 of the Texas Health and Safety Code, the TCEQ is required to mail a copy of this application or a summary of its contents to other regulatory agencies. Section I may be considered a summary of the entire application provided that all questions are completely answered. Therefore, Section I responses must not rely solely on cross-references to other sections of the application.

Groundwater Contamination:

If groundwater monitoring has detected the presence of hazardous constituents in the facility groundwater, the owner or operator must submit a Compliance Plan Application that is included as Section XI of this application. For more detailed instructions concerning a Compliance Plan, please see Section XI.

Submittal:

The complete application should be prepared using word processing. The third copy in the submittal package should consist of paper copies or PDF files of all surveys, reports, plot plans, diagrams, P&IDs, maps, etc., and a Compact Disk (CD) of the completed application form document and tables formatted in MS Word. Files may be compressed using PKZIP Ver. 2 or a 100% compatible program. For Renewal, Amendment, and Modification applications, the MS Word files should include both a finalized version and, where available, a redline/strikeout version clearly identifying all proposed changes from the existing permit. For revised application sections and incorporated documents where redline/strikeout versions are not available, submit a detailed listing of all proposed changes to the existing permit. In addition, the submitted electronic version of the application should be easily searchable during the review process by TCEQ staff.

For a new permit application or renewal, submit:

1. an original updated Part A permit application plus three (3) full copies;
2. the original Part B application plus three (3) full copies (including the electronic third copy);
3. a check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division;
4. Pre-printed mailing labels of the adjacent landowners or an electronic mailing list on Compact Disk (CD) in MS Word format; and
5. Completed RCRA Part B Administrative and Technical Evaluation Electronic Checklist (Form #00136) on CD, DVD, or USB drive.

For a new compliance plan or renewal of an existing compliance plan, please submit the following in addition to the above:

1. Sections I and XI.A. through XI.E., as applicable;
2. Tables XI.A.I., XI.E.I. through XI.E.III., and CP Tables I, II, V, VI through VIII, are required; and CP Tables III, IIIA, IV, and IVA as applicable; and
3. a Sampling and Analysis Plan (SAP) compliant with "Attachment A" requirements and evaluation of monitoring wells compliant with "Attachment B" well specification requirements.

For a post-closure care permit submit:

1. an original updated Part A permit application plus three (3) full copies;
2. the original Part B application (excluding Sections III B and F; IV A, C and D; VII A and B; VIII.B and C; and X) plus three (3) full copies;
3. a check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division;
4. pre-printed mailing labels of the adjacent landowners or an electronic mailing list on Compact Disk (CD) in MS Word format; and
5. Completed RCRA Part B Administrative and Technical Evaluation Electronic Checklist (Form #00136) on CD, DVD, or USB drive.

For major amendments to an issued hazardous waste permit, submit:

1. (if appropriate) an original updated Part A permit application plus three (3) full copies;
2. an original Part B application plus three (3) full copies, consisting of, at a minimum, Section I of the Part B plus replacement pages for the changed portions of the application that change as a result of the amendment;
3. an explanation of why the major amendment is needed;
4. a check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division;
5. pre-printed mailing labels of the adjacent landowners or an electronic mailing list on Compact Disk (CD) in MS Word format; and
6. Completed RCRA Part B Administrative and Technical Evaluation Electronic Checklist (Form #00136) on CD, DVD, or USB drive.

For minor amendments to an issued hazardous waste permit, submit:

1. (if appropriate) an original updated Part A permit application plus three (3) full copies;
2. an original Part B application plus three (3) full copies, consisting of, at a minimum, Section I of the Part B plus replacement pages for the changed portions of the application that change as a result of the amendment;
3. an explanation of why the minor amendment is needed;
4. a check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division; and
5. pre-printed mailing labels of the adjacent landowners or an electronic mailing list on diskette on Compact Disk (CD) in MS Word format.

For Class 3 modifications (including adding or revising a Compliance Plan) to an issued hazardous waste permit, submit:

1. (if appropriate) an original updated Part A permit application plus three (3) full copies;
2. an original Part B application plus three (3) full copies, consisting of, at a

minimum, Section I of the Part B plus replacement pages for the changed portions of the application that change as a result of the modification;

3. a description of the exact changes to be made to the permit conditions and supporting documents referenced by the permit;
4. an explanation of why the Class 3 modification is needed;
5. evidence of the public notice mailing and publication (after the public meeting, please submit a statement that the public meeting was held within the required timeframes);
6. a check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division;
7. pre-printed mailing labels of the adjacent landowners or an electronic mailing list on Compact Disk (CD) in MS Word format; and
8. Completed RCRA Part B Administrative and Technical Evaluation Electronic Checklist (Form #00136) on CD, DVD, or USB drive.

For Class 2 modifications to an issued hazardous waste permit, submit:

1. (if appropriate) an original updated Part A permit application plus three (3) full copies;
2. an original Part B application plus three (3) full copies, consisting of, at a minimum, Section I of the Part B plus replacement pages for the changed portions of the application that change as a result of the modification;
3. a description of the exact changes to be made to the permit conditions and supporting documents referenced by the permit;
4. an explanation of why the Class 2 modification is needed;
5. evidence of the public notice mailing and publication (after the public meeting, please submit a statement that the public meeting was held within the required timeframes);
6. a check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division; and
7. pre-printed mailing labels of the adjacent landowners or an electronic mailing list on diskette on Compact Disk (CD) in MS Word format.

For Class 1[1] modifications to an issued hazardous waste permit, submit:

1. (if appropriate) an original updated Part A permit application plus three (3) full copies;
2. an original Part B application plus three (3) full copies, consisting of, at a minimum, Section I of the Part B plus replacement pages for the changed portions of the application that change as a result of the modification;
3. a description of the exact changes to be made to the permit conditions and supporting documents referenced by the permit;
4. an explanation of why the Class 1[1] modification is needed;
5. a check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division; and

6. Completed RCRA Part B Administrative and Technical Evaluation Electronic Checklist (Form #00136) on CD, DVD, or USB drive, for applications involving the partial transfer of some permitted waste management units.

For Class 1 modifications to an issued hazardous waste permit, submit:

1. (if appropriate) an original updated Part A permit application plus three (3) full copies;
2. an original Part B application plus three (3) full copies, consisting of, at a minimum, Section I of the Part B plus replacement pages for the changed portions of the application that change as a result of the modification;
3. a description of the exact changes to be made to the permit conditions and supporting documents referenced by the permit;
4. an explanation of why the Class 1 modification is needed; and
5. a check for payment of permit application fees transmitted directly to the TCEQ Financial Administration Division.

If several modifications are submitted as one application, the application review will proceed at rate of the amendment or modification which has the longest timeframe.

Application Revisions:

Please submit any application revisions with a revised date and page numbers at the bottom of the page(s).

Waivers:

Any request for waiver of any of the applicable requirements of this permit application must be fully documented.

Designation of Material as Confidential:

The designation of material as confidential is frequently carried to excess. The Commission has a responsibility to provide a copy of each application to other review agencies and to interested persons upon request and to safeguard confidential material from becoming public knowledge. Thus, the Commission requests that the applicant (1) be prudent in the designation of material as confidential and (2) submit such material only when it might be essential to the staff in their development of a recommendation.

The Commission suggests that the applicant not submit confidential information as part of the permit application. However, if this cannot be avoided, the confidential information should be described in non-confidential terms throughout the application, cross-referenced to Section XIII: Confidential Material, and submitted as a separate Section XIII document or binder, and conspicuously marked "CONFIDENTIAL."

Reasons of confidentiality include the concept of trade secrecy and other related legal concepts which give a business the right to preserve confidentiality of business information to obtain or retain advantages from its right in the information. This includes authorizations under, 18 U.S.C. 1905 and special rules cited in 40 CFR Chapter I, Part 2, Subpart B. Section 361.037 of the Texas Health and Safety Code does not allow an applicant for an industrial solid waste permit to claim as confidential any record pertaining to the characteristics of the industrial solid waste.

The applicant may elect to withdraw any confidential material submitted with the application.

However, the permit cannot be issued, amended, or modified if the application is incomplete.

Exposure Assessment:

In accordance with 30 TAC 305.50(a)(8) and 40 CFR 270.10(j), any Part B application submitted for a facility that stores, processes, or disposes of hazardous waste in a surface impoundment or a landfill (including post-closure) must be accompanied by exposure information of the potential for the public to be exposed to hazardous wastes or hazardous constituents through releases related to the unit. This exposure information is considered separate from the permit application, as stated in 40 CFR 270.10(c).

Pre-Application Meeting/Public Participation Activities [30 TAC 335.391 and 30 TAC 39.503]:

The TCEQ encourages applicants to conduct an applicant held public meeting prior to submittal of an application to allow the applicant and the public to identify potential issues. A pre-application public meeting is required prior to submittal of an application for an initial permit for hazardous waste management units, an application for hazardous waste part B applications for renewal of permits which propose a significant change in facility operations that would classify as a Class 3 Modification and an application for a major amendment. The pre-application public meeting requirements are described under 40 CFR Part 124.31(b)-(d).

Applicants are encouraged to request a pre-application meeting with TCEQ Permits Section staff and to notify the Industrial and Hazardous Waste Permits Section, Waste Permits Division of intent to file a permit application.

If a local review committee has been established to facilitate communication between the applicant and the local host community, the applicant should summarize the activities of the committee and submit this summary with the application. Any report completed by a review committee must be submitted.

Bilingual Notice Instructions:

For certain permit applications, public notice in an alternate language is required. If an elementary school or middle school nearest to the facility offers a bilingual program, notice may be required to be published in an alternative language. The Texas Education Code, upon which the TCEQ alternative language notice requirements are based, requires a bilingual education program for an entire school district should the requisite alternative language speaking student population exist. However, there may not be any bilingual-speaking students at a particular school within a district which is required to offer the bilingual education program. For this reason, the requirement to publish notice in an alternative language is triggered if the nearest elementary or middle school, as part of a larger school district, is required to make a bilingual education program available to qualifying students and either the school has students enrolled at such a program on-site, or has students who attend such a program at another location to satisfy the school's obligation to provide such a program.

If it is determined that a bilingual notice is required, the applicant is responsible for ensuring that the publication in the alternate language is complete and accurate in that language. Electronic versions of the Spanish template examples are available from the TCEQ to help the applicant complete the publication in the alternative language.

Bilingual notice confirmation for this application:

1. Is the school district of the elementary or middle school nearest to the facility required by the Texas Education Code to have a bilingual program?

☒ Yes ☐ No

(**If No**, alternative language notice publication not required)

2. **If Yes** to question 1, are students enrolled in a bilingual education program at either the elementary school or the middle school nearest to the facility?

   ☒ Yes ☐ No

   (**IF Yes** to questions 1 and 2, alternative language publication is required; **If No** to question 2, then consider the next question)

3. **If Yes** to question 1, are there students enrolled at either the elementary school or the middle school nearest to the facility who attend a bilingual education program at another location? ☐ Yes ☐ No

   (**If Yes** to questions 1 and 3, alternative language publication is required; **If No** to question 3, then consider the next question)

4. **If Yes** to question 1, would either the elementary school or the middle school nearest to the facility be required to provide a bilingual education program but for the fact that it secured a waiver from this requirement, as available under 19 TAC 89.1205(g)?

   ☐ Yes ☐ No

   (**If Yes** to questions 1 and 4, alternative language publication is required; **If No** to question 4, alternative language notice publication not required)

If a bilingual education program(s) is provided by either the elementary school or the middle school nearest to the facility, which language(s) is required by the bilingual program?

Texas Commission on Environmental Quality
Industrial & Hazardous Waste Part B Permit Application

I. General Information

A. Applicant Name: [Facility Operator (or Facility Owner & Operator, if same)]

KM Liquids Terminals LLC – Galena Park Terminal

(Individual, Corporation, or Other Legal Entity Name – must match the Secretary of State's database records for the Facility)

Previous or former names of the facility, if applicable: Not applicable

Address: 906 Clinton Drive

City: Galena Park State: TX Zip Code: 77547

Telephone Number: 346-352-5923

TCEQ Solid Waste Registration No.: 30573 EPA I.D. No.: TXD026481523

Permit No.: 50054 County: Harris

Regulated Entity Name: Galena Park Terminal

Regulated Entity Reference Number: RN100237452

Customer Name: KM Liquids Terminals LLC

Customer Reference Number: CN603254707

If the application is submitted on behalf of a corporation, please identify the Charter Number as recorded with the Office of the Secretary of State for Texas.

800838036
(Charter Number)

B. Facility Owner : Identify the Facility Owner if different than the Facility Operator

Same as operator

Address: _____

City: _____, Texas, Zip Code: _____

Telephone Number: _____

The operator has the duty to submit an application if the facility is owned by one person and operated by another [30 TAC 305.43(b)]. The permit will specify the operator and the owner who is listed on Part A of this application [Section 361.087, Texas Health and Safety Code].

C. Facility Contact

1. List those persons or firms, including a complete mailing address and telephone number, who will act as primary contact for the applicant during the processing of the permit application.

Mr. Johnny Kennedy
Remediation Manager
KM Liquids Terminals LLC
1500 Clinton Drive
Galena Park, Texas 77547
Tel: (713) 654-6035
Email: [redacted]

2. If the application is submitted by a corporation or by a person residing out of state, the applicant must register an Agent in Service or Agent of Service with the Texas Secretary of State's office and provide a complete mailing address for the agent. The agent must be a Texas resident.

Not Applicable – application is submitted by a corporation residing in state

3. List the individual who will be responsible for causing notice to be published in the newspaper and his/her mailing address, telephone number and fax number. If e-mail is available please provide an e-mail address.

Mr. Johnny Kennedy
Remediation Manager
KM Liquids Terminals LLC
1500 Clinton Drive
Galena Park, Texas 77547
Tel: (713) 654-6035
[redacted]

4. For applications for new permits, renewals, major amendments and Class 3 modifications a copy of the administratively complete application must be made available at a public place in the county where the facility is, or will be, located for review and copying by the public. Identify the public place in the county (e.g., public library, county court house, city hall), including the address, where the application will be made available for review and copying by the public.

Galena Park Branch Library
1500 Keene Street
Galena Park, Texas 77547

5. If an applicant proposes a new industrial or hazardous waste facility that would accept municipal solid waste, the applicant shall hold a public meeting in the county in which the facility is proposed to be located. This meeting must be held before the 45th day after the date the application is filed. In addition, the

applicant shall publish notice of the public meeting in accordance with 30 TAC 39.503(e)(5).

Not Applicable – This application is for an existing facility

Contact: Mr. Johnny Kennedy Title: Remediation Manager

Address: 1500 Clinton Drive

City: Galena Park State: Texas Zip Code: 77547

Telephone Number(s): Office 713-654-6035 Other _____

D. Application Type and Facility Status

1.

☒permit	☒amendment	☐modification
☐new	☒major	☐Class 3
☐ interim status	☐minor	☐Class 2
☒renewal		☐Class 1[1]
☐RD&D		☐Class 1
☒Compliance Plan		

2. Is this submittal part of a Consolidated Permit Processing request, in accordance with 30 TAC Chapter 33?
☐Yes ☒No

If Yes, state the other TCEQ program authorizations requested.

3. Does the application contain confidential material? ☐ Yes ☒ No

If Yes, cross-reference the confidential material throughout the application to Section XIII: Confidential Material, and submit as a separate Section XIII document or binder conspicuously marked "CONFIDENTIAL".

4. In either column, check all that apply.

☐Proposed hazardous waste management facility	☒Existing hazardous waste management facility
☐On-site	☒On-site
☐Off-site	☐Off-site
☐Commercial	☐Commercial
☐Recycle	☐Recycle
☐Land Disposal	☐Land Disposal
	☐Areal or capacity expansion
	☒Compliance plan

5. Is the facility within the Coastal Management Program boundary (for Class 3 Modifications, Permit Renewals, and New Permit applications only)?

   ☒ Yes ☐ No

6. Provide a brief description of the portion of the facility covered by this application in the table below, including the changes for which an amendment or modification is requested: *[**Note:** List all changes requested in the table below. Unlisted requests risk remaining unaddressed or possibly denied if brought to the permit application reviewer's attention at a later time.]*

Permit/Compliance Plan Application Section	Brief Description of Proposed Change	Modification or Amendment Type	Supporting Regulatory Citation
Permit Section: I	Change in facility boundary/size	Minor	30 TAC 305.69(k)(A)(4)(b)
Permit Section: VII.G and Table VII.G	Extend Post Closure Care Period for Southeast Holding Basin (TCEQ Permit Unit No. 1, NOR No. 017) to October 1, 2037	Minor	30 TAC 305.69(c) 30 TAC 305.69(k)(E)(2)
Permit Section XI (Compliance Plan)	Add new corrective action area to the Corrective Action Program (North Plant AOC)	Major	30 TAC 305.69(d) 30 TAC 305.69(k)(C)(8)(a)
Permit Section XI (Compliance Plan)	Changes in the number of upgradient wells (West Plant PMZ)	Minor	30 TAC 305.69(k)(C)(1)(a); 305.69(k)(C)(2)
Permit Section XI (Compliance Plan)	Changes in indicator parameters, hazardous constituents, or concentration limits as specified in the groundwater protection standard (SEHB and Central Plant PMZ)	Major	30 TAC 305.69(k)(C)(5)(a)
Permit Section XI (Compliance Plan)	NFA of Old Pump House #5 AOC	Minor	30 TAC 305.69(k)(C)(8)(b)

Permit Section XI (Compliance Plan)	Removal of one well at NHB	Minor	30 TAC 305.69(k)(C)(1)(a); 305.69(k)(C)(2)
Permit Section XI (Compliance Plan)	Removal of well and change in PMZ boundary in Central Plant PMZ	Minor	30 TAC 305.69(k)(C)(1)(a); 305.69(k)(C)(2)
Permit Section XI (Compliance Plan)	Updates to CP Tables I, II, III, IIIA and V	Major	305.69(k)(C)(5)(a) 305.69(k)(C)(8)(a)

7. Total acreage of the facility being permitted: 421.410acres

8. Identify the name of the drainage basin and segment where the facility is located: San Jacinto River Basin – Segment 1007

E. Facility Siting Summary

Is the facility located or proposed to be located:

1. within a 100-year floodplain?
☒Yes ☐ No

2. in wetlands?
☐Yes ☒No

3. in the critical habitat of an endangered species of plant or animal?
☐Yes ☒No

4. on the recharge zone of a sole-source aquifer?
☐Yes ☒ No

5. in an area overlying a regional aquifer?
☒Yes ☐ No

6. Within 0.5 mile (2,640 feet) of an established residence, church, school, day care center, surface water body used for a public drinking water supply, or dedicated public park? (Use only for a new commercial hazardous waste management facility or areal expansion of an existing commercial hazardous waste management facility or unit of that facility as defined in 30 TAC 335.202)
☐Yes ☐No ☒Not Applicable

If Yes: the TCEQ shall not issue a permit for this facility.

7. In an area in which the governing body of the county or municipality has prohibited the processing or disposal of municipal hazardous waste or industrial solid waste?
☐Yes ☒No

If Yes: provide a copy of the ordinance or order.

F. Wastewater and Stormwater Disposition

1. Is the disposal of any waste to be accomplished by a waste disposal well at this facility?
☒ No ☐Yes (**If Yes**: List WDW Permit No(s):_____).

2. Will any point source discharge of effluent or rainfall runoff occur as a result of the proposed activities?
☐ Yes ☒No

3. If Yes, is this discharge regulated by a TPDES or TCEQ permit?
☐ Yes Permit No._____(TCEQ)
Permit No._____(TPDES)

4. ☐No Date TCEQ discharge permit application filed: _____
Date TPDES discharge permit application filed:_____

G. Information Required to Provide Notice

State Officials List

Provide the name and mailing address for the State Senator and State Representative in the district in which the facility is or will be located. Either local district addresses or capitol addresses are acceptable. This list should not be included in the Adjacent Landowners List required below. [30 TAC 39.103(b)]

State Senator:
The Honorable Carol Alvarado, Senate District 6
4450 Harrisburg
Suite 436
Houston, Texas 77011
Tel: (713) 926-6257
[redacted]

State Representative:
Representative Ana Hernández, House District 143
1233 Mercury Drive
Houston, TX 77029
Tel: (713) 675-8596
Fax: (713) 675-8599
[redacted]

Local Officials List

Provide the name and mailing address of the mayor and health authority of the municipality in whose territorial limits or extraterritorial jurisdiction the facility is or will be located. In addition, please provide the county judge and health authority of the county in which the facility is located. This list should not be included in the Adjacent Landowners List required below. [30 TAC 39.103(c)]

Galena Park Mayor:
Esmeralda Moya
City of Galena Park
2000 Clinton Drive
Galena Park, Texas 77547-3406
Tel: (713) 672-2556

Fax: (713) 672-1840
[redacted]

Galena Park Health Authority:
Zenaida Granados, Commissioner Position 1
City of Galena Park
2000 Clinton Drive
Galena Park, Texas 77547-3406
Tel: (713) 672-2556
Fax: (713) 672-1840
[redacted]

County Judge:
Lina Hildalgo Judge, Harris County
1001 Preston, Suite 911
Houston, TX 77002
Tel: (713) 755-4000
Fax: (713) 755-8379
[redacted]

County Health Authority:
Barbie Robinson, Executive Director
Harris County Public Health
1111 Fannin Street
Houston, TX 77002
Tel: (713) 439-6000
[redacted]

Adjacent Landowners List

Submit a map indicating the boundaries of all adjacent parcels of land, and a list (see samples in the instructions) of the names and mailing addresses of all adjacent landowners and other nearby landowners who might consider themselves affected by the activities described by this application. Cross-reference this list to the map through the use of appropriate keying techniques. The map should be a USGS map, a city or county plat, or another map, sketch, or drawing with a scale adequate enough to show the cross-referenced affected landowners. The list should be updated prior to any required public notice. It is the applicant's responsibility to ensure that the list is up-to-date for any required public notice. For all applications (with the exception of Class 1 and Class 1[1] modifications) this mailing list should be submitted on:

1. a Compact Disk (CD) using software compatible with MS Word [30 TAC 39.5(b)]; or
2. four sets of printed labels.

If the adjacent landowners list is submitted on a compact disk (CD), please label the disk with the applicant's name and permit number. Within the file stored on the disk, type the permit number and applicant's name on the top line before typing the addresses. Names and addresses must be typed in the format indicated below. This is the format required by the U.S. Postal Service for machine readability. Each letter in the name and address must be capitalized, contain no punctuation, and the appropriate two-character abbreviation must be used for the state. Each entity listed must be blocked and spaced consecutively as shown below. The list is to be 30 names, addresses, etc. (10 per column) per page (MS WORD Avery Standard 5160 – ADDRESS template).

Example:

Industrial Hazardous Waste Permit No. 50000, Texas Chemical Plant

HEAVY METALS LP
PO BOX 85624
PUMPKIN PARK TX 79998-5624

MR AND MRS W R NEIGHBOURLY
1405 ACROSSTHE WAY
GREATER METRO CITY TX 79199

A list submitted on compact disk (CD) should be the only item on that disk. Please do not submit a list on a disk that includes maps or other materials submitted with your application.

If you wish to provide the list on printed labels, please use sheets of labels that have 30 labels to a page (10 labels per column) (for example: Avery® Easy Peel® White Address Labels for Laser Printers 5160). Please provide four complete sets of labels of the adjacent landowners list.

Based on the questions in the Bilingual Notice Instructions for this form, are you required to make alternate (Bilingual) notice for this application?

☒Yes ☐No

Bilingual Language(s):__Spanish_____

H. TCEQ Core Data Form

The TCEQ requires that a Core Data Form CDF (Form 10400) be submitted on all incoming applications. Please ensure that the submitted CDF does not show a change for any information that will remain the same as previously submitted. For more information regarding the Core Data Form, call (512) 239 1575 or go to the TCEQ Web site at http://www.tceq.texas.gov/permitting/central_registry/guidance.html

SEE Attachment B to this Part B application

I. Signature on Application

It is the duty of the operator to submit an application for a permit. The person who signs the application form will often be the operator himself; when another person signs on behalf of the applicant, his title or relationship to the applicant will be shown. In all cases, the person signing the form must be authorized to do so by the applicant. An application submitted by a corporation must be signed by a responsible corporate officer such as a president, secretary, treasurer, vice president, or by his duly authorized representative, if such representative is responsible for the overall operation of the facility from which the activity described in the form originates. In the case of a partnership or a sole proprietorship, the application must be signed by a general partner or the proprietor, respectively. In the case of a municipal, state, federal, or other public facility, the application must be signed by a principal executive officer, a ranking elected official, or another duly authorized employee. A person signing an application on behalf of an applicant must provide notarized proof of authorization.

Interim Status Land Disposal Unit(s) Certification

For all land disposal units managing wastes which are newly listed or identified as hazardous wastes, the following certification must be executed by or on the date 12 months after the effective date of the rule identifying or listing the waste as hazardous. If the operator fails to certify compliance with these requirements, the operator shall lose authority to operate under interim status. [40 CFR 270.73(d)]

I,_____, _____

(operator) *(title)*

certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete.

I further certify that in accordance with Section 3005(e)(3) of the Resource Conservation and Recovery Act, as amended, the subject land disposal unit(s) are in compliance with all applicable groundwater monitoring and financial responsibility requirements of 30 TAC Sections 335.112, 335.116, and 335.117. I am aware there are significant penalties for submitting false information, including the possibility of civil penalty, criminal fines, and imprisonment.

Signature:_____ Date: _____

II. Facility Siting Criteria

For all new hazardous waste management facilities or areal expansions of existing hazardous waste management facilities provide a report which includes all applicable information regarding Unsuitable Site Characteristics found in 30 TAC Chapter 335, Subchapter G. The report must address each requirement applicable to the type of activity submitted in the application. Reference specific rule numbers whenever possible. Supporting information may be cross-referenced to other parts of this application such as Section V - Engineering Report or Section VI - Geology Report, but information submitted in previous applications must be fully reproduced herein. In addition, provide the information in Sections II.A. through II.G. below as applicable.

For permit renewals provide a report which includes all applicable information regarding Unsuitable Site Characteristics found in 30 TAC Chapter 335, Subchapter G. In addition, provide the information in Sections II.A through II.G below, as applicable. The applicant may resubmit the information submitted with the original permit application provided this information has not changed. For a renewal this information is necessary to ensure a complete application is received.

For capacity expansions of existing facilities, please provide information in Sections II.A through II.G, as applicable. Please note however, that additional technical information may be requested to address any facility siting characteristics noted in Section I.E.

> **NOTE:** The standards contained in §335.204(a)(6) - (9), (b)(7) - (12), (c)(6) - (11), (d)(6) - (11), and (e) (8) - (13) are not applicable to facilities that have submitted a notice of intent to file a permit application pursuant to §335.391 of this title (relating to Pre-Application Review) prior to May 3, 1988, or to facilities that have filed permit applications pursuant to §335.2(a) of this title which were submitted in accordance with Chapter 305 of this title and that were declared to be administratively complete pursuant to §281.3 of this title (relating to Initial Review) prior to May 3, 1988.[30 TAC 335.201(b)]

A. Requirements for Storage or Processing Facilities, Land Treatment Facilities, Waste Piles, Storage Surface Impoundments, and Landfills.

Is the facility located or proposed to be located:

1. in wetlands? [as applicable: 30 TAC 335.204(a)(2), (b)(2), (c)(2), (d)(2), and/or (e)(2)]

   ☐ Yes ☒ No

   Provide the source of information.

   Wheeler, Frankie F. Soil Survey of Harris County, Texas. United States Department of Agriculture, Soil Conservation Service, 1972.

   RCRA Facility Investigation Report, Phase I. (GATX, April 15, 1997).

   If Yes: the TCEQ shall not issue a permit for a new hazardous waste management facility or areal expansion of an existing facility into wetlands, pursuant to 30 TAC 335.205(a)(1).

2. in the critical habitat of an endangered species of plant or animal? [as applicable: 30 TAC 335.204(a)(8), (b)(10), (c)(9), (d)(9), and/or (e)(11)]

☐Yes ☒No ☐ Not Applicable

Provide the source of information.

U.S. Fish & Wildlife Service Endangered Species List – Harris County, Texas.

http://ecos.fws.gov/ecos/home.action

The Texas prairie dawn flower and whooping crane are endangered in Harris County. This facility is not a likely habitat for these species as it is an industrial site.

If Yes: submit in Section V information demonstrating that design, construction, and operational features will prevent adverse effects on such critical habitat.

3. on the recharge zone of a sole-source aquifer? [30 TAC 335.204(a)(3), (b)(3), (c)(3), (d)(3), and/or (e)(3)]

☐ Yes ☒ No

Provide the source of the information.

E.T. Baker, Jr. Stratigraphic and Hydro-geologic Framework of Part of the Coastal Plain of Texas. United States Geological Survey. July, 1979.

If Yes, then for storage and processing facilities (excluding storage surface impoundments), submit in Section V information demonstrating that secondary containment is provided to preclude migration to groundwater from spills, leaks, or discharges.

Note: Land treatment facilities, waste piles, storage surface impoundments, and landfills may not be located on the recharge zone of a sole-source aquifer.

4. in an area overlying a regional aquifer? [as applicable: 30 TAC 335.204(a)(4), (b)(4), (c)(4), (d)(4), and/or (e)(4)]

☒ Yes ☐ No

Provide the source of information.

See Attachment M – Geology Report

If Yes: submit site-specific information in Section V and/or Section VI demonstrating compliance with 30 TAC 335.205(a)(1).

5. in areas where soil unit(s) are within five feet of the containment structure, or treatment zone, as applicable, that have a Unified Soil Classification of GW, GP, GM, GC, SW, SP, or SM, or a hydraulic conductivity greater than 10-5 cm/sec? [as applicable: 30 TAC 335.204(a)(5), (b)(5), (c)(5), (d)(5), and/or (e)(5)]

☐ Yes ☒ No

Provide information to verify the above.

Wheeler, Frankie F. Soil Survey of Harris County, Texas. United States Department of Agriculture, Soil Conservation Service. 1972.

If Yes: provide additional information in Sections V and/or Section VI demonstrating compliance with 30 TAC 335.205(a)(1)

6. in areas of direct drainage within one mile of a lake at its maximum conservation pool level, if the lake is used to supply public drinking water through a public water system? [as applicable: 30 TAC 335.204 (a)(6), (b)(7), (c)(6), and/or (e)(8)].

   ☐ Yes ☒ No ☐ Not Applicable

Provide information to verify the above.

Wheeler, Frankie F. Soil Survey of Harris County, Texas. United States Department of Agriculture, Soil Conservation Service. 1972.

If Yes: provide information in Section V demonstrating compliance with 30 TAC 335.205(a)(1).

7. in areas of active geologic processes, including but not limited to erosion, submergence, subsidence, faulting, karst formation, flooding in alluvial flood wash zones, meandering river bank cuttings, or earthquakes? [as applicable: 30 TAC 335.204(a)(7), (b)(8) ,(c)(7), (d)(7), and/or (e)(9)]

   ☒ Yes ☐ No ☐ Not Applicable

Provide the source of the information.

See Attachment M – Geology Report

If Yes: specify in Section V the design, construction, and operational features of the facility that will prevent adverse effects resulting from the geologic processes.

8. within 30 feet of the upthrown side or 50 feet of the downthrown side of the actual or inferred surface expression of a fault that has reasonably been shown to have caused displacement of shallow Quaternary sediments or of man-made structures? [as applicable: 30 TAC 335.204(a)(9), (b)(12) ,(c)(11), (d)(11), and/or (e)(13)]

   ☐ Yes ☒ No ☐ Not Applicable

Provide the source of information.

See Attachment M – Geology Report

If Yes: specify in Section V the design, construction, and operational features that will prevent adverse effects resulting from any fault movement.

If a fault is found to be present, the width and location of the actual or inferred surface expression of the fault, including both the identified zone of deformation and the combined uncertainties in locating a fault trace, must be determined by a qualified geologist or geotechnical engineer and reported in Section VI.

B. Additional Requirements for Land Treatment Facilities [30 TAC 335.204(b)]

Is the land treatment facility located or proposed to be located:

1. within 1000 feet of an established residence, church, school, day care center, surface water body used for a public drinking water supply, or dedicated public park which is in use at the time the notice of intent to file a permit application is filed with the commission, or which is in use at the time the permit application is filed with the commission?

☐ Yes ☒ No

If Yes, the TCEQ shall not issue a permit for a new hazardous waste land treatment unit or an areal expansion of an existing land treatment unit, pursuant to 30 TAC 335.204(b)(6) and 335.205(a).

2. either

a. within 1000 feet of an area subject to active coastal shoreline erosion even though the area is protected by a barrier island or peninsula?

☐ Yes ☒ No

If Yes: submit in Section V.F design, construction, and operational features which will prevent adverse effects resulting from storm surge and erosion or scouring by water.

b. within 5000 feet of a coastal shoreline subject to active shoreline erosion and which is unprotected by a barrier island or peninsula.

☐ Yes ☒ No

If Yes: submit Section V.F design, construction and operational features, which will prevent adverse effects resulting from storm surge and erosion or scouring by water.

3. on a barrier island or peninsula?

☐ Yes ☒ No ☐ Not Applicable

If Yes: the TCEQ shall not issue a permit for a new hazardous waste land treatment unit or an areal expansion of an existing land treatment unit, pursuant to 30 TAC 335.204(b)(11) and 335.205(a)(1).

C. Additional Requirements for Waste Piles [30 TAC 335.204(c)]

Not Applicable

Is the waste pile located or proposed to be located:

1. either

a. within 1000 feet of an area subject to active coastal shoreline erosion even though the area is protected by a barrier island or peninsula?

☐ Yes ☐ No

If Yes: submit in Section V.E design, construction, and operational features on the facility which will prevent adverse effects resulting from storm surge and erosion or scouring by water.

b. within 5000 feet of a coastal shoreline subject to active shoreline erosion and which is unprotected by a barrier island or peninsula.

☐ Yes ☐ No

If Yes: submit Section V.E design, construction, and operational features which will

prevent adverse effects resulting from storm surge and erosion or scouring by water.

2. on a barrier island or peninsula?

☐ Yes ☐ No ☐ Not Applicable

If Yes: the TCEQ shall not issue a permit for a new hazardous waste pile or an areal expansion of an existing waste pile, pursuant to 30 TAC 335.204(c)(10) and 335.205(a)(1).

D. Additional Requirements for Storage Surface Impoundments [30 TAC 335.204(d)]

Not Applicable

Is the storage surface impoundment located or proposed to be located:

1. either
   a. within 1000 feet of an area of active coastal shoreline erosion even though the area is protected by a barrier island or peninsula?

☐ Yes ☐ No

If Yes: submit in Section V.D design, construction and operational features of the facility which will prevent adverse effects resulting from storm surge and erosion or scouring by water.

   b. within 5000 feet of a coastal shoreline subject to active shoreline erosion and which is unprotected by a barrier island or peninsula?

☐ Yes ☐ No

If Yes: then submit in Section V.D design, construction and operational features which will prevent adverse effects resulting from storm surge and erosion or scouring by water.

2. on a barrier island or peninsula?

☐ Yes ☐ No ☐ Not Applicable

If Yes: the TCEQ shall not issue a permit for a new hazardous waste storage surface impoundment or an areal expansion of an existing storage surface impoundment, pursuant to 30 TAC 335.204(d)(10) and 335.205(a)(1).

E. Additional Requirements for Landfills (and Surface Impoundments Closed as Landfills with wastes in place)

Is the landfill located or proposed to the located:

1. within 1000 feet of an established residence, church, school, day care center, surface water body used for a public drinking water supply, or dedicated public park which is in use at the time the notice of intent to file a permit application is filed with the commission, or which is in use at the time the permit application is filed with the commission?

☐ Yes ☒ No

If Yes: the TCEQ shall not issue a permit for a new hazardous waste landfill or an areal expansion of an existing landfill, pursuant to 30 TAC 335.204(e)(6) and 335.205(a)(1).

2. (for commercial hazardous waste landfills) in the 100-year flood plain of a perennial stream that is delineated on a flood map adopted by the Federal Emergency Management Agency after September 1, 1985, as zone A1-99, VO, or V1-30?

☐ Yes ☐ No

If Yes: the TCEQ shall not issue a permit for a new hazardous waste landfill or an areal expansion of an existing landfill, pursuant to 30 TAC 335.204(e)(7) and 335.205(a)(1).

3. either:

a. within 1000 feet of an area subject to active coastal shoreline erosion even though the area is protected by a barrier island or peninsula?

☐ Yes ☒ No

If Yes: then submit in Section V.G design, construction, and operational features which will prevent adverse effects resulting from storm surge and erosion or scouring by water.

b. within 5000 feet of a coastal shoreline subject to active shoreline erosion and which is unprotected by a barriers island or peninsula.

☐ Yes ☒ No

If Yes: then submit in Section V.G design, construction, and operational features which will prevent adverse effects resulting from storm surge and erosion or scouring by water.

4. on a barrier island or peninsula?

☐ Yes ☒ No ☐ Not Applicable

If Yes: the TCEQ shall not issue a permit for a new hazardous waste landfill or an areal expansion of an existing landfill, pursuant to 30 TAC 335.204(e)(12) and 335.205(a)(1).

F. Flooding

1. Identify whether the facility is located within a 100-year flood plain [40 CFR 270.14(b)(11)(iii)]. This identification must indicate the source of data for such determination and include a copy of relevant documentation (e.g., flood maps, if used and/or calculations). The boundaries of the hazardous waste management facility must be shown on the flood plain map. If the facility is not subject to inundation as a result of a 100-year flood event, do not complete Sections II.F.2. through II.F.4. below. An applicant for a proposed hazardous waste landfill, areal expansion of a hazardous waste landfill, or a commercial hazardous waste land disposal unit may not rely solely on flood plain maps prepared by the Federal Emergency Management Agency (FEMA) or a successor agency for this determination.

The permitted units, Corrective Action Management Unit (CAMU)/Former North Holding Basin (NHB) (NOR 004) and the Southeast Holding Basin (SEHB) (NOR 017), are within the 100-year flood plain. Attachment C includes the outline of the Terminal and the units to be permitted on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) for Harris County and the

Incorporated Areas, Panel 905 of 1150, revised May 2, 2019. The permitted units did not fall within the 100-year flood plain prior to the 2019 FIRM map revisions that encompass the Terminal.

2. If the facility is located within the 100-year flood plain the applicant must provide information detailing the specific flooding levels and other events (e.g., Design Hurricane projected by Corps of Engineers) which impact the flood protection of the facility. Information shall also be provided identifying the 100-year flood level and any other special flooding factors (e.g., wave action) which must be considered in designing, construction, operating, or maintaining the facility to withstand washout from a 100-year flood.

   The permitted units were not located within the 100-year flood zone prior to 2019 flood map updates following Hurricane Harvey. The SEHB (NOR 017) unit was closed in 1987 and is located beneath a paved parking lot.

   Flood protection devices exist at CAMU/NHB (NOR 004) and consist of berms approximately 20 feet above mean sea level (msl) around the unit. Storm surge data were referenced for National Oceanic and Atmospheric Administration (NOAA) station 8770777 (Manchester, TX), which is located approximately 2 miles west of the Terminal on Buffalo Bayou. The storm surge data was referenced during the following major storm events: Hurricane Ike, Hurricane Harvey and Hurricane Beryl. The storm surge data from station 8770777 documented a maximum storm surge height of approximately 12 feet above msl during Hurricanes Ike and Harvey and approximately 10 above msl during Hurricane Beryl. This is eight to ten feet below the maximum height of the berms surrounding CAMU/NHB (NOR 004). The storm surge data is included in Attachment C.

3. State whether any flood protection devices exist at the facility (e.g., flood walls, dikes, etc.), designed to prevent washout from the 100-year flood.

   The permitted units were not located within the 100-year flood zone prior to 2019 flood map updates following Hurricane Harvey. Flood protection devices exist at CAMU/NHB (NOR 004) and consist of berms approximately 20 feet above mean sea level around the unit. As presented in the NHB 1995 Engineering Report, the CAMU/NHB (NOR 004) was designed to withstand a 100-year storm event (assuming 12.8 inches of rainfall in 24-hour duration). A safety factor of 2 was utilized and operations in the NHB maintain a minimum of two feet of freeboard. Additionally, as described above, the measured storm surge during major storm events has been eight to ten feet below the maximum height of the berms surrounding CAMU/NHB (NOR 004). The CAMU/NHB did not overtop or washout during recent major flooding events (which include Hurricanes Ike and Harvey), which demonstrates that the containment around the CAMU/NHB has effectively protected the CAMU/NHB from washout during major storm events.

   a. **If Yes**: provide in Section V an engineering analysis to indicate the various

hydrodynamic and hydrostatic forces expected to result at the facility as a consequence of a 100-year flood. [40 CFR 270.14(b)(11)(iv)(A)]

Include structural or other engineering studies showing the design of operational units (e.g., tanks, incinerators) and flood protection devices (e.g., flood walls, dikes) at the facility and how these will prevent washout. [40 CFR 270.14(b)(11)(iv)(B)]

See Attachment J – Engineering Report

b. **If No**: the applicant shall provide in Section V a plan for constructing flood protection devices and a schedule including specific time frames for completion. Provide engineering analyses to indicate the various hydrodynamic and hydrostatic forces expected to result at the facility as a consequence of a 100-year flood. [40 CFR 270.14(b)(11)(iv)(A)]

Include structural or other engineering studies showing the design of operational units (e.g., tanks, incinerators) and flood protection devices (e.g., flood walls, dikes) at the facility and how these will prevent washout. [40 CFR 270.14(b)(11)(iv)(B)]

4. If applicable, and in lieu of the flood protection devices from above, provide a detailed description of the procedures to be followed to remove hazardous waste to safety before the facility is flooded. [40 CFR 270.14(b)(11)(iv)(c)] The procedures should include:
   a. Timing of such movement relative of flood levels, including estimated time to move the waste, to show that such movement can be completed before flood waters reach the facility. Indicate which specific events shall be use to begin waste movement (e.g., Hurricane warning, Flash Flood watch, etc.);
   b. A description of the location(s) to which the waste will be moved and a demonstration that these facilities will be eligible to receive hazardous waste in accordance with appropriate regulations (i.e., a permitted facility);
   c. The planned procedures, equipment, and personnel to be used and the means to ensure that such resources will be available in time for use; and
   d. The potential for accidental discharges of the waste during movement and precautions taken to preclude accidental discharges.

Not applicable. Hazardous waste would not be removed/relocated during potential flood event.

G. Additional Information Requirements

1. For a new hazardous waste management facility, include a map of relevant local land-use plans and descriptions of the major routes of travel in the vicinity of the facility to be used for the transportation of hazardous waste to and from the facility covering at least a five (5)-mile radius from the boundaries of the facility. [30 TAC 305.50(a)(10)(A)&(D)]

   Not Applicable – Application is for existing units

2. For a new commercial hazardous waste management facility as defined in 30

TAC 335.202 or the subsequent areal expansion of such a facility or unit of that facility, indicate on the map the nearest established residence, church, school, day care center, surface water body used for a public drinking water supply, and dedicated public park.

Not Applicable – Application is for existing units

3. For new commercial hazardous waste management facilities, submit the following: [30 TAC 305.50(a)(12)(A)]
   a. the average number, gross weight, type, and size of vehicles used to transport hazardous waste;
   b. the major highways nearest the facility irrespective of distance; and
   c. the public roadways used by vehicles traveling to and from the facility within a minimum radius of 2.5 miles from the facility.

   Not Applicable – Application is for existing units

4. Include the names and locations of industrial and other waste-generating facilities within 0.5 miles for a new on-site hazardous waste management facility and the approximate quantity of hazardous waste generated or received annually at those facilities. [30 TAC 305.50(a)(10)(B)&(C)]

   Not Applicable – Application is for existing units

5. Include the names and locations of industrial and other waste-generating facilities within 1.0 miles for a new commercial hazardous waste management facility and the approximate quantity of hazardous waste generated or received annually at those facilities. [30 TAC 305.50(a)(10)(B)&(C)]

   Not Applicable – Application is for existing units

6. For existing land disposal facility units provide documentation that the information required by 30 TAC 335.5 has been placed in the county deed records. If previously submitted, please reference the submittal by date and registration number.

   See Attachment D – Deed Recordation

7. If a surface impoundment or landfill (including post-closure) is to be permitted, provide exposure information to accompany this application and in accordance with 30 TAC 305.50(a)(8) and 40 CFR 270.10(j). This information will be considered separately from the TCEQ application completeness determination.

   See Attachment E – Exposure Information

8. For a hazardous waste management facility requesting a capacity expansion of an existing hazardous waste management facility, please provide in Section VI.A.1.a the requested fault delineation information. [30 TAC 305.50(a)(4)(D)]

Not Applicable – expansion of the units is not requested in this application

III. Facility Management

A. Compliance History and Applicant Experience

1. Provide listings of all solid waste management sites in Texas owned, operated, or controlled by the applicant as required by 30 TAC 305.50(a)(2).

   Listed Below

2. For a new commercial hazardous waste management facility, provide a summary of the applicant's experience in hazardous waste management as required by 30 TAC 305.50(a)(12)(F).

   Not Applicable

Name	RN Number	Address	County
Galena Park Terminal	RN100237452	906 Clinton Dr. Galena Park, TX 77547	Harris
Jefferson Street Truck Rack	RN100225986	400 N Jefferson St. Pasadena, TX 77501	Harris
Pasadena Terminal	RN100224815	530 Witter St. Pasadena, TX 77506	Harris
Kinder Morgan Export Terminal	RN100542877	901 Light Company Rd., Pasadena, TX 77506	Harris

B. Personnel Training Plan

Provide an outline of the facility training plan which includes all the information required by 40 CFR 264.16. Indicate which training will be repeated annually.

See Attachment F – Personnel Training Plan

C. Security

Describe how the facility complies with the security requirements of 40 CFR 264.14 or submit a justification demonstrating the reasons for requesting a waiver of these requirements.

See Attachment G – Security System

D. Inspection Schedule

Provide an inspection schedule summary for the facility which reflects the requirements of 40 CFR 264.15(b), 264.33 and, where applicable, the specific requirements in 40 CFR 264.174, 264.193(i), 264.195, 264.226, 264.254, 264.273, 264.303, 264.347, 264.552, 264.574, 264.602, 264.1033(f), 264.1034, 264.1052, 264.1053(e), 264.1057, 264.1058, 264.1063, 264.1084, 264.1085, 264.1086, 264.1088, 264.1101(c)(4) and 270.14(b)(5). The inspection schedule should reflect the requirements described below. The schedule should encompass each type of hazardous waste management (HWM) unit (i.e., facility

component) and its inspection requirements. For incorporation into a permit, complete Table III.D. - Inspection Schedule for all units to be permitted.

The owner or operator must inspect the facility for malfunctions and deterioration, operator errors, and discharges which may be causing or may lead to the release of hazardous waste constituents to the environment or which may pose a threat to human health. The owner or operator must conduct these inspections often enough to identify problems in time to correct them before they harm human health or the environment.

The owner or operator must develop and follow a written schedule for inspecting other basic elements such as monitoring equipment, safety and emergency equipment, security devices, the presence of liquids in leak detection systems, where installed, and operating and structural equipment (such as dikes and sump pumps) that are important to preventing, detecting, or responding to environmental or human health hazards.

If the owner or operator of a facility which contains a waste pile wishes to pursue an exemption from the groundwater monitoring requirements for that waste management unit, the inspection schedule must include examination of the base for cracking, deterioration, or other conditions that may result in leaks. The frequency of inspection must be based on the potential for the liner (base) to crack or otherwise deteriorate under the conditions of operation (e.g., waste type, rainfall, loading rates, and subsurface stability).

See Attachment H – Inspection Schedule

E. Contingency Plan (Not Applicable to Permits for Post-Closure Care Only)

If the owner or operator has already prepared a Spill Prevention, Control, and Countermeasures (SPCC) Plan or some other emergency or contingency plan, he need only amend that plan to incorporate hazardous waste management provisions that are sufficient to comply with the requirements of this section. Provide a Contingency Plan which includes all the information required by 40 CFR Part 264 Subparts C and D, except for 40 CFR 264.56(d)(1) and 30 TAC 335.153(2). This plan must also include a drawing of the facility which shows the location of all emergency equipment. In addition, complete the following tables to summarize information expressed in more detail in the plan.

Integrated Contingency Plan is included as Volume III to the permit application

1. Arrangements with Local Authorities

   Complete Table III.E.1. - Arrangements With Local Authorities to indicate arrangements (if made) with local authorities to familiarize local fire and police departments, local hospitals, equipment suppliers, and local and State emergency response teams with the layout of the facility, properties of hazardous waste handled at the facility and associated hazards, places where facility personnel would normally be working, entrances to and roads inside the facility, and possible evacuation routes. Provide documentation of the attempts and any arrangements made with local authorities and emergency response teams.

2. Emergency Coordinator's List

   For inclusion into a permit, list in Table III.E.2. - Emergency Coordinators the persons qualified to act as emergency coordinator. List the alternates in the order in which they will assume responsibility.

3. Emergency Equipment List

   For inclusion into a permit, list in Table III.E.3. - Emergency Equipment all types of emergency equipment at the facility [such as fire-extinguishing systems, spill-control equipment, communications and alarm systems (internal and external), and decontamination equipment], if this equipment is required. Briefly outline the equipment capabilities.

4. Waiver from Preparedness and Prevention Requirements

   If the owner or operator wishes to request a waiver from any of the preparedness and prevention requirements, he must submit a justification demonstrating the reasons for requesting the waiver, as discussed below.

F. Emergency Response Plan

For a new commercial hazardous waste management facility, the application shall contain evidence sufficient to demonstrate that emergency response capabilities are available or will be available before the facility first receives waste. An emergency response plan must be provided which satisfies the requirements of 30 TAC 305.50(a)(12)(C) and (D). This plan must show that the proposed facility has sufficient emergency response capabilities for managing a reasonable worst-case emergency condition associated with the operation of the facility. (For financial assurance requirements associated with the emergency response activities, please see Section VIII.C.3.)

Not Applicable – Application is for an existing facility

1. Practice Drills

   In addition to the contingency plan required under 40 Code of Federal Regulations Part 270.14(b)(7), provisions specifying procedures and timing of practice facility evacuation drills are required. Provide a description and a frequency for facility evacuation drills.

2. If a private corporation, municipality or county group will provide emergency response actions at the proposed facility, include a copy of the contract for this type of agreement with this application or state that documentation will be submitted before the facility accepts wastes.

3. Historical weather data for the area should be documented and submitted. Information regarding how emergency response operations may be affected by weather conditions should be included. (Local rainfall extremes, average rainfall amounts, average wind speeds and directions, potential for major weather events such as hurricanes, tornados, icy conditions, flash flooding etc., should be addressed.)

4. A definition of a worst-case emergency for the proposed facility should be described in the application. This worst-case emergency should take into account the possible complications involved with a facility emergency compounded by adverse weather conditions. It should also detail spills, fires, explosions, etc. This worst case scenario should be developed with the help of local governmental entities where possible. Emergency planning should include both unexpected emergencies and emergencies occurring as a result of a predictable event such as

a flood or hurricane. For areas which are prone to hurricanes and flash flooding, the worst case which allows for a realistic situation should be used. For example, response teams should be well versed in reacting to events such as a 100-year flood.

5. A training program for personnel who will respond to these types of emergencies must be provided and must include the requirements described in OSHA Federal Register 1910 and EPA Federal Register 311, the Texas Hazard Communication Act, SARA Title III 302, 304, 311, 312, and 313. If emergency response actions are contracted out, the contracted employees must be properly trained and documentation of this training must be maintained on-site. All responders to emergencies at the proposed facility must be involved in training and drills at the facility in order to be thoroughly familiar with the facility and its operations.

6. The application must include a description and identification of first-responders (i.e. all pertinent facility personnel, local responders, and contractors). The duties of the facility employee who is to be the on-scene coordinator (OSC) must be described. Additional information must be provided detailing the OSC's role in the emergency response activities. This person must have the authority to commit the resources needed to carry out the Emergency Response Plan. His duties must be thoroughly described so that it is clear whether he will remain in control once the emergency response team arrives or whether he will relinquish control to another incident commander upon that person's arrival on the scene. Additionally, there must be a qualified OSC on-site or on call 24 hours a day. The name, address and phone numbers (home and work) of the OSC(s) must be listed in the Emergency Response Plan. Where more than one person is listed, one must be named as the primary OSC and others must be listed in the order in which they will assume responsibility as alternates.

7. Local or regional emergency medical services or hospitals which have experience in hazardous materials training must be identified in the application. The names, addresses and phone numbers of the hospitals or medical centers should be listed here and updated as necessary. Additionally, maps showing the quickest routes to the medical services must be provided. A description of decontamination procedures for injured personnel prior to transport to medical services must also be provided. The decontamination and transport of injured people to appropriate medical centers must be included in the emergency evacuation training and drills.

8. A pre-disaster plan which includes training drills must be included in the application. This plan should include a schedule for staging evacuations of the facility and for emergency response training drills. At least two evacuations and two emergency response drills should occur annually. The plan should also include additional drills for responding to "predictable" emergencies such as floods and hurricanes. The plan must include the following (or must reference applicable sections of the Contingency Plan): a description of arrangements already in place with local authorities; emergency phone numbers; internal communication or alarm systems and proper alarm codes; a list of all types of emergency equipment at the facility, including a physical description and the capabilities of each item on the list, and the location of each item (a map would be useful here); a description of decontamination equipment; an evacuation plan including signals, evacuation routes and alternate evacuation routes; listing of pertinent first responder emergency phone numbers, and codes for other types of

communication devices; and a description of actions that will be performed in the event that a "predictable" emergency occurs.

9. Describe the mechanism which will be used to notify first responders and appropriate local governmental entities that an emergency has occurred. Also describe the mechanism which will be used to notify all applicable governmental agencies when an incident occurs (i.e., TCEQ, Texas Parks and Wildlife, General Land Office, TCEQ Office of Air Quality, Texas Department of Health, and the Texas Railroad Commission).

10. Evidence must be provided that shows coordination with the Local Emergency Planning Committee (LEPC) and any local comprehensive emergency management plan. The applicants should be able to show compliance with SARA Title III.

11. Any medical response capabilities proposed for the facility property must be detailed in the application.

Table III.D. – Inspection Schedule

Facility Unit(s) and Basic Elements	Possible Error, Malfunction, or Deterioration	Frequency of Inspection
SEHB NOR 017		
Final Cap	Erosion; Non-Uniform Subsidence	Quarterly
Benchmark	Damaged or missing Accuracy verification completed by Texas Registered Professional Land Surveyor	Quarterly Every Five Years
Perimeter Fence	Damaged	Quarterly
Monitor Wells	Well caps locked; well caps missing; damage to well covers, well casings, well pads and guard posts (if applicable); silt build-up	Semiannually – during sampling event
Recovery Wells	Damage to well covers, well casings, well pads and guard posts (if applicable); silt build-up	Semiannually – during sampling event
CAMU/Former NHB NOR 004		
Freeboard	Equal to Two Feet	Weekly
Dike	Leaks, erosion or cracks	Weekly
Monitor Wells	Well caps locked; well caps missing; damage to well covers, well casings, well pads and guard posts (if applicable); silt build-up	Semiannually – during sampling event
Recovery Wells	Damage to well covers, well casings, well pads and guard posts (if applicable); silt build-up	Semiannually – during sampling event

Name	Home Address	Office Phone(s) and/or Pager	Home Phone(s)
Primary: Alex Rendon	NA	(281) 678-4653 (24-hours/day)	NA
Alternates: Corey McGuire	NA	(832) 963-4373 (24-hours/day)	NA

Table III.E.3. – Emergency Equipment

Equipment	Location	Physical Description	Capabilities
Alarm System	Galena Park Terminal/Site Wide	Emergency alert horn broadcast facility wide	Notify personnel of emergency situation within the Galena Park Terminal
Communication	On CAMU operations field supervisor during soil management activities in the CAMU	Two-way handheld radios	The radios have direct contact to facility emergency personnel 24 hours a day, 365 days a year
Fire Extinguishers	On vehicles operating within the CAMU during soil management activities in the CAMU	Portable, Multi-Class	Fire fighting
Decontamination Pad	At exit from the CAMU. This is temporary equipment that will only be staged during soil management activities within the CAMU	14-mil plastic sheet over sandbag berm	Decontaminate trucks and earth moving equipment

Equipment	Location	Physical Description	Capabilities

IV. Wastes and Waste Analysis

(Sections IV.A, IV.C, and IV.D do not apply to post closure applications.)

A. Waste Management Information

For a new hazardous waste management facility or for a facility hazardous waste management capacity expansion, complete Table IV.A. - Waste Management Information for each waste, source, and volume of waste to be stored, processed, or disposed of in the facility units to be permitted as required by 30 TAC 305.50(a)(9). For on-site facilities, list "on-site" for the waste source. For off-site facilities, list the source of the waste. If unknown, identify potential sources (e.g., industries/processes to be serviced).

Not Applicable – existing unit will not be modified to expand capacity

B. Waste Managed In Permitted Units

For all hazardous waste management facilities and for inclusion into a permit, complete Table IV.B. - Wastes Managed In Permitted Units for each waste and debris to be managed in a permitted unit. Provide a description, EPA waste codes, and TCEQ waste form codes and classification codes. Guidelines for the Classification & Coding of Industrial Wastes and Hazardous Wastes, TCEQ publication RG-22, contains guidance for how to properly classify and code industrial waste and hazardous waste in accordance with 30 TAC 335.501-335.515 (Subchapter R).

Applicants need not specify the complete 8-digit waste code formulas for their wastes but must include the 3-digit form codes and 1-digit classification codes. This allows the applicant to specify major categories of wastes in an overall manner without having to list all the specific waste streams as generated.

C. Sampling and Analytical Methods

For inclusion into a permit, complete Table IV.C. - Sampling and Analytical Methods for each waste and debris proposed to be sampled and analyzed and include sampling location, sampling method, sample frequency, analytical method, and desired accuracy level for each waste and debris to be managed in a permitted, storage, processing, or disposal unit at the facility.

D. Waste Analysis Plan

The Waste Analysis Plan must address the requirements of 40 CFR §264.13 and §268.7. The Plan should include supplemental and coordinating information on how the facility will analyze wastes and debris (as listed in Table IV.B) to be managed in permitted units. The plan must address the determination of land disposal restrictions. Generators must determine and certify with the manifest the land disposal restriction status of a waste, even if the waste or debris is not intended for land disposal. Land disposal treatment facilities must identify the treatment process and analytical procedures to be used, and include them in the waste analysis plan. Land disposal restriction records must be maintained at the facility until closure of the facility [40 CFR §264.73(b)]. Landfill facilities must determine through the Paint Filter Liquids Test (SW-846 Method 9095) if there is free liquid in a bulk or containerized waste to be landfilled. If so, it must be

stabilized; adding adsorbents alone is not acceptable, even for containerized waste.

For off-site facilities the waste analysis plan must specify procedures which will be used to inspect and, if necessary, analyze each movement of industrial and hazardous waste or hazardous debris received at the facility to ensure it matches the identity of the waste designated on the accompanying shipping ticket. The plan must describe methods which will be used to determine the identity of each movement of waste and debris managed at the facility and sampling method used if the identification method includes sampling in order to store, process, or dispose of the wastes and debris in accordance with 40 CFR Parts 264 and 268 and any abnormal characteristics which may upset further treatment or processing operations. Include rejection criteria for shipments of waste and debris received at the facility

For on-site facilities the waste analysis plan must specify the normal characteristics of the waste (including EPA hazardous waste codes, EPA hazard codes, and 40 CFR Part 261, Appendix VIII Hazardous Constituents) which must be known to store, process, or dispose of the wastes and debris in accordance with 40 CFR Parts 264 and 268 and any abnormal characteristics which may upset further treatment or processing operations.

The methods and equipment used for sampling waste materials will vary with the form and consistency of the waste materials to be sampled. Those sampling methods listed in 40 CFR Part 261 Appendix I, for sampling waste with properties similar to the indicated materials, or equivalent sampling methods approved by EPA under 40 CFR §260.20 and §260.21, will be considered by the TCEQ to be acceptable.

See Attachment I – Waste Analysis Plan

Table IV.A. – Waste Management Information

Waste Type(s)	Source	Volume (tons/year)
Not Applicable – Existing Unit, No Capacity Expansion		

Table IV.B. – Wastes Managed In Permitted Units

No.	Waste	EPA Hazardous Waste Numbers	TCEQ Waste Form Codes and Classification Codes
1	Corrective Action Soil – NH Class II	N/A	301 2
2	Corrective Action Soil – NH Class I	N/A	301 1
3	Corrective Action Soil H	*See Below	301, 319 H
4	Tank 100-5 Bottoms	**See Below	301 H
* D001, D018, D023, D024, D025, D026, D028, U002, U019, U052, U043, U120, U159, U165, U220, U226, U227, U239			
** D001, D002, D016, D018, D022, D023, D024, D025, D026, D028, D035, D039, D043, U002, U003, U009, U012, U019, U031, U043, U051, U052, U055, U056, U077, U112, U120, U125, U140, U154, U159, U161, U177, U188, U191, U210, U220, U226, U227, U239, U240			
* While several constituents expected to be present in the corrective action soil waste, as described by the U-codes, above, may be ignitable, based on historical experience, it is not expected that the soil waste will be ignitable.			

Table IV.C. – Sampling and Analytical Methods

Sampling Location	Sampling Method	Frequency	Parameter	Test Method	Reporting Limit (mg/kg)	Proposed Treatment Standards (mg/kg)
Roll-Off Boxes OR Soil Stockpiles in CAMU	See Section 4.1 of the Waste Analysis Plan	Initial 100 cy per 500 yards of similar corrective action area	Methanol	GC/FID	50	8,400

V. Engineering Reports

The engineering report represents the conceptual basis for the storage, processing, or disposal units at the hazardous waste management (HWM) facility. It should include calculations and other such engineering information as may be necessary to follow the logical development of the facility design. Plans and specifications are an integral part of the report. They should include construction procedures, materials specifications, dimensions, design capacities relative to the volume of wastes (as appropriate), and the information required by 40 CFR 270.14(b)(8), 270.14(b)(10). Since these reports may be incorporated into any issued permit, the report should not include trade names, manufacturers, or vendors of specific materials, equipment, or services unless such information is critical to the technical adequacy of the material. Technical specifications and required performance standards are sufficient to conduct a technical review. For landfills, surface impoundments, and waste piles, a Construction Quality Assurance Plan, which considers the guidance in EPA publication 530-SW-85-014, Minimum Technology Guidance on Double Liner Systems for Landfills and Surface Impoundments; Design, Construction, and Operation, and/or EPA/600/R-93/182, Quality Assurance And Quality Control For Waste Containment Facilities, should be submitted.

For facilities which will receive wastes from off-site sources, the engineering report must also contain information on the units which will manage these off-site wastes in accordance with 30 TAC 335.45(a).

Certain ancillary components or appurtenant devices must be addressed in the Part B application. These include but are not limited to sumps, pipelines, ditches, and canals. The technical information and the level of detail required will vary with the nature, scope, and location of the ancillary component. At a minimum they should be included in descriptions of piping and process flow. More information may be required. A single area containing a large number of ancillary components or a remote appurtenant device in an unusually sensitive location may warrant some specific permit requirements. All ancillary components must be included in calculating closure cost estimates.

In each of the unit-specific sections, describe precautions taken to prevent accidental commingling of incompatible wastes. If reactive or ignitable wastes are to be managed, or if incompatible wastes are deliberately commingled, provide information to ensure that precautions are taken to avoid danger due to:

- generation of extreme heat or pressure, fire, explosion, or violent reaction;
- production of uncontrolled toxic mists, fumes, dusts, or gases in sufficient quantities to threaten human health;
- production of uncontrolled flammable fumes or gases in sufficient quantities to pose a risk of fire or explosion;
- damaging the structural integrity of the device or facility containing the waste; or
- threatening human health or the environment by any other means.

Comprehensive consideration should be given to ensure that the facility is designed in accordance with good public health and hazardous waste management practices. The application will be evaluated primarily for the aspects of design covered by the regulations. Nothing in any approval is intended to relieve the facility owner or operator of any liabilities or responsibilities with respect to the design, construction, or operation of the project.

A. General Engineering Reports

1. General Information

Complete Table V.A. – Facility Waste Management Handling Units listing all past, current or proposed units. *[Indicate units' status as* Active, Closed, Inactive *(built but not yet managing waste)*, Proposed *(not yet built)*, Never Built, Transferred, or Post-Closure. *Indicate appropriate units for Capacity information.]* **Note for renewals and modifications involving adding or dropping units from the permit:** List all TCEQ Permit Unit Numbers that have been assigned previously as in a current permit Attachment D –Authorized Facility Units table and do not reuse or reassign permit numbers for units that have been replaced, closed, removed from the permit, or transferred to other ownership. All Notice of Registration (NOR) Numbers must match the State of Texas Environmental Electronic Reporting System (STEERS) and may not be reused for replacement units.

Provide an overall plan view of the entire facility. Identify each hazardous or industrial solid waste management unit (container storage area, tank, incinerator, etc.) to be permitted in relation to its location and the type of waste managed in that unit. Also provide a plan view at an appropriate scale to clearly show the location of all hazardous waste management units to be permitted on one or more 8 1/2" x 14" sheets. Indicate on this plan view how the design or operation provides for buffer zones or waste segregation as appropriate for incompatible, ignitable, or reactive wastes.

Submit a topographic map or maps of the facility which clearly shows the information specified in 40 CFR 270.14(b)(19), 270.14(c)(3), and 270.14(d)(1)(i) (for large HWM facilities, the TCEQ will allow the use of other scales on a case-by-case basis). Please note that the term "facility" includes all contiguous land, structures, other appurtenances, and improvements on the land for storing, processing, or disposing of hazardous and industrial solid waste.

See Attachment J – Engineering Report

2. Features to Mitigate Unsuitable Site Characteristics

   For all new hazardous waste management storage and/or processing facilities or areal expansions of existing hazardous waste management storage and/or processing facilities, include in the engineering report design, construction, and operational information specified in 30 TAC 335.204(a)(1) and (a)(3) through (9).

   Not Applicable – This application is for existing units that will not undergo areal expansion

3. Construction Schedules

   a. In order to meet the required design standards, extensive retrofitting of some facilities may be required. In the worst case, the applicant may elect to close certain operations rather than comply with the RCRA standards. Thus, the permit may specify a schedule of compliance requiring the accomplishment of given tasks within specific time frames. As required, indicate an appropriate schedule(s) of compliance in this application. The schedule should provide for facility compliance as soon as possible and in accordance with 40 CFR 270.33(a)(2) and 270.33(b).

   b. For commercial hazardous waste management facilities, permit applications (new, renewal, or interim status applications), major amendments, and Class 3 modifications must include a construction schedule. A construction schedule must be submitted even if the application does not include an

addition of units or a revision to permitted units. This schedule should comply with the requirements of 30 TAC 305.149.

Not Applicable – Construction has been completed

4. Provide detailed plans and specifications which when, accompanied by the engineering report, will be sufficiently detailed and complete to allow the Executive Director to ascertain whether the facility will be constructed and operated in compliance with all pertinent permitting requirements. Engineering plans and specifications must be prepared under the supervision of and sealed by a licensed Professional Engineer, with current license, along with the Registered Engineering Firm's name and Registration Number as required by the Texas Engineering Practice Act. For some facilities, plans in the form of a standard piping and instrumentation diagram will be sufficient. Overall dimensions and materials of construction must be shown.

See Attachment J – Engineering Report, Attachment A - CAMU Construction Certification

B. Container Storage Areas

1. Provide an engineering report which includes all of the information specified in 40 CFR 264.170-264.173, 264.175-264.177, and 270.15.

Complete Table V.B - Container Storage Areas and list the container storage areas covered by this application to be permitted. List the N.O.R. unit number, the rated capacity or size of each unit (including the maximum number of each type of container to be stored at each unit and total maximum capacity of all types wastes stored in the unit), the areal dimensions, containment volume, aisle space requirements, whether ignitable, reactive, or incompatible waste will be stored in each unit, and whether processing will occur within the unit.

Not Applicable

2. Container storage areas must have a containment system that is capable of collecting and holding spills, leaks, and precipitation. In addition to the requirements of 40 CFR 270.15, the design report should include the following:
   a. Capacity of the containment relative to the number and volume of containers to be stored; in addition, for unenclosed areas, the amount of rainfall collected prior to removal. The TCEQ recommends using a 25-year, 24-hour rainfall event for this extra capacity; and
   b. Run-on into the containment system must be prevented, or a collection system with sufficient excess capacity must be provided. If run-on is collected within the containment system, delineate the area(s) from which run-on is collected. The 25-year, 24-hour rainfall event should be used to calculate the excess capacity.

Not Applicable

3. Wastes Containing No Free Liquids

With the exception of 40 CFR 264.175(d), storage areas that hold only wastes that do not contain free liquids need not have a containment system, provided that compliance with 40 CFR 264.175(c) is demonstrated. This demonstration must be submitted as part of the application and must include:

a. test procedures and results or other documentation or information to show that the wastes do not contain free liquids; and

b. a description of how the storage area is designed or operated to drain and remove liquids or how containers are kept from contact with standing liquids.

Not Applicable

4. Managing Ignitable or Reactive Wastes

If a container storage area will manage ignitable or reactive waste, as indicated on Table V.B, provide in the engineering report drawings demonstrating compliance with the buffer zone requirement of 40 CFR 264.17 and 264.176.

Not Applicable

5. Managing Incompatible Wastes

If a container storage area will manage incompatible waste, as indicated on Table V.B, provide in the engineering report a description of the procedures used to ensure compliance with 40 CFR 264.17 and 264.177.

Not Applicable

6. Managing Nonhazardous Wastes and/or Universal Wastes

If a container storage area will manage nonhazardous wastes, and/or universal wastes in addition to hazardous waste, provide a description of all types of wastes managed in the engineering report and procedures used to ensure compliance with 40 CFR 264 Subpart I.

Not Applicable

C. Tanks and Tank Systems

Provide an engineering report which includes all of the information specified in 40 CFR 264.190-264.194, 264.196, 264.198-264.199, and 270.16.

1. For inclusion into a permit, complete Table V.C - Tanks and Tank Systems and list the tanks covered by this application to be permitted. List the N.O.R. unit number, whether the unit is for storage and/or processing, the waste managed in each unit, the rated capacity of each unit, overall dimensions of each unit, containment volume, and whether ignitable, reactive, or incompatible waste will be stored in each unit.

2. If a tank will manage ignitable or reactive waste, as indicated on Table V.C, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.198 and provide drawings demonstrating compliance with any applicable buffer zone requirements and 40 CFR 264.17.

3. If a tank will manage incompatible waste, as indicated on Table V.C, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.199.

4. Submit written assessments that were reviewed and certified by an independent, qualified licensed Professional Engineer that attests to the structural integrity and suitability of handling the hazardous waste for each tank system, as required under 40 CFR 264.191-264.192 for existing tanks which do not have secondary containment meeting the standards of 40 CFR 264.193. The engineer signing the written assessment must make the certification specified in 40 CFR 270.11(d).

The certification must be sealed by a licensed Professional Engineer, with current license, along with the Registered Engineering Firm's name and Registration Number as required by the Texas Engineering Practice Act.

5. If a tank has been de-rated or if the permitted capacity is otherwise different from the design capacity, specify any such change(s) in the engineering report.

Provide in the report any additional information for tanks and tank systems as specified in the above regulatory citations including: specifics of leak, spill, and unfit for use systems responses; assessments of tank systems; new tank systems or components; overfill control and prevention; special requirements for ignitable and/or reactive wastes; incompatible wastes; air emissions control; detection of leaks into secondary containment; ancillary equipment; and plans and specifications individually sealed by a licensed professional engineer with current Texas registration with the Registered Engineering Firm's name and Registration number.

Not Applicable

D. Surface Impoundments

Provide an engineering report which includes all of the information specified in 30 TAC 305.50(a)(6), 335.168, 335.169, and 40 CFR 264.19, 264.220, 264.221, 264.222, 264.223, 264.226(a) and (c), 264.227, 264.229-264.231, and 270.17.

For storage surface impoundments at a new hazardous waste management facility or which are part of an areal expansion of an existing hazardous waste management facility, include in the engineering report design, construction, and operational information specified in 30 TAC 335.204(d). For any surface impoundment to be closed as a landfill (where wastes will remain after closure of the impoundment) at a new hazardous waste management facility or which are part of an areal expansion of an existing hazardous waste management facility, include in the engineering report design, construction, and operational information specified in 30 TAC 335.204(e).

For all impoundments, include in the report the following information.

1. Complete Table V.D.1 - Surface Impoundments and list the surface impoundments, covered by this application, to be permitted. List the waste(s) managed in each unit and the rated capacity or size of each unit.

2. If a surface impoundment will manage ignitable or reactive waste, as indicated on Table V.D.1., describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.229.

   Not Applicable – The units will not manage ignitable or reactive waste

3. If a surface impoundment will manage incompatible waste, as indicated on Table V.D.1., describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.230.

   Not Applicable – The units will not manage incompatible waste

4. If a surface impoundment will manage F020, F021, F022, F023, F026, and F027 waste, as indicated on Table V.D.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.231.

   Not Applicable – The units will not manage the wastes identified above

5. Describe the surface impoundment. Detailed plan view and cross-sectional drawings of the surface impoundment should be included with the engineering report.

See Attachment J– Engineering Report, Attachment A - CAMU Construction Certification and Attachment K – Closure Plan for NHB (NOR 004)

6. Freeboard

Specify the minimum freeboard to be maintained and the basis of the design to prevent overtopping resulting from normal or abnormal operations; overfilling; wind and wave action; rainfall; run-on; malfunctions of level controllers, alarms, and other equipment; and human error. Show that adequate freeboard will be available to prevent overtopping from a 100-year, 24-hour storm. [40 CFR 264.221(g)]

If the impoundment is inflow sensitive, it should be equipped with a high-level alarm based on a different level sensor than that used for automatic control.

See Attachment J – Engineering Report

7. Waste Flow

Describe the means that will be used to immediately shut off the flow of waste to the impoundment to prevent overtopping or in the event of liner failure, and include appropriate detailed drawings.

If the surface impoundment is a flow-through facility describe the flow of waste, including a hydraulic profile.

See Attachment J – Engineering Report

8. Dike Construction

a. If dikes are used, include the following certification as part of the engineering report:

"I, *(qualified licensed Professional Engineer)*, Texas P.E. License Number _____, of Registered Firm *(Name)* Registered Firm No. *(Registration Number)* certify under penalty of law that I have personally examined and am familiar with the design and construction of the dikes that are a portion of *(surface impoundment unit name)*.

I further certify that I have evaluated the dike design and materials of construction using accepted engineering procedures, and have determined that the dike, including the portion of the dike providing freeboard, has structural integrity, and

(1) will withstand the stress of the pressure exerted by the types and amounts of wastes to be placed in the impoundment; and
(2) will not fail due to scouring or piping, without dependence on any liner system included in the impoundment construction.

Date: _____"

"(Signature)"

"(Seal)"

b. The structural integrity of the dike system must be certified by a qualified Professional Engineer before a permit is issued. If the impoundment is not

being used, the dike licensed system must be certified before it can be put into use. The certification must be sealed by a licensed Professional Engineer, with current license, along with the Registered Engineering Firm's name and Registration Number as required by the Texas Engineering Practice Act.

c. A report shall accompany the dike certification which summarizes the activities, calculations, and laboratory and field analyses performed in support of the dike certification. Describe the design basis used in construction of the dikes. Provide the following analyses as attachments to the engineering report (A Quality Assurance Project Plan <QAPP> should be included in the report to ensure that each analysis is performed appropriately):

(1) Slope Stability Analysis
(2) Hydrostatic and Hydrodynamic Analysis
(3) Storm Loading
(4) Rapid Drawdown

d. Earthen dikes should have a protective cover to minimize wind and water erosion and to preserve the structural integrity of the dike. Describe the protective cover used and describe its installation and maintenance.

See Attachment J – Engineering Report

9. Containment System

We suggest that the applicant use available recognized guidance documents, such as EPA publication 530-SW-85-014, which provide design guidance for liner systems. The applicant is strongly encouraged to test each synthetic liner after installation by an electrical leak location test, such as the electric field method described in EPA Technical Guidance Document EPA/600/R-93/182, Quality Assurance and Quality Control for Waste Containment Facilities, or an equivalent method, such as those found in ASTM publications, and approved by the Executive Director. Construction above the liner may not proceed until any detected leaks are sealed.

a. Complete Table V.D. 6. - Surface Impoundment Liner System for each surface impoundment to be permitted.

b. In the engineering report, describe the design, installation and operation of liner and leak detection components. The description must demonstrate that the liner and leak detection system will prevent discharge to the land, and ground and surface water. Include the following analyses as attachments to the engineering report (A QAPP should be included in the report to ensure that each analysis is performed appropriately):

For artificial liners:

(1) Seaming method
(2) Surface preparation method
(3) Tensile Strength
(4) Impact Resistance
(5) Compatibility Demonstration
(6) Foundation Design (including Settlement Potential, Bearing Capacity and Stability, and Potential for Bottom Heave Blow-out)

For soil liners:

(7) Waste Migration Analysis (based on head, porosity, and permeability) for the most mobile and least attenuated waste constituents

(8) Atterberg Limits, % passing a #200 sieve, and Permeability
(9) Moisture Content
(10) Standard Proctor Density, Compaction Data

For leachate collection systems:

(11) Pipe Material and Strength
(12) Pipe Network Spacing and Grading
(13) Collection Sump(s) Material and Strength
(14) Drainage Media Specifications and Performance
(15) Analyses showing that pipe and pipe perforation size will prevent clogging and allow free liquid access to the pipe.
(16) Compatibility Demonstration
(17) Capacity of System
  (a) rate of leachate removal
  (b) capacity of sumps
  (c) thickness of mounding and maximum hydraulic head

c. Specify the liner system installation date and expected lifetime of liner system (years).

d. Specify whether the liner is chemically resistant to the waste and how this resistance was determined. Attach any tests or documentation to the engineering report.

e. Submit a quality assurance/quality control plan for all components to demonstrate that all components will be properly installed and will perform to design specifications.

f. Submit a Response Action Plan that proposes actions to be taken if the Action Leakage Rate for the surface impoundment exceeds. At a minimum the Response Action Plan must include the requirements of 40 CFR 264.223.

See Attachment J – Engineering Report

10. Surface impoundments that receive waste on or after May 8, 1985 (or for newly-regulated units, the effective date of the new RCRA regulation) into new units and/or lateral expansions or replacements of existing units must meet the minimum technological requirements of the Hazardous and Solid Waste Amendments of 1984, unless an appropriate waiver is granted by the Commission. The owner or operator of each new surface impoundment unit for which the construction commences after January 29, 1992, or each lateral expansion of an existing surface impoundment unit where construction commences after July 29, 1992, or replacement of an existing surface impoundment unit that commence reuse after July 29, 1992 must install two or more liners and leachate collection and removal system unless commission approves alternate design or operating practices. Plans and specifications for both new and existing surface impoundments must demonstrate conformity with 30 TAC 335.168 and 40 CFR 264.221

See Attachment J– Engineering Report

11. Run-on Diversion

Describe in detail how the surface impoundment system will manage stormwater run-on away from the surface impoundment. Stormwater run-on must be diverted away from a surface impoundment. Use at least a 100-year, 24-hour

rainfall event in the design and analysis of diversion structures. Where dikes are used to divert run-on, they must be protected from erosion. Include all analyses used to calculate run-on volumes.

See Attachment J – Engineering Report

12. The Commission may approve an alternate design or operating practice for a surface impoundment if the owner or operator demonstrates that such design or operating practices, together with location characteristics [40 CFR 264.221(d)]:
    a. Will prevent the migration of hazardous constituents into the groundwater or surface water at least as effectively as the liners and leachate collection and removal system required by 40 CFR 264.221; and
    b. Will allow detection leaks of hazardous constituents through the top liner at least as effectively.

    See Attachment J– Engineering Report

13. Exemption from Double-Liner Requirements for Monofills [264.221(e)]

    Owners or operators of hazardous waste surface impoundment monofills will be exempted from the double-liner requirements if the Commission finds, based on a demonstration by the owner or operator, that alternative design and operating practices, together with location characteristics are at least as effective as a double liner in preventing migration of hazardous constituents to the groundwater or surface water. If an exemption is sought, submit detailed plans and engineering and hydrogeologic reports, as appropriate, describing alternate design and operating practices that will, in conjunction with location aspects, prevent the migration of any hazardous constituents into the groundwater or surface water at any future time.

    Attachment J – Engineering Report

    Attachment E – Exposure Information

E. Waste Piles

This section applies to owners or operators of industrial solid waste facilities that store or process hazardous waste in piles. A hazardous waste pile that will be closed with wastes left in place must be managed as a landfill. Existing portions of waste piles are those areas that were listed on the original Part A and on which wastes have been lawfully placed.

Provide an engineering report which includes all of the information specified in 30 TAC 335.170 and 40 CFR 264.19, 264.250, 264.251, 264.252-264.253, 264.254(a) and (c), 264.256, 264.257, 264.259, and 270.18.

For waste piles at a new hazardous waste management facility or which are part of any areal expansion of an existing hazardous waste management facility, include in the engineering report design, construction, and operational information specified in 30 TAC 335.204(c).

For all waste piles, include in the report the following information.

1. For inclusion into a permit, complete Table V.E.1 - Waste Piles and list the waste piles covered by this application. List the waste managed in each unit and the rated capacity or size of the unit.
2. If a waste pile will manage ignitable or reactive waste, as indicated on Table

V.E.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.256.

3. If a waste pile will manage incompatible waste, as indicated on Table V.E.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.257.

4. If a waste pile will manage F020, F021, F022, F023, F026, and F027 waste, as indicated on Table V.E.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.259.

5. Describe the waste pile, including any structure surrounding or enclosing the waste pile.

6. Containment System

We suggest that the applicant use available recognized guidance documents, such as EPA publication 530-SW-85-014, which provide design guidance for liner systems. The applicant is strongly encouraged to test each synthetic liner after installation by an electrical leak location test, such as the electric field method described in EPA Technical Guidance Document EPA/600/R-93/182, Quality Assurance and Quality Control for Waste Containment Facilities, or an equivalent method, such as those found in ASTM publications, and approved by the Executive Director. Construction above the liner may not proceed until any detected leaks are sealed.

a. For inclusion into a permit, complete Table V.E. 3 - Waste Pile Liner System and specify the type of containment/liner system.

b. In the engineering report, describe the design, installation, construction, and operation of the liner and leachate collection system. The description must demonstrate that containment systems will prevent discharge to the land, surface water, or groundwater. Include the following analyses as attachments to the engineering report, when applicable to the containment system being described (A QAPP should be included in the report to ensure that each analysis is performed appropriately):

For artificial liners:

(1) Seaming method
(2) Surface preparation method
(3) Tensile Strength
(4) Impact Resistance
(5) Compatibility Demonstration
(6) Foundation Design (including Settlement Potential, Bearing Capacity and Stability, and Potential for Bottom Heave Blow-out)

For soil liners:

(7) Waste Migration Analysis (based on head, porosity, and permeability) for the most mobile and least attenuated constituents.
(8) Atterberg Limits, % passing a #200 sieve, and Permeability
(9) Moisture Content
(10) Standard Proctor Density, Compaction Data

For leachate detection, collection, and removal system:

(11) Capacity of system

(a) rate of leachate removal
(b) capacity of sumps
(c) thickness of mounding and maximum hydraulic head

(12) Pipe Material and Strength
(13) Pipe Network Spacing and Grading
(14) Collection Sump(s) Material and Strength
(15) Drainage Media Specifications and Performance
(16) Analysis showing that pipe and perforation size will prevent clogging and allow free liquid access to the pipe.
(17) Compatibility Demonstration

c. Containment/liner system installation date and expected lifetime of liner system (years).

d. Specify whether the containment/liner system is chemically resistant to the waste and how this resistance was determined. Attach any tests or documentation to the engineering report.

e. Submit a quality assurance/quality control plan for all components to demonstrate that all components will be properly installed and will perform to design specifications.

f. Submit a Response Action Plan that proposes actions to be taken if the Action Leakage Rate for the waste pile exceeds. At a minimum the Response Action Plan must include the requirements of 40 CFR 264.253.

7. Wind Dispersal [30 TAC 335.170(j)]

Waste piles containing hazardous waste which could be subject to dispersal by wind must be covered or otherwise managed so that wind dispersal is minimized. Describe practices to control wind dispersal (e.g., cover or frequent wetting) of the hazardous waste.

8. Run-on Diversion [30 TAC 335.170(g)]

Describe in detail the measures used to control and divert run-on from the unit. The owner or operator must design, construct, operate, and maintain a run-on control system capable of preventing flow onto the active portion of the pile during peak discharge from at least a 100-year, 24-hour storm.

Include all analyses used to calculate: flow rates; run-on volume and depth; and back-water calculations for the ditches on plant property.

Any tanks or basins associated with the run-on control systems must be emptied or otherwise managed expeditiously after a storm to maintain the design capacity of the system. [30 TAC 335.170(i)]

9. Run-off Control [30 TAC 335.170(h)]

Describe in detail the measures used to control run-off from the unit. Include all analyses used to calculate the run-off volumes.

The owner or operator must design, construct, operate, and maintain a run-off management system to collect and control at least the water volume resulting from a 100-year, 24-hour storm.

Collection and holding facilities (e.g., tanks or basins) associated with the run-off control systems must be emptied or otherwise managed expeditiously after storms to maintain the design capacity of the system. [30 TAC 335.170(i)]

10. Give a description of design and operating procedures to properly manage and/or dispose of any residuals (e.g., leachate) that may be generated during waste management. Describe the management process and any equipment used.

11. Provide a description and list of all equipment and procedures used to place the waste in or on the waste pile, and how the liner surface will be exposed for inspection, if necessary. A containment system must be protected from plant growth which could puncture any component of the system.

12. Exemption from Liner and Leachate Collection Requirements

    The Commission may approve an alternate design or operating practice for a waste pile if the owner or operator demonstrates that such design or operating practices, together with location characteristics [40 CFR 264.251(d)]:

    a. Will prevent the migration of hazardous constituents into the groundwater or surface water at least as effectively as the liners and leachate collection and removal system; and
    b. Will allow detection leaks of hazardous constituents through the top liner at least as effectively.

13. Exemption from Groundwater Monitoring under 40 CFR 264.250(c)

    A waste pile may be exempt from groundwater monitoring if the following standards are met:

    a. The waste pile (including its underlying liners) must be located entirely above the seasonal high water table; and
    b. The waste pile is inside or under a structure that provides protection from precipitation so that neither run-off nor leachate is generated, provided that:
        (1) Liquids or materials containing free liquids are not placed in the pile;
        (2) The waste pile is protected from surface water run-on by the structure or in some other manner;
        (3) The waste pile is designed and operated to control dispersal of the waste by wind, where necessary, by means other than wetting; and
        (4) The waste pile will not generate leachate through decomposition or other reactions; or
    c. The waste pile must have a leachate collection and removal system above the top liner; and
    d. Underlayment:
        (1) either:
            (a) The waste pile must be underlain by two liners, which are designed and constructed in a manner that prevents the migration of liquids into or out of the space between the liners and a leak detection system which must be designed, constructed, maintained, and operated between the liners to detect any migration of liquids into the space between the liners; and
            (b) A demonstration must be made that there is a low potential for migration of liquid from the waste pile to the uppermost aquifer during the life of the waste pile (including the closure period). The owner or operator must base any predictions made on assumptions that

maximize the rate of liquid migration;

(2) or:

(a) The waste pile must be underlain by a liner (base) that is designed, constructed, and installed in a manner that prevents the migration of liquids or waste beyond the liner; and

(b) The wastes in the waste pile must be removed periodically, and the liner must be inspected for deterioration, cracks, or other conditions that may result in leaks. The frequency of inspection will be specified in the inspection plan and must be based on the potential for the liner (base) to crack or otherwise deteriorate under the conditions of operation (e.g., waste type, rainfall, loading rates and subsurface stability).

The liner(s) used to satisfy V.D.13.d. must be of sufficient strength and thickness to prevent failure due to puncture, cracking, tearing, or other physical damage from equipment used to place waste in or on the pile or to clean and expose the liner surface for inspection.

Not Applicable

F. Land Treatment Units

Provide an engineering report which includes all of the information specified in 30 TAC 305.50(a)(6), 335.171, 335.172, 40 CFR 264.270-264.272, 264.273, 264.276, 264.278, 264.279, 264.281-264.283, and 270.20 for each land treatment unit.

For land treatment units at a new hazardous waste management facility or which are part of an areal expansion of an existing hazardous waste management facility, include in the engineering report design, construction, and operational information specified in 30 TAC 335.204(b).

For all land treatment units, include in the report the following information.

1. Complete Tables V.F.1 - Land Treatment Units and V.F.2 - Land Treatment Unit Capacity and list the land treatment units covered by this application. List the waste(s) managed in each unit and the rated capacity or size of the unit. If different wastes are placed on separate portions of the land treatment area, each portion is considered a land treatment unit, and requires a separate summary form and engineering report.

   The treatment zone is defined as the soil area of the unsaturated zone of a land treatment unit within which hazardous constituents are degraded, transformed, or immobilized. In this section, specify the depth of the treatment zone. The maximum depth of the treatment zone for new land treatment units must be [40 CFR 264.271(c)]:

   a. No more than 1.5 meters (5 feet) from the surface; and

   b. More than 1 meter (3 feet) above the seasonal high water table.

2. If a land treatment unit will manage ignitable or reactive waste, as indicated on Table V.F.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.281.

3. If a land treatment unit will manage incompatible waste, as indicated on Table V.F.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.282.

4. If a land treatment unit will manage F020, F021, F022, F023, F026 and F027 waste, as indicated on Table V.F.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.283.

5. Describe the land treatment unit. The report shall include all the information requested in this section including drawings. At a minimum, a plan view and cross-section of the unit should be included with the engineering report.

6. Complete Table V.F.3. - Land Treatment Principal Hazardous Constituents and list the wastes for which the treatment demonstration will be made and the principal hazardous constituents in each waste. Specify in the report the data sources to be used to make the demonstration such as laboratory data, field data, operating data, literature, or other.

7. Run-on Diversion

   Describe in detail the measures used to control run-on and divert run-on from the unit. Include all the analyses used to calculate the run-on volumes.

   The owner or operator must design, construct, operate, and maintain a run-on control system capable of preventing flow onto the active portion of the land treatment unit during peak discharge from a 100-year, 24-hour storm. [30 TAC 335.171(3)]

   Collection holding facilities (e.g., tanks or basins) associated with the run-on control system must be emptied or otherwise managed expeditiously after storms to maintain the design capacity of the system. [30 TAC 335.171(5)]

8. Run-off Control

   Describe in detail the measures used to control the run-off from the unit, and minimize hazardous constituents in the run-off, include all the analyses used to calculate the run-off volumes.

   The owner or operator must design, construct, operate and maintain a run-off management system to collect and control at least the water volume resulting from a 100-year, 24-hour storm. [30 TAC 335.171(4)]

   Collection and holding facilities (e.g., tanks or basins) associated with run-off control systems must be emptied or otherwise managed expeditiously after storms to maintain design capacity of the system. [30 TAC 335.171(5)]

9. Wind Dispersal

   The owner or operator of a land treatment unit containing hazardous waste which could be subject to dispersal by wind must cover or otherwise manage the land treatment unit so that wind dispersal is minimized. Describe practices to control wind dispersal (e.g., cover or frequent wetting) of the hazardous waste. [30 TAC 335.171(6)]

10. Treatment Demonstration

    A description of the treatment demonstration required under 40 CFR 264.272 and 270.20(a) shall be included with the engineering report. If the owner or operator intends to conduct field tests or laboratory analyses in order to make the

demonstration, he must obtain a treatment or disposal permit.

11. The owner or operator must establish an unsaturated zone monitoring program in accordance with 40 CFR 264.278 and a detailed monitoring program must be included in the application.

12. Food Chain Crops [40 CFR 264.276]

    Several conditions must be satisfied if food-chain crops are to be grown in or on the treatment zone. A demonstration must be prepared similar to the one described in the Treatment Demonstration and submitted at least 90 days prior to the planting of crops. The demonstration need not be submitted with this application. However, a description of the demonstration must be included as part of the engineering report. This demonstration may be combined with the Treatment Demonstration description, as some of the information required is identical.

    Not Applicable

G. Landfills

Provide an engineering report which includes all of the information specified in 30 TAC 305.50(a)(5), (6), (9), (10), and (12), 335.173, 40 CFR 264.19, 264.300, 264.301, 264.302, 264.303(a), 264.304, 264.309, 264.312, 264.313, 264.315-264.317, and applicable requirements of 270.21. The text of the report should be written to supplement engineering plans, specifications, and test results necessary to provide a detailed description of how the landfill will comply with these standards.

For landfills at a new hazardous waste management facility or which are part of an areal expansion of an existing hazardous waste management facility, include in the engineering report design, construction, and operational information specified in 30 TAC 335.204(e).

For all landfills, include in the report the following information.

1. Complete Table V.G.1 - Landfills and list the landfills (and number of cells, if applicable) covered by this application. List the waste(s) managed in each unit and the rated capacity or size of the unit. If wastes are segregated in some manner, list the cell number in which wastes are placed next to each waste type.

2. If a landfill will manage ignitable or reactive waste, as indicated on Table V.G.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.312.

3. If a landfill will manage incompatible waste, as indicated on Table V.G.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17 and 264.313.

4. If a landfill will manage F020, F021, F022, F023, F026, and F027 waste, as indicated on Table V.G.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.317.

5. Describe the landfill. A plan view and cross-section of the landfill should be included with the engineering report. As appropriate, detailed plan, elevation, cross-section of landfill containment facilities shall be included with the report.

6. Containment System

    We suggest that the applicant use available recognized guidance documents, such

as EPA publication 530-SW-85-014, which provide design guidance for liner systems. The applicant is strongly encouraged to test each synthetic liner after installation by an electrical leak location test, such as the electric field method described in EPA Technical Guidance Document EPA/600/R-93/182, Quality Assurance and Quality Control for Waste Containment Facilities, or an equivalent method, such as those found in ASTM publications, and approved by the Executive Director. Construction above the liner may not proceed until any detected leaks are sealed.

a. Complete Table V.G.3. - Landfill Liner System and specify the type of liner used for the landfill.

b. In the engineering report, describe the design, installation, construction, and operation of the liner and leachate collection system. The description must demonstrate that the liner system will prevent discharge to the land, groundwater, and surface water. The following analyses should be included as attachments to the engineering report (A QAPP should be included in the report to ensure that each analysis is performed appropriately):

For artificial liners:

(1) Seaming method
(2) Surface preparation method
(3) Tensile Strength
(4) Impact Resistance
(5) Compatibility Demonstration
(6) Foundation Design (including Settlement Potential, Bearing Capacity and Stability, and Potential for Bottom Heave Blow-out)

For soil liners:

(7) Waste Migration Analysis (based on head, porosity, and permeability) for the most mobile and least attenuated waste constituents
(8) Atterberg Limits, % passing a #200 sieve, and Permeability
(9) Moisture Content
(10) Standard Proctor Density, Compaction Data

For Leachate Collection System

For incorporation into the permit, complete Table V.G.4. - Landfill Leachate Collection System used for the landfill.

(11) Capacity of the system:
  (a) rate of leachate removal
  (b) capacity of sumps
  (c) thickness of mounding and maximum hydraulic head
(12) Pipe Material and Strength
(13) Pipe Network Spacing and Grading
(14) Collection Sump(s) Material and Strength
(15) Drainage Media Specifications and Performance
(16) Analyses showing that pipe and pipe perforation size will prevent clogging and allow free liquid access to the pipe.
(17) Compatibility Demonstration

c. State whether the liner system components are chemically resistant to the waste and how this resistance was determined. Attach any tests or documentation to the engineering report.

d. Provide a quality assurance/quality control plan for all components to demonstrate that all components will be properly installed and will perform to design specifications.
e. Whether the leachate collection components are chemically resistant to the waste and how this resistance was determined. Attach any tests or documentation to the engineering report.
f. Provide a Response Action Plan that proposes actions to be taken in the case of exceedance of the landfill Action Leakage Rate. At a minimum the Response Action Plan must include the requirements of 40 CFR 264.304.

7. For Dikes:
   a. Slope Stability Analysis;
   b. Hydrostatic and Hydrodynamic Analyses
   c. Ability to withstand scouring from leaking liner.

8. Landfills that receive waste on or after May 8, 1985 (or for newly-regulated units, the effective date of the new RCRA regulation) into new units and/or lateral expansions or replacements of existing units must meet the minimum technological requirements of the Hazardous and Solid Waste Amendments of 1984, unless an appropriate waiver is granted by the Commission. The owner or operator of each new landfill unit for which the construction commences after January 29, 1992, or each lateral expansion of an existing landfill unit where construction commences after July 29, 1992, or replacement of an existing landfill unit that commence reuse after July 29, 1992 must install two or more liners and leachate collection and removal system unless commission approves alternate design or operating practices. Plans and specifications for both new and existing landfills must demonstrate conformity with 30 TAC 335.173 and 40 CFR 264.301(c).

9. Site Development Plan

   Describe the methods used to deposit waste in the landfill. This description should include rate of waste deposition, waste segregation, average lift size, maximum lift, average cell or trench size, maximum cell or trench size, and other information necessary to depict how the landfill will be developed. Do not include liner or leachate collection system information, closure information, or handling of special wastes. This will be included elsewhere in the report.

10. Run-on Control [30 TAC 335.173(g)]

    The owner or operator must design, construct, operate, and maintain a run-on control system capable of preventing flow onto the active portion of the landfill during peak discharge from at least a 100-year, 24-hour storm.

    In the engineering report, include the following analyses:

    a. Run-on volume and depth calculations from the peak discharge of the 100-year, 24-hour storm; and
    b. For ditches on the plant property, back-water calculations.

    Collection and holding facilities (e.g., tanks or basins) associated with the run-on control system must be emptied or otherwise managed expeditiously. [30 TAC 335.173(i)]

11. Run-off Control [30 TAC 335.173(h)]

The owner or operator must design, construct, operate, and maintain a run-off management system to collect and control the water volume resulting from a 100-year, 24-hour storm.

Include all analyses used to calculate run-off volumes.

Collection and holding facilities (e.g., tanks or basins) associated with run-off control systems must be emptied or otherwise managed expeditiously after storms to maintain design capacity of the system. [30 TAC 335.173(i)]

12. Wind Dispersal [30 TAC 335.173(j)]

    If the landfill contains any particulate matter which may be subject to wind dispersal, the owner or operator must cover or otherwise manage the landfill to minimize wind dispersal. Based upon the characteristics of the material to be landfilled describe the likelihood of wind dispersal occurring. Describe in detail any method and/or control mechanism used to prevent wind dispersal.

13. Liquid Waste

    If liquid waste or waste containing free liquids is to be stabilized and then placed in the landfill, the procedures used to stabilize the waste must be described in the engineering report. The waste must be treated prior to landfilling using a treatment technology that does not solely involve the use of a material that functions primarily as a sorbent. Provide supporting documentation to verify that an appropriate stabilization procedure is used to comply with 30 TAC 335.175.

14. The Commission may approve an alternate design or operating practice for a landfill if the owner or operator demonstrates that such design or operating practices, together with location characteristics [40 CFR 264.301(d)]:
    a. Will prevent the migration of hazardous constituents into the groundwater or surface water at least as effectively as the liners and leachate collection and removal system; and
    b. Will allow detection leaks of hazardous constituents through the top liner at least as effectively.

15. Exemption from Double-Liner Requirements for Monofills [264.301(e)]

    Owners or operators of hazardous waste monofills will be exempted from the double-liner requirements if the Commission finds, based on a demonstration by the owner or operator, that alternative design and operating practices, together with location characteristics are at least as effective as a double liner in preventing migration of hazardous constituents to the groundwater or surface water. If an exemption is sought, submit detailed plans and engineering and hydrogeologic reports, as appropriate, describing alternate design and operating practices that will, in conjunction with location aspects, prevent the migration of any hazardous constituents into the groundwater or surface water at any future time.

16. Above-grade Benefits

    The engineering report must evaluate the benefits, if any, associated with the construction of the landfill above existing grade at the proposed site, the costs associated with the above-grade construction, and the potential adverse effects, if any, which would be associated with the above-grade construction. [TX. Health and Safety Code 361.108]

Not Applicable

H. Incinerators

As applicable, provide an engineering report which includes all of the information specified in 30 TAC 305.171-305.176, 40 CFR 264.340, 264.342-264.346, 264.347(a), and 270.19. In addition, the Executive Director may require additional information to address the requirements in 30 TAC 305.50(a)(15).

Note: Please review the information provided in the section above entitled "Engineering Report for Combustion Units" and 40 CFR 270.19(e) to determine applicability of standards and associated requirements in 40 CFR Part 264, Subpart O. If the permit contains risk-based permit conditions, please ensure that all applicable supporting information is included in the engineering report.

1. Complete Table V.H.1 - Incinerators and list the incinerators covered by this application and list the waste managed in each unit.
2. Complete Table V.H.2 - Incinerator Permit Conditions, Monitoring, and Automatic Waste Feed Cutoff Systems for each Incinerator.
3. Complete Table V.H.3 - Maximum Constituents Feed Rate for each Incinerator.
4. Complete Table V.H.4 - Maximum Allowable Emission Rates for each Incinerator.
5. For use during the shakedown period, the trial burn period and the period after completion of the initial trial burn, complete Table V.H.5 - Incinerator Permit Conditions, Monitoring, and Automatic Waste Feed Cutoff-Short-Term Operation for each new or modified Incinerator.
6. If an incinerator will manage reactive or incompatible waste, as indicated on Table V.H.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17.
7. If an incinerator will manage F020, F021, F022, F023, F026, and F027 waste, as indicated on Table V.H.1, the DRE requirement is 99.9999%.
8. If a trial burn for a modified unit and Comprehensive Performance Test under 40 CFR Part 63, Subpart EEE (HWC MACT) (for all new and modified units) will be performed, designate one or more of the 40 CFR 261 Appendix VIII organic compounds present in the wastes to be incinerated as Principal Organic Hazardous Constituents (POHCs). Selection will be based upon the degree of difficulty of incineration of these compounds and upon their concentration or mass in the waste feed. These POHCs will be used to determine the destruction and removal efficiency (DRE) specified in the performance standards of 40 CFR 264.343 and HWC MACT. In addition, complete Table V.H.8 - Principal Organic Hazardous Constituents.
9. Submit a Quality Control/Quality Assurance Plan for all sampling, analysis, and monitoring activities which will occur in conjunction with the trial burn.
10. As applicable, facilities with existing permits may request that the Executive Director to address permit conditions that minimize emissions from startup, shutdown, and malfunction events in accordance with the options under 40 CFR 270.235 when requesting the removal of permit conditions that are no longer applicable according to 30 TAC 305.175. Please provide the relevant information needed to process the requested option to minimize emissions identified in 40

CFR 270.235(1)(a)(i)-(iii). (30 TAC 305.176)

Not Applicable

I. Boilers and Industrial Furnaces

As applicable, provide an engineering report which includes all of the information specified in 30 TAC 305.50(a)(13), 305.571-573, 40 CFR 266.100 and 266.102 (as incorporated by reference in 30 TAC 335.221 through 335.225), 266.104-266.112, and 270.22. In addition, the Executive Director may require additional information to address the requirements in 30 TAC 305.50(a)(15).

Note: Please review the information provided in the section above entitled "Engineering Report for Combustion Units" and 40 CFR 270.22 to determine applicability of standards and associated requirements in 40 CFR Part 266, Subpart H. Area sources that elect to comply with the standards and associated requirements of 40 CFR 266.105, 266.106, and 266.107 should address those elected standards and requirements in the engineering report. If the permit contains risk-based permit conditions, please ensure that all applicable supporting information is included in the engineering report.

1. Complete Table V.I.1 - Boilers and Industrial Furnaces and list the boilers and/or industrial furnaces covered by this application to be permitted and list the waste managed in each unit.
2. Complete Table V.I.2 - Boiler and Industrial Furnace Permit Conditions, Monitoring, and Automatic Waste Feed Cutoff Systems for each unit.
3. Complete Table V.I.3 - Maximum Constituent Feed Rate for each unit.
4. Complete Table V.I.4 - Maximum Allowable Emission Rates for each unit.
5. For use during the shakedown period, trial burn period and the period after completion of the initial trial burn, complete Table V.I.5 - Boiler and Industrial Furnace Permit Conditions, Monitoring, and Automatic Waste Feed Cutoff Systems-Short-Term Operation for each new or modified unit.
6. If a boiler or industrial furnace will manage reactive or incompatible waste, as indicated on Table V.I.1, describe in the engineering report the procedures used to ensure compliance with 40 CFR 264.17.
7. If a boiler and industrial furnace will manage F020, F021, F022, F023, F026, and F027 waste, as indicated on Table V.I.1, the DRE requirement is 99.9999%.
8. If a trial burn for modified units and Comprehensive Performance Test under 40 CFR Part 63, Subpart EEE (HWC MACT) (for all new and modified units) will be performed, designate one or more of the 40 CFR 261 Appendix VIII organic compounds present in the wastes to be incinerated as Principal Organic Hazardous Constituents (POHCs). Selection will be based upon the degree of difficulty of incineration of these compounds and upon their concentration or mass in the waste feed. These POHCs will be used to determine the destruction and removal efficiency (DRE) specified in the performance standards of 40 CFR 266.104 and HWC MACT. In addition, complete Table V.I.8 - Principal Organic Hazardous Constituents.
9. Submit a Quality Control/Quality Assurance Plan for all sampling, analysis, and monitoring activities.
10. As applicable, facilities with existing permits may request that the Executive

Director to address permit conditions that minimize emissions from startup, shutdown, and malfunction events in accordance with the options under 40 CFR 270.235 when requesting the removal of permit conditions that are no longer applicable according to 30 TAC 305.571(b). Please provide the relevant information needed to process the requested option to minimize emissions identified in 40 CFR 270.235(1)(a)(i)-(iii). [30 TAC 305.572(a)(6)]

Not Applicable

J. Drip Pads

Provide an engineering report which includes all of the information specified in 40 CFR 264.570-573 and 270.26.

1. Complete Table V.J.1. - Drip Pads and list the drip pads, covered by this application, to be permitted. List the N.O.R. unit number, the waste managed in each unit, the rated capacity of each unit, and the overall dimensions of the unit (including perimeter curb or berm height) that will be in contact with the waste.
2. For either new drip pads[1] or existing drip pads for which the owner/operator elects to comply with the synthetic liner requirement of 40 CFR 264.573(b), please complete Table V.J.2. - Drip Pad Synthetic Liner System.
3. In the engineering report, describe the design, installation, construction, and operation of the liner and leakage collection system. The description must demonstrate that the liner system will prevent discharge to the land, groundwater, and surface water. The following analyses should be included as attachments to the engineering report (A QAPP should be included in the report to ensure that each analysis is performed appropriately):

For artificial liners:

a. Seaming method
b. Surface preparation method
c. Tensile Strength
d. Impact Resistance
e. Compatibility Demonstration
f. Foundation Design (including Settlement Potential, Bearing Capacity and Stability, and Potential for Bottom Heave Blow-out)

For Leakage Collection System

g. Capacity of the system:
    (1) rate of leachate removal
    (2) capacity of sumps
    (3) thickness of mounding and maximum hydraulic head
h. Pipe Material and Strength
i. Pipe Network Spacing and Grading

1 New drip pads are those drip pads constructed after 12/06/90 and which had no binding contract for construction. If electing to comply with 40 CFR 264.573(b), the requirement to install a leakage collection system of 40 CFR 264.573(b)(3) applies only to those drip pads constructed after 12/24/92 and which had no binding contract for construction.

j. Collection Sump(s) Material and Strength
k. Drainage Media Specifications and Performance
l. Analyses showing that pipe and pipe perforation size will prevent clogging and allow free liquid access to the pipe.

K. Miscellaneous Units

A miscellaneous unit is a unit other than a container, tank, incinerator, boiler, industrial furnace, landfill, surface impoundment, waste pile, underground injection well, land treatment area, drip pad, or unit eligible for an R, D & D permit that is used to process, store, or dispose of hazardous waste.

For each miscellaneous unit for which an operating permit is sought, provide an engineering report which includes all of the information specified in 40 CFR 264.600-264.602, and 270.23.

1. Complete Table V.K - Miscellaneous Units and list the miscellaneous units covered by this application. List the waste managed in each unit and the rated capacity or size of the unit. If the information requested is not applicable, an explanation must be submitted.
2. Provide any other information which is descriptive of the relationship between the miscellaneous unit and the environment. Application information may include design requirements of 30 TAC 305 and 335, 40 CFR Part 264 Subparts I through O, and Part 270 that are appropriate for the miscellaneous unit or portions of the unit being permitted.
3. For a unit which involves combustion, please provide emissions data or a trial burn plan. Tables V.H.1-5 for incinerators or Tables V.I.1-5 for boilers and industrial furnaces may be adapted as appropriate to provide operation, monitoring, and emission information for a miscellaneous combustion unit.

Not Applicable

L. Containment Buildings

Provide an engineering report which includes all of the information specified in 40 CFR 264.1100-1101(c)(3), and 264.1101(d)-(e).

Complete Table V.L. - Containment Buildings and list the containment buildings covered by this application to be permitted. List the N.O.R. unit number, whether the unit is for storage and/or processing, the waste or debris managed in each unit, the rated capacity of each unit, and the overall dimensions of the unit (including containment wall height) that will be in contact with the waste or debris.

Not Applicable

Table V.A. – Facility Waste Management Handling Units

TCEQ Permit Unit No.[1]	Unit Name	NOR No.[1]	Unit Description[3]	Capacity	Unit Status[2]
Not Applicable					

1. Permitted Unit No. and NOR No. cannot be reassigned to new units or used more than once and all units that were in the Attachment D of a previously issued permit must be listed.
2. Unit Status options: Active, Closed, Inactive (built but not managing waste), Proposed (not yet built), Never Built, Transferred, Post-Closure.
3. If a unit has been transferred, the applicant should indicate which facility/permit it has been transferred to in the Unit Description column of Table V.A.

Table V.B. – Container Storage Area

Permit Unit No.	Container Storage Area	N.O.R. No.	Waste Nos.[4]	Rated Capacity[3]	Dimensions	Containment Volume (including rainfall for unenclosed areas)	Unit will manage Ignitable[1], Reactive[1], or Incompatible[2] waste (state all that apply)
3	[Former] East Plant Turnaround Container Storage Area TCEQ Permit Unit No. 3 **(Unit certified closed)** **(Date of acceptance of Closure Certification Report by the TCEQ 10/21/2010)**	029	3	20 Roll-off boxes at 20 cubic yards each **(Unit no longer exists)**	Approximately 100 feet x 125 feet **(Unit no longer exists)**	400 cubic yards **(Unit no longer exists)**	Does not apply

1 Containers managing ignitable or reactive waste must be located at least 15 meters (50 feet) from the facility's property line.
2 Incompatible waste must be separated from other waste or materials stored nearby in other containers, piles, open tanks, or surface impoundments by means of a dike, berm, wall, or other device.
3 Container Storage Areas need to include in capacity calculations any nonhazardous wastes and universal wastes managed in the unit in addition to hazardous wastes.

4 from Table IV.B, first column

Table V.C. – Tanks and Tank System

Permit Unit No.	Tank	N.O.R. No.	Storage and/or Processing	Waste Nos.[1]	Rated Capacity	Dimensions	Containment Volume (including rainfall for unenclosed areas)	Unit will manage Ignitable, Reactive, or Incompatible Waste (state all that apply)
Not Applicable								

1 from Table IV.B, first column

Table V.D.1. – Surface Impoundments

Permit Unit No.	Surface Impoundment	N.O.R. No.	Waste Nos.[1]	Rated Capacity	Dimensions[2]	Distance from lowest liner to groundwater	Action Leakage Rate (if required)	Unit will manage Ignitable, Reactive, Incompatible, or F020, F021, F022, F023, F026, and F027 Waste (state all that apply)
1	SEHB (Currently in Post-Closure Care and is included in Compliance Plan)	017	N/A	740**	100 x 70' x 12'	24"	NOT REQUIRED	NONE APPLY
2	CAMU/ Former NHB	004	1, 2, 3, 4	50,000*	480' x 276' ~18' deep	10'	NOT REQUIRED	NONE APPLY

1from Table IV.B, first column
2Dimensions should be provided as average length, width and depth, also include the surface acreage for the unit.

*The Former North Holding Basin original design capacity was 88,000 cubic yards. After partial closure of the Former North Hold Basin and construction of the CAMU only 50,000 cubic yards of capacity was available for the CAMU

**The Southeast Holding Basin original design capacity was 3,111 cubic yards.

Table V.D.6. – Surface Impoundment Liner System

Surface Impoundment	Primary Liner			Secondary Liner			Clay Liner		
	Material	Permeability (cm/sec)	Thickness	Material	Permeability (cm/sec)	Thickness	Material	Permeability (cm/sec)	Thickness
SEHB (NOR 017) (Currently in Post-Closure Care and is included in Compliance Plan)	Limestone/ cement aggregate	Unknown	18”	Soil	3.7×10^{-4}	6”	N/A	N/A	N/A
CAMU/Former NHB (NOR 004)	Stabilized Sludge	0	6”	Clay/Soil	1×10^{-7}	3-6”	N/A	N/A	N/A

Table V.E.1. – Waste Piles

Permit Unit No.	Waste Pile	N.O.R. No.	Waste Nos.[1]	Rated Capacity	Dimensions[2]	Distance from lowest liner to groundwater	Action Leakage Rate (if required)	Unit will manage Ignitable, Reactive, Incompatible, or F020, F021, F022, F023, F026, and F027 Waste (state all that apply)
Not Applicable								

1from Table IV.B, first column
2Dimensions should be provided as average length, width and depth, also include the surface acreage for the unit.

Table V.E.3. – Waste Pile Liner System

Waste Pile	Primary Liner			Secondary Liner			Clay Liner		
	Material	Permeability (cm/sec)	Thickness	Material	Permeability (cm/sec)	Thickness	Material	Permeability (cm/sec)	Thickness
Not Applicable									

Table V.F.1. – Land Treatment Units

List the land treatment units covered by this application. List the waste managed in each unit and the rated capacity or size of the unit.

Permit Unit No.	Land Treatment Unit	N.O.R. No.	Waste Nos.[1,2]	Dimensions[3]	Distance from lowest liner to groundwater	Unit will manage Ignitable, Reactive, Incompatible, or F020, F021, F022, F023, F026, and F027 Waste (state all that apply)
Not Applicable						

1from Table IV.B, first column
2If cadmium is present in the waste, state the concentration in the report.
3Dimensions should be provided as average length, width and depth, also include the surface acreage for the unit.

Table V.F.2. – Land Treatment Unit Capacity

For the land treatment units listed in Table IV.F.1, specify the waste treatment capacity.

Permit Unit No.*	Land Treatment Unit	N.O.R. No.	Rated Capacity				Treatment Zone Depth
			Monthly Hydraulic Loading	Monthly Organic Loading	Monthly Inorganic Loading	Cumulative Lifetime Loading	
Not Applicable							

* This number should match the Permit Unit No. given on Table V.F.1.

Table V.F.3. – Land Treatment Principal Hazardous Constituents

List the wastes for which the demonstration will be made and the principal hazardous constituents in each waste. Indicate by an (*) asterisk which constituents will be treated and rendered nonhazardous.

Waste	Hazardous Constituents
Not Applicable	

Table V.G.1. – Landfills

Permit Unit No.	Landfill	N.O.R. No.	Waste Nos.[1]	Rated Capacity	Dimensions[2]	Distance from lowest liner to groundwater	Action Leakage Rate (if required)	Unit will manage Ignitable, Reactive, Incompatible, or F020, F021, F022, F023, F026, and F027 Waste (state all that apply)
Not Applicable								

1from Table IV.B, first column
2Dimensions should be provided as average length, width and depth, also include the surface acreage for the unit.

Table V.G.3. – Landfill Liner System

Permit Unit No.*	Landfill	Primary Liner			Secondary Liner			Clay Liner		
		Material	Permeability (cm/sec)	Thickness	Material	Permeability (cm/sec)	Thickness	Material	Permeability (cm/sec)	Thickness
Not Applicable										

* This number should match the Permit Unit No. given on Table V.G.1.

Table V.G.4. – Landfill Leachate Collection System

Landfill	Primary Leachate Collection System					Secondary Leachate Collection System				
	Drainage Media	Collection Pipes (including risers)	Filter Fabric	Geofabric	Sump Material	Drainage Media	Collection Pipes (including risers)	Filter Fabric	Geofabric	Sump Material
Not Applicable										

Table V.H.1. – Incinerators

List the incinerators covered by this application to be permitted. List the waste managed in each unit and the rated capacity or size of each unit.

Permit Unit No.*	Incinerators	N.O.R. No.	Waste Nos.[1]	Waste Physical Form (Pumpable or Non-pumpable	Reactive, Incompatible, or F020, F021, F022, F023, F026, or F027 Waste
Not Applicable					

1From the first column of Table IV.B.

* If the unit is already permitted, use the established "Permit Unit No." If the unit is not yet permitted, the number given here for the unit will become the "Permit Unit No." The numbers should be in an order that will be convenient for the facility operator.

Table V.H.2. – Incinerator Permit Conditions, Monitoring and Automatic Waste Feed Cutoff Systems

Not Applicable

Parameter	Monitoring Basis[1]	Monitoring Device	Device Location	Permit Limit	Primary Combustion Chamber AWFCO Y/N2	Secondary Combustion Chamber AWFCO Y/N[2]

Pressure drop across Baghouse *[or fabric filter]*				_____ in. W.C.		
[Wet Scrubbers:]						

Parameter	Monitoring Basis[1]	Monitoring Device	Device Location	Permit Limit	Primary Combustion Chamber AWFCO Y/N2	Secondary Combustion Chamber AWFCO Y/N[2]
Ionizing Wet Scrubber minimum voltage				_____ kilovolts (kV)		
Minimum liquid to flue gas ratio (L/G)				_____ gallons/1000 actual cubic feet (acf)		
Minimum scrubber blowdown				_____ gallons/min		
Minimum scrubber water pH				_____		
[Venturi Scrubbers:]						
Venturi scrubber minimum liquid to gas ratio (L/G)				_____ gallons/1000 actual cubic feet minute (acfm		
Minimum differential gas pressure across venturi scrubber				_____ in. W.C.		
[Dry Scrubbers:]						
Minimum alkaline reagent *[insert name of reagent here, such as lime]* flow to the dry scrubber				_____ pounds per minute		
Maximum flue gas flow rate				_____acfm		
[Absorbers:]						
Absorber minimum pH of incoming liquid				_____		
Absorber minimum liquid to gas ratio (L/G)				_____ gallons/1000 actual cubic feet (acf)		
Other Air Pollution Control Devices permit conditions as necessary						

1Instantaneous as defined in 40 CFR 266.102(e)(6)(i)(A) shall mean a value which occurs at any time. A value shall be determined by the monitoring device no less than every 15 seconds.

Continuous monitor is one which continuously samples or measures the regulated parameter without interruption, and evaluates the detector response at least once each 15 seconds, and computes and records the average value at least every 60 seconds.
Hourly Rolling Average (HRA) as defined in 40 CFR 266.102(e)(6)(i)(B).
- For carcinogenic metals and lead feed rates: Instantaneous as defined above or, rolling average as defined in 40 CFR 266.102(e)(6)(ii).
2AWFCO: Automatic Waste Feed Cutoff. For AWFCOs indicated by "Y", the Permit Limit in the table triggers an AWFCO.
3The respective specific gravity and constituent concentration of each stream associated with a volumetric rate must be known to determine the mass feed rate.

Table V.H.3. – Maximum Constituent Feed Rates

[Multi-chamber Incinerators (e.g., rotary kilns) may need feed rate limits to each combustion chamber.] The total feed rate of constituents to the incinerator(s) shall not exceed the following limitations in grams per hour (g/hr) or tons per year (T/yr), as noted. The metals limitations have been evaluated through the risk assessment. The ash and chlorine limits are based upon testing or regulatory limits.

Constituent	Maximum Allowable Feed Rate In All Feedstreams Hourly Basis (g/hr)	Maximum Allowable Feed Rate In All Hazardous Waste Feedstreams Hourly Basis (g/hr)[1]	Maximum Allowable Feed Rate in All Pumpable Hazardous Waste Feedstreams Hourly Basis (g/hr)[1]	Maximum Allowable Feed Rate in All Feedstreams Annual Basis (T/yr)
Not Applicable				
Arsenic				
Beryllium				
Cadmium				
Total Chromium				
Antimony				
Barium				
Lead				
Mercury				
Silver				
Thallium				
(Others as Necessary)				
Total Chlorine		Not applicable	Not applicable	Not applicable
Ash to Secondary Combustion Chamber or Other Primary Chamber if Only Pumpable Waste is Fed		Not applicable	Not applicable	Not applicable

1Not applicable for Tier I or Tier I adjusted metals feed rate screening limits.

[Hourly feed rate limits must comply with the requirements of 40 CFR 266.106 for carcinogenic metals and non-carcinogenic metals. As applicable, the feed rate limit for chromium may be specified as hexavalent and total chromium limits.]

Table V.H.4. – Maximum Allowable Emission Rates

[Use a table for each operating mode as applicable]

Carcinogenic Constituent (Compliance Tier)	Maximum Allowable Emission Rate[1]	Units[2]
Not Applicable		
Arsenic (Tier____)		g/hr
Beryllium (Tier____)		g/hr
Cadmium (Tier____)		g/hr
Chromium, Total (Tier____)		g/hr
Non-Carcinogenic Constituent(Compliance Tier)	Maximum Allowable Emission Rate1	Units2
Antimony (Tier____)		g/hr
Barium (Tier____)		g/hr
Lead (Tier____)		g/hr
Mercury (Tier____)		g/hr
Silver (Tier____)		g/hr
Thallium (Tier____)		g/hr
Hydrogen Chloride (Tier____)		g/hr
Free Chlorine (Tier____)		g/hr
Particulate Matter	0.08	Grains/dscf

1 Not applicable for Tier I or Tier I adjusted feed rate screening limits.
2g/hr denotes grams per hour. Grains/dscf denotes grains per dry standard cubic foot (standard conditions: 760 mm Hg, 68 °F) after correction to a stack gas concentration of 7% oxygen.

Note: Site-specific dispersion modeling factor x.xxx *[insert dispersion factor for Tier III as applicable]* micrograms per cubic meter per grams per second emission rate.

Table V.H.5. - Incinerator Permit Conditions, Monitoring and Automatic Waste Feed Cutoff Systems - Short-Term Operation

[Use this table for each new or modified Incinerator unit and fill in all columns with the appropriate information]

Other Air Pollution Control Devices permit conditions as necessary								

1 **(I)** *Instantaneous* as defined in 40 CFR 266.102(e)(6)(i)(A) shall mean a value which occurs at any time. A value shall be determined by the monitoring device no less than every 15 seconds.

(C) *Continuous monitor* is one which continuously samples or measures the regulated parameter without interruption, and evaluates the detector response at least once each 15 seconds, and computes and records the average value at least every 60 seconds.

(HRA) *Hourly Rolling Average* as defined in 40 CFR 266.102(e)(6)(i)(B).

- For carcinogenic metals and lead feed rates: *Instantaneous* as defined above or, *Rolling average* as defined in 40 CFR 266.102(e)(6)(ii).

2 **AWFCO**: *Automatic Waste Feed Cutoff*. For AWFCOs indicated by "Y", the Permit Limit in the table triggers an AWFCO. During the Trial Burn phase, AWFCOs will be as necessary to ensure protection of human health and the environment.

3 The respective specific gravity and constituent concentration of each stream associated with a volumetric rate must be known to determine the mass feed rate

.

Table V.I.8. - Principal Organic Hazardous Constituents

VI. Geology Report

This portion of the application applies to owners or operators of new hazardous waste management facilities; areal and/or capacity expansions of existing hazardous waste management facilities; and existing industrial solid waste facilities that store, process or dispose of hazardous waste in surface impoundments, landfills, land treatment units, waste piles (except those waste piles that meet the requirements of Section V.E.10.b. of this application), and tanks or drip pads which require a contingent post-closure plan.

For a new Compliance Plan or modification/amendment to an existing Compliance Plan of Section XI of this application, submit a Geology Report which contains updated site geologic information derived from on-going investigations since submittal of the last Permit modification/amendment application.

Submit a Geology Report which includes at a minimum the following information. This report and all specifications, details, calculations/estimates and each original sheet of plans, drawings, maps, cross-sections, other graphics, such as limits of contamination maps, etc. or any other geoscientific work must be signed and sealed by a Professional Geoscientist licensed in the State of Texas under the Professional Geoscientists Practice Act.

Attachment M – Geology Report for Galena Park Terminal

Affected Property Assessment Reports (APARs), not included in this Permit Renewal Application, can be referenced for the Galena Park Terminal SWMUs/AOCs areas listed in CP Table I.C.

A. Geology and Topography

1. Active Geologic Processes

   Provide a description and interpretation of the active geologic processes in the vicinity of the facility. This description should include:

   a. An identification of any faults (active or otherwise) in the area of the facility. The preparer should determine which Holocene sediments or man-made structures have been displaced. The report should contain a description of the investigation techniques used to identify faults and should assess the degree, if any, to which a particular fault increases the long-term potential for waste migration. The clearance required from active faults to ensure that liner systems will not be disrupted will be based upon site specific factors such as the zone of significant surface deformation, uncertainty in locating the fault, activity of the fault, and a distance to provide a reasonable margin of safety. These issues should be addressed when discussing the offset of an industrial solid waste facility unit from an active fault.

      To satisfy the requirements of 30 TAC 305.50(a)(4)(D) and 305.50(a)(10)(E), for a proposed hazardous waste management facility or a modification or amendment of a permit which includes a capacity expansion of an existing hazardous waste management facility, submit the following.

      (1) A geologic literature review should be conducted, from which useful information on the possibility of faulting at a given site may be revealed. This includes, but is not limited to, maps of surface faults, subsurface structure, and field investigations by the author(s).

(2) Descriptions and maps of faulting, fracturing, and lineations in the area are necessary. An aerial photo with lineation interpretations is suggested.

(3) The maps and cross-sections are to be constructed using an amount of data necessary to adequately describe the geology of the area. Surface data, including data regarding known surface expressions, such as surface faults, gas seeps, lineations, etc., should be accounted for in the subsurface interpretations. A surface structure map should be prepared, incorporating all of the subsurface data as well as known surface features.

(4) A minimum of two structural cross-sections, utilizing available oil field and/or water well electric log data, shall be made perpendicular to each other, crossing at the proposed surface unit location. These cross-sections should define geologic units, indicating especially Holocene sediments and Underground Sources of Drinking Water (USDWs), as well as lithology. The cross-sections should be constructed from the surface, down through the shallowest major structure or the base of the Holocene, whichever is deeper. These cross-sections need to be on a scale necessary to depict the local geology (3000' radius from the site location minimum). If needed to adequately describe the local geology, then a larger radius or deeper area of review may be necessary.

(5) A minimum of two structural subsurface maps need to be prepared. One map should be made on the shallowest mappable subsurface marker, the other on a deeper horizon that shows the underlying major structure. Additional maps may be necessary.

(6) Field surveillance will be necessary to check the area of the facility for surface features, such as lineations, and to investigate potential surface faults as indicated by, but not limited to, aerial photos, topographic maps, and seismic and subsurface structural maps.

(7) The above requirements do not limit the use of any additional information, such as seismic data, isopach maps, or potentiometric maps, that may help in defining the geology of the area of review.

(8) If faulting exists within 3000 feet of the surface unit, it must be demonstrated that the fault has not had displacement within Holocene time. If such a fault does exist, it cannot pass within 200 feet of the surface unit.

(9) If a fault that has been active within the Holocene is located within 3000 feet of the surface unit, it must be demonstrated that, a.) the fault is not transmissive, i.e., it will not provide for groundwater movement that would result in endangerment to human health or the environment, and b.) there is no actual and/or potential problem of subsidence, which could endanger the stability of the surface unit.

b. A discussion of the extent of land surface subsidence in the vicinity of the facility including total recorded subsidence and past and projected rates of subsidence. For facilities located at low elevations along the coast which have experienced appreciable rates of subsidence, the potential for future submergence beneath Gulf water should be addressed.

c. A discussion of the degree to which the facility is subject to erosion. The potential for erosion due to surface water processes such as overland flow, channeling, gullying, and fluvial processes such as meandering streams and undercut banks should be evaluated. If the facility is located in a low-lying coastal area, historical rates of shoreline erosion should also be provided.

d. Complete Table VI.A.1. – Major Geologic Formations.

2. Regional Physiography and Topography (applicable only to owners or operators of facilities that store, process, or dispose of hazardous waste in surface impoundments, landfills, land treatment units, waste piles, except waste piles exempt from groundwater monitoring requirements, and tanks which require a contingent post-closure plan)

a. Distance and direction to nearest surface water body

b. Slope of land surface

c. Direction of slope

d. Maximum elevation of facility

e. Minimum elevation of facility

3. Regional Geology (applicable only to owners or operators of facilities that store, process, or dispose of hazardous waste in surface impoundments, landfills, land treatment units, waste piles, except waste piles exempt from groundwater monitoring requirements, and tanks which require a contingent post-closure plan)

Provide a description of the regional geology of the area. This section should include:

a. A geologic map of the region with text describing the stratigraphic and lithologic properties of the map units. An appropriate section of a published map series such as the Geologic Atlas of Texas prepared by the Bureau of Economic Geology is acceptable.

b. A description of the generalized stratigraphic column in the facility area from the base of the lowermost aquifer capable of providing usable groundwater to the land surface. At least the uppermost 1,000 feet of section below the facility should be described. The geologic age, lithology, variation in lithology, thickness, depth, geometry, hydraulic conductivity, and depositional history of each geologic unit should be described based upon available geologic information. Regional stratigraphic cross sections should be provided, where available.

4. Subsurface Soils Investigation Report

This section should contain the results of an investigation of subsurface conditions for each land based unit and/or unit which requires contingent closure and post-closure care. If several units are in close proximity, a single investigation for the area will suffice. This report should include:

a. The logs of borings performed at the waste management area. All borings must be conducted in accordance with established field exploration methods. Investigation procedures should be discussed in the report. A sufficient number of borings should be performed to establish subsurface stratigraphy and to identify and allow assessment of potential pathways for pollution migration. Borings must be sufficiently deep to allow identification of the uppermost aquifer and underlying hydraulically interconnected aquifers.

Borings should penetrate through the uppermost aquifer and all deeper hydraulically interconnected aquifers, deep enough to identify the aquiclude at the lower boundary. Borings should be completed to a depth at least 30 feet below the deepest excavation planned at the waste management area. The required number of borings will increase or decrease depending on the heterogeneity of subsurface materials. Locations with stratigraphic complexities such as non-uniform beds which pinch out, vary significantly in thickness, coalesce, or grade into other units, will require a significantly greater degree of subsurface investigation than areas with simple hydrogeologic frameworks. Boring logs should include a detailed description of materials encountered including any discontinuities such as fractures, fissures, slickensides, lenses or seams. Whenever possible, electric logs should be run on each borehole. The hollow stem auger boring method is recommended in those instances where an accurate determination of initial water levels is important. A key explaining both the symbols used on the boring logs and the classification terminology for soil type, consistency, and structure should be provided.

b. Cross-sectional drawings prepared from the borings depicting the generalized soil strata profile at the site. For small waste management areas two cross sections prepared perpendicular to each other will normally suffice.

c. A text which describes the investigator's interpretations of the subsurface stratigraphy based upon the field investigation. If appropriate, soils may be assigned to generalized strata to aid in the discussion.

d. Complete Table VI.A.4. - Waste Management Area Subsurface Conditions and provide in the report data which describes the geotechnical properties of the subsurface soil materials. All laboratory and field tests must be performed in accordance with recognized procedures. A brief discussion of test procedures should be included. All major strata encountered during the field investigation phase should be characterized with regard to: Unified Soil Classification, moisture content, percent less than number 200 sieve, Atterberg limits (liquid limit, plastic limit, and plasticity index), and coefficient of permeability. Field permeability tests should be used to determine the coefficient of permeability of sand or silt units and should also be used to supplement laboratory tests for more clay-rich soils. In addition, particle size distribution and relative density based upon penetration resistance should be determined for coarse-grained soils. For fine-grained soils the following parameters should also be determined: cohesive shear strength based upon either penetrometer or unconfined compression tests, dry unit weight, and degree of saturation(s). For the major soil strata encountered, the maximum, minimum, and average for each of these variables should be compiled.

e. For land treatment units, provide a description of the surficial soils at the site which includes:

    (1) The name and description of the soil series at the site;
    (2) Important physical properties of the series such as depth, permeability, available water capacity, soil pH, and erosion factors;
    (3) Engineering properties and classifications such as USDA texture, Unified Soil Classification, size gradation, and Atterberg limits (liquid limit, plastic limit, and plasticity index); and

(4) The cation exchange capacity (CEC) of the soil(s) expressed in units of meq/100g.

Much of this information may be obtained by consulting the county soil survey published by the United States Department of Agriculture, Soil Conservation Service. If available, a copy of an aerial photograph showing soil series units on the land treatment area should be provided.

If an aerial photograph is not available, include a soil series map as an attachment to this subsurface soils investigation report.

B. Facility Groundwater

If past monitoring has shown the presence of hazardous constituents in the groundwater, the owner or operator must submit a Compliance Plan Application with this application. The Compliance Plan Application and instructions can be found in Section XI of this application form.

1. Regional Aquifers

Provide a description of the regional aquifers in the vicinity of the facility based upon available geologic references. The section should provide:

a. Aquifer names and their association with geologic units described in Section VI.A.3.b.;
b. A description of the constituent materials of the aquifer(s);
c. A description of the water-bearing and transmitting properties of the aquifer(s);
d. Whether the aquifers are under water table or artesian conditions;
e. Whether the aquifers are hydraulically connected;
f. A regional water table contour map or potentiometric surface map for each aquifer, if available, from published references;
g. An estimate of the rate of groundwater flow in units of ft/yr;
h. Values for total dissolved solids content of groundwater from the aquifers;
i. Identification of areas of recharge to the aquifers; and

Note: An application for a new hazardous waste surface impoundment, waste pile, land treatment unit, or landfill, which is to be located in the apparent recharge zone of a major or minor aquifer, as designated by the Texas Water Development Board, must include a hydrogeologic report documenting the potential effects, if any, on the regional aquifer in the event of a release from the waste containment system. See the publication entitled Water for Texas, Today and Tomorrow (1990) or subsequent revision (Available at http://www.twdb.texas.gov/waterplanning/swp/1990/index.asp) for more information [30 TAC 305.50(6)]

j. The present use of groundwater withdrawn from aquifers in the vicinity of the facility.

The preparer should update Section III.C.1.e. of the Part A permit application to ensure that all water wells within 1 mile of the property boundaries of the facility have been located. The aquifer(s) yielding water should be identified for each well.

2. Provide groundwater conditions for each land based unit or unit which requires post closure care which includes all the information specified in 30 TAC 335.156-335.167. This discussion should also include:

   a. Records of water level measurements in borings. The boring logs prepared in response to Section VI.A.4.a. should be annotated to note the level at which groundwater is first encountered and the level of groundwater after equilibration. Normally a 24-hour period is adequate for equilibration of groundwater but an extended period may be required for saturated clay deposits. This information should also be presented on the cross-sections required in Section VI.A.4.b. and recorded and retained in the facility groundwater monitoring record.

   b. Records of historical maximum and minimum static water level measurements in monitor wells. Historic water level measurements made during any previous groundwater monitoring should be presented in a table for each well.

   c. Upper and lower limits of the uppermost aquifer and deeper aquifers which are hydraulically interconnected to it beneath the facility boundary. In most cases this identification would include surface contour maps of the top and bottom surfaces. Indicate the typical depth at which groundwater is first encountered.

   d. A site specific water table contour map or potentiometric surface map for the uppermost aquifer, and the basis for such identification (the information obtained from hydrogeologic investigations of the facility area). The predicted groundwater flow direction and rate should be indicated.

   e. A discussion of the variation of hydraulic gradient across the site, including vertical gradient. Calculations for the maximum, minimum, and average groundwater flow velocities for each aquifer identified should also be provided, including pump test data where appropriate.

   f. An analysis of the most likely pathway(s) for pollutant migration in the event that the primary barrier liner system is penetrated.

3. Description of the Detection Monitoring Program

   The groundwater monitoring standards apply to owners and operators of facilities that treat, store, or dispose of hazardous waste in surface impoundments, waste piles, land treatment units, landfills, or tanks without satisfactory secondary containment for which a post-closure care plan or permit is required. If a waste management unit meets certain standards it may qualify for an exemption to the groundwater monitoring requirements. An exemption for a unit does not exempt an entire facility. (See the instructions for each type of unit for a specific exemption.) A facility-wide exemption is described in Section VI.C.

   Not Applicable

   It is important to note that even if the proposed program may use the same well system as the present program, the sampling parameters may be different.

   a. Include in the design report a description of the proposed detection monitoring program. This description should contain all requirements of 30

TAC 335.163-335.164.

b. Provide a justification for the selected suite of waste specific parameters specified in Table VI.B.3.c. - Groundwater Sample Analysis based on toxicity, mobility, persistence, and concentrations in light and dense non-aqueous phase components of the waste.

c. (Sampling and Analysis Plan) Describe the proposed sampling and analysis methods, as well as statistical comparison procedures to be utilized in evaluating groundwater monitoring data. Note: Methods listed for use in groundwater programs may provide flexibility allowing for updates of the base method. For methods other than the standard acceptable methods, applicant must provide a demonstration that the proposed methods are appropriate for groundwater analysis per 30 TAC 335.163(5).

d. Specify the statistical method and process for determining whether constituent concentrations in groundwater are above background, in accordance with 30 TAC 335.163. Refer to the EPA guidance document entitled Statistical Analysis of Ground-Water Monitoring Data at RCRA Facilities – Unified Guidance (March 2009) (document # EPA 530-F-09-020) for recommended methods.

   All data submitted to the TCEQ shall be in a manner consistent with the latest version of the "*Quality Assurance Project Plan for Environmental Monitoring and Measurement Activities Relating to the Resource Conservation Recovery Act and Underground Injection Control*" (TCEQ QAPP) which a can be found on the agency's website.

   Monitoring samples and measurements shall be taken at times and in a manner so as to be representative of the monitored activity. The method used to obtain a representative sample of the material to be analyzed shall be the appropriate method from ***Ground Water, Volume II: Methodology***, (document # EPA/625/6-90/016b) or an equivalent method approved by the Executive Director of the TCEQ. Laboratory methods shall be those specified in ***Test Methods for Evaluating Solid Waste: Physical/Chemical Methods, SW-846***, 1987, as revised; ***Standard Methods for the Examination of Water and Wastewater, Fifteenth Edition***, 1980, and 1981 supplement, or current adopted edition; ***RCRA Ground-Water Monitoring: Draft Technical Guidance***, 1992, ***OSWER Directive 9950.1***, or an equivalent method approved in writing prior to use by the Executive Director. [30 TAC Section 305.125(11)(A)]

e. For inclusion into a permit, complete Table VI.B.3.b. - Unit Groundwater Detection Monitoring System to specify the proposed well system for each unit or waste management area which requires groundwater monitoring.

f. For inclusion into a permit, complete Table VI.B.3.c to specify:
   (1) the suite of waste specific parameters (indicator parameters, waste constituents, or reaction products) which will be analyzed at each sampling event for each well or group of wells. These parameters must provide a reliable indication of the presence of hazardous constituents in the groundwater;
   (2) the sampling frequencies and calendar intervals (e.g., monthly; quarterly within the second 30 days of each quarter; semiannually within the first 30 days of the 2nd and 4th quarters, etc.);

(3) the analytical method and the laboratory predicted detection limit and predicted Practical Quantification Limit (PQL) of the sample preparation and analysis methods for the selected parameters. This detection limit will represent the capability of the sampling and analysis to reliably and accurately determine the presence of the selected parameters in the sample; and

(4) the concentration limit which will be the basis for determining whether a release has occurred from the waste management unit/area. Concentration limits shall be based on background values for the waste management unit/area, or PQL values developed through laboratory data obtained using practices consistent with the latest version of the TCEQ QAPP. If background values are lower than PQLs, the applicant may choose respective PQLs as concentration limits for hazardous constituents.

g. Submit drawings depicting the monitoring well design, current and proposed.

h. Submit at least one map of the entire facility and additional maps or drawings if necessary on one or more 8.5" x 11" sheets of sufficient scale to show the following in adequate detail:

(1) Monitoring well locations, current and proposed;
(2) Soil-pore liquid and core sampling points, current and proposed;
(3) Waste management unit(s)/area;
(4) Property boundary;
(5) Point of compliance;
(6) Direction of groundwater flow; and
(7) Extent of any known plume of contamination

i. For the description of site-specific groundwater for inclusion in permit summary documents, please complete the following brief description:

Groundwater is typically encountered approximately *[###]* feet below grade (*[###]* feet *[above/below]* Mean Sea Level) in the uppermost aquifer. The uppermost aquifer is part of the *[Name]* Formation and consists of *[brief lithological description]* ranging in thickness from *[### to ###]* feet. Groundwater flow is generally toward the *[north/east/south/west]*.

C. Exemption from Groundwater Monitoring for an Entire Facility

Not Applicable

In accordance with 30 TAC 335.156(b)(4), a waste management facility may be exempt from groundwater monitoring if the owner or operator can demonstrate that there is no potential for migration of liquid from any regulated unit to the uppermost aquifer during the active life of the regulated unit (including the closure period) and post-closure care period. This demonstration must be submitted with the permit application, and must be certified by a qualified geologist or geotechnical engineer.

This exemption does not apply to Unsaturated Zone Monitoring. Owners and operators of Land Treatment Units must monitor the unsaturated zone under all circumstances.

The following areas should be addressed in the demonstration, and any predictions must

be made on assumptions that maximize the rate of liquid migration:

1. Thickness of soil between the base of the unit and saturated zone;
2. Thickness of saturated zone;
3. Head pressure of the fluids;
4. Properties of the saturated and unsaturated zone (including permeability, effective porosity, and homogeneity), and
5. Total life of facility

The criteria used for the evaluation of this demonstration are more stringent than those used for evaluations of demonstrations submitted prior to permitting. Thus it is necessary for an owner or operator to submit another demonstration even if one was submitted and approved previously.

This type of exemption differs from the exemptions described in Sections V.D. (Surface Impoundments), V.E. (Waste Piles), and V.G. (Landfills). An owner or operator may pursue a facility-wide exemption as well as an exemption for a particular unit, if the owner or operator wishes.

D. Unsaturated Zone Monitoring

Not Applicable

This section applies only to facilities which contain land treatment units. Attach any previous monitoring data to the monitoring report. Provide any additional information necessary to demonstrate compliance with 40 CFR 264.278.

1. List all hazardous constituents that have been or will be monitored.
   a. Current parameters.
   b. Proposed parameters.
2. Number of soil-pore liquid sampling points.
   c. Depth of sampling points.
   d. Equipment used for soil pore liquid monitoring.
3. Number of soil core sampling points.
   e. Depth of soil core sampling points.
   f. Indicate on a facility map locations of all sampling points.

Table VI.A.1. – Major Geologic Formations

Names Of Major Geologic Formation(s) Beneath The Facility	Lithology Of The Major Geologic Formation	Formation Thickness (Feet)	Depth To Top Of Formation	
			Feet/MSL(1)	Feet/BGS(2)
Beaumont Formation	Poorly bedded, calcareous clay of various colors, containing thin, discontinuous stringers and lenses of silt and fine sand.	100	0-100	0-100
Montgomery Formation	Clay, silt, sand, and very minor amounts of gravel of granule to small pebble size	100	100-200	100-200
Bentley Formation	Clay, silt, sand, and very minor amounts of coarse gravel	100	200-300	200-300
Willis Formation	Clay, silt, sand, siliceous granule to pebble gravel	75	300-375	300-375
Goliad Formation	Clay, sandstone, marl, caliche, limestone, and conglomerate	100-500	375-975	375-975
Fleming Formation	Clay and Sandstone	1200	975-2175	975-2175

(1) MSL: Mean Sea Level
MLGL: Mean Low-tide Gulf Level
(2) BGS: Below Grade Surface

Table VI.A.4 – Waste Management Area Subsurface Conditions

Boring Number	Depth Below Grade	Stratum	USC Symbol	Liquid Limit	Plasticity Index	Percent Passing #200 Sieve	Permeability	Percent Porosity

Maximum depth: 64 feet below grade
49 feet above MSL

N/A – Data not available because geotechnical analysis for has not been collected.

*For the major soil strata encountered, record the minimum, maximum, and average values of these parameters as applicable.

Table VI.B.3.b. – Unit Groundwater Detection Monitoring Systems

Waste Management Unit/Area Name[1]	***Not Applicable***					
Well Number(s):						
Hydrogeologic Unit Monitored						
Type (e.g., point of compliance, background, observation, etc.)						
Up or Down Gradient						
Casing Diameter and Material						
Screen Diameter and Material						
Screen Slot Size (in.)						
Top of Casing Elevation (Ft, MLGL or MSL)						
Grade or Surface Elevation (Ft, MLGL or MSL)						
Well Depth (Ft, Below Grade Surface *[BGS]*)						
Well Depth (Ft, Below Top of Casing *[BTOC]*)						
Screen Interval From(Ft, BGS) To(Ft, BGS)						
Screen Interval From(Ft, BTOC) To(Ft, BTOC)						
Facility Coordinates (e.g., lat./long. or company coordinates)						

1From Tables in Section V.

MSL: Mean Sea Level; *MLGL*: Mean Low-tide Gulf Level; *BGS*: Below Grade Surface; *BTOC*: Below Top of Casing

Table VI.B.3.c. – Groundwater Detection Monitoring Parameters

Unit/Waste Management Area:

Well No(s):

Parameter	Sampling Frequency	Analytical Method	Method Detection Limit (MDL) or Method Quantification Limit (MQL) Value, (units), MDL or MQL[2]	Concentration Limit[1]
Not Applicable				

1 The concentration limit is the basis for determining whether a release has occurred from the waste management unit/area.

2 a. Enter the laboratory expected *Method Detection Limit* if determination of *Statistically Significant Increase* (SSI) occurrence is based on detection of the presence of the constituent of concern in the sample.

2 b. Enter the laboratory expected Method Quantification Limit if determination of SSI is based on statistical analysis of detection monitoring data or direct comparison to a limit value.

This should be based on the laboratory's minimum expected level of performance. Please designate which type of limit has been entered for each constituent, with its value and units.

VII. Closure and Post-Closure Plans

Submit a full closure plan and post-closure plan, if applicable, which contains all the information required by 30 TAC 335.8, 335.169, 335.172, 335.174, 335.177, 335.178, 335.551-335.569, 30 TAC Chapter 350, 40 CFR 264.112, 264.118, 264.178, 264.197, 264.228, 264.258, 264.280, 264.310, 264.351, 264.575, 264.601, 264.603, 264.1102, 270.14(b)(13), 270.17(f), 270.18(h), 270.20(f), 270.21(e), 270.23(a)(2) & (3), and 270.26(c)(16) where applicable. The owner of property on which an existing disposal facility is located must also submit documentation that a notation has been placed in the deed to the facility that will in perpetuity notify any potential purchasers of the property that the land has been used to manage hazardous wastes and its use is restricted (see 30 TAC 335.5). For hazardous waste disposal units that were closed before submission of the application, the applicant should submit documentation to show that plats and notices required under 40 CFR 264.116 and 264.119 have been filed.

Attachment K – Closure Plan for CAMU/Former NHB (NOR 004)

Attachment L – Certification of Closure for the SEHB (NOR 017)

A. Closure

This section applies to the owners and operators of all hazardous waste management facilities to be permitted. The applicant must close the facility in a manner that minimizes need for further maintenance and controls, or eliminates, to the extent necessary to protect human health and the environment, the post-closure release of hazardous waste, hazardous constituents, leachate, contaminated rainfall, or waste decomposition products to the groundwater, surface waters, or to the atmosphere.

The facility type and type of unit to be closed can determine the level of detail sufficient for a closure plan.

For each unit to be permitted, complete Table VII.A. - Unit Closure and list the facility components to be decontaminated, possible methods of decontamination, and possible methods of disposal of wastes and waste residues generated during unit closure. All ancillary components must be included in calculating closure cost estimates.

Additionally, if the applicant plans to close a surface impoundment in accordance with 30 TAC 335.169(a)(1) and the impoundment does not comply with the liner requirements of 30 TAC Section 335.168(a) then the closure plan for the impoundment must include both a plan for complying with 30 TAC 335.169(a)(1) and a contingent plan for complying with 30 TAC 335.169(a)(2).

Guidance on design of a closure cap and final cover for landfills is given in TCEQ Technical Guideline No. 3, and EPA publication 530-SW-85-014 presents guidance on construction quality assurance of liner construction.

If a waste pile does not comply with the liner requirements of 30 TAC Section 335.170(a)(1) then the closure plan for the waste pile must include both a plan for complying with 40 CFR 264.258(a) and a contingent plan for complying with 40 CFR 264.258(b).

The final certification of closure of a land treatment unit may be prepared by an independent licensed Professional Geoscientist in lieu of an independent licensed Professional Engineer. [30 TAC 335.172(b)]

B. Closure Cost Estimate (including contingent closure) [30 TAC 335.178, 40 CFR 264.142]

This section applies to owners or operators of all hazardous waste facilities, except state and federal agencies. A detailed estimate, in current dollars, of the cost of closing the facility should be included in the report. The cost estimate must include the cost of closure at the point in the facilities operating life when the extent and manner of its operation would make closure the most expensive. The TCEQ has published Technical Guideline No. 10, Closure and Post-Closure Cost Estimates, for calculating closure costs which should be consulted. Closure costs should be developed on the basis of abandonment of the site at full capacity and closure activities to be conducted by a third party with no operable on-site equipment. The costs for closing each unit must be detailed.

1. If closure costs are based on contractor bids, the applicant should submit a copy of the bid specification and each contractor's response.

2. If closure costs are based on a detailed analysis, the applicant should submit details of item costs and number of each item, and details of costs for equipment rental, third party labor and supervision, transportation, analytical costs, etc. Provide an itemized cost on Table VII.B. - Unit Closure Cost Estimate for a complete, third party permitted facility closure.

   As units are added or deleted from these tables through future permit amendments or modifications, the remaining itemized unit costs should be updated for inflation when re-calculating the revised total cost in current dollars.

3. The closure plan may propose on-site disposal of wastes, residues, etc. during closure of a unit, and this may be executed if on-site capacity exists in other units during closure of a unit. However, the cost estimate for closure must be based on off-site shipment and disposal during closure of all wastes, waste residues, wastes generated by decontamination, contaminated stormwater, and leachate.

4. For each surface impoundment, waste pile, or tank system required to have a contingent closure plan, the cost for closure under the contingent closure plan should be detailed, as well as the cost of proposed closure. The more expensive of the cost of the proposed closure of a unit versus the cost of the contingent closure of the unit should be used in the total facility closure cost estimate.

C. Post-closure

This section applies to owners or operators of all hazardous waste disposal facilities. This section also applies to certain waste piles, tanks and surface impoundments from which the owner or operator intends to remove wastes at closure but which are required to have contingent post-closure plans.

Post-closure care of each hazardous waste management unit must continue for 30 years after the date of completing closure of the unit and must consist of monitoring and reporting of the groundwater monitoring systems in addition to the maintenance and monitoring of waste containment systems. Continuation of certain security requirements may be necessary after the date of closure. Post-closure use of property on or in which hazardous waste remains after closure must never be allowed to disrupt the integrity of the containment system. In addition, submit the following information.

1. The post-closure care plan for a landfill or of a surface impoundment, waste pile, miscellaneous unit, or tank system closed with wastes or waste constituents left

in place, or closed under a contingent closure plan, must demonstrate compliance with 30 TAC 335.174(b).

2. The name, address, and phone number of the person or office to contact about the disposal facility during the post-closure period; and

3. A discussion of the future use of the land associated with each unit.

4. For landfills, surface impoundments, waste piles, and land treatment areas closed under interim status, submit the required documentation of 40 CFR 270.14(b)(14).

5. Landfills, surface impoundments, waste piles and land treatment areas that received hazardous wastes after July 26, 1982 or for which closure was certified after January 26, 1983 must be included in post-closure care plans unless they have been determined to have closed by removal equivalent to the closure standards in 40 CFR 264 Subpart G. If such a demonstration has been made pursuant to 40 CFR 270.1(c)(5), but an equivalency determination has not been made, please submit a copy of the demonstration documentation. If an equivalency determination has been made pursuant to 40 CFR 270.1(c)(6), applicant should submit a copy of the determination. Complete Table VII.C.5. - Land-Based Units Closed Under Interim Status for all land based units closed under interim status.

D. Post-closure Cost Estimate [40 CFR 264.144]

This section regarding post-closure cost estimate applies to owners or operators of all hazardous waste disposal facilities, except state and federal agencies, and certain waste piles, tank systems, and surface impoundments from which the owner or operator intends to remove wastes at closure, but which are required to have contingent closure and post-closure plans. A detailed estimate, in current dollars, of the annual cost of monitoring and maintenance of the facility in accordance with the applicable post-closure regulations must be included in the report. The TCEQ has published Technical Guideline No. 10 for calculating post-closure costs, which should be consulted. Costs should be developed in detail for 30 years of post-closure care activities to be conducted by a third party, for each applicable unit.

1. The applicant should submit details of item costs and number of each item for off-site disposal of leachate and bailed monitor well water, labor and supervision, monitor well sampling and analyses, inspection and repair of the cap(s), mowing and re-seeding of the vegetative cover, maintaining site security, etc. Provide an itemized cost estimate on Table VII.D. - Unit Post-Closure Cost Estimate for complete, third party permitted facility post-closure care.

2. As units are added or deleted from these tables through future permit amendments or modifications, the remaining itemized unit costs should be updated for inflation when re-calculating the revised total cost in current dollars.

3. Total annual cost of post-closure care for the facility including costs of contingent post-closure care should be multiplied by 30 years.

E. Closure and Post-Closure Cost Summary

Please complete Table VII.E.1 - Permitted Unit Closure Cost Summary.

Please complete Table VII.E.2 - Permitted Unit Post-Closure Cost Summary.

Table VII.A. - Unit Closure

For each unit to be permitted, list the facility components to be decontaminated, the possible methods of decontamination, and the possible methods of disposal of wastes and waste residues generated during unit closure:

Equipment or HWM Unit	Possible Methods of Decontamination[1]	Possible Methods of Disposal[1]
Ancillary Equipment	Triple rinse and sample the final rinsate. Sample will be compared to potable water and will be analyzed for TOC (EPA 9060). Decontamination will be complete when TOC levels in rinsate are less than or equal to TOC levels in potable water.	Equipment determined not to be decontaminated will be placed into the impoundment after stabilization of the sludges for final disposal.
Piping: All piping leading into or out of the NHB will be severed at its point of entry. The piping will be blinded on each side of the cut.	Triple rinse and sample the final rinsate. Sample will be compared to potable water and will be analyzed for TOC (EPA 9060). Decontamination will be complete when TOC levels in rinsate are less than or equal to TOC levels in potable water.	Equipment determined not to be decontaminated will be placed into the impoundment after stabilization of the sludges for final disposal.

1Applicants may list more than one appropriate method.

Table VII.B. - Unit Closure Cost Estimate

Task	Cost
CAMU/Former NHB (NOR 004)	
1. De-watering to GCWDA	
Disposal:4 million gallons @ $0.02/ 1 gallon	$200,000
Pumping:4 million gallons @ $10.10/1,000 gallons	$40,400
2. Contractor Mobilization – 1 Each @ $23,000	$23,000
3. Grading and Slope Prep – 3.1 acres x $7,700/acre	$23,870
4. Stabilization material for sludge – 1,700 cy x $18.50/cy	$31,450
5. Earthwork for sludge stabilization – 6,700 cy x $12.50/cy	$87,750
6. Intermediate cover (fill) – 2,800 cy x $27.00/cy	$75,600
7. Compacted Clay Cover – 15,000 cy x $31.00/cy	$465,000
8. Drainage Sand Layer – 5,000 cy x $18.50/cy	$92,500
9. Topsoil – 5,000 cy x $17.50/cy	$87,500
10. Drainage Piping – 2,000 x $23/ft.	$46,000
11. Hydromulch (seeding) – 135,000 sf x $0.10/sf	$13,500
12. Other Tasks (engineering, soil QA/QC testing, plat survey, PE certification, certification report	$50,000
subtotal	**$1,236,570**
Contingency (10% minimum)	**$123,657**
Total Unit Closure Cost	**$1,360,227 (2023)**
Reserved	
Total Permitted Facility Closure Cost *(all unit costs combined)*	**$1,360,227 (2023)**

Table VII.C.5. - Land-Based Units Closed Under Interim Status

N.O.R. Unit #	Unit Description[1,2]	Date of Receipt of Last Waste[3]	Date of Closure Certification[3]
Reserved			

1Indicates a unit for which a 40 CFR 264 closure equivalency determination has been requested pursuant to 40 CFR 270.1(c)(5).
2Indicates a unit for which a 40 CFR 264 closure equivalency determination has been made pursuant to 40 CFR 270.1(c)(6).
3Enter month, day, and year.

Table VII.D. - Unit Post-Closure Cost Estimate

Task	Cost
CAMU/Former NHB (NOR 004)	
Inspections – semiannually (4 hrs/event x $85/hr)	$680
Maintenance – labor: semiannually (8 hrs/event x 85/hr)	$1,360
materials: semiannually $1,500/event	$3,000
Groundwater Sampling (assuming 15 wells semiannually)	$7,500
Laboratory Analytical Fees (assuming 15 wells and 3 QA/QC samples semiannually)	4,000
Annual Reporting	$4,500
Administration of Post Closure (20%)	$4,208
subtotal	**$25,248**
Contingency (10% minimum)	**$2,525**
Total Unit Post-Closure Care Cost (x 30 yrs.)	**$833,190 (2023)**
Southeast Holding Basin (NOR 017)	
Inspection – semiannually (8 hrs/event x $85/hr)	$1,360
Maintenance – labor: semiannually (16 hrs/event x 85/hr)	$2,720
materials: semiannually $2,000/event	$4,000
Groundwater Sampling (assuming 32 wells semiannually)	$12,000
Laboratory Analytical Fees (assuming 32 wells and 3 QA/QC samples semiannually)	$35,000
Annual Reporting	$5,000
Administration of Post Closure (20%)	$12,016
Subtotal	**$72,096**
Contingency (10% minimum)	**$7,210**
Total Unit Post-Closure Care Cost (x 10 yrs.)	**$793,060 (2023)**

Total Permitted Facility Post-Closure Cost *(all unit costs combined)*	**$1,626,250 (2023)**

VIII. Financial Assurance

A. Financial Assurance Information Requirements for all Applicants (30 TAC Chapter 37, Subchapter P, 305.50(a)(4)(A-E), 335.152(a)(6) and 335.179)

1. Financial Assurance for Closure

   An owner or operator must establish financial assurance for the closure of the facility no later than 60 days prior to the first receipt of waste [30 TAC Section 37.31(a)]. Please refer to 30 TAC Chapter 37, Subchapter P, for the financial assurance requirements for closure and provide a signed statement from an authorized signatory per 30 TAC 305.44 regarding how the owner or operator will comply with this provision.

   If a financial mechanism has been obtained, provide a copy of the mechanism.

   For applications involving a permit transfer, the new owner or operator must provide a financial assurance mechanism (in original form) satisfactory to the TCEQ executive director. Prior to the executive director issuing the permit modification transferring the permit, the new owner or operator must provide proof of financial assurance in compliance with 30 TAC Section 305.64 (g) and Chapter 37, Subchapter P.

   See Attachment N – Financial Assurance

2. Financial Assurance for Post-Closure Care (applicable to disposal facilities and contingent post-closure care facilities only)

   An owner or operator subject to post-closure monitoring or maintenance requirements must establish financial assurance for the post-closure care of the facility no later than 60 days prior to the first receipt of waste [30 TAC Section 37.31(a)]. Please refer to 30 TAC Chapter 37, Subchapter P for the financial assurance requirements for post-closure and provide a signed statement from an authorized signatory per 30 TAC 305.44 regarding how the owner or operator will comply with this provision.

   If a financial mechanism has been obtained, provide a copy of the mechanism.

   For applications involving a permit transfer, the new owner or operator must provide a financial assurance mechanism (in original form) satisfactory to the TCEQ executive director. Prior to the executive director issuing the permit modification transferring the permit, the new owner or operator must provide proof of financial assurance in compliance with 30 TAC Section 305.64 (g) and Chapter 37, Subchapter P.

   See Attachment N – Financial Assurance

3. Financial Assurance for Corrective Action

   An owner or operator must establish financial assurance for corrective action of the facility no later than 60 days after the permit or order requiring the corrective action financial assurance is signed by the executive director or commission [30 TAC Section 37.31(b)]. Please refer to 30 TAC Chapter 37, Subchapter P, for the financial assurance requirements for closure and provide a signed statement from an authorized signatory per 30 TAC 305.44 regarding how the owner or

operator will comply with this provision and indicate below the type of financial assurance mechanism to cover corrective action for the facility.

If a financial mechanism has been obtained, provide a copy of the mechanism.

For applications involving permit transfers, the new owner or operator must provide a financial assurance mechanism (in original form) satisfactory to the TCEQ executive director. Prior to the executive director issuing the permit modification transferring the permit, the new owner or operator must provide proof of financial assurance in compliance with 30 TAC Section 305.64 (g) and Chapter 37, Subchapter P.

See Attachment N – Financial Assurances

4. Liability Requirements (not required for post-closure care)

All owners or operators must establish financial assurance for third party sudden liability coverage of the facility no later than 60 days prior to the first receipt of waste [30 TAC Section 37.31(a)]. Owners or operators of disposal facilities must establish financial assurance for third party sudden and nonsudden liability coverage of the facility no later than 60 days prior to the first receipt of hazardous waste. Please refer to 30 TAC Chapter 37, Subchapter P, for the financial assurance requirements for liability coverage, and provide a signed statement from an authorized signatory per 30 TAC 305.44 regarding how the owner or operator will comply with this provision.

If a financial mechanism has been obtained, provide a copy of the mechanism.

For applications involving a permit transfer, the new owner or operator must provide a financial assurance mechanism (in original form) satisfactory to the TCEQ executive director. Prior to the executive director issuing the permit modification transferring the permit, the new owner or operator must provide proof of financial assurance in compliance with 30 TAC Section 305.64 (g) and Chapter 37, Subchapter P.

See Attachment N – Financial Assurances

B. Applicant Financial Disclosure Statements for a new permit, permit amendment, or permit modification, or permit renewal (30 TAC 305.50(a)(4))

Refer to the Supplemental Technical Information Guidance for Applicants Subject to Financial Capability Requirements, included in Section VIII.B., and the requirements listed below as you complete this section.

1. Provide information required in 30 TAC 305.50(a)(4), as applicable to the application request.
2. Complete Table VIII.B. if requesting capacity expansion or new construction.
3. For new commercial hazardous waste management facility applications, a written statement signed by an authorized signatory per 30 TAC 305.44 explaining how the applicant intends to provide emergency response financial assurance per 30 TAC 305.50(a)(12)(C) or (D).
4. For renewal applications with no capacity expansion, please complete and submit the attached Financial Disclosure Letter.

See Attachment N – Financial Assurances

Information for Applicants Subject to Financial Capability Requirements

Certain applications involving Hazardous Waste facilities are subject to review of the applicant's financial ability to construct, operate, and/or close the facility, perform post-closure care and corrective action at the facility in accordance with State law as specified in Section 361.085 of the Texas Health and Safety Code. TCEQ refers to these reviews as financial capability reviews. This document summarizes and clarifies the information required in an application to meet the TCEQ requirements of 30 Texas Administrative Code (TAC) 305.50.

Information requirements vary depending on the type of financial information available to applicants, primarily whether audited financial statements are available as well as the type of application submitted. For each scenario described below, financial information must be provided for the specific applicant.

I. New Facilities, Facility Expansions and Permit Transfers

A. Publicly traded Entities

1. Securities and Exchange Commission (SEC) Form 10-Ks

   This portion of the requirement calls for the two most recent 10-K reports filed.

2. SEC Form 10-Q

   This portion of the requirement calls for a copy of the most recent quarterly report.

3. Explanation statement

   This portion of the requirement calls for a statement signed by an authorized signatory [as described in 30 TAC 305.44(a)] explaining in detail how the applicant demonstrates sufficient financial resources to construct, safely operate, properly close, perform post-closure care, perform corrective action and provide adequate liability coverage for the facility. This statement must also address how the closure, post-closure, corrective action, and liability coverage financial assurance requirements of Chapter 37, Subchapter P will be met. (ie. which financial assurance mechanism is or will be used).

4. Construction capital cost estimates

   This portion of the requirement calls for estimates of capital costs for expansion and/or initial construction if the application encompasses facility expansion, capacity expansion, or new construction.

B. Privately held entities with audited financial statements

1. Audited financial statements

   This portion of the requirement calls for complete copies of the audited financial statements for each of the most recent two fiscal years. If an audit has not been completed for one of the previous two years, a complete copy of the fiscal year end financial statement and federal tax return may be substituted in lieu of the audit not performed. The tax return must be certified by original signature of an authorized signatory as being a "true and correct copy of the return filed with the Internal Revenue Service." Financial statements must be prepared consistent with generally accepted accounting principles and include a balance sheet, income statement, cash flow statement, notes to the financial statement, and an accountant's opinion letter.

2. Quarterly financial statement

   This portion of the requirement calls for a complete copy of the most current quarterly financial statement prepared consistent with generally accepted accounting principles. Internally prepared statements are satisfactory.

3. Supplementary information statement

   This portion of the requirement calls for a written statement detailing the information that would normally be found in SEC's Form 10-K including descriptions of the business and its operations; identification of any affiliated relationships; credit agreements and terms; any legal proceedings involving the applicant; contingent liabilities; and significant accounting policies.

4. Construction capital cost estimates

   This portion of the requirement calls for estimates of capital costs for expansion and/or initial construction if the application encompasses facility expansion, capacity expansion, or new construction.

5. Explanation statement

   This portion of the requirement calls for a statement signed by an authorized signatory [as described in 30 TAC 305.44(a)] explaining in detail how the applicant demonstrates sufficient financial resources to construct, safely operate, properly close, perform post-closure care, perform corrective action and provide adequate liability coverage for the facility. This statement must also address how the closure, post-closure, corrective action, and liability coverage financial assurance requirements of Chapter 37, Subchapter P will be met (ie. which financial assurance mechanism is or will be used).

C. Entities without audited financial statements or entities choosing not to provide the information listed above

1. Financial Plan

   This portion of the requirement calls for a financial plan (including balance sheets listing assets, liabilities and capital accounts) sufficiently detailed to clearly demonstrate that the applicant will be in a position to readily secure financing for construction, operation, and closure, post-closure, and corrective action if the permit is issued. At least 3 balance sheets should be included as of: a) approximately the date of the permit application, b) 12 months after any construction is completed (or assumption of operational control for a permit transfer), and c) 24 months after any construction is completed (or assumption of operational control for a permit transfer).

2. Letters of opinion

   The submitted financial plan must be accompanied by original letters of opinion from two financial experts, not otherwise employed by the applicant, who have the demonstrated ability to either finance the facility or place the required financing. If the permit action sought involves construction of a new facility or expansion of an existing facility, the opinion letters must certify that financing is obtainable within 180 days of permit approval and include the time schedule contingent upon permit finality for securing the financing as well as certify the financial plan is reasonable. Even if the application does not involve a facility or capacity expansion, the opinion letters must certify that the financial plan is reasonable. Only one opinion letter from a financial expert, not otherwise

employed by the applicant, is required if the letter renders a firm commitment to provide all the necessary financing.

Letters of opinion are usually issued by investment or commercial bankers but there could be additional sources. Applicants are encouraged to verify the adequacy of the credentials of their chosen financial expert with TCEQ's financial assurance unit prior to a formal engagement. Financial experts should describe their qualifications and disclose their independence from the applicant and/or any entity or person affiliated with the applicant.

3. Operating and cash flow statement

   This portion of the requirement calls for a written detail of the annual operating costs of the facility and a projected cash flow statement including the period of construction and first two years of operation. The cash flow statement must demonstrate the financial resources to meet operating costs, debt service, and provide financial assurance for closure, post-closure care, and liability coverage requirements. A list of the assumptions made to forecast cash flow must also be provided.

4. Explanation statement

   This portion of the requirement calls for a statement addressing how the closure, post-closure, corrective action, and liability coverage financial assurance requirements of Chapter 37, Subchapter P will be met (ie. which financial assurance mechanism is or will be used).

5. Construction capital cost estimates

   This portion of the requirement calls for estimates of capital costs for expansion and/or initial construction if the application encompasses facility expansion, capacity expansion, or new construction.

D. Entities with a resolution from a governing body approving or agreeing to approve the issuance of bonds to satisfy financial assurance requirements (e.g. a city or county)

1. Explanation statement

   This portion of the requirement calls for a statement signed by an authorized signatory [as described in 30 TAC30 305.44(a)] explaining in detail how the applicant demonstrates sufficient financial resources to construct, safely operate, properly close, perform post-closure, perform corrective action and provide adequate liability coverage for the facility. This statement must also address how the closure, post-closure, corrective action, and liability coverage financial assurance requirements of Chapter 37, Subchapter P will be met (ie. which financial assurance mechanism is or will be used).

2. Certified copy of the resolution from the governing body,

3. Certification by the governing body of passage of the resolution.

Not Applicable – this application does not request expansion or new construction

II. Permit Renewals

Complete the attached letter with applicable information inserted into the parentheses. *Note that additional information must be provided if requested by TCEQ.*

[Date]

Mr. Gulay Aki
Manager, Industrial and Hazardous Waste Permits Section
Texas Commission on Environmental Quality
Building F, MC 130
12100 Park 35 Circle
Austin, Texas 78753

Re: Financial Disclosure Letter for [name of applicant]

Permit Renewal
Hazardous Waste Permit No. [xxxxx] / Compliance Plan No. [xxxxx]
Industrial Solid Waste Registration No. [xxxxx]
EPA ID No. [TXDxxxxxxxxx]
RN[xxxxxxxxx]; CN[xxxxxxxxx]

Dear Ms. Aki:

This letter is furnished to you in response to financial disclosure requirements as applicable under Texas Health and Safety Code Section 361.085 and Title 30, Texas Administrative Code (30 TAC), Section 305.50 to provide assurance that Kinder Morgan Liquid Terminals has sufficient financial resources.

In keeping with the above law and rule requirements I hereby certify that [name of applicant] is adequately capitalized and has sufficient financial resources to operate, close, provide post-closure care for and perform corrective action for the above-referenced facility in a safe manner, and in compliance with the permit and all applicable rules.

[name of applicant] currently provides a [describe type of mechanism, i.e., letter of credit, surety bond, etc.] financial assurance mechanism as set out in 30 TAC, Chapter 37, Subchapter C to meet Kinder Morgan Liquid terminal's financial assurance obligations.

I am authorized to make these statements on behalf of [name of applicant]. I understand that the TCEQ may request additional information as part of their review.

Sincerely,

[Signature block]
[Title of Signatory]

*[**Note**: signatory must be person whose title and job responsibilities meet the requirements in 30 TAC § 305.44]*

Table VIII.B - Estimated Capital Costs

Not Applicable

	Estimated Capital Costs
Site preparation, fencing, paving, curbing, lighting, roadways:	$_____
Foundations, buildings, other structures, utilities and connections, drainage system, HVAC system, electrical system, wastewater system:	$_____
Process and control equipment:	$_____
Auxiliary equipment, including but not limited to exhaust hoods fans, ducting, pumps, piping, conveyors, stacks, storage tanks, process tanks, waste disposal facilities, pollution control equipment, and fire protection system:	$_____
Process integration and instrumentation:	$_____
Emergency response equipment:	$_____
Transportation equipment:	$_____
Office equipment:	$_____
Engineering design, supervision, overhead:	$_____
Construction expenses including permits, insurance, temporary facilities, and clean-up	$_____
Contractor's fees and overhead	$_____
Contingency	$_____
Total	$_____

The estimates listed above were derived from the following sources:

IX. Releases from Solid Waste Units and Corrective Action

The Texas Solid Waste Disposal Act, 30 TAC 335.167, 40 CFR 270.14(d) and Section 3004(u) of the Hazardous and Solid Waste Amendments of 1984 (HSWA) *require that each hazardous waste management permit application review shall address corrective action for all releases of hazardous waste and hazardous constituents* listed in 40 CFR 261, Appendix VIII, 40 CFR Part 264, Appendix IX, and/or other constituents of concern from any solid waste management unit (SWMU) and/ or Areas of Concern (AOCs) at a facility, regardless of the time at which waste was placed in such unit[3]. Current EPA interpretation of this requirement has resulted in a Corrective Action process that begins with a RCRA Facility Assessment (RFA) to determine if corrective action is necessary.

The first step in the RFA is the development of a Preliminary Review (PR) from all available documentation for a facility (including but not limited to all facility documents, Part A, and Part B of the permit application, TCEQ correspondence files and inspection reports, etc.). The PR compiles available information on every SWMU and/or AOC that has ever existed at the facility. A unit checklist is completed for each SWMU and/ or AOC. On a unit-by-unit basis, the PR may recommend no further action for:

- well-designed and well-managed units;
- units that have not managed hazardous wastes or wastes containing hazardous constituents;
- units already under corrective action by enforcement order; or
- units scheduled to be addressed in a compliance plan.

In addition, the unit checklists are summarized in a *Facility Checklist*. If there is a known release or potential for a release of hazardous waste or hazardous constituents from a unit/area, the PR may recommend a *RCRA Facility Investigation* (RFI), or an *Affected Property Assessment* (APA), if 30 TAC Chapter 350, Texas Risk Reduction Program (TRRP) applies, to determine the extent of the release for future corrective action, or stabilization as an appropriate and immediate corrective action.

The second step is a *Visual Site Inspection* (VSI) of the entire facility. The RFA is the combination of the PR and VSI documentation and any sample results. The RFA process should be scheduled so as to be completed during the latter stages of the Technical Review process or no later than one month in advance of the preparation of an initial draft permit for the facility. The RFA includes recommendations for whether further investigation or corrective action is warranted.

The requirements for an RFI or any other corrective action will be included in the permit, in the associated compliance plan which is mandatory for facilities with known groundwater contamination, or pursuant to 40 CFR 270.14(d)(3), the applicant may be required to start the RFI or other corrective action before the permit is issued. The RFI shall comply with all the applicable items contained in the U.S. EPA publication EPA/520-R-94-004, OSWER Directive 9902.3-2A, RCRA Corrective Action Plan (Final), May 1994, unless an alternate investigation approach is approved by the Executive Director. An RFI workplan may typically include a soil

---

3For the purposes of HSWA Corrective Action, a SWMU may include, but is not limited to, any landfill, surface impoundment, land treatment unit, waste pile, underground injection well, incinerator, boiler, industrial furnace, tank, container storage area, drip pad, containment building, miscellaneous unit; any units exempt from hazardous waste permitting requirements, such as wastewater treatment units, elementary neutralization units, totally enclosed treatment units, waste recycle/reuse units, and 90-day accumulation time units; or process units or areas which may have routine and/or systematic releases to the environment (e.g., process drainage ditches or product storage tanks).

boring program, installation of monitoring wells, and sampling and analysis for 40 CFR 261 Appendix VIII and 40 CFR 264 Appendix IX hazardous constituents for surface soils, subsurface strata, surface water, groundwater, and/or air.

The permittee shall perform the RFI or APA and report the results. Corrective Action under 30 TAC Chapter 350 consists of an APA, determination of protective concentration levels, selection of a remedy standard (if necessary), development and implementation of a response action (if necessary), and submittal of required report according to 30 TAC Chapter 350.

If the RFI report indicates releases of hazardous waste or hazardous constituents for SWMUs and/or AOCs that have been grandfathered under 30 TAC Chapter 335 Subchapters A and S, Corrective Action shall consists of, if necessary, Interim Corrective Measures, *Baseline Risk Assessment* (BLRA)/*Corrective Measures Study* (CMS) Report, and *Corrective Measures Implementation* (CMI).

For grandfathered SWMUs and/or AOCs, the permittee may continue to complete the Corrective Action requirements under 30 TAC Chapter 335, Subchapter A and S, provided the permittee complies with the notification and schedule requirements pursuant to 30 TAC 335.8 and 350.(2)(m).

This report shall evaluate the risk, identify and evaluate corrective measure alternatives, and recommend appropriate corrective measure(s) to protect human health and the environment. The BLRA/CMS Report shall address all of the applicable items in 30 TAC 350, 30 TAC 335 Subchapter S, and the U.S. EPA publication EPA/520-R-94-004, OSWER Directive 9902.3-2A, RCRA Corrective Action Plan (Final), May 1994.

Upon approval of the BLRA/CMS Report by the TCEQ, the permittee shall submit a CMI Workplan to address all of the items for CMI Workplan contained in the U.S. EPA publication EPA/520-R-94-004, OSWER Directive 9902.3-2A, RCRA Corrective Action Plan (Final), May 1994. For projects conducted under TRRP, the risk assessment process shall be addressed in the *Affected Property Assessment Report* (APAR), and the evaluation of corrective measures shall be conducted as part of the remedy standard selection process provided in the *Response Action Plan* (RAP). If the CMI or RAP does not propose a permanent remedy, then a CMI Workplan or RAP shall be submitted as part of a new compliance plan application or as a modification/amendment application to an existing compliance plan. The workplan or RAP shall contain detailed final engineering design, monitoring plans, and schedules necessary to implement the selected remedy. Implementation of the corrective measures shall be addressed through a new and/or a modified/amended compliance plan. Upon installation of a corrective action system based upon the approved CMI Workplan or RAP, the permittee shall submit a CMI Report or RAP which includes as-built drawings of the corrective action system. To report the progress of the corrective measures, the permittee shall submit periodic CMI Progress Reports or Response Action Effectiveness Reports to the TCEQ in accordance with the schedule specified in the compliance plan. Upon completion of the corrective action requirements, the permittee shall submit CMI Report or Response Action Completion Reports for review and approval.

Please note that the applicant/permittee may perform voluntary corrective action, stabilization, or "interim measures" at any time prior to or during the RFA/RFI/CMS/CMI or the APAR/RAP process without prior TCEQ approval. The TCEQ strongly supports these actions when undertaken to mitigate releases or reduce or minimize exposure and releases to human health and the environment.

Attachment O – Preliminary Review Checklists and Preliminary Review Unit Checklists

Attachment P – RCRA Facility Assessment

A. Preliminary Review Checklists

For Applications for a New Hazardous Waste Permit:

- For all facility Solid Waste Management Units (SWMUs) and/or Areas of Concern (AOCs), complete the accompanying forms entitled "Preliminary Review Facility Checklist" and "Preliminary Review Unit Checklist". Make additional copies as necessary.

For Applications for a Renewal/Amendment/Modification of an Existing Hazardous Waste Permit:

- Update the Preliminary Review Facility Checklist to include any newly identified SWMUs and/or AOCs that were not incorporated into the previous permit issuance (new, amendment, modification, or renewal), and to update the status of all previously identified SWMUs or AOCs which are incorporated into the existing permit under either Section IX – Corrective Action for Solid Waste Management Units, or Section XI – Compliance Plan. Status updates should include notes regarding whether the SWMU or AOC has been incorporated into a compliance plan, has received approval of no further action (NFA), has had changes in its corrective action status, or has had other determinations issued by the TCEQ. Include the date of the status change in the updated checklist;
- Complete the Preliminary Review Unit Checklists for any newly identified SWMUs or AOCs that were not incorporated into the previous permit issuance (new, amendment, modification, or renewal);
- Update the status on the Preliminary Review Unit Checklists for all previously identified SWMUs or AOCs that had not yet received TCEQ approval of NFA at the time of the previous permit issuance;
- Provide copies of the letters from the TCEQ approving NFA or other determinations that were issued since the previous permit issuance;
- For previously identified SWMUs and/or AOCs which are incorporated into the existing permit and are included in Section XI – Compliance Plan of this application, you may forego filling out the Preliminary Review Unit Checklists for these units. Briefly note on the Preliminary Review Facility Checklist that the SWMUs or AOCs are addressed in Section XI. Provide the location where the SWMU's and addressed in Section XI. Or
- If all previously identified SWMUs and/or AOCs reached NFA status at or before the last permit issuance you may forego filling out the Preliminary Review Unit Checklists, indicate Not Applicable, and provide a brief explanation of the facts.

Instructions for Preliminary Review Facility Checklist

Fill out the information block at the top of the page (the reviewer space should remain blank for the TCEQ authorized agent).

Facility:_____ City:_____

ISW Reg. No:_____ Date:_____

Permit No:_____ Reviewer:_____

EPA ID No:_____

Waste Management Units:

RCRA Regulated Units: List all units that received hazardous wastes after July 26, 1982 or for which closure was certified after January 26, 1983 with the appropriate information under the three provided column headings as explained in the Unit Checklist instructions. [40 CFR 264.90(a)(2)]

Solid Waste Management Units, and/or Areas of Concern (AOC):

List all remaining SWMUs and/or AOCs.

Reviewed Documents:

Enter the appropriate information for sub-items 1-6, including document dates (item 6 should include pertinent company files).

Summary:

Provide an overall summary of the results of this Preliminary Review noting units and areas of concern.

Recommended Actions:

Summarize the Unit Checklist Recommended Actions and list those units recommended for further investigation including appropriate Unit No.

Provide the following information for EACH unit or area of concern:

A. Waste Management Unit: Enter SWMU and/or AOC name and facility designated number (e.g., Tank 101)

B. N.O.R. No.: enter TCEQ Notice of Registration (N.O.R.) Number or, if unassigned, a letter designation (i.e., A-Z)

C. Description: enter type of unit (e.g., above-grade processing tank) and Process Code as listed below:

Instructions for Preliminary Review Unit Checklist (Continued)

Process Types Table

Process Code	Unit Type	Process Code	Unit Type
Disposal		Miscellaneous (Subpart X)	
D79	Injection Well	X01	Open Burning/Open Detonation
D80	Landfill	X02	Mechanical Processing
D81	Land Application	X03	Thermal Unit
D83	Surface Impoundment - Disposal	X04	Geologic Repository
D99	Other Disposal	X99	Other Subpart X
Storage			
S01	Container	S05	Drip Pad
S02	Tank - Storage	S06	Containment Building – Storage
S03	Waste Pile	S99	Other Storage
S04	Surface Impoundment - Storage		
Treatment			
T01	Tank - Treatment	T86	Blast Furnace
T02	Surface Impoundment - Treatment	T87	Smelting, Melting, or Refining Furnace
T03	Incinerator	T88	Titanium Dioxide Chloride Process Oxidation Reactor
T04	Other Treatment	T89	Methane Reforming Furnace
T80	Boiler	T90	Pulping Liquor Recovery Furnace
T81	Cement Kiln	T91	Combustion Device Used in Recovery of Sulfur Values from Spent Sulfuric Acid
T82	Lime Kiln	T92	Halogen Acid Furnace
T83	Aggregate Kiln	T93	Other Industrial Furnaces Listed in 40 CFR 260.10
T84	Phosphate Kiln	T94	Containment Building – Treatment
T85	Coke Oven		

D. Dates of Operation:

Enter the date the unit was placed into service and any other dates the unit changed status (active, inactive, closed, post-closure) with the appropriate status designation.

E. Wastes Managed:

List all solid wastes ever managed in the unit and include the TCEQ NoR waste #, EPA Hazard Codes, and EPA waste codes. For each waste, list any hazardous constituent listed in 40 CFR 261 Appendix VIII and 264 Appendix IX, as appropriate.

F. Evidence of Release:

Completely describe the release, including time frame, waste amount, to what media, and any corrective measures taken.

G. Pollutant Dispersal Pathways:

Completely describe the possible and actual run-off pathways (i.e., to which tributary, creek, river, and bay or through subsoil to which aquifer with groundwater flow gradient, speed, and direction and any discharge point).

H. Summary:

Provide complete unit description including unit type, elements of construction, location, age, condition, dimensions, size, capacity (i.e., gallons, square feet, cubic yards, etc.), and potential for release.

I. Recommended Action:

Recommend No Further Action, Stabilization (interim measures), or Further Investigation and justify. Note, corrective action under another authority is justification for No Further Action.

Appendices to Preliminary Review (PR)

The PR should also include Appendices I-IV to correspond to the Roman numerals in the Unit Checklist:

Appendix I. FACILITY and SWMU LOCATION MAPS

- Regional Location Map
- Site Location Map
- Facility SWMU Map - Use the Notice of Registration (NOR) number to show the location of each unit on a replicate of the topographic map required in Section V.A.1 of this application. Also, please note that the term "facility" includes the entire contiguous property under the control of the owner or operator, which in most cases is the area shown as the legal description of the site in the facility's Part A permit application.

Appendix II. WASTES MANAGED

- List all wastes managed and 40 CFR 261 Appendix VIII and 40 CFR 264 Appendix IX hazardous constituents. Provide pertinent health, safety, and risk data on each.

Appendix III. EVIDENCE of RELEASE

- Provide any applicable documentation on a release. Provide a map of release locations, SWMU identification, and paths traveled.

Appendix IV. POLLUTANT DISPERSAL PATHWAYS

- Provide a facility, local, and regional map identifying all possible and eventual pathways in which a release from any unit could or did travel. Provide a facility general cross-section to illustrate vertical pathways and lateral movements in groundwater, including discharges (i.e., seeps, creeks, etc.).

Preliminary Review Submittal Format

The PR should be bound with a cover page and contain a Table of Contents with the Facility Checklist entered first followed by all the Unit Checklists in unit NOR numerical order and alphabetical order.

X. Air Emission Standards

Section X.D. applies to Permittees with "one- stop" permits applying for an amendment, modification, or renewal of the Air Permits Division portions of their combined "one-stop" permit.

Not Applicable

A. Process Vents

Does the facility have process vents and equipment subject to the requirements of 40 CFR Part 264, Subpart AA?

☐ Yes ☐ No

If Yes: please provide a report that includes all of the information required by 40 CFR §270.24. Indicate on a facility plot plan the approximate location of process vents.

1. For incorporation into the permit, complete Table X.A - Process Vents for all vents on waste management units that manage hazardous waste with an annual average total organics concentration of 10 ppmw or greater ("process vents"). Specifically include:
   a. process vents on distillation, fractionation, thin-film evaporation, solvent extraction, air or steam stripping operations, and vents on condensers serving these operations; and
   b. process vents on tanks (e.g., distillate receivers, bottom receivers, surge control tanks, separator tanks, and hot wells) associated with distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping processes if emissions from these process operations are vented through the tanks.

      Emissions caused by natural means such as daily temperature changes or by tank loading and unloading are not subject to control.
2. For process vents, include the following certification as part of the air emissions report:

   I,____ *[owner or operator]* __, certify that the operating parameters used in the design analysis reasonably represent the conditions that exist when the hazardous waste management unit is or would be operating at the highest load or capacity level reasonably expected to occur.

   I further certify that the control device is designed to operate at an efficiency of 95 weight percent or greater.

   OR

   I further certify that the total organic emission limits of 40 CFR §264.1032(a) for affected process vents at the facility can be attained by a control device involving vapor recovery at an efficiency less than 95 weight percent.

   [Signature] _____ *[Date]* _____.

B. Equipment Leaks

Does the facility have equipment subject to the requirements of 40 CFR Part 264, Subpart BB?

☐ Yes ☐ No o Not Applicable (facility contains no regulated ancillary equipment types associated with permitted units)

If No: please provide the regulatory exclusion/exemption(s):

If Yes: please provide a report that includes all of the information required by 40 CFR §270.25.

1. For incorporation into the permit, complete Table X.B. – Equipment Leaks for all valves, pumps, compressors, pressure relief devices, sampling connection systems, and open-ended valves or lines that contain or contacts hazardous waste streams with organic concentrations of 10% by weight or greater. Equipment in vacuum service is not subject to control if identified in the facility operating record.

2. For equipment, include the following statement as part of the air emissions report:

   I,_____ *[owner or operator]* _____, certify that the operating parameters used in the design analysis reasonably represent the conditions that exist when the hazardous waste management unit is operating at the highest load or capacity level reasonably expected to occur.

   I further certify that the control device is designed to operate at an efficiency of 95 weight percent or greater.

   [Signature] _____ *[Date]* _____.

C. Tanks, Surface Impoundments, and Containers

Does the facility have tanks subject to the requirements of 40 CFR Part 264, Subpart CC?

☐ Yes ☐ No ☐ Not Applicable (no permitted tanks)

If No: provide the regulatory exception/exemption(s) for each tank subject to regulation under 40 CFR Part 264, Subpart J:

Does the facility have surface impoundments subject to the requirements of 40 CFR Part 264, Subpart CC?

☐ Yes ☐ No o Not Applicable (no permitted surface impoundments)

If No: provide the regulatory exception/exemption(s) for each permitted surface impoundment subject to regulation under 40 CFR Part 264, Subpart K:

Does the facility have containers subject to the requirements of 40 CFR Part 264, Subpart CC?

☐ Yes ☐ No ☐ Not Applicable (no permitted container storage areas)

If No: provide the regulatory exception/exemption(s) applicable to the authorized containers subject to regulation under 40 CFR Part 264, Subpart I:

If the facility contains tanks, surface impoundments, and containers subject to the requirements of 40 CFR Part 264 Subpart CC, please provide a report that includes all of the information required by 40 CFR §270.27.

1. For incorporation into the permit, complete Table X.C.

2. As applicable, include the following floating roof cover certification as part of the air emissions report for tanks:

   I,_____*[owner or operator]*_____, certify that the floating roof cover meets the applicable design specifications as listed in 40 CFR §264.1084(e)(1) or 40 CFR §264.1084(f)(1).

   [Signature] _____ *[Date]* _____.

3. As applicable, include the following floating membrane cover certification as part of the air emissions report for surface impoundments:

   I,_____*[owner or operator]*_____, certify that the floating membrane cover meets the applicable design specifications listed in 40 CFR §264.1085(c)(1).

   [Signature] _____ *[Date]* _____.

4. As applicable, include the following container certification as part of the air emissions report for containers:

   I,_____*[owner or operator]*_____, certify that the requirements of 40 CFR Part §264, Subpart CC, are met for all containers subject to control.

   [Signature] _____ *[Date]* _____.

5. As applicable, include the following control device certification as part of the air emissions report:

   I,_____*[owner or operator]*_____, certify that the control device is designed to operate at the performance level documented by a design analysis as specified in 40 CFR 264.1089 (e)(1)(ii) or by performance tests as specified in 40 CFR §264.1089(e)(1)(iii) when the tank, surface impoundment, or container is or would be operating at capacity or the highest level reasonably expected to occur.

   [Signature] _____ *[Date]* _____.

D. "One-Stop" Permits:

Does the facility have a "one-stop" permit?

☐ Yes ☐ No

If yes: does this permit application propose to delete the "one-stop" portion of the permit?

☐ Yes ☐ No

Does the facility want the application processed in accordance with 30 TAC Chapter 33 – Consolidated Permit Applications?

☐ Yes ☐ No

If yes: please provide a copy of the notification of intent required by 30 TAC 33.43.

Permittees having "one-stop" permits may elect to combine the air and waste management amendment, modification, or renewal of permitted waste management units. The combined amendment, modification, or renewal application will follow the application processing procedures for an industrial solid waste permit. "One-Stop" permit applications shall include the following air quality information, as applicable.

1. Area map (to scale) showing the location of the plant and land use in the vicinity

of the facility including buildings, schools, residences, etc. within 3000 feet.

2. Plot plan (to scale) with latitude and longitude showing the plant layout, property boundary and location of all emission points of air contaminants. Emission points are to be numbered.

3. Specific chemical name of each air contaminant and emission rate in maximum pounds per hour, maximum tons per year and calculations used to determine emission rates. Fugitive emissions are to be included. Complete Table 1(a) entitled "Emission Sources."

4. Process description, operating schedule, and flow chart in sufficient detail that will explain the process and operation and a material balance for processes where applicable. The description should include a discussion of disposal methods for any generated residues and associated air emissions.

5. Design specifications about each emission control device using the appropriate OAQ table.

6. Volatile organic compound (VOC) concentrations in water or sludges or soil and volumes or weights of water, sludges or soils to be processed.

7. Exhaust stack or emission point parameters for each emission point including height, diameter, temperature, velocity and flow rate, except ground level fugitive emissions.

8. Best available control technology (BACT) documentation for all new and modified facilities.

9. Documentation of compliance with any applicable Federal New Source Performance Standard (NSPS) and Federal National Emission Standard for Hazardous Air Pollutants (NESHAPS).

10. Documentation as to whether a permit is required under new source review requirements of part C or D or Title I of the Federal Clean Air Act, 42 U.S.C. 7401 et seq., for a major source or major modification.

11. Information that demonstrates reliability of emission control systems including process instrumentation, equipment redundancy and operating procedures.

12. Results of atmospheric dispersion modeling certified to have been conducted in accordance with applicable TCEQ Office of Air Quality (OAQ) procedures. Model results must show maximum off-property 30-minute and annual ground level concentrations of each air contaminant. Dispersion modeling results must indicate compliance with all OAQ Rules and Regulations. Dimensions of buildings/structures that may influence dispersion modeling are to be furnished. Please consult with OAQ before beginning any modeling study.

13. Storage tank data including capacity in gallons, diameter, height, paint color, composition, density, vapor pressure and molecular weight of liquid stored, maximum hourly and annual throughput and number of turnovers per year. Complete Table 7 entitled "Storage Tank Summary" for each tank.

14. A statement addressing the applicability of each OAQ regulation.

15. All methods of calculating emissions must be properly referenced with justification for selecting and assuming the values used in any equation.

Table X.A. – Process Vents

List all process vents covered by this application.

I.D. No. (if any)	Process Vent	Annual Throughput	Operating Hours	Total Vent Facility Emissions
Not Applicable				

Table X.B. - Equipment Leaks

List all equipment covered by this application

Emission Sources _____ Date _____

Review of applications and issuance of permits will be expedited by supplying all necessary information requested on this Table.

Air Contaminant Data									Emission Point Discharge Parameters						
Emission Point[1]		Chemical Composition of Total Stream		Air Contaminant Emission Rate		UTM Coordinates of Emission Pt. [6]			Stack Sources (7)					Area Sources [8]	
											Exit Data				
Number	Name	Component or Air Contaminant Name [2]	Conc. (%v)	Lb/hr [4]	Tons/ Yr [5]	Zone	East [meters] (Lat.)	North [meters] (Long.)	Height Above Ground [ft.]	Height Above Structures [ft.]	Dia. [ft.]	Vel. [fps]	Temp. [°F]	Length [ft.]	Width [ft.]
Not Applicable															

Ground Elevation of Facility Above Mean Sea Level _____ feet.

TACB Standard Conditions Are 68°F and 14.7 psia [RULE 131.01.00.001(55)]

General Instructions for Table X.D.1(a):

1. Identify each emission point with a unique number for this plant site, consistent with emission point identification used on plot plan, previous permits and Emissions Inventory Questionnaire. Limit emission point number to 8 character spaces. For each emission point, use as many lines as necessary to list air contaminant data. Typical emission point names are : heater, vent, boiler, tank, reactor, separator, baghouse, fugitive, etc. Abbreviations are OK.
2. Typical component names are: air, H2O, nitrogen, oxygen, CO2, CO, Nox, SO2, hexane, particulate matter (PM), etc. Abbreviations are OK.
3. Concentration data is required for all gaseous components. Show concentration in volume percent of total gas stream.
4. Pounds per hour (lb/hr) - maximum emission rate expected by applicant.
5. Tons per year (tons/year, t/yr.) is annual maximum emission rate expected by applicant which takes into account process operating schedule.
6. As a minimum, applicant must furnish a facility plot plan drawn to scale showing a plant benchmark, latitude and longitude correct to the nearest second for the benchmark, and all emission points dimensioned with respect to the benchmark as required by General Application, Form PI-1. This information is essential for calculation of emission point UTM coordinates. Please show emission point UTM coordinates if known.
7. Supply additional information as follows if appropriate:
   a. Stack exit configuration other than a round vertical stack. Show length and width for a rectangular stack. Indicate if horizontal discharge with a note.
   b. Stack's height above supporting or adjacent structures if structure is within three (3) "stack heights above ground" of stack.
   c. If emission point is a flare, show flare data on Table 8.
8. Normally used for fugitive sources. Show dimensions of a minimum size rectangle which will "enclose" all fugitive sources included in this emission point number.

Table 74-82 Storage Tank Summary

I. Applicant's Name:_____

II. Tank Parameters (one form for each tank).

1. Location (indicate on plot plan or provide coordinates):

   _____

2. Tank No. _____

3. Emission Point No. _____

4. Nominal Capacity : _____ barrels or

   _____ gallons

5. Dimensions: Diameter _____ft.

   Height or Length _____ ft.

6. Color: Chalking white ☐ Aluminum ☐ Light grey or blue ☐

   Dark color or not paint ☐ Other ☐ (Describe _____)

7. Status: New tank ☐ Altered tank ☐ Relocation ☐ Change of Service ☐

8. Previous permit or exemption number

   _____

9. Type: Fixed roof ☐ Pressure ☐ Insulated ☐ External floating roof o

10. Open top ☐ Underground ☐ Internal floating roof ☐ Horizontal ☐

11. Heated/Cooled ☐ (Temp. _____°F)

12. For floating roof tanks, please supply the following information:

    a. Type of roof: Double deck ☐ Pontoon ☐
       Other ☐ (Describe_____)

    b. Roof color: Chalking white ☐ Aluminum ☐
       Other ☐ (Describe _____)

    c. Shell construction: Riveted ☐ Welded ☐
       Other ☐ (Describe_____)

    d. Seals:

       Primary:

       Mechanical Shoe ☐ Liquid-Mounted ☐ Vapor-Mounted ☐

       Other ☐ (Describe _____)

       Secondary:

       Shoe-Mounted ☐ Rim-Mounted ☐ Weather Shield ☐None ☐

Other ☐ (Describe_____)

Vent Valve Data	Number	Pressure Setting	Vacuum Setting *[Specify "atmosphere" or Discharging To: (name of abatement device)]*
Combination vent valve			
Pressure vent valve			
Vacuum vent valve			
Open vent			

III. Properties of Stored Material (If tank is to hold several different materials or mixtures, attach appropriate information)

1. Material to be stored in this tank:

   _____

2. Liquid density at average annual bulk storage temperature: _____lbs/gal or _____°API
3. Average vapor molecular weight _____
4. Vapor pressure @ average annual bulk storage temperature: _____psia @ _____°F. (or _____lbs. Reid).
5. Vapor pressure @ maximum bulk storage temperature: _____psia @ _____°F.
6. Initial boiling point: _____°F.
7. If material stored is a solution, please supply the following information:
   a. Name of solvent: _____
   b. Partial pressure of solvent: _____ psia
   c. Name of solute: _____
   d. Partial pressure of solute: _____ psia
   e. Concentration of solute: _____ wt% or _____ vol% or _____lbs/gal.

IV. Operating Data:

1. Maximum filling rate: _____ bbls/hr or _____ gal/hr.
2. Average outage (average distance from top of tank shell to liquid surface): _____ft.
3. Tank turnovers per year: _____ (Use zero (0) for constant-level tanks).

XI. Compliance Plan

Groundwater Monitoring and Corrective Action Requirements for Regulated Units

Owners or operators of facilities that process, store, or dispose of hazardous waste may be required to establish groundwater monitoring and response programs in accordance with the provisions of 30 TAC 335.157. There are three types of groundwater monitoring programs which may be addressed in a Compliance Plan Application for Regulated Units: i) detection monitoring, ii) compliance monitoring, and iii) corrective action monitoring. The applicability of these various monitoring programs and the associated application requirements are illustrated in Figure 2 of the Compliance Plan Application instructions and further outlined below. A Compliance Plan Application will be required to be submitted when establishing a new compliance plan or incorporating changes in an existing compliance plan.

Detection Monitoring: An owner/operator required to conduct detection monitoring per the requirements of 30 TAC 335.164 must monitor for indicator parameters, such as specific conductance, total organic carbon, and total organic halogen, as well as chemical parameters and hazardous constituents specified in the facility permit. If a statistically significant increase in any parameter or hazardous constituent specified in the facility permit is detected in any monitoring well down gradient of the compliance point, the owner/operator must sample the groundwater in all monitoring wells and analyze the samples for the presence of 40 CFR Part 264 Appendix IX hazardous constituents. As shown in the accompanying Flow Diagram (see Figure 2), if the analytical results confirm the presence of Appendix IX constituents down gradient of the compliance point, the owner/operator must submit a Compliance Plan Application to establish a compliance monitoring program or corrective action program.

Compliance Monitoring: The requirements for compliance monitoring programs are detailed in 30 TAC 335.165. Owners/operators required to establish a compliance monitoring program must monitor the groundwater to determine whether Regulated Units are in compliance with the Groundwater Protection Standard (GWPS) specified in the compliance plan (see 30 TAC 335.158 .160). If a statistically significant increase above the GWPS in any chemical parameter or hazardous constituent specified in the compliance plan is confirmed, the owner/operator must submit a application to modify the compliance plan to establish a corrective action program in accordance with 30 TAC 335.166 (see Figure 2). If no such exceedance of the GWPS is detected for three consecutive years and the applicable compliance period has expired, the owner/operator must apply for modification of the compliance plan to re-establish a detection monitoring program for the unit. No further monitoring may be needed if the applicable post-closure care period for the unit is complete.

Regulated Unit Corrective Action Program: Owners/operators required to implement a corrective action program in accordance with the provisions of 30 TAC 335.166 must remove the hazardous waste constituents found in the groundwater or treat the groundwater in-place to levels equal to or less than the GWPS down gradient of the compliance point. The owner/operator must also establish and implement a groundwater monitoring program to demonstrate the effectiveness of the corrective action program. Corrective action measures may be terminated once the concentrations of hazardous constituents are reduced to levels equal to or below their respective concentration limits. After termination of the corrective action measures, the owner/operator must submit an application for modification of the compliance plan to re-establish a compliance monitoring program for the duration of the compliance period (see Figure 2).

Groundwater Corrective Action Requirements for Solid Waste Management Units (SWMUs)

HSWA Solid Waste Management Unit (SWMU) Corrective Action Program: An owner/operator

of a Permitted facility or an applicant applying for a hazardous waste permit is required to submit a Compliance Plan Application if hazardous constituents have been released from a SWMU and/or Area of Concern (AOC) to the groundwater and exceeds background or Practical Quantitation Limit (PQL) values, if under Risk Reduction Rules 30 TAC 335 and/or appropriate Protective Concentration Limits (PCLs), if under Texas Risk Reduction Program Rules 30 TAC 350. The Permitted facility must implement a corrective action program for SWMUs and/or AOCs in accordance with provisions 30 TAC 335.167 (see Figure 3, page 122 of the instructions for example of process-alternate, but equivalent process may be authorized by the Executive Director).

Compliance Plan Application Form Structure:

The Compliance Plan Application consists of Sections XI.A. through E.

Application Information Form:

This section contains detailed information necessary for the application and regulatory requirements needed to put in the final compliance plan.

The application form contains the following subsections:

A. Site Specific Information

B. Groundwater Protection Standard (GWPS)

C. Compliance Monitoring Program

D. Corrective Action Program

E. Cost Estimates for Financial Assurance

CP Attachments:

A. Alternate Concentration Limits

B. Well Design and Construction Specifications

C. Sampling and Analysis Plan

Compliance Plan Site Specific Tables:

This section includes the following tables which are to be completed by the applicant, as applicable, and shall be incorporated as part of the final draft Compliance Plan. [Note: include a CD disk with the application providing an electronic copy of the files supporting the compliance plan tables, as applicable, in MS Word format]:

CP Table I – Waste Management Units and/or Areas Subject to Groundwater Corrective Action and Compliance Monitoring

CP Table II – Solid Waste Management Units and/or Areas of Concern for which Corrective Action applies pursuant to 30 TAC 335.167.

CP Table III – CORRECTIVE ACTION PROGRAM Table of Detected Hazardous and Solid Waste Constituents and the Groundwater Protection Standard

CP Table IIIA – CORRECTIVE ACTION PROGRAM Table of Indicator Parameters and the Groundwater Protection Standard

CP Table IV – COMPLIANCE MONITORING PROGRAM Table of Hazardous and Solid Waste Constituents and Practical Quantitation Limits or Method Quantitation Limits for Compliance Monitoring

CP Table IVA – COMPLIANCE MONITORING PROGRAM Table of Detected Hazardous

Constituents and the Groundwater Protection Standard for Compliance Monitoring

CP Table V – Designation of Wells by Function

CP Table VI – Compliance Period for RCRA-Regulated Units

Note to the Permittee: All responses to each item in Section XI of the application form should be entered immediately below the original text associated with the form. Do not delete any areas of the application form that are not applicable, retain these areas with a response of either 'Reserved' or 'Not Applicable' below the original text of the form. In addition, if material supporting a response is located elsewhere in the application, the response should provide details as to the specific location within the referenced material.

One of the primary goals of the performance based Compliance Plan is the wells listed in, CP Table V – Designation of Wells by Function (to be included in the final Compliance Plan) are the wells in which the GWPS must be met to verify compliance with Compliance Monitoring program or corrective action objectives, and to change the table would require a modification. On the other hand, the following types of wells Corrective Action Observation Wells, Corrective Action System well, etc., that are included in "Attachment A" maps of the final draft Compliance Plan, should be flexible. The purpose is to provide the permittee with the authority to alter the groundwater monitoring system and Corrective Action System designs, as necessary, to proactively address changing environmental conditions without modifying or amending the Compliance Plan. An application to modify/amend the compliance plan is only required if wells listed in CP Table V are changed; consequently, Corrective Action Observation and Corrective Action System Wells are not listed in CP Table V of the compliance plan so they may be added or removed without modifying/amending the compliance plan. Notification of proposed changes to the groundwater monitoring system and Corrective Action System designs can be included in the semiannual or annual report required by CP Table VIII – Compliance Schedule (to be included in the final Compliance Plan).

Figure 1 – Overview of Required Submittals And Revisions Associated with TCEQ Groundwater Compliance Plan Application

Note:
(RRR) – Risk Reduction Rules, 30 TAC 335
(TRRP) – Texas Risk Reduction Program, 30 TAC 350

A. Site Specific Information

1. General Site Information (provide the following information):

   a. An overall plan view map of the entire facility delineating the facility's property boundary, Facility Operations Area (FOA) boundaries, as applicable, and the plume management zone (PMZ) boundaries as applicable;

      Included in Attachment U

   b. A 7.5 minute U.S.G.S. quadrangle topographic map showing the entire facility;

      Included in Attachment U

   c. All oversized (larger than 8.5" by 11") drawings submitted in accordance with a and b, above, should be accompanied with legible photocopies of the reduced drawing on 8.5" by 11" sheet(s) of paper which shall be used as "CP Attachment A" maps in the final draft Permit/Compliance Plan. The applicant should title the map(s) accordingly as "CP Attachment A, Sheet 1 of xx – Facility Site Map"; "CP Attachment A, Sheet xx of xx, FOA Lateral Boundary Map"; "CP Attachment A, Sheet xx of xx, PMZ Boundary Location Map"; and

      Included in Attachment U

   d. Aerial photographs through time depicting changes in the land use, if available.

      Not available

2. Waste Management

   Provide a complete list and a plan view drawing(s) locating and identifying the following waste management units at the scale of 2.5 centimeters (1 inch) equal to not more than 61.0 meters (200 feet). All oversized (larger than 8.5" by 11") drawings should be accompanied with legible photocopies of the reduced drawing on 8.5" by 11" sheet(s) of paper. Please provide information for each waste management unit listed below on Table XI.A.1. – Facility History for Waste Management Units.

   a. All hazardous waste management units regulated under the Industrial Solid Waste and Municipal Hazardous Waste Rules (Chapter 335) required to be monitored in accordance with 30 TAC 335.164 (Detection Monitoring), 335.165 (Compliance Monitoring Program) and 335.166 (Corrective Action Program);

      Included in Attachment U

   b. All solid waste management units (SWMUs) and Areas of Concern (AOCs) regulated under 335.167 which are recommended for further investigation and/or corrective action in the RCRA Facility Assessment (RFA) shall include those identified in accordance with the permit requirements subsequent to the initial RFA.

      Included in Attachment U

c. All on site wastewater treatment units.

No onsite wastewater treatment units are present

3. Facility History

Based on the information provided in Table XI.A.1., complete CP Table I – Waste Management Units and Areas Subject to Groundwater Corrective Action and Compliance Monitoring accordingly in the format provided.

For the SWMUs or AOCs listed in Table XI.A.1. regulated under 30 TAC 335.167 which are recommended for further investigation and/or corrective action in the RCRA Facility Assessment (RFA), including those identified in accordance with permit requirements subsequent to the initial RFA, complete CP Table II – Solid Waste Management Units and Areas of Concern for which Corrective Action applies pursuant to 30 TAC 335.167. CP Table II will become part of the Compliance Plan.

Updated CP Table I and CP Table II are provided below. TCEQ closure approval letters are included in Attachment V.

4. Site Geology, Hydrogeologic Conditions, and Relationship to Surface Water

For New, modified/amended Compliance Plan, please provide a Geology Report as required by Section VI.B of this application containing updated site geologic information including the following descriptions, maps and tables with appropriate supporting documentation [All maps should be at the scale of 1 inch equal to not more than 200 feet and legible when reduced to 8.5" by 11" letter size paper]:

a. A description of the site geology for the facility. The geologic description should include a site geology map and sufficient cross sections (see Item h. below) to describe the uppermost aquifer and any confining stratigraphic unit(s) beneath the site.
b. A description of the site soils and subsurface lithologies using the Unified Soil Classification System. For those soil units which do not extend beneath the entire site area, the soil description should include a plan view map designating the soil's areal extent;
c. Where a soil remedy is required in a corrective action program of Section XI.D.1. of this application for a Regulated Unit, SWMU and/or AOC, the applicant shall submit a description of contamination in soils of the vadose zone (unsaturated zone above the uppermost aquifer). The soil description should include maps indicating lateral and vertical extent of contamination;
d. A description and designation of the uppermost saturated zone or uppermost aquifer including the name, the type of unit (e.g. perched, confined, etc.,), and groundwater characteristics (flow rates, directions, hydraulic conductivity, etc.). As defined in 40 CFR 260.10, an aquifer is a geologic formation, group of formation, or part of a formation, capable of yielding significant amount of groundwater to wells or springs. Persons using Texas Risk Reduction Program (TRRP) should also consider the definition of a groundwater bearing

unit as a saturated geologic formation, group of formations, or part of a formation with a hydraulic conductivity of equal to or greater than 1 x 10 -5 centimeters/second (30 TAC 350.4(a)40).

e. Present the geologic, stratigraphic and hydrogeological information; and

f. Maps indicating the lateral and vertical extent of the contamination for each stratigraphic unit affected, with supporting documentation.

g. Current Contaminant Plume Map(s) Locating and identifying the extent of contamination as determined from previous monitoring on a separate facility base map(s). Locate and identify all monitor wells and waste management units/areas.

h. Cross section Cross section transect lines should be indicated on the Contaminant Plume Map. The applicant, at a minimum, must submit two (2) stratigraphic cross sections for each waste management unit/area. One cross section should be drawn through all the point of compliance wells and the second cross section should be drawn along the direction of the movement of the contaminant plume released from the unit/area. Cross sections should follow the requirements outlined in the Geologic and Hydrogeologic Report of Parts IV and V of this application. At a minimum, the cross sections should include the following information:

    (1) the stratigraphic interpretation (e.g., surface grade, uppermost aquifer, aquiclude);
    (2) lithology/geologic description of the uppermost aquifer and aquiclude;
    (3) the potentiometric surface;
    (4) detected non-aqueous phase liquids (NAPLs) and hazardous constituents; and
    (5) screen length and screen depth for each well in the cross section.

i. Well Construction diagram The report should include a well construction diagram for all wells used in the cross section. The well construction diagram should include the information in "Attachment B" of this (Compliance Plan) application. The well construction diagram information may be included on the geologic cross-section(s).

j. Describe the potential for any surface water bodies to be hydraulically connected to groundwater containing hazardous constituents. Apply the guidance provided in Determining PCLs for Surface Water and Sediment, RG-366/TRRP-24 Revised, December 2002, in order to determine the water body type and applicable surface water criteria for human health, aquatic life and wildlife, as applicable.

See Attachment M for the Geology and Hydrogeology Report for Regulated Units. The APARs (not included in this application) can be referenced for SWMUs and AOCs. Application Sections XI.A.4.a through XI.A.4.j are addressed by the Geology and Hydrogeology Report and Table II.2a, Table II.2b, Table II.3a, Table II.3b, Table II.4a, and Table II.4b also included in Attachment M.

B. Hazardous Constituents In Groundwater And Groundwater Protection Standards (GWPSs)

Hazardous Constituents in Groundwater

For each contaminated hydrogeologic unit beneath a waste management unit/area (40 CFR 264.95), provide a list of all 40 CFR Part 264 Appendix IX hazardous constituents that have been detected in groundwater samples above background values, Practical Quantitation Limits (PQLs), or Method Quantitation Limits (MQLs). Please submit for each unit/area the most recent Appendix IX laboratory analysis results showing the constituents, constituent concentrations, methods used for analysis and associated laboratory QA/QC.

Recent data related to hazardous constituents in groundwater are included in the updated geologic information included in Attachment M for the RCRA permitted units. The RAPs and/or RAP Addendums are included in Attachment V for the SWMU/AOC corrective action areas, which include Central Plant PMZ, SWMU Group W3 (West Plant PMZ)/West Chemical AOC, Texmark and North Plant AOC. Additionally, the Annual Corrective Action Program Report, dated February 28, 2024, with the most recent laboratory results is included in Attachment W.

The groundwater samples (collected for the purpose of determining whether constituents listed in Appendix IX are present) shall be from each waste management unit/area monitoring well system as required by 30 Texas Administrative Code (TAC) 335.164 (detection monitoring program).

If the waste management unit/area is subject to Corrective Action Program required by 30 TAC 335.166 or 335.167 and/or Compliance Monitoring required by 30 TAC 335.165, then list the unit/area and include the list of hazardous constituents and their principal degradation constituents in:

CP Table III – Corrective Action Program Table of Detected Hazardous and Solid Waste Constituents and the Groundwater Protection Standard; and

An updated CP Table III is provided below

CP Table IV – Compliance Monitoring Program Table of Hazardous and Solid Waste Constituents and Practical Quantitation Limits or Method Quantitation Limits for Compliance Monitoring.

1. Groundwater Protection Standards (GWPSs)

   The GWPS (30 TAC 335.158) is designed to ensure that hazardous constituents (30 TAC 335.159) identified in groundwater and their principal degradational constituents do not exceed concentrations that pose a present or potential hazard to human health and the environment. Compliance monitoring and corrective action programs for a Regulated Unit (30 TAC 335.165 and 335.166) and a corrective action program for a solid waste management unit (SWMU) (30 TAC 335.167) require human health and the environment to be protected from all releases of hazardous wastes and constituents. These corrective action and monitoring programs are evaluated using the GWPS. The GWPS is based on the following criteria.

   a. Background Levels Background levels authorized under 30 TAC 335.160(a)(1) are defined as constituent concentration values that are naturally occurring or are not influenced by contamination coming from the waste management unit. These values are established by statistical analysis

of upgradient well sampling data. Analytical results from a sufficient number of independent samples are required to be utilized with an approved and appropriate statistical method. For guidance on the statistical methods consult, Statistical Analysis of Groundwater Data at RCRA Facilities-Unified Guidance, U.S. EPA, March 2009, and any subsequent updates to this document.

Practical Quantitation Limits (PQLs) or Method Quantitation Limits (MQLs) are utilized in lieu of background values unless a background demonstration establishes concentrations for naturally occurring constituents. The PQL or MQL is defined in the footnote of CP Tables III and IV.

b. Primary and Secondary Maximum Contaminant Levels (MCLs) Maximum permissible level of a contaminant in water which is delivered to any user of a public water system (40 CFR Part 141 and 143, Federal Safe Drinking Water Act).

c. Alternate Concentration Limits (ACLs) determined in accordance with 30 TAC 335.160(b) and are defined in footnote of CP Tables III and IV.

ACLs were determined based on the Texas Risk Reduction Program (TRRP). The Tier 1 residential groundwater protective concentration levels (PCLS) for Class 1/Class 2 groundwater and surface water to groundwater exposure were selected.

2. Establishing the Groundwater Protection Standard (GWPS)

a. If background, PQL or MQLs are proposed for the GWPS, the applicant must list all constituents (i.e., detected and degradational constituents) for which a GWPS is being applied for and the appropriate concentration limits. This information shall be submitted in the format of CP Tables III, and IV.

b. Alternate Concentration Limits (ACLs) ACLs are established at the point of compliance (POC) for a regulated or solid waste management unit (SWMU). All concentration values or limits listed in Section XI.B.1.c. are considered ACLs. ACLs are evaluated in accordance with the provisions of 30 TAC 335.160(b) and other regulations acceptable to the executive director. If an ACL is requested on the basis of Section XI.B.1.c. (MCLs), then no ACL demonstration is necessary. The ACL demonstration must establish constituent concentrations in groundwater in accordance with regulations acceptable to the executive director. This information shall be submitted in the format of CP Tables III and IV. Note that depending upon the rule employed [i.e., 30 TAC 335 Subchapter S – Risk Reduction Rules (RRR) or 30 TAC 350 – Texas Risk Reduction Program (TRRP)], the applicant should determine the GWPS for the point of compliance and point of exposure, as applicable, in accordance with the remedy standard being utilized.

The Groundwater Protection Standards (GWPS) for the areas within or being incorporated into the Corrective Action Program are based on TRRP PCLs and/or on Alternate Concentration Limits developed under the TRRP. The ACL demonstrations for each of the areas within in the Corrective Action Program are detailed in the respective RAPs included in Attachment V to this Part B application.

Proposed modifications to the GWPS since the Class 3 Permit Modification was issued on November 18, 2019 include the following:

- **Changing the GWPS from $^{GW}GW_{ING}$ to ^{SW}GW at SEHB. SEHB is within SWMU Group C2 of the Central Plant. The groundwater to surface water evaluation was presented in the 2007 Central Plant RAP and incorporated in the Class 3 Permit Modification for the Central Plant PMZ in CP Table III and CP Table IIIA. As SEHB is within SWMU Group C2 within the Central Plant, these calculations were utilized for the COCs applicable COCs in both the Central Plant PMZ and SEHB. For COCs only within the SEHB, new groundwater to surface water calculations were completed and are included in Attachment Z.**
- **Addition of North Plant AOC based on 2024 RAP Addendum. The POE wells are based on TRRP Class 1/2 PCLs and the AMP wells are based on calculated AALs presented in the RAP Addendum, included as Attachment V.**

c. If the contaminant plume discharges or has a potential to discharge into surface water, then the facility must also comply with 30 TAC Chapter 307 (Texas Surface Water Quality Standards) unless other regulatory requirements acceptable to the executive director are requested.

d. "Attachment A" of this Compliance Plan Application provides a summary of regulatory requirements for an ACL demonstration in accordance with 30 TAC 335.160(b).

C. Compliance Monitoring Program
RESERVED

As required by 30 TAC 335.165, an owner or operator must monitor the groundwater to determine whether Regulated Units are in compliance with the Groundwater Protection Standard (GWPS) under 30 TAC 335.158. The applicant must provide the following information when proposing a compliance monitoring program.

A Compliance Monitoring Program is currently not being proposed. The Regulated Units are currently in corrective action.

1. Groundwater Monitoring Program Description

   a. Describe the proposed groundwater monitoring system to be used to monitor compliance with the GWPS which includes the following information.

      (1) Changes, if applicable, from the current detection monitoring system or compliance monitoring system groundwater monitoring program at the waste management unit that will be required to comply with the compliance monitoring program described in 30 TAC 335.165. This description should address changes concerning:

         (a) Geological and/or hydrogeological information differences since the submittal of the previous application [must submit an updated Geologic and Hydrogeologic Report required by Section XI.A.4];

         (b) Waste management areas/units;

(c) Construction details for monitor wells to evaluate compliance with "Attachment B" well specification requirements;
(d) The number and locations of additional monitor wells [also see Section XI.C.1.b.(2)];
(e) Sample handling, chain of custody, and analytical procedures (also see "Attachment C");
(f) Frequency of monitoring;
(g) Monitoring parameters;
(h) Evaluation of compliance with GWPS (Statistical Methods);
(i) Other Sampling and Analysis Plan information to be compliant with "Attachment C";
(j) Compliance period as defined in Section XI.E.1.c. of the application;
(k) Financial assurance (see Section XI.E.); and
(l) An ACL variance under 30 TAC 335.160(b), if applicable (also see "Attachment A").

(2) The number, depth and location of all monitor wells (Background Wells, Point of Compliance Wells, Observation Wells, Piezometers, etc.). Complete CP Table V – Designation of Wells by Function and make changes as applicable to plans referenced in Section XI.C.1.b.

(3) The proposed hazardous constituent monitoring list which is based on constituents that were monitored during detection monitoring (if applicable), constituents detected in accordance with 30 TAC 335.164, and degradational constituents identified in Table CP IV accordingly to develop the constituent list for the Compliance Monitoring Program. Also, list the PQL, MQL, or background concentration for each constituent in CP Table IV. CP Table IV shall become part of the final Compliance Plan to be analyzed at least annually as required by 30 TAC 335.165(7).

(4) The proposed indicator parameter monitoring list. From the list of constituents and GWPS identified in CP Table IV., complete CP Table IVA – Compliance Monitoring Program, Table of Detected Hazardous Constituents and the Groundwater Protection Standard for Compliance Monitoring, accordingly. CP Table IVA shall become part of the final Compliance Plan to be analyzed at least semiannually as required by 30 TAC 335.165(6).

(5) Monitoring frequency.

(6) Provisions for reporting of groundwater data at least on an annual basis.

(7) Annual determination of contamination plume rate and direction of migration.

(8) Compliance period. Calculate the compliance period as required by 30 TAC 335.162 and 335.165(1)(d). Include calculations and complete CP Table VI – Compliance Period for RCRA-Regulated Units which shall become part of the final Compliance Plan.

b. Submit the following plans and reports.

(1) Current Sampling and Analysis Plan The Sampling and Analysis Plan must include information required by 30 TAC 335.163(4) and

335.163(5) and 40 CFR Subpart 270.30(j). For guidance, please see "Attachment C" to the application.

(2) Monitoring System Plan If the applicant is proposing a monitoring well or a monitoring system in the application, the applicable well installation specifications outlined in "Attachment B" of this application should be followed. All new monitoring wells must be installed in accordance with the specifications outlined in "Attachment B", unless an alternative design is approved by the agency prior to installation. If the applicant proposes as part of the monitoring system, any well (existing or proposed) that does not meet or exceed the requirements outlined in "Attachment B", then the proposed alternative design must be described in detail in the Monitoring System Plan and must be submitted with this application. The Monitoring System Plan must include:

(a) Monitoring System Design and Specifications Certified by a qualified engineer and/or geologist which provides detailed plans and specifications on the monitoring system design; and

(b) Well Drilling and Well Casing Specifications Certified by a qualified engineer and/or geologist which provides details on well casing specification, drilling logs and reports.

(3) Current Geologic and Hydrogeologic Report Provide a report per Section X.I.A.4 of this application discussing the geologic and hydrogeologic conditions of the facility and the specific area affected by the waste management areas. This report should include the most up-to-date information from which the design of the groundwater monitoring system was based.

2. Waste Management Units Monitored

a. Delineate and identify the following for each waste management unit in the proposed groundwater monitoring program.

(1) Boundary of the waste management unit and, if applicable, the proposed waste management area which includes more than one waste management unit (identify all waste management units which are included in the waste management area). These waste management units subject to compliance monitoring should be listed in CP Table I – Waste Management Units and Areas Subject to Groundwater Corrective Action and Compliance Monitoring which shall become part of the final Compliance Plan.

(2) The proposed point of compliance (30 TAC 335.161) and point of exposure wells.

(3) Any other proposed monitor wells such as supplemental wells, observation wells, background wells, etc. If appropriate the groundwater monitoring system should have a sufficient number of wells be designated to monitor the downgradient extent of the plume.

(4) Features which may serve as conduits for subsurface contamination.

b. For each waste management unit/area in the proposed groundwater monitoring system, submit the locations of individual waste management unit/area monitor wells (existing or proposed) and any soil borings (plugged

and unplugged) specifically drilled for assessment of contamination. These individual monitor wells shall be identified by respective well number on a plan view drawing and only the background, point of compliance and/or point of exposure wells should be indicated in CP Table V – Designation of Wells by Function. The plan view map depicting the location of individual monitoring wells for compliance monitoring should be labeled as "CP Attachment A, sheet xx of xx" in the text box. The title box should also include reference to the facility name, Permit/Compliance Plan Number, Solid Waste Registration Number, Unit Description or name with Notice of Registration (NoR) Unit No. 0000. The "CP Attachment A" map(s) and CP Table V shall also become part of the final Compliance Plan.

3. Implementation Schedule

Itemize and discuss, in detail, the estimated time schedule necessary for any testing and assessments, system design, construction and installation, and final implementation of the groundwater monitoring program for each Regulated Unit and solid waste management unit. If the schedule of implementation for items are not completed at the time of the application, or are not completed at the time of issuance of the final draft Permit/Compliance Plan, then the items should be added to the CP Table VIII - Compliance Schedule of the application.

D. Corrective Action Program

As required by 30 TAC 335.166, the owner or operator must take corrective action to ensure that Regulated Units are in compliance with the Groundwater Protection Standards (GWPS) under 30 TAC 335.158. As required under 30 TAC 335.167, all releases of hazardous constituents from any solid waste management unit at the facility must also be addressed. For existing corrective action programs which have been approved by the TCEQ, the applicant shall provide a copy of the TCEQ corrective action system approval letter, design system specifications and any updates as requested in Section XI.D.3.a.(1) of this section. The applicant must provide the information requested below when proposing a corrective action program which has not been previously approved by the TCEQ including a detailed description of a corrective action or a combination of corrective actions that will remedy the groundwater contamination at the waste management unit and a proposed plan for a monitoring program that will demonstrate the effectiveness of the corrective action.

The owner or operator may also apply for a Facility Operations Area (FOA) pursuant to the requirements of 30 TAC 350.131 - 350.135 of the Texas Risk Reduction Program (TRRP) rules, provided the applicant meets the FOA pre-approval process steps 1 through 3 approved by the Commission.

Also, the owner or operator may apply for alternative groundwater Corrective Action Program pursuant 30 TAC 335.151, 335.156 and 30 TAC 350, where there are commingled releases from RCRA-regulated unit from one or more SWMUs, PCO, and/or AOC.

The Corrective Action Program, last updated with the Class 3 Permit Modification issued on November 18, 2019, includes the Regulated Units and SWMUs and AOCs listed in CP Table I. Annual reports of the ongoing Corrective Action Program have been provided to the TCEQ and acknowledgment has been received for the TCEQ that the reports fulfill the requirements of CP Section VII.B.

See Attachment R, S, and T for the locations and description of the Groundwater Monitoring, Corrective Action Program, and current recovery systems for the description of the Groundwater Monitoring and Corrective Action Programs for Regulated Units (SEHB and NHB). See Attachment V (RAPs) for SWMUs and AOCs.

Detailed descriptions of each of the response actions, including the information requested in Sections D.1 through D.4 and Section D.6 below, as applicable, is included in Attachments R, S, and T for Regulated Units (SEHB and NHB) and Attachment V (RAPs) for SWMUs and AOCs. In accordance with Section D.3.c. a Sampling and Analysis is included at Attachment Y to this Part B application.

Plan view maps in accordance with Section XI.D.4.b are included in Attachment U.

Proposed modifications to the Corrective Action Program since the Class 3 Permit Modification was issued on November 18, 2019, include the following:

- **No Further Action for Old Pump House No. 5. The RACR is included in Attachment X.**
- **Incorporating North Plant PMZ AOC into the permit. The 2024 RAP Addendum is included in Attachment V.**
- **Reducing the COC list for Central Plant WMA PMZ (East, Southeast and South Migration Pathway) as presented in the 2014 Central Plant RAP Addendum is included in Attachment V.**
- **Removing one upgradient well in the Central Plant WMA PMZ that was destroyed and a slight modification of northern PMZ boundary. This is presented in the 2024 Central Plant RAP Addendum included in Attachment V.**
- **Removing AMP and CAO wells in West Plant PMZ based on last 4 years of groundwater monitoring data. This is presented in the 2024 West Plant RAP Addendum included in Attachment V.**
- **Removing one CAO well (MW-10) from the well network at NHB. This well is upgradient to the NHB and the COC has not been detected above the reporting limit in this well over the last 5 groundwater sampling events. Revised plan view map included in Attachment U.**

1. Type of Corrective Action Proposed

   From the list below, indicate the type of groundwater corrective action proposed for each hazardous waste unit/area. Discuss in detail if more than one corrective action is to be used in a waste management area. Submit the discussion and descriptions as an attachment to the application.

   a. Groundwater well recovery with surface treatment
   b. Groundwater well recovery/surface treatment/re injection
   c. **Groundwater well recovery and disposal at SEHB, NHB, TCI Group and West Plant WMA PMZ**
   d. Vapor extraction system

e. **Interceptor trench recovery and disposal Proposed for SEHB**

f. Interceptor trench recovery and surface treatment

g. In-situ treatment – bioreclamation

h. In-situ treatment – chemical reaction

i. Barrier walls/encapsulation

j. Permeable treatment beds

k. Other, please describe

2. Program Description

Attach a technical report providing a detailed description of a complete corrective action system including above and below ground equipment/facilities. Include discussions on the following concerns for each type of corrective action as applicable.

See Attachment R, S, and T for the locations and description of the Groundwater Monitoring, Corrective Action Program, and current recovery systems for the description of the Groundwater Monitoring and Corrective Action Programs for Regulated Units (SEHB and NHB). See Attachment V (RAPs) for SWMUs and AOCs.

a. Recovery Wells

(1) Indicate on a plan view of the waste management area the anticipated location of Recovery Well(s) which would optimize the extraction of the groundwater contaminants.

(2) Indicate on a plan view the estimated radius of influence of each Recovery Well.

(3) Indicate the optimum pumping rate of each Recovery Well determined from the aquifer pump test.

(4) Describe the design of the Recovery Wells and pump system including diameter, construction material, gravel packing, screen slot sizes and patterns, type of pumps and maintenance requirements.

(5) Describe the collection and storage of the contaminated groundwater which is classified hazardous waste (on site storage of hazardous waste shall require compliance with the applicable regulations):

(a) Less than 90 day tanks (see 40 CFR 262.34/40 CFR 265 Subpart J);

(b) Permitted Tanks (see 40 CFR 264 Subpart J);

(c) (Less than 90 day Container Storage Area (see 40 CFR 262.34/40 CFR 265 Subpart I);

(d) Permitted Container Storage Area (see 40 CFR 264 Subpart I); and

(e) Temporary Units (see CFR 264.553).

(6) Describe the treatment and/or final disposition of the hazardous and nonhazardous contaminated groundwater.

b. Vapor Extraction System

(1) Indicate on a plan view of the waste management area the anticipated location of the vapor extraction system which would optimize the extraction of hazardous constituents from the vadose zone.
(2) Describe the construction design of the vapor extraction system in detail, including all diagrams and drawings.
(3) Describe the emission control equipment used to comply with air quality regulations.
(4) Provide the anticipated volatile contaminants to be remediated along with information on the expected effectiveness of the vapor extraction system at the waste management unit.
(5) Provide established treatability data for the proposed design.
(6) Specify the hazardous constituents affected by this type of treatment.

c. Interceptor Trenches

(1) Indicate on a plan view of the waste management area the anticipated location of the interceptor trench.
(2) Provide the construction design.
(3) Describe the procedure for construction.
(4) Describe the liquid removal and collection system.
(5) Describe the surface storage and/or treatment of the contaminated groundwater.
(6) Describe the final disposition of the contaminated groundwater.

d. In-situ Treatment – Chemical Reaction

(1) Characterize the chemical agents to treat the contaminated groundwater and/or soils in the vadose zone.
(2) Provide laboratory treatability data.
(3) Specify the hazardous constituents affected by this type of treatment.
(4) Specify the reaction by products produced during the chemical reactions.
(5) Indicate degradation time for each treated hazardous constituent and any resulting chemical reaction by products.
(6) Describe the potential health risks caused by human exposure to the reaction by products.
(7) Describe potential damage to wildlife, crops, vegetation and physical structures caused by exposure to reaction by products.
(8) Describe the persistence and permanence of the potential effects of the reaction by products.
(9) Describe the method of chemical reactant injection and other important aspects of the system design.

e. In-situ Treatment Bioreclamation

(1) Describe the type of bacteria most appropriate for the degradation of the hazardous constituents present in the groundwater and/or soil in the vadose zone.
(2) Describe the nutrients necessary and application frequency to encourage effective bioreclamation.
(3) Provide laboratory data from treatability studies utilizing the contaminated groundwater and describe any potential hazardous by products.

(4) Indicate the degradation time for each hazardous constituent affected by this treatment.
(5) Describe the method of injecting the bacteria and nutrients and describe the delivery system design.

f. Barrier Walls
(1) Provide laboratory permeability data using the actual contaminated groundwater.
(2) Describe the barrier wall materials.
(3) Summarize construction design and installation procedures.

g. Permeable Treatment Beds
(1) Provide laboratory data of treatability simulations using actual contaminated groundwater in combination with the material proposed to be used in treatment beds.
(2) Discuss the properties of the treatment material which would make it effective for use at this site.
(3) Indicate which hazardous constituents will be affected by this treatment. Indicate the reactions which will take place and the resulting reactant by products. Discuss the anticipated lifetime of the permeable treatment beds.
(4) Provide the construction design and installation procedures.

h. Other

Discuss in detail, any other corrective action (soils and groundwater) not included above which is proposed for use at the affected waste management area(s).

3. Groundwater Monitoring and Corrective Action Program Description

a. Describe the proposed groundwater monitoring system to be used to monitor corrective action and compliance with the GWPS which includes the following information.

See Attachment R for the description of the Groundwater Monitoring and Corrective Action Programs for Regulated Units (SEHB and NHB). See Attachment V (RAPs) for SWMUs and AOCs.

(1) Changes, if applicable, from the current groundwater monitoring program at the waste management unit that will be required to comply with the corrective action monitoring program described in 30 TAC 335.166. This description should address changes concerning:
(a) Geological and/or hydrogeological information differences since the submittal of the previous application [must submit a Geologic and Hydrogeologic Report in accordance with Section XI.A.4;
(b) Waste management areas/units;
(c) Construction details for monitor wells to evaluate compliance with "Attachment B" well specification requirements;
(d) The number and locations of additional monitor wells [must submit the Monitoring System Plan/Report required

by Section XI.D.3.c.(2);

(e) Sample handling, chain of custody, and analytical procedures (also see "Attachment C");
(f) Frequency of monitoring;
(g) Monitoring parameters;
(h) Evaluation of compliance with GWPS (statistical methods);
(i) Other Sampling and Analysis Plan information to be incompliant with "Attachment C";
(j) Compliance period as defined in Section XI.E.1.c. of the application;
(k) Financial assurance; and
(l) An ACL variance under 30 TAC 335.160(b), if applicable (also see "Attachment A").

(2) The number, depth and location of all monitor wells (Background Wells, Point of Compliance Wells, Corrective Action Observation Wells, Supplemental Wells, piezometers, etc.) and all Recovery Wells and complete CP Table V – Designation of Wells by Function. Also, make revisions as applicable to plans referenced in Section XI.D.3.c.

(3) The proposed hazardous constituent monitoring list which is based on constituents that were monitored during detection monitoring (if applicable), constituents detected in accordance with 30 TAC 335.164, and degradational constituents identified in CP Table III accordingly to develop the constituent list for the Corrective Action Monitoring Program. CP Table III shall become part of the final Compliance Plan.

(4) The proposed indicator parameter monitoring list. From the list of constituents and GWPS identified in CP Table III complete CP Table IIIA – Corrective Action Program Table of Indicator Parameters and the Groundwater Protection Standard, accordingly. CP Table IIIA shall become part of the Compliance Plan to be analyzed at least semiannually as required by 30 TAC 335.166(7).

(5) Monitoring frequency.

(6) Provisions for semiannual reporting of groundwater data.

(7) Annual determination of contamination plume rate and direction of migration.

(8) Compliance period. Calculate the compliance period as required by 30 TAC 335.162 and 335.165(1)(d). Include calculations and complete CP Table VI – Compliance Period for RCRA-Regulated Units which shall become part of the final Compliance Plan.

b. Proposed methods of evaluating the effectiveness of the corrective action in the saturated and vadose zone.

c. Submit the following plans and reports.

See Attachment Y for the current Sampling and Analysis Plan (SAP)

(1) Current Sampling and Analysis Plan The Sampling and Analysis Plan must include information required by 30 TAC 335.163(4) and 335.163(5) and 40 CFR Subpart 270.30(j). For guidance, please see "Attachment C" to the application.

(2) Groundwater Recovery and Monitoring System Plan At a minimum, the plan must include:

(a) Recovery System Plan The applicant should propose a recovery system design that will achieve the performance requirement to protect human health and the environment. The plan should provide detailed plans, information and specifications on the recovery system's design and well installation specifications. All new recovery wells must be installed in accordance with applicable specifications outlined in "Attachment B", unless an alternative well design is approved by the agency prior to installation of the well. The Recovery System Plan must include Recovery System Design and Specifications Certified by a Texas Registered Professional Engineer. The certification must be sealed by a licensed Professional Engineer, with current license, along with the Registered Engineering Firm's name and Registration Number as required by the Texas Engineering Practice Act.;

(b) Monitoring System Plan If the applicant is proposing a monitoring well or a monitoring system in the application, the applicable well installation specifications outlined in "Attachment B" of this application should be followed. All new monitoring wells must be installed in accordance with the specifications outlined in "Attachment B", unless an alternative design is approved by the agency prior to installation. If the applicant proposes as part of the monitoring system, any well (existing or proposed) that does not meet or exceed the requirements outlined in "Attachment B", then the proposed alternative design must be described in detail in the Monitoring System Plan and must be submitted with this application. The Monitoring System Plan must include:

(i.) Monitoring System Design and Specifications Certified by a qualified engineer and/or geologist which provides detailed plans and specifications on the monitoring system design; and

(ii.) Well Drilling and Well Casing Specifications Certified by a qualified engineer and/or geologist which provides details on well casing specification, drilling logs and reports.

(3) Current Geologic and Hydrogeologic Report - Provide a report per Section XI.A.4 of this application discussing the geologic and hydrogeologic conditions of the facility and the specific area affected by the waste management areas. This report should include the most up-to-date information from which the design of the groundwater monitoring system was based.

4. Waste Management Units/Areas Monitored Under Corrective Action Programs

   a. Delineate and identify the following for each waste management unit/area in the proposed groundwater monitoring and corrective action programs.

      (1) Boundary of the waste management unit and, if applicable, the proposed waste management area which includes more than one waste management unit (identify all waste management units which are included in the waste management area). These waste management units/areas subject to corrective action pursuant to 30 TAC 335.166 and 335.167 should be listed in CP Table I – Waste Management Units and Areas Subject to Groundwater Corrective Action and Compliance Monitoring. CP Table I shall become part of the final Compliance Plan.

      (2) The proposed point of compliance (30 TAC 335.161), point of exposure wells, or alternate point of exposure wells.

      (3) Any proposed monitor wells such as supplemental wells, observation wells, background wells, etc. If appropriate the groundwater monitoring system should have a sufficient number of wells to monitor the downgradient extent of the plume.

      (4) Features which may serve as conduits for subsurface contamination.

      (5) Corrective action system.

   b. For each waste management unit/area in the proposed groundwater monitoring system, submit the locations of individual waste management unit/area monitor wells (existing or proposed) and any soil borings (plugged and unplugged) specifically drilled for assessment of contamination. These individual monitor wells shall be identified by respective well number on a plan view drawing and only the background, point of compliance, point of exposure wells and/or alternate point of exposure wells should be indicated in CP Table V – Designation of Wells by Function. The plan view map depicting the location of individual monitoring wells for corrective action monitoring should be labeled as "CP Attachment A, sheet xx of xx" in the text box. The title box should also include reference to the facility name, Permit/Compliance Plan Number, Solid Waste Registration Number, Unit Description or name with Notice of Registration (NoR) Unit No. 0000. The "CP Attachment A" map(s) and CP Table V shall also become part of the final Permit/Compliance Plan.

   See Attachment U for plan view maps show monitoring wells for corrective action monitoring at the permitted units (SEHB and CAMU/Former NHB), SWMUs and AOCs.

5. Waste Management Units/Areas Addressed Under Other Corrective Action Programs -Facility Operations Area (FOA), specific to the requirements of 30 TAC 350.131 - 350.135. The Permittee should also complete Sections XI.D.4. for other units not addressed by the FOA that may require corrective action outside the FOA boundary. For other units not addressed by the FOA, either within the FOA or outside the FOA which may require compliance monitoring, the Permittee should complete Section XI.C. of this application accordingly.

   NOT APPLICABLE

   a. Provide an approved version of the FOA Qualifying Criteria Checklist and

evidence that Steps 1 through 3 of the FOA pre-approval process has been approved by the Commission.

b. Provide a discussion on exceptions to the TRRP rule requested.

c. Provide a summary of the SWMUs/AOCs that will be addressed within the FOA boundary and a discussion of the multiple sources of COCs present and how FOA will better address these sources.

d. Provide maps of appropriate scale depicting the following (maps may be combined where appropriate):

    (1) The number, location and type of monitoring points in each stratigraphic unit to be monitored individual monitoring wells should be identified by respective well number on a plan view drawing, to include the background, Point of Compliance (POC), Point of Exposure (POE), FOA Boundary of Compliance wells, FOA piezometers or supplemental wells, Corrective Action Observation ((CAO), Corrective Action System (CAS) wells that are applicable for FOA monitoring program should be labeled as "CP Attachment A, sheet no xx of xx" in the title box. The title box should also include reference to the facility name, Permit/Compliance Plan Number (00000), TCEQ Solid Waste Registration Number and Unit Description or Name. The "CP Attachment A" map(s) shall become part of the final Permit/Compliance Plan.
    (2) HWMUs/SWMUs/AOCs addressed
    (3) Surrounding land use
    (4) FOA lateral boundaries
    (5) Potential source areas
    (6) Potentiometric surface of all relevant transmissive units
    (7) Surrounding water wells
    (8) Extent of known contamination in each transmissive unit
    (9) Areas of potential ecological impact
    (10) Known occurrences of NAPL or DNAPL in each transmissive units
    (11) FOA access control components

e. Provide cross-sections in accordance with Section XI.A.4. depicting the following (maps may be combined where appropriate);

    (1) The vertical boundaries of the FOA;
    (2) The vertical extent of contamination;
    (3) Groundwater level elevations for each transmissive unit.

f. Provide tabulated information for;

    (1) Results of Appendix IX GW sampling.
    (2) Proposed PCLs for each hazardous constituent and principal degradational constituent for each monitoring point with supporting documentation (including a discussion of exposure pathways) should be listed in CP Table III – CORRECTIVE ACTION PROGRAM Table of Detected Hazardous and Solid Waste Constituents and the Groundwater Protection Standard. CP Table III shall become part of the final Compliance Plan.
    (3) The proposed indicator parameter monitoring list. From the list of constituents and GWPS identified in CP Table IIIA. CP Table IIIA shall become part of the Compliance Plan to be analyzed at

least semiannually as required by 30 TAC 335.166(7).

(4) Only the background, POC, POE, FOA Boundary of Compliance wells should be listed in CP Table V which shall become part of the final Permit/Compliance Plan.

g. Provide a discussion of the types of corrective action that will be employed to address contaminated media.

h. Provide detailed descriptions of GW recovery and other remedial technologies such as vapor extraction, interceptor trenches, hydraulic containment, barrier walls, etc., including radius of influence, estimated optimum recovery rates, location of collection, storage or disposal facilities.

i. Provide a detailed description of the ground water monitoring system including placement of monitoring wells, hydrogeologic characteristics of monitored units and well completion details.

j. Provide a Sampling and Analysis plan for the proposed FOA that includes development of COCs to be monitored, sampling methodology, sample handling procedures, sampling frequency and statistical procedures for evaluating analytical results (Appendix C).

k. Propose a methodology for evaluating the effectiveness of remedial measures and potential remedial system enhancements.

l. Propose a reporting schedule to provide updated information on the installation and operation of remedial and monitoring systems.

m. Provide Financial Assurance in accordance with Section XI.E.

n. Provide draft language intended to comply with the deed notification requirements of 30 TAC 350.111 and 350.135(a)(11).

o. Provide a summary of the approved workers protection plan.

p. Provide a discussion of areas of ecological impact, if any, and development of associated Protective Concentration Limits (PCLs).

q. Provide a discussion of how NAPL occurrences, if any, will be addressed inside and outside the FOA.

r. Provide a schedule of implementation for items not completed at the time of application See also Section XI.D.8.

6. Waste Management Units/Areas Monitored Under Corrective Action Programs - Plume Management Zone (PMZ)

a. Please provide a summary of the HWMUs and SWMUs/AOCs that will be addressed within the PMZ boundary.

b. Please provide a discussion of the multiple sources of COCs present and how PMZ will better address these sources.

c. Please provide maps of appropriate scale depicting the following (maps may be combined where appropriate);

(1) HWMUs/SWMUs/AOCs addressed
(2) surrounding land use
(3) PMZ lateral boundaries
(4) potential source areas
(5) Potentiometric surface of all relevant transmissive units
(6) Surrounding water wells
(7) extent of known contamination in each transmissive unit

(8) number, location and type of monitoring points in each stratigraphic unit to be monitored
(9) Areas of potential ecological impact
(10) known occurrences of LNAPL or DNAPL in each transmissive unit

d. Please provide sufficient cross-sections depicting the following (maps may be combined where appropriate);
   (1) The vertical boundaries of the PMZ;
   (2) The vertical extent of contamination;
   (3) potentiometric surfaces for each transmissive unit.

e. Please provide tabulated information for;
   (1) history of all relevant units or AOCs;
   (2) summary of hydrogeologic data for each affected transmissive unit;
   (3) results of Appendix IX GW sampling;
   (4) proposed PCLs for each constituent for each monitoring point (Point of Exposure wells, alternate point of exposure wells, etc) with supporting documentation (including a discussion of exposure pathways). This should also include the designation/establishment of sufficient number of Attenuation Monitoring Points (AMPs) beginning at an appropriate hydraulically upgradient location within the groundwater protective concentration level exceedence (PLCE) zone and continuing down the approximate central flow path of the constituent of concern (COC) in the downgradient extent of the Plume Management Zone(s) in accordance with 30 TAC 350.33(f)(4)(D).
   (5) Establish/Calculate Attenuation Action Levels (AALs) (critical PCLs) for each attenuation monitoring point in accordance with 30 TAC 350.33(f)(4)(D)(ii). The established AALs (critical PCLs) for each AMP well should be graphically presented in table format on the plan view map depicting the location of individual monitoring wells (including AMP wells) for corrective action monitoring labeled "CP Attachment A, Sheet xx of xx", referenced in XI.D.4.b.

f. Please provide a discussion of the types of corrective action that will be employed to address contaminated media.

g. Please provide detailed descriptions of GW recovery and other remedial technologies such as vapor extraction, interceptor trenches, hydraulic containment, barrier walls, etc., including radius of influence, estimated optimum recovery rates, location of collection, storage or disposal facilities.

h. Please provide a detailed description of the groundwater monitoring system including placement of monitoring wells, hydrogeologic characteristics of monitored units and well completion details.

i. Please provide a Sampling and Analysis plan for the proposed PMZ that includes development of COCs to be monitored, sampling methodology, sample handling procedures, sampling frequency and statistical procedures for evaluating analytical results.

j. Please propose a methodology for evaluating the effectiveness of remedial measures and potential remedial system enhancements.

k. Please propose a reporting schedule to provide updated information on the installation and operation of remedial and monitoring systems.

l. Please provide a thorough detailed description of an estimate of all costs that will be incurred by implementing, operating, and maintaining the corrective action and monitoring systems addressed by the compliance plan.

m. Please provide draft language intended to comply with the deed notification requirements of 350.111, and schedule to verify compliance with institutional control requirements in accordance with 30 TAC 350.31(g) which provides notice of the existence and location of the PMZ and which prevents exposure to groundwater from this zone until such a time as constituents of concern may be reduced to below the GWPS.

n. Schedule for notification requirements if an unexpected event occurs, or a condition is detected, during post-response action care period which indicates that additional response actions will be required at an affected property pursuant to 30 TAC 350.33(k).

o. Please provide a summary of the approved soil response action plan.

p. Please provide a discussion of areas of ecological impact, if any, and development of associated PCLs.

q. Please provide a discussion of how NAPL occurrences, if any, will be addressed inside the PMZ.

r. Please provide a schedule of implementation for items not completed at the time of application {See also Section XI.D.8.}

Refer to RAPs in Attachment V for West Plant, Central Plant, North Plant and TCI.

7. Waste Management Units/Areas Monitored Under Alternative Corrective Action Program for Co-mingled plumes Alternative groundwater Corrective Action Program apply, pursuant 30 TAC 335.151, 335.156 and 350, for commingled release from RCRA-regulated unit and from one or more SWMUs and/or AOC.

NOT APPLICABLE - RESERVED

a. Complete Sections XI.D.1. through 4.;

b. In addition to the CP Attachment A maps in Section XI.D.4.b., CP Attachment A maps should clearly depict those waste management unit or areas of the facility which have commingled plumes and the alternative corrective action applies.

c. Please provide a schedule of implementation for items not completed at the time of application {See also Section XI.D.8.}

8. Implementation Schedule

Itemize and discuss, in detail, the estimated time schedule necessary for any testing and assessments, system design, construction and installation, and final implementation of the groundwater monitoring program for each Regulated Unit and solid waste management unit. If the schedule of implementation for items are not completed at the time of the application, or are not completed at the time of issuance of the final draft Compliance Plan, then the items should be added to the CP Table VIII - (Compliance Schedule) of the application.

CP Table VIII was not updated since the Class 3 Permit Modification issued on November 18, 2019

E. Cost Estimates For Financial Assurance

As required by 30 TAC 335.156 and 335.167, the applicant must provide cost estimates for groundwater monitoring and corrective action to determine the amount of financial assurance. Please complete the applicable parts of this form. Cost estimates should be filled out for each proposed corrective action/monitoring system at the site; or any additional corrective action system not covered in this Part. Please note, the Executive Director may request from the applicant documentary evidence for cost estimates.

If an item is not applicable, please mark it NA.

General Information:

1. For each Waste Management Area (WMA) list the following:
   a. A description of the waste management unit(s) in the WMA (e.g., landfill, surface impoundment, land treatment);

      RCRA-Regulated Units

      1. **CAMU/Former North Holding Basin (NHB) (NOR004) – RCRA permitted, operating Corrective Action Management Unit (CAMU) within a closed surface impoundment**
      2. **Southeast Holding Basin (SEHB) (NOR017) – RCRA permitted, closed surface impoundment.**
      3. **The description of other SWMUs are included in Attachment Q.**

   b. The NoR unit number(s) in the WMA; and the compliance period for the WMA listed above.

      NOR004 (CAMU/NHB) and NOR017 (SEHB)

      Year(s) = ___**11**_____

   c. (The compliance period is the number of years equal to the active life of the waste management area as defined in 30 TAC 335.162).
   d. In instances where the compliance period is equal to or exceeds 30 years, the maximum amount of financial assurance required will be based on 30 years because the required post-closure care period to perform corrective action and groundwater monitoring is 30 years. In instances where the compliance period is less than 30 years, the financial assurance for corrective action or compliance monitoring will be based on the longest time frame established by one of the following criteria:
      (1) the duration of your compliance plan;
      (2) the time frame for clean-up based on model projections and historical data as approved by the Executive Director; or
      (3) the compliance period for the unit/area.
      Total Years Used To Calculate the Financial Assurance for the Corrective Action and/or Compliance Monitoring Program

Year(s) = **11**

2. Please complete Table XI.E.1. – Corrective Action Program Cost Estimate.
3. Please complete Table XI.E.2. – Groundwater Monitoring Cost Estimate.
4. Please complete Table XI.E.3. – Financial Assurance Summary.

Table XI.A.1. - Facility History for Waste Management Units

Name of Waste Management Unit[1]	Type of Waste Management Unit	Notice of Registration Unit Number	Date Waste Was *First* Placed in Unit	EPA Waste Code	Estimated Capacity of Unit	Quantity of Waste Left in Place	Date Waste Was *Last* Placed in Unit[2]	Date of Unit Closure Or Projected Closure	Date Unit Certified Closed[3]	Is There Evidence of a Release of Hazardous Constituent(s)[4] to Groundwater? (Yes, No, or Unknown)
1. CAMU/Former North Holding Basin	Surface Impoundment	004	1975	D001,D002,D003, D004,D005,D006, D007,D008,D009, D010, D011, D012, D013, D014, D015, D016, D017, D018, D019, D020,D021, D022, D023,D024	88,000 CY	35,000 CY	NA	Active	NA	Yes
2. Southeast Holding Basin (SEHB)	Surface Impoundment	017	1974	Same as Unit No. 1	3,110 CY	3,110 CY	1985	1985	NA	Yes

Name of Waste Management Unit[1]	Type of Waste Management Unit	Notice of Registration Unit Number	Date Waste Was *First* Placed in Unit	EPA Waste Code	Estimated Capacity of Unit	Quantity of Waste Left in Place	Date Waste Was *Last* Placed in Unit[2]	Date of Unit Closure Or Projected Closure	Date Unit Certified Closed[3]	Is There Evidence of a Release of Hazardous Constituent(s)[4] to Groundwater? (Yes, No, or Unknown)
3. Drum Storage Building	Drum Storage Building	001	1989	D001,D002,D003, D004,D005,D006, D007,D008,D009, D010, D011, D012, D013, D014, D015, D016, D017, D018, D019, D020,D021, D022,D023,D024, D025,D026,D028, D035,D039,U002, U003,U009,U012, U019,U031,U043, U051,U052,U055, U056,U111,U112, U120,U125,U140, U154,U159,U161, U165,U210,U220, U239,U240	NA	NA	NA	Active	NA	No
4. Tank 29	Tank	002	1974	Same as Unit No. 1	1,095,730 Gals	0	1988	1993	NA	No
5. Tank 10-12	Tank	003	Unknown	Same as Unit No. 1	420,000 Gals	0	1993	1993	NA	No

Name of Waste Management Unit[1]	Type of Waste Management Unit	Notice of Registration Unit Number	Date Waste Was *First* Placed in Unit	EPA Waste Code	Estimated Capacity of Unit	Quantity of Waste Left in Place	Date Waste Was *Last* Placed in Unit[2]	Date of Unit Closure Or Projected Closure	Date Unit Certified Closed[3]	Is There Evidence of a Release of Hazardous Constituent(s)[4] to Groundwater? (Yes, No, or Unknown)
6. Tank 100-5	Tank	005	1988	D001,D002,D003, D004,D005,D006, D007,D008,D009, D010, D011, D012, D013, D014, D015, D016, D017, D018, D019, D020,D021, D022,D023,D024, D025,D026,D028, D035,D039,D043, U002,U003,U009, U012,U019,U031, U043,U051,U052 U055,U056,U112, U120,U125,U140, U154,U159,U161, U165,U177,U188, U191,U210,U220, U226,U227,U239, U240	4,200,000 Gals	0	1998	1998	NA	No
7. Tank 100-6	Tank	006	1988	Same as Unit No. 6	4,200,00 Gals	0	1998	1998	NA	No
8. Tank 50	Tank	007	1980	Same as Unit No.1	30,080 Gals	0	1988	1989	NA	No

Name of Waste Management Unit[1]	Type of Waste Management Unit	Notice of Registration Unit Number	Date Waste Was *First* Placed in Unit	EPA Waste Code	Estimated Capacity of Unit	Quantity of Waste Left in Place	Date Waste Was *Last* Placed in Unit[2]	Date of Unit Closure Or Projected Closure	Date Unit Certified Closed[3]	Is There Evidence of a Release of Hazardous Constituent(s)[4] to Groundwater? (Yes, No, or Unknown)

30. East Plant Waste Management Area	Unknown	None	NA	NA	NA	NA	NA	2013	NA	Yes

1 Indicate by asterisk (*) those waste management units that have received any hazardous waste constituent listed in Appendix VIII of 40 CFR Part 261.
2 For the purposes of this Compliance Plan Application, a waste management unit receiving hazardous waste after July 26, 1982 shall be considered a Regulated Unit. A waste management unit that ceased receiving hazardous waste on or before that date shall be considered a Solid Waste Management Unit (SWMU).
3 Date the applicant submitted certification of closure to the Commission.
4 Hazardous constituents are those hazardous constituents listed in Appendix IX of 40 CFR Part 264.

Table XI.E.1. Corrective Action Program Cost Estimate

1. Pumping Capacity Per Year:			
Daily average system pumping rate	63,000	•	gal/day
Annual groundwater volume recovered	23MM	•	gal/yr
2. Off-Site Liquid Treatment / Disposal Cost:		•	
A. Volume of treated contaminated water to be disposed of off-site yearly	23MM	•	gal/yr
Transportation of liquid waste disposed of off-site yearly		•	
(1) Transportation cost per gallon	NA	•	$/gal
(2) Gallons of contaminated water shipped per year	NA	•	gal/yr
(3) Annual cost of transportation (1 x 2)	NA	•	$/yr
On-site yearly storage cost prior to off-site disposal	NA	•	$/yr
Off-site yearly treatment cost of liquid waste		•	
(1) Treatment charge per gallon	NA	•	$/gal
(2) Total volume to be treated per year	NA	•	gal/yr
(3) Annual treatment cost (1 x 2)	NA	•	$/yr
Off-site disposal cost of liquid waste per year		•	
(1) Disposal charge per gallon	0.02	•	$/gal
(2) Total volume to be disposed per year	23MM	•	gal/yr
(3) Annual disposal cost (1 x 2)	460,000	•	$/yr
***Annual Off-Site Liquid Treatment / Disposal Cost (2B3 + 2C +2D3 + 2E3)**	460,000	**$**	
3. On-site Waste Water Treatment System Cost and On-site Treatment / Disposal Cost:			
Submit a cost estimate for a treatment system specifically designed and used exclusively for the groundwater corrective action program and operational after some start up maintenance. Estimates to clean out the system should also be included in the following cost.			
A. Initial capital expenditure for treatment system including start up maintenance	0	$	
***On-Site Waste Water Treatment System Capital Cost (3A)**	0	**$**	

B. Gallons of contaminated water to be treated on-site per year	0	•	gal/yr
C. Cost of on-site treatment per gallon	NA	•	$/gal
D. Cost of sludge, or solids disposal per year	12,500	•	$/yr
E. Cost per year of maintenance on treatment system and recovery system, along with any additional equipment and repairs needed for the systems	15,000	•	$/yr
F. Cost of on-site disposal per year	NA	•	$/yr
***Annual On-Site Treatment / Disposal Cost [(3B x 3C) + 3D + 3E + 3F]**	27,500	**$**	
4. Inspections, Maintenance and Operation Cost for the Corrective Action Program:		•	
A. Operator's time on-site for inspections and maintenance per year	1,410	•	hour/yr
B. Charge of salary per hour	80	•	$/hr
C. Annual cost of labor (4A x 4B)	112,800	•	$/yr
D. Replacement of parts and equipment per year	15,000	•	$/yr
E. Electricity cost per year	0	•	$/yr
***Annual Inspections / Maintenance / Operation Cost for the Corrective Action Program (4C + 4D + 4E)**	127,800	**$**	

Table XI.E.2 Groundwater Monitoring Cost Estimate

	Central Plant WMA PMZ (West Migration Pathway/East, Southeast and South Migration Pathway)		**West Plant WMA PMZ (SWMU Group W3/ West Chemical AOC)**		**Texmark Chemical Inc. (TCI) Group**		**North Plant PMZ AOC**		**CAMU/North Holding Basin**		**Southeast Holding Basin**	
1. Annual Sampling and Analysis Cost:												
A. Background Wells												
(1) Number of wells	0		0		0		2		2		0	
(2) Sample analysis cost per well	350	$/well	225	$/well	135	$/well	190	$/well	85	$/well	350	$/well
(3) Number of sampling events per year		/yr		/yr		/yr	2	/yr	2	/yr		/yr
(4) Sampling cost (1 x 2 x 3)	0	$	0	$	0	$	760	$	340	$	0	$
B. Point of Compliance Wells												
(1) Number of wells	0		0		4		0		4		3	
(2) Sample analysis cost per well	350	$/well	225	$/well	135	$/well	190	$/well	85	$/well	350	$/well
(3) Number of sampling events per year		/yr		/yr	1	/yr		/yr	2	/yr	2	/yr
(4) Sampling cost (1 x 2 x 3)	0	$	0	$	540	$	0	$	680	$	2,100	$
C. Recovery Wells												
(1) Number of wells	0		0		0		0		0		9

Table XI.E.3. – Financial Assurance Summary

Annual Off-Site Liquid Treatment / Disposal Cost	$	460,000
Annual On-Site Treatment / Disposal Cost	$	27,500
Annual Inspection / Maintenance / Operation Cost For The Corrective Action Program	$	127,800
Annual Groundwater Monitoring Cost	$	99,450
Annual Administrative Cost	$	40,000
Annual Inspection And Maintenance Cost For The Groundwater Monitoring Program (**Included in Annual Inspection/Maintenance for Corrective Action Program**)	$	0
Annual Sub Total	**$**	**754,750**
Total Years Used For Calculating Financial Assurance		11 Yrs
Remediation Cost (Annual Sub Total x Total Years Used)	$	8,302,250
On-Site Waste Water Treatment System Capital Cost	$	0
Total Well Cost	$	0
10% Contingency	$	830,225
Grand Total Cost (nearest $1000)	**$**	**9,132,475**

CP Table I: Waste Management Units and Areas Subject to Groundwater Corrective Action and Compliance Monitoring

A. Corrective Action[1] (30 TAC §335.166)

Unit Type[5]	Unit Name	Notice of Registration (NOR) Number, if applicable	Date Program Requirement and Remedy Standard Completed[5]
Surface Impoundment	1.CAMU/North Holding Basin	004	Ongoing Monitoring
Subsurface Impoundment	2.Southeast Holding Basin	017	Ongoing Monitoring

B. Compliance Monitoring[1] (30 TAC §335.165)

Unit Type[5]	Unit Name	Notice of Registration (NOR) Number, if applicable	Date Program Requirement and Remedy Standard Completed[5]
Reserved			

C. Corrective Action[2] (30 TAC §335.167)

Unit Type[5]	Unit Name	Notice of Registration (NOR) Number, if applicable	Date Program Requirement and Remedy Standard Completed[5]
SWMU	1. Texmark Chemical Inc. (TCI) Group	N/A	Ongoing Monitoring
SWMU	2. Central Plant WMA PMZ (West Migration Pathway/East, Southeast and South Migration Pathway)	N/A	Ongoing Monitoring
SWMU	3. West Plant WMA PMZ (SWMU Group W3)/West Chemical AOC)	N/A	Ongoing Monitoring
AOC	4. North Plant	N/A	Ongoing Monitoring

	PMZ AOC		

D. Alternative Corrective Actions[3] (30 TAC §335.151)

Unit Type[5]	Unit Name	Notice of Registration (NOR) Number, if applicable	Date Program Requirement and Remedy Standard Completed[5]
Reserved			

E. Facility Operations Area (FOA)[4] (30 TAC §335.156 and Chapter 350)

Unit Type[5]	Unit Name	Notice of Registration (NOR) Number, if applicable	Date Program Requirement and Remedy Standard Completed[5]
Reserved			

[Note: Enter "Reserved" if a specific program (referenced in CP Table I.A., I.B., I.C., I.D., and/or I.E.) is not applicable. More than one program may apply to a facility. Also, include a CD disk with the application that provides an electronic copy of the applicable files supporting CP TABLES I-VI in MS Word format.]

Foot Notes:

1 Program applies to RCRA-regulated units only.

2 Program applies to releases from solid waste management units (SWMUs) and/or areas of concern (AOCs).

3 Program applies to commingled releases from RCRA-regulated unit and from one or more SWMUs and/or AOCs.

4 List SWMUs, additional units/areas of Investigation, AOCs, RCRA-regulated units within the FOA that are subject to corrective action. For RCRA units, SWMUs and/ or AOC outside the FOA boundary for which compliance monitoring and/ or corrective action applies should be listed separately in Items A, B or C as appropriate.

5 Specify the date of Commissions No Further Action approval letter for program requirement and remedy standard completed for all media of concern. [Note: for the purpose of maintaining a historical record, the permittee shall update CP Table I to reflect the new status of the unit / area to include the remedy standard achieved for all media of concern and the date of the Commissions No Further Action approval letter. The units/area shall not be deleted from this table even though the program objectives have been completed and no further action has been approved. Put "N/A" in this column if not applicable.]

CP Table II: Solid Waste Management Units and/or Areas of Concern for which Corrective Action applies pursuant to 30 TAC 335.167

Unit Number[1]	Unit Name	Notice of Registration (NOR) Number, if applicable	SWMU or AOC	Media Affected[2]	Date Program Requirement and Remedy Standard Completed[3]
1.	<u>Central Plant WMA PMZ:</u> SWMU Group C1: Belowground OWS Tank 117 Tank 50 Tank 51 Tank 116 Tank 29 SWMU Group C2: Southeast Holding Basin SEHB Sump Tank 26 Tank 82 Lift Station #4 T/TR Storm Water Drainage SWMU Group C3: Tank 3-9 Tank 32 Aboveground OWS SWMU Group C4: Drum Storage Area Impoundment #1 Tank 25-1	 015 010 007 008 009 002 017 None None None None None 013 012 014 001 None 011	SWMU	Soil and GW	Ongoing remedy for affected soil and groundwater
2.	<u>East Plant Waste Management Area:</u> Texaco Landfill #3 Impoundment #3	 None None	SWMU	Soil and GW (except Texaco Landfill #3)	Texaco Landfill #3 - Approved No Release 12/8/00 Impoundment #3 – Approved NFA 4/11/2013

	East Plant Tank Car Rack EPWMA Benzene Release	None None			East Plant Tank Car Rack – Approved NFA 1/5/2005 EPWMA Benzene Release – Approved NFA 4/11/2013
3.	<u>North Plant Waste Management Area:</u> Tract A Tract B Tract C	 016 None None	SWMU		Ongoing remedy for affected soil and groundwater Approved NFA 4/1/2005 Approved NFA 1/5/2005
4.	<u>West Plant Waste Management Area (WMA):</u> SWMU Group W1: CAMU/North Holding Pond/ DAF Tank EQ Basin SWMU Group W2: Tank 100-5 Tank 100-6 SWMU Group W3: WPWMA GW Plume Tank 10-12 Others: Tank 5-20	 004 019 020 005 006 None 003 018	SWMU	Soil and GW	Ongoing remedy for affected soil and groundwater Approved NFA 5/11/2004
5.	<u>Texmark Chemical Inc. (TCI) Group:</u> Impoundment #2 Tank 28	 None None	SWMU	Soil and GW	Ongoing remedy for affected soil and groundwater
6.	Additional RFI Unit Texaco Landfill #4 North Spoils Area	 None None	SWMU	Soil	Approved No Release 6/14/1999 Approved No Release 6/14/1999
7.	West Chemical AOC	None	AOC	Soil and GW	Ongoing remedy for affected soil and groundwater

8.	Old Pump House No. 5 AOC	None	AOC	Soil and GW	Remedy Standard B. Response Action Completion Report (RACR) that requested removal of the unit from the permit approved on January 30, 2025
9.	Gate 6 AOC	None	AOC	Soil and GW	Approved NFA 12/16/2022
10.	North Plant PMZ AOC	None	AOC	Soil and GW	Ongoing remedy for affected soil and groundwater

Foot Notes:
SWMU ' Solid Waste Management Unit
AOC ' Area of Concern
1 For sites with FOA Authorization, list SWMUs and/or AOCs that were not included in the FOA, and are subject to corrective action.
2 Specify affected media groundwater, soils, etc.
3 Specify the date of Commissions No Further Action approval letter for program requirement and remedy standard completed for all media of concern.

CP Table III: Corrective Action Program Table of Detected Hazardous and Solid Waste Constituents and the Groundwater Protection Standard

Unit Name	COLUMN A Hazardous Constituents	COLUMN B Groundwater Protection Standards (mg/l)	COLUMN C Groundwater Protection Standards at the POE (mg/l)
1. CAMU/North Holding Basin (Zones III and IV)	1,2 Dichloroethane	0.005 $^{GW}GW_{Ing}$	NA

Foot Note:

GWGWIng ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB (Residential or Commercial /Industrial) for Class 1 or Class 2 Groundwater ingestion PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.. In accordance with §350.72(b), GWGWIng, PCLs may need to be adjusted to lower concentrations to meet the cumulative carcinogenic risk level (less than or equal to 1x10-4) and hazard index criteria (less than or equal to 10) when there are more than 10 carcinogenic and/or more than 10 non-carcinogenic chemicals of concern within a source medium.

AirGWInh-V ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB (Residential or Commercial /Industrial) for Class 1 or Class 2 Groundwater inhalation PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

SWGW ACL pursuant to 30 TAC §335.160(b) based upon the Protective PCL determined under RSA or RSB for Groundwater- to-surface water PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

AAL ACL derived pursuant to 30 TAC §335.160(b) based upon the Protective Concentration level (PCL) established as an Attenuation Action Level as defined in 30 TAC §350(a)(4).

GWGWIng ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB (Residential or Commercial /Industrial) for Class 1 or Class 2 Groundwater ingestion PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.. In accordance with §350.72(b), GWGWIng, PCLs may need to be adjusted to lower concentrations to meet the cumulative carcinogenic risk level (less than or equal to 1x10-4) and hazard index criteria (less than or equal to 10) when there are more than 10 carcinogenic and/or more than 10 non-carcinogenic chemicals of concern within a source medium.

AirGWInh-V ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB (Residential or Commercial /Industrial) for Class 1 or Class 2 Groundwater inhalation PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

SWGW ACL pursuant to 30 TAC §335.160(b) based upon the Protective PCL determined under RSA or RSB for Groundwater- to-surface water PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

AAL ACL derived pursuant to 30 TAC §335.160(b) based upon the Protective Concentration level (PCL) established as an Attenuation Action Level as defined in 30 TAC §350(a)(4).

CP Table IV: Compliance Monitoring Program Table of Hazardous and Solid Waste Constituents and Quantitation Limits

Unit Name	COLUMN A Hazardous Constituents	COLUMN B Concentration Limits (mg/l)
Reserved		

[**Note:** This Table should provide the long list of hazardous constituents that are reasonably expected to be in or derived from waste placed in the units, and may not necessarily be detected and that are to be monitored annually to determine if any new constituents need to be added to CP Table IVA. Also, instead of listing individual constituents of concern (COCs), Appendix IX can be referenced in this table. If Appendix IX list and associated Practical Quantitation Limit (PQL) or Method Quantitation Limit (MQLs) are being required instead of listing individual COCs, add this sentence: The Permittee may petition the Executive Director for deletion of specific parameters from Appendix IX analysis if the Permittee can demonstrate that the constituents were never used in the facility's operation or were never disposed in the waste management area.]

Foot Note:

In the Footnote use one of the following Quantitation Limit designations as the concentration limit if RRR or TRRP apply

*** For RRR use the following designation, or***

ND Non-detectable at PQL as determined by the analytical methods of the EPA SW-846 most recent edition, and as listed in the July 8, 1987 edition of the Federal Register and later editions. PQL is indicated in parentheses. PQL is the lowest concentrations of analytes in groundwaters that can be reliably determined within specified limits of precision and accuracy by the indicated methods under routine laboratory operating condition.

BKG Background as determined in accordance with 30 TAC 350.4(a)(6).

*** Use the following designation if TRRP applies:***

ND Non-detectable at MQL as determined by the analytical methods of the EPA SW-846 most recent edition, and as listed in the July 8, 1987 edition of the Federal Register and later editions. MQL is indicated in parentheses. MQL is defined in 30 TAC §350.4 (54) as the lowest non-zero concentration standard in the laboratory's initial calibration curve and is based on the final volume of extract (or sample) used by the laboratory.

BKG Background as determined in accordance with 30 TAC 350.4(a)(6).

CP Table IVA: Compliance Monitoring Program Table of Detected Hazardous Constituents and the Groundwater Protection Standard

Unit Name	COLUMN A Hazardous Constituents	COLUMN B Groundwater Protection Standard (mg/l)
Reserved		

* [Note: This Table should provide a list of all hazardous constituents detected above the Quantitation Limits specified in CP Table IV – Compliance Monitoring Program Table of Hazardous and Solid Waste Constituents and Practical Quantitation Limits or Method Quantitation Limits for Compliance Monitoring. CP Table IVA constituents are to be monitored semiannually to verify achievement of the GWPS.]

Foot Note:

Use the following GWPS footnote designations if Risk Reduction Rules (RRR) or Texas Risk Reduction Program (TRRP) apply:

*** For RRR use the following designation, or***

MSC ACL pursuant to 30 TAC §335.160(b) based upon the Groundwater Medium-Specific Concentration, Residential {...or Industrial...) Risk Reduction Standard No. 2 {...or No. 3} specified in 30 TAC §335 Subchapter S.

MCL ACL pursuant to 30 TAC §335.160(b) based upon the Groundwater Maximum Contaminant Level specified in 40 CFR Part 141, National Primary Drinking Water Regulations Subparts B and G.

SMCL ACL pursuant to 30 TAC §335.160(b) based upon the Groundwater Secondary Maximum Contaminant Level specified in 40 CFR Part 143, National Secondary Drinking Water Regulations.

AL ACL pursuant to 30 TAC §335.160(b) based upon the Action Level specified in 40 CFR Part 141, National Primary Drinking Water Regulations Subpart I.

BKG Background as determined in accordance with Provision XI.F.1.

ND Non-detectable at PQL as determined by the analytical methods of the EPA SW-846 most recent edition, and as listed in the July 8, 1987 edition of the Federal Register and later editions. PQL is indicated in parentheses. PQL is the lowest concentrations of analytes in groundwaters that can be reliably determined within specified limits of precision and accuracy by the indicated methods under routine laboratory operating condition.

*** Use the following designation if TRRP applies:***

GWGWIng ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB (Residential or Commercial /Industrial) for Class 1 or Class 2 Groundwater ingestion PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table. In accordance with §350.72(b), GWGWIng, PCLs may need to be adjusted to lower concentrations to meet the cumulative carcinogenic risk level (less than or equal to 1x10-4) and hazard index criteria (less than or equal to 10) when there are more than 10 carcinogenic and/or more than 10 non-carcinogenic chemicals of concern within a source medium.

GWGWClass3 ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB (Residential or Commercial /Industrial) Tier I for Class 3 Groundwater ingestion PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

AirGWInh-V ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB (Residential or Commercial /Industrial) for Class 1 or Class 2 Groundwater inhalation PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

SWGW ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB for Groundwater-to-surface water PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

SEDGW ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB for Groundwater-to-sediment PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

ECOGW ACL pursuant to 30 TAC §335.160(b) based upon the PCL determined under RSA or RSB for Groundwater- based on ecological receptor(s) PCL of 30 TAC Chapter 350. The PCL value, Column B, will change as updates to the rule are promulgated. Changes to the rule automatically change the concentration value established in Column B in this table.

BKG Background as determined in accordance with Provision XI.F.1.

ND Non-detectable at MQL as determined by the analytical methods of the EPA SW-846 most recent edition, and as listed in the July 8, 1987 edition of the Federal Register and later editions. MQL is indicated in parentheses. MQL is defined in 30 TAC §350.4 (54) as the lowest non-zero concentration standard in the laboratory's initial calibration curve and is based on the final volume of extract (or sample) used by the laboratory.

CP Table V: Designation of Wells

Point of Compliance Wells:

1. CAMU/North Holding Basin

   Zone III – MW-7 and RW-16

   Zone IV – MW-6 and RW-17

2. Southeast Holding Basin

   Sandy Channel Fill (SCF) and Uppermost Natural Transmissive Unit (UNTU) – MW-2R, MW-3R

   Uppermost Natural Transmissive Unit (UNTU) – MW-4R

3. Texmark Chemical Inc. (TCI) Group

   MW-18TCI, MW-19TCI, RW-3, and RW-5

4a. Central Plant WMA PMZ (East, Southeast, and South Migration Pathway)

   None

4b. Central Plant WMA PMZ (West Migration Pathway)

   None

5. West Plant WMA PMZ (SWMU Group W3)/West Chemical AOC)

   None

6. North Plant PMZ AOC

   None

Point of Exposure Wells:

1. CAMU/North Holding Basin

   None

2. Southeast Holding Basin

   Sandy Channel Fill (SCR) and Uppermost Natural Transmissive Unit (UNTU) – MW-5, MW-13, and MW-33

3. Texmark Chemical Inc. (TCI) Group

   None

4a. Central Plant WMA PMZ (East, Southeast, and South Migration Pathway)

   RI-1-17 and RI-1-18

4b. Central Plant WMA PMZ (West Migration Pathway)

   POE-1, POE-2, RI-1-14, RI-3-02, and RI-3-03

5. West Plant WMA PMZ (SWMU Group W3)/West Chemical AOC)

   P-2, MW-18, MW-25, MW-26, and MW-28

6. North Plant PMZ AOC
   MW-15, MW-16, and MW-18

Alternate Point of Exposure Wells:

1. CAMU/Former North Holding Basin
   None
2. Southeast Holding Basin
   None
3. Texmark Chemical Inc. (TCI) Group
   None
4a. Central Plant WMA PMZ (East, Southeast, and South Migration Pathway)
   None
4b. Central Plant WMA PMZ (West Migration Pathway)
   None
5. West Plant WMA PMZ (SWMU Group W3)/West Chemical AOC)
   None
6. North Plant PMZ AOC
   None

Background Wells:

1. CAMU/Former North Holding Basin
   Zone III – MW-1, MW-8
2. Southeast Holding Basin
   None
3. Texmark Chemical Inc. (TCI) Group
   None
4a. Central Plant WMA PMZ (East, Southeast, and South Migration Pathway)
   None
4b. Central Plant WMA PMZ (West Migration Pathway)
   None
5. West Plant WMA PMZ (SWMU Group W3)/West Chemical AOC)
   None
6. North Plant PMZ AOC
   MW-11, MW-13A

Note: Wells that are not listed in this table are subject to change, upon approval by the Executive Director, without modification to the Compliance Plan.

CP Table VI: Compliance Period for RCRA-Regulated Units

CAMU/North Holding Basin	Year or Number of Years
Year Waste Management Activities Initiated	1975
Year Closed	Active CAMU
Compliance Period	NA*
Compliance Period Began	1992

*Compliance Period will be evaluated upon closure of the Corrective Action Management Unit (CAMU).

Southeast Holding Basin	Year or Number of Years
Year Waste Management Activities Initiated	1974
Year Closed	1985
Compliance Period	11 Years
Compliance Period Began	1994

CP Table VII: Reporting Requirements

Item	Program	Reporting Frequency	Requirements
1.	All programs	Annual by March 1	Each report shall be certified by a qualified engineer and/or geoscientist.
2.	Corrective Action	Annual by March 1	A table of all modifications and amendments made to this Compliance Plan with their corresponding approval dates by the Executive Director or the Commission and a brief description of each action;
3.	Corrective Action	Annual by March 1	A summary of any activity within an area subject to institutional control.
4.	Corrective Action	Annual by March 1	Tabulation of well casing elevations in accordance with CP Attachment C;
5.	Corrective Action	Annual by March 1	Certification and well installation diagram for any new well installation or replacement and certification for any well plugging and abandonment;
6.	Corrective Action	Annual by March 1	Recommendation for any changes to the program;
7.	Corrective Action	Annual by March 1	Any other items requested by the Executive Director;
8.	Corrective Action	Annual by March 1	Water table maps shall be prepared from the groundwater data collected pursuant to Permit Provision XI.G. and shall be evaluated by the permittee with regard to the following parameters: a. Development and maintenance of a cone of depression during operation of the system; b. Direction and gradient of groundwater flow; c. Effectiveness of hydrodynamic control of the contaminated zone during operation; and d. Estimation of the rate and direction of groundwater contamination migration.

Item	Program	Reporting Frequency	Requirements
9.	Corrective Action	Annual by March 1	The permittee shall submit a report to each recipient listed in Provision XI.J.3., which includes the all applicable information listed in this table (CP Table VII: Reporting Requirements), determined since the previously submitted report, if those items are applicable. If both Corrective Action and Compliance Monitoring Programs are authorized, then the Groundwater Monitoring Report required by CP Table VII shall contain information required for both programs.
10.	Corrective Action	Annual by March 1	The Corrective Action System(s) authorized under Provision XI.B.3. in operation during the reporting period and a narrative summary of the evaluations made in accordance with Permit Sections XI.E., XI.F., and XI.G. for the preceding reporting period. The reporting periods shall be January 1 through June 30 and July 1 through December 31 for Corrective Action Monitoring, unless an alternative semiannual schedule is approved by the Commission. The period for Compliance Monitoring shall be based on the calendar year.
11.	Corrective Action	Annual by March 1	The method(s) utilized for management of recovered/purged groundwater shall be identified in accordance with Provision XI.B.8. The permittee shall maintain this list as part of the facility operating record and make it available for inspection upon request.

Item	Program	Reporting Frequency	Requirements
12.	Corrective Action	Annual by March 1	An updated table and map of all monitoring and corrective action system wells. The wells to be sampled shall be those wells proposed in the Compliance Plan Application referenced in Provision I.B. and any changes subsequently approved by the Executive Director pursuant to Provision XI.B.3. Provide in chronological order, a list of those wells which have been added to, or deleted from, the groundwater monitoring and remediation systems since original issuance of the Compliance Plan. Include the date of the Commission's approval for each entry;
13.	Corrective Action	Annual by March 1	The results of the chemical analyses, submitted in a tabulated format acceptable to the Executive Director which clearly indicates each parameter that exceeds the Groundwater Protection Standard (GWPS). Copies of the original laboratory report for chemical analyses showing detection limits and quality control and quality assurance data shall be provided if requested by the Executive Director;
14.	Corrective Action	Annual by March 1	Tabulation of all water level elevations required in Provision XI.F.3.d.(1), depth to water measurements, and total depth of well measurements collected since the data that was submitted in the previous monitoring report;
15.	Corrective Action	Annual by March 1	Potentiometric surface maps showing the elevation of the water table at the time of sampling, delineation of the radius of influence of the Corrective Action System, and the direction of groundwater flow gradients outside any radius of influence;
16.	Corrective Action	Annual by March 1	Tabulation of all data evaluation results pursuant to Provision XI.F.4. and status of each well with regard to compliance with the Corrective Action objectives and compliance with the GWPS;
17.	Corrective Action	Annual by March 1	An updated summary as required by CP Table VIII;

Item	Program	Reporting Frequency	Requirements
18.	Corrective Action	Annual by March 1	Summary of any changes made to the monitoring/ corrective action program and a summary of well inspections, repairs, and any operational difficulties;
19.	Corrective Action	Annual by March 1	A notation of the presence or absence of non-aqueous phase liquids (NAPLs), both light and dense phases, in each well during each sampling event since the last event covered in the previous monitoring report and tabulation of depth and thickness of NAPLs, if detected;
20.	Corrective Action	Annual by March 1	Quarterly tabulations of quantities of recovered groundwater and NAPLs, and graphs of monthly recorded flow rates versus time for the Recovery Wells during each reporting period. A narrative summary describing and evaluating the NAPL recovery program shall also be submitted;
21.	Corrective Action	Annual by March 1	Tabulation of the total contaminant mass recovered from each recovery system for each reporting period;
22.	Corrective Action	Annual by March 1	Maps of the contaminated area where GWPSs are exceeded depicting concentrations of CP Table IIIA constituents and any newly detected CP Table III constituents as isopleth contours or discrete concentrations if isopleth contours cannot be inferred. Areas where concentrations of constituents exceed the GWPS should be clearly delineated. Depict the boundary of the plume management zone (PMZ), if applicable;
23.	Corrective Action	Annual by March 1	Maps and tables indicating the extent and thickness of the NAPLs both light and dense phases, if detected;

Item	Program	Reporting Frequency	Requirements
24.	Corrective Action	Annual by March 1	Corrective Measures Implementation (CMI) Progress Report or Response Action Effectiveness Report or Response Action Completion Report to be submitted as a section of the Compliance Plan report in accordance with Provision XI.H.6., if necessary. The permittee will include a narrative summary of the status of the approved final corrective measures conducted in accordance with the approved CMI Workplan or RAP, and that the requirements of Provision XI.H.7. are being met.
25.	Corrective Action	Annual by March 1	The permittee will include a narrative summary of the status of each Solid Waste Management Unit (SWMU) and/or Area of Concern (AOC) subject to the requirements of Permit Provision XI.H. and ICM Program for a SWMU and/or AOC which documents that the objectives of Provision XI.H.8.b. are being achieved. This summary shall be included as a section of the Compliance Plan groundwater monitoring report.
26.	PMZ	Annual by March 1	A summary evaluating the effectiveness of the corrective action system in controlling migration beyond the downgradient boundary and vertical limit of the PMZ to achieve the GWPS. The summary shall include an evaluation of whether the attenuation action levels are not exceeded at their respective attenuation monitoring points pursuant to 30 TAC Sections 350.33(f)(4)(A) and 350.33(f)(4)(D)(ii), if applicable;
27.	PMZ	Annual by March 1	An estimate of the percentage of the response action which has been completed within the PMZ, if applicable;
28.	PMZ	Annual by March 1	An estimate in years of the additional time necessary to complete the response actions for the PMZ, if applicable;
29.	PMZ	Annual by March 1	A determination whether sufficient progress is being made to achieve the selected remedy standard within a reasonable time frame given the circumstance of the affected property in the PMZ, if applicable.

Item	Program	Reporting Frequency	Requirements
30.	Facility Operations Area (FOA)	Not Applicable	The following additional reporting requirements to fulfill requirements of 30 TAC Section 350.134 and 30 TAC Section 350.135. These include but are not limited to: a. Provide an average of both lost workday injury case rates and injury incidence rates for the most recent three (3) year period compared to the most recent specific industry national average published by the Bureau of Labor Statistics. (continued on next page)

Item	Program	Reporting Frequency	Requirements
30. (contd.)	Facility Operations Area (FOA)	Not Applicable	b. Document that the worker health and safety program meets the requirements of the Occupational Safety and Health Administration (OSHA) by providing records of the OSHA compliance history or the results of the most recent audit of the health and safety programs by the OSHA or a third party certified professional industrial hygienist and safety specialist. An audit is required anytime there is a significant change to the health and safety program, or at a minimum every three (3) years, the results of which indicate the program is satisfactory c. Document a compliance history ranking of average or better for the TCEQ. d. Document the pollution prevention program that has a goal of prevention of releases of COCs to environmental media within the FOA. e. Provide a statement that the program required in 30 TAC Section 350.134(a)(7) to protect workers within the FOA from environmental media having concentrations of COCs greater than PCLs or action levels based on the health and safety program is still in effect. In addition, the permittee shall provide, for the preceding year, an updated map delineating areas where the Soil Response Action Plan has been implemented pursuant to 30 TAC Section 350.135(a)(5). f. Document there have not been any significant outstanding non_compliance issues resulting from inspections for compliance with the RCRA permit or order, if any.

Item	Program	Reporting Frequency	Requirements
30. (contd.)	Facility Operations Area (FOA)	Not Applicable	g. Document areas of ecological impact identified within the FOA and procedures for responding to these identified ecologically impacted areas on a continual basis. Review any ecologically impacted areas annually and report any new ecological impacts within thirty (30) days of verification of impact. h. Document activity associated with tracking and responding to releases to soil and groundwater above reportable quantities, which occur within the FOA after the issuance of the Compliance Plan, in accordance with 30 TAC Section 350.135(a)(7). i. Document any NAPL occurrences and any procedure(s) used to address known NAPLs and any NAPLs identified during the operational life of the FOA. This should include any previously discovered NAPL occurrences. j. Provide documentation that access is restricted to the FOA.

CP Table VIII: Compliance Schedule

Item	**Compliance Schedule** (from the date of issuance of the Compliance Plan unless otherwise specified)	**Regulatory Citation**	**Requirement**
A.	60 days	Compliance Plan	Submit to the Executive Director a schedule summarizing all activities required by the Compliance Plan. The schedule shall list the starting dates of all routine activities. The permittee shall include an updated schedule in the groundwater monitoring report required by Provision XI.G.3. and CP Table VII. The schedule shall list the activity or report, the Compliance Plan Section which requires the activity or report, and the calendar date the activity or report is to be completed or submitted (if this date can be determined.)
B.	Requirement completed on September 2018 and included in August 2024 permit application	30 TAC §335.163(4) and Provision XI.F.2.	Submit to the Executive Director for review and approval a Sampling & Analysis Plan (SAP) unless the SAP has been submitted with the application and referenced in Provision I.B.
C.	During the first thirty (30) days of each first and third quarter	30 TAC §335.166	Corrective Action monitoring shall be conducted on a semiannual basis for the RCRA-regulated units listed in CP Table I.A. which are subject to the Corrective Action Program.
D.	Not Applicable	30 TAC §335.165	Compliance Monitoring shall be conducted on Choose an item. basis for the RCRA-regulated units listed in CP Table I.B. which are subject to the Compliance Monitoring Program.
E.	During the first thirty (30) days of each first and third quarter	30 TAC §335.167	Corrective Action monitoring shall be conducted on a semiannual basis for the solid waste management units (SWMUs) and/or areas of concern (AOCs) listed in CP Table I.C. which are subject to the Corrective Action Program.

Item	**Compliance Schedule** (from the date of issuance of the Compliance Plan unless otherwise specified)	**Regulatory Citation**	**Requirement**
F.	Not Applicable	30 TAC §335.151	Alternative Corrective Action monitoring shall be conducted on Choose an item. basis for the RCRA-regulated units, SWMUs, and/or AOCs listed in CP Table I.D. which are subject to the Corrective Action Program.
G.	Not Applicable	30 TAC Section 335.156 and Chapter 350	FOA Corrective Action monitoring shall be conducted on Choose an item. basis for the RCRA-regulated units, SWMUs, and/or AOCs listed in CP Table I.E., which are located within the FOA Boundary and are subject to the Corrective Action Program.
H.	Requirement completed on Central Plant WMA PMZ: 7/30/14; West Plant WMA PMZ: 5/7/18 120 days: North Plant PMZ AOC	30 TAC §350.31(g) and §350.33(f) (4)(C)(i)	If a plume management zone (PMZ) has been authorized, submit to the Executive Director proof of compliance with the institutional control requirements which provides notice of the existence and location of the PMZ and which prevents exposure to groundwater from this zone until such a time when the concentrations of the chemicals of concern are less than the groundwater protection standards (GWPS) listed on CP Table III.
I.	Notify within 30 days	30 TAC §350.33(k)	If a PMZ has been authorized, after an unexpected event occurs which indicates that additional response actions will be required at an affected property.

Notes:

1. Please note that Corrective Action monitoring is conducted on semiannual basis unless a less frequent monitoring schedule is approved based on plume stability and achievement of Corrective Action objectives.

CP Table IX: Description of Uppermost Aquifer

Groundwater is typically encountered approximately ten feet below grade (approximately five feet above Mean Sea Level) in the uppermost aquifer. The uppermost aquifer is part of the Beaumont Formation and consists of recent alluvium. The alluvial material consists of clay, silt, and sand. The Beaumont Formation in this area is characterized by clay, silt, and occasional sand layers ranging in thickness from 30 to 100 feet. The Beaumont Formation is generally a poorly bedded, calcareous clay of various colors, containing thin, discontinuous stringers and lenses of silt and fine sand. Concretions of calcium carbonate, iron oxide and iron-manganes·eoxides are found in zones of weathering. The unit contains mainly stream channel point bar, natural levee and backswamp deposits. Well logs in the Galena Park area indicate that alternating clays, silts, and infrequent sands of the Beaumont, Montgomery, Bentley and Willis formations extend to depths of approximately 700 feet. All these formations ate thought to have formed by the discharge of sediments from stream gaps. These deposits are deltaic and fluvial in origin and difficult to distinguish between because of their similarities. Each formation dips gently gulfward, with groundwater flow generally toward the south (Houston Ship Channel).

Attachment A

Alternate Concentration Limits

Alternate Concentration Limits (ACLs) must be submitted by hazardous waste facility owners or operators who seek ACLs for any hazardous constituent as provided by 30 TAC 335.160(b) as a part of a compliance monitoring or corrective action program. An ACL demonstration should follow the guidance provided in this attachment. Compliance Plan Application, Section XI.B.2.b. outlines when an ACL demonstration must be conducted. Where possible in "Attachment A", the applicant may copy information previously submitted to the Commission and reference the information submitted in other Sections (Sections I and XI.B. through E.) of this Compliance Plan Application.

Alternate Concentration Limit Demonstration

An ACL petition is based on a demonstration that hazardous constituents detected in the groundwater will not pose a substantial present or future threat to human health or the environment at the ACL levels. Potential adverse effects on both groundwater quality and hydraulically connected surface water quality must be addressed. Using Environmental Protection Agency published lists of 40 CFR Part 264 Appendix IX hazardous constituents, the applicant must submit a list of all contaminants in the groundwater. For all the petitioned ACL constituents, the applicant must address all known synergistic and additive effects on human health and the environment to develop appropriate ACL levels.

Required Information for Alternate Concentration Limits

In addition to rule specific requirements (i.e., 30 TAC Chapter 335 Subchapter S RRR, or 30 TAC Chapter 350 TRRP), the following items must be addressed for each hazardous constituent for which an alternate concentration is sought (CP Tables III and IV, XII.B.). If the information required in this part has been furnished in other parts of Compliance Plan Application, please provide an adequate reference.

1. Potential adverse effects on groundwater quality, considering:
    a. The physical and chemical characteristics of the waste in the Regulated Unit, Solid Waste Management Unit(SWMU) or Area of Concern (AOC), including its potential for migration;
    b. The hydrogeological characteristics of the facility and surrounding land;
    c. The quantity of groundwater r and the direction of groundwater flow;
    d. The proximity and withdrawal rates of groundwater users;
    e. The current and future uses of groundwater in the area;
    f. The existing quality of groundwater, including other sources of contamination and their cumulative impact on the groundwater quality;
    g. The potential for health risks caused by human exposure to waste constituents;
    h. The potential damage to wildlife, crops, vegetation, and physical structures caused by exposure to waste constituents; and,
    i. The persistence and permanence of the potentially adverse effects.
2. Potentially adverse effects on hydraulically connected surface water quality, considering:

a. The volume and physical and chemical characteristics of the waste in the Regulated Unit, Solid Waste Management Unit (SWMU) or Area of Concern (AOC);
b. The hydrogeological characteristics of the facility and surrounding land;
c. The quantity and quality of groundwater, and the direction of groundwater flow;
d. The patterns of rainfall in the region;
e. The proximity of the Regulated Unit to surface waters;
f. The current and future uses of surface waters in the area and any water quality standards established for those surface waters;
g. The existing quality of surface water, including other sources of contamination and the cumulative impact on surface water quality;
h. The potential for health risks caused by human exposure to waste constituents;
i. The potential damage to wildlife, crops, vegetation, and physical structures caused by exposure to waste constituents; and,
j. The persistence and permanence of the potentially adverse effects.

Attachment B

Well Design And Construction Specifications

The following well design and construction specifications should be used as guidance when designing a groundwater Compliance Monitoring Program (Section XI.C.) or a Corrective Action Program (Section XI.D.). This guidance is provided to establish minimum well design and construction specifications for the Compliance Plan.

1. Well drilling methods that minimize potential adverse effects on the quality of water samples withdrawn from the well and that minimize or eliminate the introduction of foreign fluids into the borehole must be utilized.

2. All wells shall be constructed such that the wells can be routinely sampled with a pump, bailer, or alternate sampling device. Piping associated with recovery wells should be fitted with sample ports or an acceptable alternative sampling method to facilitate sampling of the recovered groundwater on a well by well basis.

3. Above the saturated zone the well casing may be two (2) inch diameter or larger schedule 40 or 80 polyvinyl chloride (PVC) rigid pipe or stainless steel or polytetrafluoroethylene (PTFE or "teflon") or an approved alternate material. The PVC casing must bear the National Sanitation Foundation logo for potable water applications (NSF pw). Solvent cementing compounds shall not be used to bond joints and all connections shall be flush threaded. In and below the saturated zone, the well casing shall be stainless steel or PTFE.

   PVC or fiberglass reinforced resin may be used as an alternate well casing material in and below the saturated zone provided that it yields samples for groundwater quality analysis that are unaffected by the well casing material.

4. Any well that has deteriorated due to incompatibility of the casing material with the groundwater contaminants or due to any other factors must be replaced.

5. Well casings and screens shall be steam cleaned prior to installation to remove all oils, greases, and waxes. Well casings and screens made of fluorocarbon resins shall be cleaned by detergent washing.

6. Screen length shall not exceed ten (10) feet within a given transmissive zone unless otherwise approved by the executive director. Screen lengths exceeding ten (10) feet may be installed in groundwater recovery or injection wells to optimize the groundwater remediation process in accordance with standard engineering practice.

7. The intake portion of a well shall be designed and constructed so as to allow sufficient water flow into the well for sampling purposes and minimize the passage of formation materials into the well during pumping. The intake portion of a well shall consist of commercially manufactured stainless steel or PTFE screen or approved alternate material. The annular space between the screen and the borehole shall be filled with clean siliceous granular material (i.e., filter pack) that has a proper size gradation to provide mechanical retention of the formation sand and silt. The well screen slot size shall be compatible with the filter pack size as determined by sieve analysis data. The filter pack should extend no more than three (3) feet above the well screen. A silt trap, no greater than one (1) foot in length, may be added to the bottom of the well screen to collect any silt that may enter the well. The bottom of the well casing shall be capped with PTFE or stainless steel or approved alternate material.

Groundwater recovery and injection wells shall be designed in accordance with standard engineering practice to ensure adequate well production and accommodate ancillary equipment. Silt traps exceeding one (1) foot may be utilized to accommodate ancillary equipment. Well heads shall be fitted with mechanical well seals, or equivalent, to prevent entry of surface water or debris.

8. A minimum of two (2) feet of pellet or granular bentonite shall immediately overlie the filter pack in the annular space between the well casing and borehole. Where the saturated zone extends above the filter pack, pellet or granular bentonite shall be used to seal the annulus. The bentonite shall be allowed to settle and hydrate for a sufficient amount of time prior to placement of grout in the annular space. Above the minimum two (2) foot thick bentonite seal, the annular space shall be sealed with a cement/bentonite grout mixture. The grout shall be placed in the annular space by means of a tremie pipe or pressure grouting methods equivalent to tremie grouting standards.

   The cement/bentonite grout mixture or TCEQ approved alternative grout mixture shall fill the annular space to within two (2) feet of the surface. A suitable amount of time shall be allowed for settling to occur. The annular space shall be sealed with concrete, blending into a cement apron at the surface that extends at least two (2) feet from the outer edge of the monitor well for above ground completions. Alternative annular space seal material may be proposed with justification and must be approved by the executive director prior to installation.

   In cases where flush to ground completions are unavoidable, a protective structure such as a utility vault or meter box should be installed around the well casing and the concrete pad design should prevent infiltration of water into the vault. In addition, the following requirements must also be met 1) the well/cap juncture is watertight; 2) the bond between the cement surface seal and the protective structure is watertight; and 3) the protective structure with a steel lid or manhole cover has a rubber seal or gasket.

9. Water added as a drilling fluid to a well shall contain no bacteriological or chemical constituents that could interfere with the formation or with the chemical constituents being monitored. For groundwater recovery and injection wells, drilling fluids containing freshwater and treatment agents may be utilized in accordance with standard engineering practice to facilitate proper well installation. In these cases, the water and agents added should be chemically analyzed to evaluate their potential impact on in-situ water quality and to assess the potential for formation damage. All such additives shall be removed to the extent practicable during well development.

10. Upon completion of installation of a well, the well must be developed to remove any fluids used during well drilling and to remove fines from the formation to provide a particulate free discharge to the extent achievable by accepted completion methods and by commercially available well screens. Development shall be accomplished by reversing flow direction, surging the well or by air lift procedures. No fluids other than formation water shall be added during development of a well unless the aquifer to be screened is a low yielding water bearing aquifer. In these cases, the water to be added should be chemically analyzed to evaluate its potential impact on in-situ water quality, and to assess the potential for formation damage.

For recovery and injection wells, well development methods may be utilized in accordance with standard engineering practice to remove fines and maximize well efficiency and specific capacity. Addition of freshwater and treatment agents may be utilized during well development or re development to remove drilling fluids, inorganic scale or bacterial slime. In these cases, the water and agents added should be chemically analyzed to evaluate their potential impact on in-situ water quality and to assess the potential for formation damage. All such additives shall be removed to the extent practicable during well development.

11. Each well shall be secured and/or designed to maintain the integrity of the well borehole and groundwater.

12. The above ground portion of the well must be protected by bumper guards and/or metal outer casing protection when wells are located in traffic areas or outside the secured plant area.

13. The attached Table of Well Construction Details is to be completed or updated for each well installed and kept on site. Items in the table that require a yes or no answer indicate diagrams plans, or procedures that shall be kept on site and made available to inspection. The completed table and other records shall include all of the following information:

    - name/number of well (well designation);
    - intended use of the well(sampling, recovery, etc.);
    - date/time of construction;
    - drilling method and drilling fluid used;
    - well location (+ 0.5 ft.);
    - bore hole diameter and well casing diameter;
    - well depth (+ 0.1 ft.);
    - drilling and lithologic logs;
    - depth to first saturated zone;
    - casing materials;
    - screen materials and design;
    - casing and screen joint type;
    - screen slot size/length;
    - filter pack material/size;
    - filter pack volume (how many bags, buckets, etc.);
    - filter pack placement method;
    - sealant materials;
    - sealant volume (how many bags, buckets, etc.);
    - sealant placement method;
    - surface seal design/construction;
    - well development procedure;
    - type of protective well cap;
    - ground surface elevation (+ 0.01 ft. MSL);
    - top of casing elevation (+ 0.01 ft. MSL); and,
    - detailed drawing of well (include dimensions).

14. Construction or plugging and abandonment of each well shall be completed in accordance with the requirements of 16 TAC Chapter 76 and must be reported/certified to the TCEQ that such proper construction or plugging and abandonment has occurred following installation or plugging and abandonment.

Well completion logs for each newly installed or replaced well shall be included with the report. The certification shall be prepared by a qualified geologist or geotechnical engineer. Each well certification shall be accompanied by a certification report, including an accurate log of the soil boring, which thoroughly describes and depicts the location, elevations, material specifications, construction details, and soil conditions encountered in the boring for the well. A copy of the certification and certification report shall be kept on site, and a second copy shall be submitted to the executive director.

15. The well number must be clearly marked and maintained on each well at the site.

16. The elevation of the top of each well casing must be measured in feet above mean sea level to the nearest 0.01 foot.

17. Wells must be replaced at any time the well integrity or materials of construction or well placement no longer enable the well to yield samples representative of groundwater quality.

18. Soil test borings shall be plugged and wells removed from service with a cement/bentonite grout mixture so as to prevent the preferential migration of fluids in the area of the borehole. Certification of each plugging shall be reported in accordance with Provision 14. The plugging of wells shall be in accordance with 16 TAC Chapter 76 dealing with Well Drilling, Completion, Capping and Plugging.

19. A well's screened interval shall be appropriately designed and installed to meet the well's specific objective (i.e., either DNAPL, LNAPL, both, or other objective of the well). All wells designed to detect, monitor, or recover DNAPL must be drilled to intercept the bottom confining layer of the aquifer. The screened interval to detect DNAPL should extend from the top of the lower confining layer to above the portion of the aquifer saturated with DNAPL. The screened interval for all wells designed to detect, monitor, or recover LNAPL must extend high enough into the vadose zone to provide for fluctuations in the seasonal water table. In addition, the sandpacks for the recovery or monitoring well's screened interval shall be coarser than surrounding media to ensure the movement of NAPL to the well.

Table of Well Construction Details (Item 13)

Well number					
Hole diameter (in)					
Well diameter (in)					
Total borehole depth (ft)					
Constructed well depth (ft)					
Well location available (Y/N)					
Intended Use of Well (sampling, recovery, etc.)					
Drilling & lithologic logs available (Y/N)					
Drill method					
Date drilled					
Casing I.D.(in)					
Casing type/materials

Dev. method					
Well coordinates (lat & long)					

Attachment C - Sampling And Analysis Plan

Introduction and Purpose

This Attachment was prepared for the purpose of providing guidance for the preparation of a Groundwater Sampling and Analysis Plan (SAP) to meet the requirements of 30 Texas Administrative Code (TAC) 335.163(4) and (5) and also 40 CFR 270.30(j). This guidance is based on the publication, RCRA Groundwater Monitoring: Draft Technical Guidance (TEGD Update) (November 1992, USEPA), and its updates, and is not intended to be rule or policy, or include all acceptable practices.

When preparing the SAP, the applicant may insert copies of areas of the Compliance Plan Application already completed which provides any necessary information for completion of the SAP. The SAP should include the information described in the following sections. When certain sections are not applicable, please provide justification for omission from the SAP.

1. Pre Field Activity
    a. A. The log book format should be outlined in the SAP and should contain at a minimum:

    - the names of those conducting the sampling event;
    - the purpose and provision(s) of the compliance plan requiring the sampling event;
    - weather conditions at time of sampling;
    - date and time of collection;
    - well identification;
    - integrity of well;
    - monitoring well measurements, including: total well depth; static water level depth; measurement techniques; height of water column; well volume; and, notation of the presence or absence of accumulated silt (including thickness and measurement procedures);
    - notation of the presence or absence of NAPLs (including thickness and detection method);
    - well purging procedures, including equipment, purge volume, pumping rate, and well purge time;
    - sampling methods, including well sampling sequence, sampling equipment and withdrawal procedures;
    - visual and measured water quality parameters required for analysis, such as appearance, pH, conductivity, temperature and turbidity; and,
    - sample preservation and handling procedures, including types of sample bottles, sample identification numbers, preservatives used, and internal temperature of field and shipping containers.

    b. B. The SAP should reference the Provisions or Tables within the Compliance Plan regarding monitor well designations, parameters to be monitored, and sampling frequency, rather than utilizing detailed lists.

    c. C. The SAP should include examples of the log book format, chain of custody, and information to be included on the container labels and seals.

    d. D. The SAP should reference both the Health and Safety Plan, and Field Emergency Contingency Plan. These Plans should be checked to determine if they adequately address health and safety issues that may occur during a sampling event.

2. Prior to Purging Well

a. A. Procedures for evaluating the physical condition and integrity of the well should include:

- inspecting the casing and cap for cracks, signs of deterioration or tampering;
- determination if the cap and monitoring well are secure;
- inspecting the well pad for cracks, or signs of deterioration, erosion, settling, and/or animal and insect burrowing; and,
- where appropriate, inspect any dedicated equipment for signs of cleanliness, structural integrity and deterioration.

b. B. Procedures and equipment used for measuring groundwater elevations, well depths, silt accumulation, and Non Aqueous Phase Liquids (NAPLs) should be included in the SAP. Water levels should be measured from the surveyed datum on the top of the well casing, with a precision of ±0.01 foot. If present, accumulated silt and light/dense NAPLs should be measured for thickness.

c. C. Procedures for monitoring site specific weather conditions at the time of sampling should be incorporated into the SAP, including precipitation (when applicable), temperature, and approximate wind speed and direction.

3. Sampling Preparation Activity

a. A. Well purging methods:

(1) 1) A sampling contingency plan should be developed for wells which are purged to dryness or purged such that full recovery exceeds two hours. In such instances, samples should be taken as soon as a sufficient volume of groundwater has entered the well to enable the collection of the necessary groundwater samples.

(2) 2) In all instances of purging, the SAP should describe in detail the equipment used (dedicated or non dedicated), purging rate, and the method for determining volume purged.

(3) 3) Although purging and sampling by bailers is acceptable, the EPA recommends the use of dedicated pumping equipment designed for low flow rates.

(4) 4) When utilizing micropurging methods, the purge rate may range between 0.1 to 0.5 liter/minute. During micropurging, drawdown should not exceed 0.1 meter. The applicant should provide justification for any alternate sampling procedure. The SAP should also specify the well screen interval at which the pump intake is placed and a copy of the boring log for each well utilizing micropurging. In line measurements of redox, dissolved O2 and turbidity during purging of groundwater should stabilize within 10% over at least two measurements prior to sampling.

b. B. Field filtering of groundwater samples should not be conducted unless the applicant has provided a justification and field filtration is approved by the TCEQ. If samples are field filtered, a 10 micron filter should be used while still fulfilling the data quality objectives for the groundwater monitoring program.

c. C. The container type, size, and labeling method for each procedure performed should be referenced and/or tabulated in the SAP.

d. D. Sample blanks, field blanks, trip blanks and split sampling procedures, including frequency and preservation should be specified in the SAP as quality control checks for each sampling event. The preparation, analysis, and evaluation of replicates, duplicates and spikes should also be included.

4. Well Sampling

a. A. Well sampling equipment, collection procedures, and sampling sequence of wells, should be specified in the SAP. The SAP should include sampling equipment that is constructed of inert material, which should not alter analyte concentration due to loss of analyte via absorption, or gain via desorption, degradation or corrosion.

b. B. Field QA/QC and sample preservation methods used to control pH, chemical addition and refrigeration of samples should be described in the SAP and follow the methods described in the current editions of EPA Report SW 846, "Test Methods for Evaluating Solid Waste" and American Society for Testing and Materials (ASTM) Standard Test Methods or other methods accepted by the TCEQ. The SAP should indicate that chemical preservatives are to be added to samples in the field and not in the laboratory. The SAP should indicate that coolants used for refrigerating samples need to be contained (e.g. blue ice).

c. C. Procedures for sampling inorganics and volatile/semi volatile organics should be described in the SAP and follow the methods of SW 846 and ASTM or other methods accepted by the TCEQ.

5. Post Sampling Activity

a. A. Decontamination procedures should be included in the SAP when dedicated equipment is not used for purging and sampling, or when dedicated equipment is stored outside the well. The procedures should include disassembly, cleaning of equipment, packaging and storage of equipment when not in use.

b. B. Analytical methods and holding times should be tabulated in the SAP in accordance with SW 846 and ASTM or other methods accepted by the TCEQ.

c. C. Chain of custody and shipping procedures should be described and intended to prevent misidentification of samples, to identify and prevent tampering of the samples during shipping and storage, and allow easy tracking of the shipment from the field to final analyses. A Chain of Custody Form should accompany each sample shipment and include the following information:

- sample identification number;
- signature of collector;
- date and time of collection;
- sample type (e.g. groundwater);
- identification of sampling point (well);
- number of containers;
- parameters requested for analysis;
- preservatives used;
- signature(s) of person(s) involved in the chain of possession;
- inclusive dates and time of possession;
- internal temperature of shipping container when samples were sealed into the container for shipping; and,

- internal temperature of container upon opening in the laboratory.

Samples should be shipped in coolers or similar containers designed to keep samples at a constant 4°C and prevent breakage. Containers used for sample shipment should be sealed with the seal signed and dated by the sampler.

d. D. Disposal methods of contaminated equipment, wash water and purged groundwater should be described.

e. E. Laboratory QA/QC procedures should include control samples as defined in Chapter I of SW 846. An appropriate statistical method/procedure should be used to monitor and document performance and to implement an effective program to resolve testing problems (instrument maintenance). Data from the control samples (i.e. spiked samples, duplicates and blanks) should be used as a measure of performance or as an indicator of potential source of cross contamination (i.e. from instrumentation). QA/QC documentation for reporting values should be tabulated on laboratory data sheet and include: target analyte; unit of measure (e.g. ppm); method analyses; and, time/dates of sample collection and analyses.

XII. Hazardous Waste Permit Application Fee

In accordance with 30 TAC 305.53, complete Tables XII.A. - Hazardous Waste Units (For Application Fee Calculations) and XII.B. - Hazardous Waste Permit Application Fee Worksheet. Use the following information in calculating your fee. The application fee will be non-refundable once an initial review of the application has been completed. The applicant's fees are subject to evaluation by the technical staff of the Texas Commission on Environmental Quality (TCEQ). However, the TCEQ reserves the right to assess further fees as may be necessary.

A. The minimum permit application fee for a permit or a permit renewal for each hazardous waste facility to be used for Storage, Processing, Disposal, or Closure/Post-Closure Care (disposal has already occurred) of hazardous waste shall be $2,000, plus notice fee, and the maximum shall be $50,000, calculated according to these instructions:

   1. Process Analysis - $1,000.00.
   2. Management/Facility Analysis - $500.00.
   3. A facility unit(s) analysis of $500 per unit is charged for the following:
      a. each cell of a landfill (note that multiple cells that are identical in type and use are subject to a single $500 fee);
      b. tanks and container storage areas (note that multiple tanks and container storage areas that are identical in type and use are subject to a single $500 fee)
      c. identical in type and use means the following:
         (1) made of the same material and same design;
         (2) the same size/capacity within + 10%;
         (3) store the same waste (as identified by USEPA hazardous waste number - 40 CFR 261 Subparts C & D); and
         (4) have the same management characteristics (e.g., storage only).
      d. Each incinerator, boiler/industrial furnace unit, surface impoundment, waste pile, land treatment unit, drip pad, miscellaneous unit, or containment building.
   4. Site Evaluation - $100 per acre of surface used for hazardous waste management up to 300 acres. No additional fee thereafter. This shall be calculated as any acreage which will be permitted to manage hazardous waste. This shall include, for example, the entire area within the secondary containment of a tank farm, the area within a fence that surrounds individual units (other than the facility fence), or the area defined by the toe of the dike surrounding a landfill or impoundment, etc.
   5. An applicant shall also include with each initial application a fee of $50 to be applied toward the cost of providing the required notice. An additional notice fee of $15 is required with each application for renewal.

B. The application fee for a major amendment or a Class 2 or 3 modification to a hazardous waste permit for operation, closure, or post-closure care is subject to the fees listed below:

   1. A management/facility analysis fee of $500.

2. The notice fee is $50.
3. If a unit is added or a unit area is expanded for any purpose, $100 per additional acre is assessed, until the total additional acreage reaches 300 acres.
4. If one or more of the following reports are added or are significantly revised, the process analysis fee of $1000 is assessed:
    a. waste analysis plan;
    b. site-specific or regional geology report;
    c. site-specific or regional geohydrology report;
    d. groundwater and/or unsaturated zone monitoring;
    e. closure and/or post-closure care plan; or
    f. RCRA Facility Assessments (RFAs), or corrective action reports;
    g. Alternate Concentration Limit (ACL) demonstration or Development of Protective Concentration Limits (PCLs);
    h. Regulated Unit Facility Assessment, Corrective Action (CA) work plans or reports for Regulated Units; and/or
    i. RCRA Facility Investigation (RFI)/Affected Property Assessment (APA), Remedy Selection, Corrective Measure Implementation (CMI)/Remedial Action Plan for solid waste management units, and/or areas of concern;
    j. Facility Operations Area (FOA).
5. A unit analysis fee of $500 per unit is assessed if any of the following occur:
    a. if a unit is added (even if identical to units already in place, using the criteria discussed in A.3 above);
    b. if there are design changes in an existing unit; or
    c. if a unit status changes from closure to post-closure care;
    d. Changes in the number, location, depth, or design of wells approved in compliance plan or a permit (unless it is a replacement well);
    e. Changes in point of compliance and compliance monitoring program;
    f. Changes in Groundwater Protection Standards, indicator parameters, Alternate Concentration Limits or Protective Concentration Limits; and/or
    g. Changes in corrective action program.

C. The application fee for a minor amendment, a Class 1, or a Class 1[1] modification of a hazardous waste permit is $100 plus the notice fee of $50.

Table XII.A. – Hazardous Waste Units (For Application Fee Calculations)

Verbal Description of Unit	Rated Capacity	Surface Acreage[1]	# of Unit Types[2]	Identical Unit Justification[3]
CAMU/Former NHB (NOR 004)	Original 88,000 cy	3.03	1	Not Applicable
Southeast Holding Basin (SEHB) (NOR 017)	Original 3,111 cy	0.16	1	Not Applicable
		Total[4] 3.19	Total[4] 2	

1 Number of calculated acres.
2 Enter number of units except for units identical in type and use which only count toward a single $500.00 fee.
3 Explain justification for any units claimed as identical in type and use.
4 Enter these totals on the worksheet.

Table XII.B. - Hazardous Waste Permit Application Fee Worksheet

Name of Facility: KM Liquids Terminals LLC – Galena Park Terminal

Solid Waste Registration Number: 30573

1. Process Analysis - $1,000..... $1,000
2. Facility Management Analysis - $500..... $500
3. Unit Analysis - __2___ units @ $500 per unit..... $1,000
4. Site Evaluation - _3.19_ acres @ $100 per acre..... $319

   (Maximum of 300 acres)
5. Minor amendment, Class 1, or Class 1[1] modification - $100..... $
6. Cost of Providing Notice - $50 (+ $15 for a renewal)..... $65

Pay This Amount ☒ **Total** $2,884

Make Checks Payable To:

Texas Commission on Environmental Quality - Fund 549
(your canceled check will be your receipt)

Complete And Return With Payment To:

Texas Commission on Environmental Quality
Financial Administration Division - MC 214
P.O. BOX 13088
Austin, Texas 78711-3088

The applicant's fees are subject to evaluation by the technical staff of the Texas Commission on Environmental Quality (TCEQ). However, the TCEQ reserves the right to assess further fees as may be necessitated.

Please do not submit a photocopy of the check (or equivalent transaction submittal) with your application packet but provide only the following account information:

Check No.	Date of Check	Check Amount
2269	7/3/2024	$2,884.00

XIII. Confidential Material

Any information requested in the previous Sections I. through XI. of this application which is deemed confidential shall be provided in this Section as a separate collective document and clearly labeled **CONFIDENTIAL**.

Core Data Form

TCEQ Use Only

TCEQ Core Data Form

For detailed instructions on completing this form, please read the Core Data Form Instructions or call 512-239-5175.

SECTION I: General Information

1. Reason for Submission (*If other is checked please describe in space provided.*)

☐ New Permit, Registration or Authorization (*Core Data Form should be submitted with the program application.*)

☒ Renewal *(Core Data Form should be submitted with the renewal form)* ☐ Other

2. Customer Reference Number *(if issued)*	Follow this link to search for CN or RN numbers in Central Registry**	3. Regulated Entity Reference Number *(if issued)*
CN 603254707		RN 100237452

SECTION II: Customer Information

4. General Customer Information | **5. Effective Date for Customer Information Updates** (mm/dd/yyyy) 9/5/2024

☐ New Customer ☒ Update to Customer Information ☐ Change in Regulated Entity Ownership
☐ Change in Legal Name (Verifiable with the Texas Secretary of State or Texas Comptroller of Public Accounts)

The Customer Name submitted here may be updated automatically based on what is current and active with the Texas Secretary of State (SOS) or Texas Comptroller of Public Accounts (CPA).

6. Customer Legal Name *(If an individual, print last name first: eg: Doe, John)* *If new Customer, enter previous Customer below:*

KM Liquids Terminals LLC

7. TX SOS/CPA Filing Number	8. TX State Tax ID (11 digits)	9. Federal Tax ID (9 digits)	10. DUNS Number *(if applicable)*
0800838036	12604497227	760561780	048101364

11. Type of Customer: ☒ Corporation ☐ Individual Partnership: ☐ General ☐ Limited
Government: ☐ City ☐ County ☐ Federal ☐ Local ☐ State ☐ Other ☐ Sole Proprietorship ☐ Other:

12. Number of Employees
☐ 0-20 ☐ 21-100 ☐ 101-250 ☐ 251-500 ☒ 501 and higher

13. Independently Owned and Operated?
☒ **Yes** ☐ **No**

14. Customer Role (Proposed or Actual) – *as it relates to the Regulated Entity listed on this form. Please check one of the following*

☐ Owner ☐ Operator ☒ Owner & Operator
☐ Occupational Licensee ☐ Responsible Party ☐ VCP/BSA Applicant ☐ Other:

15. Mailing Address:

Johnny Kennedy
1500 Clinton Drive

City	State	ZIP	ZIP + 4
Galena Park	TX	77547	

16. Country Mailing Information *(if outside USA)*

17. E-Mail Address *(if applicable)*

DEED RECORD FOR NORTH HOLDING BASIN

LEDERER/MILLER & ASSOCIATES REGISTERED CIVIL ENGINEERS LAND SURVEYORS

2990 Richmond Ave., Suite 105 Houston, Texas 77098 FAX (713) 529-6013 • Ph (713) 529-9124

February 27, 1991

FIELD NOTES
North Holding Basin

6.2673 Acres (or 273,001 square feet) of land out of the Ezekial Thomas Survey, A-73, in Harris County, Texas, and being more particularly described as follows, with respect to the Texas Plane Coordinate System, South Central Zone, (by surface distances):

BEGINNING at a point having coordinates: X= 3,196,352.58 and y= 708,886.60, on the south line of the 80-foot wide right-of-way of the T & NO RR at its intersection with the west line of the Arco 25-foot wide fee strip described in deed recorded in Volume 6031, Page 512, Harris County Deed Records, from which the intersection of said west line with the south right-of-way line of Clinton Drive, 100 feet wide, bears North 3° 26' 35" West 772.90 feet, and from which the City of Houston Survey Marker No. 5756-1010 bears North 68° 34' 39" East 2646.67 feet;

THENCE South 3° 26' 35" East with the west line of said fee strip 383.09 feet to a point for corner;

THENCE South 86° 45' 32" West, in part generally along a gravel roadway on top of a levee 701.40 feet to a point for corner;

THENCE North 3° 16' 53" West in part generally along the east side of an asphalt roadway 395.96 feet to a point for corner on the south line of said railroad right-of-way;

THENCE North 87° 48' 43" East with said south line 700.45 feet to the PLACE OF BEGINNING.

COUNTY OF HARRIS §

INDUSTRIAL SOLID WASTE
DISPOSAL SITE DEED RECORDATION

Pursuant to the Rules of the Texas Water Commission pertaining to Industrial Solid Waste Management, this document is hereby filed in the Deed Records of Harris County, Texas in compliance with the recordation requirements of said rules:

I.

GATX Terminals Corporation has permanently deposited industrial waste on the land described herein. A copy of Notice of Registration No. 30573, including a description of wastes deposited and a description of the facility generating this waste is attached hereto and is made a part of this filing.

II.

This land has been used to manage industrial waste and its use is, therefore, restricted under 31 Tex. Admin. Code § 335.112(a)(6). Being 6.2674 Acres (or 273,001 square feet) of land out of the Ezekial Thomas Survey, A-73, in Harris County, Texas, and being more particularly described as follows, with respect to the Texas Plane Coordinate System, South Central Zone, (by surface distances):

BEGINNING at a point having coordinates: x = 3,196,352.58 and y = 708,886.60, on the south line of the 80-foot wide right-of-way of the T & NO RR at its intersection with the west line of the Arco 25-foot wide fee strip described in deed recorded in Volume 6031, Page 512, Harris County Deed Records, from which the intersection of said west line with the south right-of-

way line of Clinton Drive, 100 feet wide, bears North 3° 26' 35" West 772.90 feet, and from which the City of Houston Survey Marker No. 5756-1010 bears North 68° 34' 39" East 2646.67 feet;

THENCE South 3° 26' 35" East with the west line of said fee strip 383.09 feet to a point for corner;

THENCE South 86° 45' 32" West, in part generally along a gravel roadway on top of a levee 701.40 feet to a point for corner;

THENCE North 3° 16' 53" West in part generally along the east side of an asphalt roadway 395.96 feet to a point for corner on the south line of said railroad right-of-way;

THENCE North 87° 48' 43" East with said south line 700.45 feet to the PLACE OF BEGINNING.

This survey may be further described as being a tract of land containing 6.2673 acres out of the tract described in Volume 1163, Page 515 of the Harris County Deed Records in the Ezekial Thomas Survey-Abstract No. 73, Harris County, Texas.

Wastes present hereon have been classified by the Texas Water Commission as Class I, hazardous waste. Class I waste is defined as "[a]ny industrial solid waste or mixture of industrial solid wastes which because of its concentration, or physical or chemical characteristics, is toxic, corrosive, flammable, a strong sensitizer or irritant, a generator of sudden pressure by decomposition, heat, or other means, and may pose a substantial present or potential danger to human health or the environment when improperly processed, stored, transported, or disposed of or otherwise managed, including hazardous industrial waste." 31 Tex. Admin. Code § 335.1.

029-01-1399

III.

The owner of the site is GATX Terminals Corporation, a Delaware corporation, and its address is P. O. Box 486, Galena Park, Texas 77547-0486, where more specific information may be obtained from the plant manager.

EXECUTED this the 13th day of March, 1991.

II. Shipping/Reporting: Pursuant to Section 335 of the Texas Administrative Code of the rules of the TWC pertaining to Hazardous Waste management, issuance of manifests and annual reporting are required for Off-site Storage/Processing/Disposal of the following wastes listed in Part I. All manifested wastes should be reported on the annual waste summary report and submitted to the TWC by the 25th of each January for the prior calendar year.

In addition for any of the following waste(s) manifested and shipped to Storage/Processing/Disposal facilities in any other state a waste shipment summary is required. All such shipments should be reported on the waste shipment summary report and submitted to the TWC no later than the 25th day of the month immediately succeeding the month in which the shipment was made. No waste shipment summary report is required for months when out of state shipments are not made.

FIRST AMENDED INDUSTRIAL SOLID
WASTE DISPOSAL SITE DEED RECORDATION

Pursuant to the Rules of the Texas Water Commission pertaining to Industrial Solid Waste Management, this document is hereby filed in the Deed Records of Harris County, Texas in compliance with the recordation requirements of said rules:

I.

GATX Terminals Corporation has permanently deposited industrial waste on the land described herein. A copy of Notice of Registration No. 30573, including a description of wastes deposited and a description of the facility generating this waste is attached hereto and is made a part of this filing.

II.

This land has been used to manage industrial waste and its use is, therefore, restricted under 31 Tex. Admin. Code § 335.112(a)(6). Being a 6997 sq. ft. tract (0.16063 acres), more or less, out of a 31.96 acre tract in the Ezekial Thomas Survey-Abstract No. 73, recorded in Volume 1163, Page 515 of the Deed Records of Harris County, Texas, said 6997 sq. ft. tract (0.16063 acres), being more particularly described as follows:

BEGINNING at a point, a concrete Texas monument, the Northwest corner of the Texas Company property as described in Volume 1163, Page 515 of the Harris County Deed Records, said point also being the Northeast corner of a tract of land described in Volume 6324, Page 409 of the Harris County Deed Records and located in the South

line of Clinton Drive, based on a right-of-way width of 100';

THENCE S01°49'38"E at a distance of 690.22' pass a 3/4" iron pipe located in the North Line of the T & N.O. Railway Company, based on a right-of-way width of 80' and continuing S01°49'38"E for a total length of 1858.62' along the West line of the aforementioned Texas Company property to a point;

THENCE N87°46'32"W a distance of 152.41' to a 60d nail, set for corner, THE PLACE OF BEGINNING OF THIS SURVEY;

THENCE N87°46'32"W a distance of 87.10' to a 60d nail set for corner;

THENCE N02°18'07"W a distance of 62.51' to a 60d nail set for corner;

THENCE N82°01'17"E a distance of 4.23' to a 60d nail set for corner;

THENCE N02°27'45"E a distance of 12.65' to a 60d nail set for corner;

THENCE N84°42'49"E a distance of 82.31' to a 60d nail set for corner;

THENCE S01°52'59"E a distance of 86.70' to THE PLACE OF BEGINNING.

This survey may be further described as being a tract of land containing 6997 sq. ft. (0.16063 acres) out of a 31.96 acre tract as described in Volume 1163, Page 515 of the Harris County Deed Records in the Ezekial Thomas Survey-Abstract No. 73, Harris County, Texas.

Wastes present hereon have been classified by the Texas Water Commission as Class I, hazardous waste. Class I waste is defined as "Any industrial solid waste or mixture of industrial solid wastes which because of its concentration, or physical or chemical characteristics, is toxic, corrosive, flammable, a strong

187-74-1823

sensitizer or irritant, a generator of sudden pressure by decomposition, heat, or other means, and may pose a substantial present or potential danger to human health or the environment when improperly treated, stored, transported, or disposed of or otherwise managed, including hazardous industrial waste."

III.

The owner of the site is GATX Terminals Corporation, a Delaware corporation, and its address is P. O. Box 486, Galena Park, Texas 77547-0486, where more specific information may be obtained from the plant manager.

EXECUTED this the 10TH day of September, 1990.

II. Shipping/Reporting: Pursuant to Section 335 of the Texas Administrative Code of the rules of the TWC pertaining to Hazardous Waste management, issuance of manifests and annual reporting are required for Off-site Storage/Processing/Disposal of the following wastes listed in Part I. All manifested wastes should be reported on the annual waste summary report and submitted to the TWC by the 25th of each January for the prior calendar year.

In addition for any of the following waste(s) manifested and shipped to Storage/Processing/Disposal facilities in any other state a waste shipment summary is required. All such shipments should be reported on the waste shipment summary report and submitted to the TWC no later than the 25th day of the month immediately succeeding the month in which the shipment was made. No waste shipment summary report is required for months when out of state shipments are not made.

Operating Permit for Corrective Action Management Unit / Former North Holding Basin (NOR 004)
KM Liquids Terminals LLC – Galena Park Terminal

EXPOSURE Information
Per 30 TAC 305.50 (8) and 40 CFR 270.10 (j)

The following is a summary of the potential for the public to be exposed to hazardous wastes or hazardous constituents through releases related to the operation of the Corrective Action Management Unit (CAMU)/ Former North Holding Basin (NHB) (NOR 004) at the KM Liquids Terminals LLC, Galena Park Terminal. This document is designed to fulfill the requirements of Section *II.G.7 Exposure Information* of the RCRA Part B Permit Application.

Introduction

A CAMU has previously been permitted and constructed at an earlier wastewater holding basin (Former NHB within the Kinder Morgan Galena Terminal. The resulting unit is referred to as the CAMU/Former NHB (NOR 004). The surrounding area is primarily industrial or undeveloped. The purpose of the exposure assessment is to consider potential foreseeable releases, pathways of exposure, and the magnitude and nature of potential exposures to hazardous releases from the unit.

Exposure from Foreseable Normal Operations and Potential Accidental Releases

Exposure from foreseeable normal operations would be limited to onsite personnel involved with excavation, transportation, treatment, and disposal of waste destined for the CAMU. During excavation and handling of soils, workers involved with operations have the potential to be exposed to chemicals released from the soil. Transportation of soil to the CAMU will not occur on public roadways and will be limited to the non-public roadways at the Galena Park Terminal. Under foreseeable normal operations and potential accidental realeases, it appears that exposure to general public would be minimum, if any. Exposure from accidental releases would be similar in nature and magnitude to potential exposures from the Fromer NHB and existing terminal operations.

Potential Pathways of Human Exposure

The purpose of assessing potential pathways is to evaluate which pathways might have the potential to expose the public.

Potential releases from the site to the following media were considered:

- Air

- Surface water
- Groundwater
- Soil

Potential pathways of human exposure to hazardous wastes or constituents would be limited to inhalation, particale ingestion, and dermal contact. Potential receptors are classified into three groups:

- Onsite workers involved with CAMU operations
- Other onsite employees
- Offsite population

Potential exposure will be limited to onsite workers involved with management of CAMU wastes.

A pathway for exposure from soils may occur during excavation, transportation, treatment and/or disposal of soil from corrective action areas, resulting in onsite workers involved with CAMU operations being exposed to contaminants. In order to monitor the concentrations of exposure, real time air monitoring will be performed while operations are conducted within the limits of the CAMU. No measurable concentrations of organic vapors are expected during CAMU activities. Releases or exposure may be in the form of volatile chemicals to the atmosphere and/or fugitive emissions generated from earth-moving activities.

In order to prevent exposure to individuals not directly involved with CAMU operations, access to the areas where CAMU operations occur will be restricted. All workers involved in handling, transportation, or treatment of soil will wear appropriate personal protective equipment, limiting potential exposure.

Shallow groundwater in the vicinity of the site is not a useable water supply, hence, groundwater is not a pathway. Shallow groundwater is presently not used and not expected to be used as a water supply due to low groundwater yields from the shallow water-bearing zone, poor water quality in this zone, and the continued availability of a municipal water supply. In addition, shallow groundwater is too deep to be encountered during normal construction activities. It is not likely that surface water will be affected by a potential release at the CAMU.

The CAMU has been construced in the footprint of the Former NHB. The Former NHB is in corrective action for groundwater due to releases of hazardous constituents from the former unit. The groundwater corrective action consists of a series of groundwater extraction wells that pump the affected groundwater

to an offsite treatment plant. The goal of the extraction system is create hydraulic contaiment of the affected groundwater and to attain the Groundwater Protection Standards (GWPSs) as established by the Compliance Plan. Containment of the plume will break the potentially complete groundwater to surface water transport pathway (Panther Creek). Potentiometric surface maps in the Geology Report (Attachment K) show that groundwater containment has been achieved. Therefore, future potential releases from the CAMU cannot reach Panther Creek, as long as the extraction system is operating.

Magnitude and Nature of Human Exposure Resulting From a Release

The potential magnitude and nature of human exposure from a release would be based on concentrations of contaminants contained within the soils being managed within the CAMU. The expected contaminants of primary concern are petroleum hydrocarbons. The exposure of CAMU workers is expected to be of short duration. Adequate monitoring and use of appropriate personal protective equipment during operation of the CAMU will mitigate potential health effects. Additionally, access to the CAMU is restricted with barricades and signs in order to eliminate exposure to individuals not involved in CAMU operations.

Personnel Training Plan

ATTACHMENT F

Personnel Training Plan Summary
KM Liquids Terminals LLC – Galena Park Terminal

Overview

The following pages describe the Personnel Training Plan designed to provide KM Liquids Terminals LLC (Kinder Morgan) employees with sufficient instruction so that they may perform their duties in a safe manner. This outline was prepared to demonstrate compliance with 40 Code of Federal Regulations (CFR) Part 264.16 on Personnel Training. The Personnel Training Plan consists of a combination of classroom and field training that ensures Kinder Morgan employees know the appropriate and safe management procedures to follow when dealing with hazardous waste in order to protect themselves from injuries and illnesses.

Personnel Training Instruction

The training program is directed by the Training Manager. The Compliance Manager, who is knowledgeable of RCRA regulations and understands the hazards and risks associated with hazardous waste, is responsible for the content of the hazardous waste training elements. Kinder Morgan supervisiors are responsible for providing employees with on-the-job training and supervision. The instruction is job-specific and directly related to the job description of the employee. Additionally, new employees and contractors are not allowed to work unsupervised until they have successfully completed all initial training requirements.

Recordkeeping

Kinder Morgan employees are required to receive their training within six months after the date of employeement and an annual refresher is administered thereafter. All training records on current employees are kept until closure of the facility and all training records on former employees are kept for at least three years from the date the employee last worked at the facility in accordance with the Kinder Morgan document retention policies set forth by the Procurement Department. The training consists of hazardous waste and emergency response elements, which Kinder Morgan employees must successfully complete prior to working in unsupervised positions within the Galena Park Terminal. The following table illustrates the hazardous waste and emergency response training elements that are required for each job title.

RCRA Training Matrix for KM Liquids Terminals (Galena Park)

APPLICABILITY: Employees involved in hazardous waste operations.

FREQUENCY: Successfully complete the initial training within six months after the date of employment or assignment to a facility, or to a new position at a facility, whichever is later. New employees and contractors must not work in unsupervised positions until they have completed the initial training. Facility personnel must take part in an 8-hr annual review of the initial training.

Job Functions and Titles

The following table on page 3 shows job positions and personnel at the Kinder Morgan Galena Park Terminal, which are directly or indirectly involved in hazardous waste management. The function of each job position and associated training requirements for each position are also presented.

Job Titles and Functions

Job Title / Employee	Job Description - RCRA Specific	Qualifications
Compliance Manager - Scott Eady	Responsible for overseeing all hazardous waste management and emergency response training and procedures are properly completed to remain in compliance.	BS/BA in Environmental Science, Engineering or other related field. Knowledgeable of RCRA regs.Understand the hazards and risks associated with hazardous waste. Understand proper PPE selection.
Remediation Manager -Johnny Kennedy	Supports the Compliance Manager and Waste/Wastewater Environmental Health and Safety Specialist with hazardous waste management acitivities.	BS/BA in Environmental Science, Engineering or other related field. Knowledgeable of RCRA regs.Understand the hazards and risks associated with hazardous waste. Understand proper PPE selection.
Waste / Wastewater (W/WW) Environmental Health and Safety Specialist (EHS) - Johnny Salinas	Responsible for all hazardous waste mamagement funtions at the facilities including paperwork, inspections and physical activities (e.g., moving and labeling containers, collecting samples).	High School Education. Knowledgeable of RCRA regs.Understand the hazards and risks associated with hazardous waste. Understand proper PPE selection. Familiar With RCRA regulations.
W/WW EHS Specialist - Johnny Salinas or designated EHS Technician - Contractor	Supports the W/WW EHS Specialist with all hazardous waste acitivities including packing and labeling.	High School Education. Knowledgeable of RCRA regs.Understand the hazards and risks associated with hazardous waste. Understand proper PPE selection. Familiar With RCRA regulations.
EHS Specialist (Fire & Safety) - Zachary Ward	Responsible for all emergency response activity and has few hazardous waste funtions.The position is also delegated as the safety officer and is responsible for all personnel safety in the event of an emergency.	High School Education. Awareness of RCRA regs and response procedures. Understand the hazards and risks associated with hazardous waste. Understand proper PPE selection.
Operations Manager - Brandon Rogers	Responsible for production activities and has limited hazardous waste management functions, supervises staff that performs physical hazardous waste activities such as filling satellite containers. The position is also designated as the emergency coordinator and is responsible for directing facility personnel in the event of an emergency.	High School Education. Awareness of RCRA regs and response procedures. Understand the hazards and risks associated with hazardous waste. Understand proper PPE selection.
Operations ERT Members / refer to LMS profile for current list of members	Respond in an emergency event. Responsible for few hazardous waste management functions; performs physical waste activities (i.e. moving and labeling containers, they will place material in satellite drums. Will also respond in the event of an emergency.	High School Education. Awareness of RCRA regs and response procedures. Understand the hazards and risks associated with haz waste. Understand proper PPE selection.
Lab Technician - refer to LMS profile for current list of dept members	Handle Universal Waste generated at lab building.	High School Education. Awareness of RCRA regs and response procedures. Understand the hazards and risks associated with hazardous waste. Understand proper PPE selection.
I & E Technician - refer to LMS profile for current list of dept members	Handle Universal Waste generated at lab building.	High School Education. Awareness of RCRA regs and response procedures. Understand the hazards and risks associated with hazardous waste. Understand proper PPE selection.

Hazardous Waste Units

A description of the hazardous waste units that are present at the Galena Park Terminal is provided to Kinder Morgan employees during the annual hazardous waste training presentations. The presentation provides Kinder Morgan employess a description of each hazardous waste unit at the terminal and where the units are located. A test on the presented material is administered to the Kinder Morgan employees upon completion of the presentation.

Security System

ATTACHMENT G

Security System

KM Liquids Terminals LLC – Galena Park Terminal

Overview

KM Liquids Terminals LLC (Kinder Morgan) – Galena Park Terminal has a security system designed to prevent unknowing entry and to minimize the possibility for the unauthorized entry of person or livestock onto the active portion of the Terminal where the Southeast Holding Basin (SEHB) in the Central Plant and the Former North Holding Basin (NHB) in the West Plant are located.

This security system consists of 24-hour surveillance of the active part of the Terminal and a combination of natural and artificial barriers around the facility; controlled access to the Terminal; and easily visible warning signs posted around the Terminal. The following pages discuss the safety system components.

Surveillance System and Barrier

Surveillance System

40 CFR 264.14 requires that owners or operators of hazardous waste facilities have a 24-hour surveillance system which continuously monitors and controls entry onto the active portion of the facility; or an artificial or natural barrier which completely surrounds the active portion of the facility.

Kinder Morgan meets both of these requirements. The Terminal is operated on a two-shift, 24-hour basis. At all times, the active portion of the Terminal is populated with trained Kinder Morgan personnel who not only monitor operational activities, but also control access to the facility. In addition, Kinder Morgan also has a security guard on duty at all times who ensures positive controls on facility entry and performs perimeter patrols.

Barrier

The Kinder Morgan Terminal is completely surrounded by a combination of natural and man-made barriers, which control access to active portions of the facility.

The site is surrounded on the north, east, and west sides by a 6 foot high chain-link fence topped with 3 strands of razor wire and controlled access points. The south side of the facility is bordered by similar chain-link fencing and the Houston Ship Channel, a natural barrier.

Controlled Areas

As mentioned above in this section on safety systems, the Kinder Morgan Terminal is protected by fences and a natural barrier.

Entry into the facility is controlled 24-hours a day by railroad arms monitored by the Customer Service Center (CSC). Remote door openers are issued to authorized Kinder Morgan personnel. Additionally, the Terminal is a TWIC-compliant facility which means all all personnel entering the Terminal must possess a current TWIC card in order to gain entry.

Warning Signs

40 CFR 264.14 requires that signed with the legend, “Danger-Unauthorized Personnel Keep Out” be posted at each entrance to the active portion of a facility, and at other locations, in sufficient number to be seen from any approach to the active portions of the facility. Warning signs are posted at each entrance to the facility, in addition to multiple locations on the fence line surrounding the facility. Warning signs are also located at the entrance to the CAMU since it is currently active and the signs are legible from a distance of 50 feet and are in English and Spanish.

Inspection Schedule

ATTACHMENT H

Inspection Schedule
KM Liquids Terminals LLC – Galena Park Terminal

Inspection Schedule

The KM Liquid Terminals LLC (Kinder Morgan) Galena Park Terminal has a comprehensive inspection program designed to detect malfunctions, deterioration, or operator errors which may cause or lead to the release of hazardous waste constituents to the environment or which may pose a threat to human health. Inspections of the inactive, closed Southeast Holding Basin (SEHB – NOR 017) are performed quarterly. Inspections of the operating Corrective Action Management Unit (CAMU)/Former North Holding Basin (NHB – NOR 004) are conducted weekly.

Kinder Morgan also routinely inspects related components to the Hazardous Waste Management Units (HWMU) such as monitoring equipment, safety and emergency equipment and security devices.

Southeast Holding Basin (SEHB - NOR 017)

Kinder Morgan performs inspections to ensure the integrity of the SEHB cap. Trained personnel conduct quarterly inspections to check the integrity of the cap throughout the post-closure period. The quarterly inspection will include checking the cap for cracks, deterioration, and subsidence.

Kinder Morgan will also inspect the landfill benchmark on a quarterly basis to ensure the presence of the benchmark or note if any damage to the benchmark has occurred.

The post-closure inspection schedule for the cap, landfill benchmark and perimeter fence is as follows and is included in Table III.D:

Inspection Item(s)	Inspection Criteria	Frequency
Final Cap	*Erosion *Non-Uniform Subsidence	Quarterly
Benchmark	*Damage *Accuracy Verification	Quarterly Five Year
Perimeter Fence	*Damage	Quarterly

ATTACHMENT H

Inspection Schedule
KM Liquids Terminals LLC – Galena Park Terminal

CAMU/Former North Holding Basin (NHB – NOR 004)

The CAMU/Former NHB is inspected weekly for freeboard, vegetative cover on the dike walls and the presence of dike erosion.

The inspection schedule is as follows and is included in Table III.D:

Inspection Item(s)	Inspection Criteria	Frequency
Freeboard	*Two Feet	Weekly
Dike	*Leaks, erosion or cracks	Weekly

All items found to be non-sufficient will be repaired, replaced or removed expeditiously.

Monitoring and Recovery Wells

Kinder Morgan currently has monitoring wells in place at the SEHB and CAMU/Former NHB. The wells will be inspected on a semiannual basis (during the groundwater sampling events) to ensure the integrity of the wells. The groundwater monitoring equipment will also be inspected for missing locks, defective covers and casing by trained personnel.

The inspection schedule is as follows and is included in Table III.D:

Inspection Item(s)	Inspection Criteria	Frequency
Well Lock	*Is it present *Damaged	Semiannually – at time of sampling
Surface Seals	*Deterioration *Tampering	Semiannually – at time of sampling
Well Casing (if exposed)	*Deterioration *Tampering	Semiannually – at time of sampling
Well Caps	*Is it present *Deterioration	Semiannually – at time of sampling
Monitor Wells	*Silt Build-up	Semiannually – at time of sampling

All items found to be non-sufficient will be repaired, replaced or removed expeditiously.

KM Liquids Terminals LLC – Galena Park Terminal

Recordkeeping

As required by 40 CFR 264.195, Kinder Morgan keeps written records of the inspections. The inspection records include the date and time of inspection, inspector name, description of observations, and remedial actions taken (with completion date) to correct any issues. These are kept at the facility and are available upon request.

1.0 INTRODUCTION

This Waste Analysis Plan (WAP) has been prepared in accordance with the requirements of the in-place closure requirements presented in 40 Code of Federal Regulations (CFR) Part 265 Subpart G and 31 Texas Administrative Code (TAC) Section 335.118. This WAP outlines the methods and procedures employed to characterize the solid wastes managed within the Corrective Action Management Unit (CAMU)/ Former North Holding Basin (NHB; Notice of Registration [NOR] 004) at the Galena Park Terminal of KM Liquids Terminals LLC (Kinder Morgan). The CAMU receives facility remediation wastes for treatment and disposal.

2.0 FACILITY DESCRIPTION

Kinder Morgan operates a bulk liquid storage terminal on the Houston Ship Channel in Galena Park, Texas, east of Houston. The 373.721-acre Galena Park Terminal is located at 906 Clinton Drive in Galena Park, Texas. Galena Park is an incorporated suburban community approximately 9 miles east of downtown Houston in Harris County. The facility is on the north bank of the Houston Ship Channel and is within the jurisdiction of the Houston Port Authority District, which administers activities on the Ship Channel.

The CAMU/Former NHB is an existing permitted hazardous waste management unit used to treat and dispose of solid wastes generated during the site corrective actions at the facility. The Former NHB portion of the combined unit was initially used to collect wastewater and storm water in the western portion of the plant. The unit was constructed in 1975 and operated up to 1988. Effluent from the wastewater/storm water collection system passed through an oil/water separator before being discharged to the Former NHB. The Former NHB is a 480-foot by 276-foot rectangular unit. The average depth of the basin is 18.3 feet from the top of the berm. The total capacity of the basin is approximately 88,000 cubic yards. The floor of the basin is sloped slightly to the east to provide drainage. In 1988, the NHB was retired from service.

In 1994 the Former NHB was proposed as a CAMU in compliance with 40 CFR 264 Subpart S to treat and dispose of remediation wastes generated by corrective actions and closure of the Former NHB at the facility. The engineering design of the CAMU was proposed in May 1995. In 1995 an engineering report for the CAMU was prepared and submitted to the Texas Natural Resource Conservation Commission (now known as the Texas Commission on Environmental Quality [TCEQ]) as part of a permit for closure of the Former NHB and construction and operation of the CAMU.

The permit was subsequently granted in 1995 and the facility's NOR identifies the CAMU/Former NHB as Unit #004. An Engineering Certification Report, providing the construction details for the CAMU/Former NHB was prepared by Fugro Environmental, Inc. in 1996. Malcolm Pirnie, Inc. prepared a CAMU Management Plan for the unit in 1998 that presented details pertaining to the operation of lead stabilization and biotreament activities conducted within the CAMU. CH2M Hill, Inc. (CH2M Hill) and ARCADIS each prepared addendums to the CAMU engineering reports in 2003.

The document presented under this cover has also been prepared using information previously presented within the engineering reports described above. CH2M Hill also prepared an addendum WAP in 2003. This WAP includes information presented within the CH2M Hill addendum.

3.0 WASTE DESCRIPTION

The CAMU is used to dispose of remediation waste generated during Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) and other site related investigation activities. Analytical results collected during previous investigations are used to evaluate soil concentrations detected in soil. **Table 1** presents a general listing of analytical parameters potentially associated with areas of investigation at the Galena Park Terminal. Wastes disposed of in the CAMU are derived from five primary sources that include:

- Soil impacted during historical lead and total petroleum hydrocarbons (TPH) management in Tracts B and C of the Galena Park facility;
- Waste accumulated as a result of the RFI;
- Impacted soil excavated during the remediation of Solid Waste Management Units (SWMUs);
- Affected soils within identified SWMUs/Areas of Concern (AOCs) impacted by releases; and
- Tank 100-5 bottom sediments, which accumulated during the time period that the tank was used to contain storm water. The tank has since been converted to service as a product storage vessel.

No free liquids are placed within the CAMU. Storm water accumulation within the CAMU is directed to the Gulf Coast Waste Authority for disposal.

- All remediation wastes placed within the CAMU are evaluated as described within this Plan and must meet the following criteria:
- Compatibility with wastes already placed in the CAMU;
- Ability to be biotreated or meet disposal standards; and
- Absence of contaminants or concentrations that is toxic to the biotreatment/treatment process (applicable to wastes in the treatment area, only).

Remediation wastes that are not compatible or containing concentrations of compounds that cannot be biotreated will not be placed in the CAMU. Incompatible wastes will be placed in containers in the Container Storage Area until proper treatment and/or disposal arrangements can be made. Remediation wastes that meet the disposal standard for CAMU disposal will not require additional treatment. Remediation wastes awaiting treatment are stockpiled separately in an interim storage portion of the CAMU. Analytical data for remediation waste will be collected prior to placement in the CAMU. **Table 2** includes a listing of constituents associated within soils disposed within the CAMU with corresponding quantification and proposed treatment and disposal levels. Descriptions of Treatment Standards developed for the CAMU are presented in Section 4.0 (Waste Characterization).

Excavated soils are treated and disposed in the CAMU based on concentrations of contaminants present in the material. Potential chemicals of interest primarily include TPH, benzene, toluene, ethylbenzene, xylenes (BTEX), and lead. Additional potential contaminants include various volatile and semivolatile organic compounds and herbicides managed at the site. Appendix VIII constituents previously identified as potentially present in the waste are listed in **Table 2**. These constituents are

included in the waste characterizations utilized to determine applicability of the excavated material for treatment and disposal within the CAMU.

Soils requiring stabilization are treated prior to disposal in the CAMU. Lead stabilization will consist of mixing fly ash (or other material, as appropriate) and water in soil. Soils requiring biological treatment are placed in the designated biological treatment section of the CAMU until the constituent concentrations reach levels appropriate for disposal. As part of biotreatment, nutrients and moisture are added to enhance bioremediation, if necessary. Samples will be collected and analyzed for TPH and BTEX to track the progress of remediation. Confirmation sampling for volatile organic constituents (VOCs), semivolatile organic constituents (SVOCs), and leachable BTEX will occur upon completion of the treatment activities.

4.0 WASTE CHARACTERIZATION

Characterization of the waste material is performed to ensure that applied material does not exceed the concentration limits established for management in the CAMU. Available data indicate that the soil has not historically been classified as ignitable, reactive, or corrosive. Liquid wastes are not disposed of or treated in the CAMU. Any water observed in a container of soils being transferred to the CAMU is pumped to the wastewater treatment system. The CAMU is operated in accordance with CAMU regulations and as specified within the CAMU Engineering Report.

Analytical data for soil samples representative of material placed within the CAMU will be collected prior to placement in the unit. The data will be collected during the RFI or related site investigations for general parameters listed on **Table 2**. Resulting data will be compared to proposed treatment standards shown on **Table 2**. The proposed treatment standards shown on **Table 2** include the constituents most likely associated with the waste soils. These treatment standards are selected from among the highest level within the following published criteria:

- Texas Risk Reduction Plan (TRRP) Tier 1 Commercial/Industrial Soil Protective Contaminant Levels (PCLs) for Direct Contact Exposure Pathway ($^{Tot}Soil_{Comb}$); and
- TRRP Tier 1 Commercial/Industrial PCLs for soil-to-groundwater leaching of constituents of concern (COCs) to Class 1 and 2 Groundwater ($^{GW}Soil_{Ing}$).

Criteria for TPH, total leachable BTEX, and leachable lead include the following:

- Soil concentrations for TPH must be at or less than 2,100 milligrams per kilogram (mg/kg), based on the lowest carbon range for the aliphatic/aromatic fractionation of TPH;
- Total leachable BTEX in soil must be at or less than 100 milligrams per liter (mg/L); and
- Total leachable lead in soil must be less than 5 mg/L.

Table 3 provides a listing of soil standards used in selection of CAMU Treatment Standards.

Prior to placement in the CAMU for treatment, soil samples representative of each of the primary source areas will initially be collected for analysis every 100 cubic yards. If more than 100 cubic

yards of material is removed from the same source, samples will be collected every 500 cubic yards to confirm homogeneity.

4.1 CAMU Treatment and Disposal Process

CAMU operations depend on the concentrations of hazardous constituents (organic chemicals) or lead in the soil and proceed sequentially. The CAMU will be utilized to stabilize and store lead and TPH-affected soil. Treatment of lead contaminated soil will be conducted as described below:

- Soils requiring stabilization for lead, or other reasons, will be spread out in 10-inch lifts over approximately one half of the CAMU, allowing for treatment of up to 2,800 cubic yards per batch. The first batch of soil to be treated will be placed directly in Area 1 as specified within the 2003 CAMU Engineering Report. The subsequent batch of soils will be stockpiled in Area 2 to await treatment as specified within the 2003 CAMU Engineering Report;
- Stabilization will be achieved by mixing the optimal volume of fly ash (or other material, as appropriate), as determined by a pilot test, into the soil by means of the Caterpillar SS2250B and adding the proper quantity of water. Treated soil will then be allowed to cure for 3 days prior to placing additional layers of wastes, as necessary; and
- Once soils have been demonstrated to meet disposal criteria, they will be graded to drain to a sump at the northeastern end of the CAMU.

Soils affected by organic compounds and TPH will be placed in the CAMU for disposal. Soils with constituent concentrations above the treatment standards established in **Tables 2** and **3** will be subject to bioremediation or other treatment, prior to final disposal. Soils that meet treatment standards will be placed directly in the final disposal locations. Management of organics-affected soils include the following:

- Soils that meet the disposal criteria will be disposed in Area 3 of the CAMU, as specified within the 2003 CAMU Engineering Report, without further treatment. Area 3 will be gradually and evenly filled with 10-inch lifts during the life of the CAMU;
- Soils requiring bioremediation will be spread out in 10-inch lifts on the treatment pad. A Caterpillar SS250B will be used to mix the soil, nutrients, as necessary, the optimal volume of water, and microbial inoculum (if required). The soil will then be aerated with the Caterpillar SS250B up to three times weekly until remediation concentrations are achieved. Once treatment goals have been reached, additional soils will be placed over the treated soils, resulting in a vertical fill over the entire biotreatment area; and
- Disposal areas will alternate between both sides of the CAMU to balance accumulation of soil. Untreated wastes will not be placed on soils undergoing bioremediation until biotreatment operations are completed for that specific batch of soil. Conversely, biotreatment operations can begin over disposed, untreated wastes that meet CAMU operational goals. The entire surface area of the CAMU can also be utilized for either purpose, if waste volumes so indicate (if necessary).

Throughout CAMU operations, the working surface elevation of the CAMU will be graded to maintain drainage of storm water to a sump in the northeastern corner. Storm water will be routed by existing piping to a publicly owned treatment works. If the entire capacity of the CAMU is required to manage

affected soils, the sump will be retrofitted with vertically oriented large diameter perforated pipe with surrounding gravel filter pack. The pipe will allow the final cell of the CAMU to be filled while maintaining storm water control for minimal engineering and construction costs.

4.2 Sample Collection

Sample collection of soil is performed to obtain a representative aliquot of the stockpiled 100-cubic-yard segment. The following procedure is employed to collect soil samples from containers or stockpiles. The procedure is also utilized to evaluate residual constituent concentrations following either biological treatment or stabilization prior to disposal in the CAMU.

1. Remove covering from the container or stockpile, as applicable;
2. Construct a composite sample by collecting a five-point composite sample from the appropriate soil volume (minimum of 100 cubic yards from initial source and every 500 cubic yards to confirm homogeneity);
3. Utilize appropriately decontaminated stainless steel augers or other hand sampling equipment to collect equal volumes of soil from each of the five sample locations;
4. Place the composite sample in a clean, decontaminated stainless steel mixing bowl and mix with a stainless steel spoon to form a homogenous and representative sample (agitation will be minimized to reduce aeration of volatiles);
5. A subsample will be place in appropriate sample containers provided by the laboratory, sealed, place in a cooler at 4 degrees Celsius ("C), and picked up by the analytical laboratory for analyses;
6. Sample containers are then placed in a cooler with wet ice or held in a refrigerator at 4°C until transfer to the laboratory;
7. A chain-of-custody form is completed for all samples immediately following sample collection. The chain-of-custody form will include the sample ID, date and time of collection, methods of analysis for each sample, number of containers included in the shipment, project information, sample collection personnel , and signatures of collecting personnel and personnel transferring samples to the laboratory, as well as the laboratory sample custodian; and
8. All sampling equipment is decontaminated following each sampling event. The decontamination procedure includes:
    a. Liquinox (or equivalent) wash with brushes;
    b. Rinse with tap water;
    c. Triple rinse with deionized water; and
    d. Air dry.

4.3 Sample Preservation

All samples are soil samples and therefore preservation includes only refrigeration of samples to maintain 2±4°C. Sample containers are placed in a cooler with wet ice or in a refrigerator prior to release to the laboratory. Samples are transferred to the laboratories in coolers with wet ice.

4.4 Sample Documentation

Field records are maintained regarding location of sample, sample collection techniques, date and time of collection, personnel, and other pertinent information relative to sample condition and type.

Samples are shipped under strict chain-of-custody with all signatures applied during transfer of the samples from Kinder Morgan to the laboratory.

4.5 Sample Analysis

The general test methods utilized are presented on Table 1. The methods listed are current USEPA-approved methods, as presented and authorized in SW-846 *Test Methods for Evaluating Solid Wastes*. Kinder Morgan reserves the right to utilize the most current approved version of each method as adopted by USEPA in SW-846.

Determination of free liquids content is based on visual observations of the soil prior to placement in the CAMU. Free liquids are pumped directly to the wastewater treatment system prior to introduction of the waste material into the CAMU.

An independent environmental analytical laboratory is contracted to perform the required analyese and submit a written report of the analytical results and supporting quality assurance information. The laboratory must be appropriately accredited as required by TCEQ.

4.6 Quality Assurance/Quality Control

An independent environmental analytical laboratory will be contracted by Kinder Morgan to perform the characterization analyses. The laboratory will include method appropriate quality control samples. These measures will include method blanks and laboratory control samples, as well as system monitoring compounds (surrogates), as specified in the USEPA method and the laboratory Standard Operating Procedures and Quality Assurance Plan (QAP). A current copy of the laboratory QAP will be retained by Kinder Morgan. Quality control samples will also include matrix spikes and matrix spike duplicates specific to the Kinder Morgan waste matrix. Kinder Morgan personnel will collect additional sample volumes at a 5 percent **(I** per 20 field samples) frequency for a specific corrective action site to generate site-specific matrix impact evaluation data.

Additionally, trip blanks are prepared by the laboratory and included in the shipment of sample containers to the site. The trip blanks are returned to the laboratory with samples requiring volatile constituent determination to evaluate potential cross contamination of samples during transport.

The laboratory is instructed to notify Kinder Morgan personnel immediately in the event that samples are received in a compromised condition including improper cooler temperature or sample preservation, broken containers, COC discrepancies, or other anomaly that could potentially impact data quality and/or data usability.

4.7 Analytical Data Review

Analytical data reports are reviewed upon receipt from the laboratory to ensure holding time compliance and report completeness including fully executed chain-of-custody form. Reporting limits

are evaluated to ensure that the appropriate limit of detection was attained. Method blanks are checked for potential contamination impacting data quality. Laboratory control samples and matrix spike recoveries are evaluated relative to method performance and potential impact to data usability.

5.0 CHARACTERIZATION FREQUENCY

Prior to placement of waste into the CAMU, waste soil from a single corrective action site is characterized based upon the initial 100 cubic yards removed. Five samples are collected from representative sections of the stockpile and composited to one sample for analysis. Soil (maximum 500 cubic yards) from the characterized zone is then managed, as appropriate, based upon the initial analytical results. This procedure is based on historical data, which indicate that a designated remediation area is typically homogenous relative to constituents and concentrations. If volume from the "single corrective action site" exceeds 500 cubic yards, addi6onal characterization samples are collected, analyzed, and managed in accordance with the additional analytical results. Waste material is, therefore, managed in 500-cubic-yard volumes.

Waste from other corrective action sites is sampled independently and managed as indicated by analytical data relative to the decision process for contaminant concentrations and available treatment and disposal protocols set forth in the 2003 CAMU Engineering Plan. Additional sampling will follow if treatment activities are conducted. In the event that stabilization is necessary to treat soil with elevated lead concentrations, subsequent sampling will be conducted to confirm that soil mixture does not leach lead concentration above proposed lead treatment standards. Verification sampling following lead stabilization will occur every 500 cubic yards and the samples will be analyzed for lead using the Toxicity Characteristic Leachate Procedure. Analytical results will be compared to the corresponding toxicity characteristic (5 mg/L) for lead to determine if the stabiliza6on activities have been successful.

In the event that biotreatment is necessary to treat elevated TPH or other organic COCs, subsequent sampling will be conducted to verify that biotreatment has successfully treated soil to the proposed treatment standards. Verification sampling following biotreatment will also occur every 500 cubic yards and samples will be analyzed for TPH and BTEX for screening. Sample collection protocols for screening biotreated soils will be conducted as follows:

- Collect first set of samples immediately following the initial treatment;
- Collect second set of samples consisting of three samples at the anticipated mid-point of biotreatment; and
- Collect the third set of samples consisting of three samples at the anticipated end of biotreatment.

Once screening data from TPH and BTEX analyses indicate that treatment goals have been reached, confirmatory analyses consisting of collection of one sample per 500 cubic yards for analyses of VOCs, SVOCs, and leachable BTEX will be conducted.

A Engineering Certification Report

1.0 Introduction

On behalf of Kinder Morgan Liquids Terminals, LLC (KMLT), ARCADIS prepared this Engineering Report. The former North Holding Basin (NHB)/Corrective Action Management Unit (CAMU) is an existing permitted hazardous waste management unit used to treat and dispose of solid wastes generated during the site corrective actions at the facility. A topographic map of the facility is presented as Figure 1. A plan view of the facility is presented as Figure 2.

The Former NHB portion of the combined unit was initially used to collect wastewater and storm water in the western portion of the plant. The unit was constructed in 1975 and operated up to 1988. Effluent from the wastewater/storm water collection system passed through an oil/water separator before being discharged to the Former NHB. The Former NHB is a 480-foot by 276-foot rectangular unit. The average depth of the basin is 18.3 feet from the top of the berm. The total capacity of the basin is approximately 88,000 cubic yards. The floor of the basin is sloped slightly to the east to provide drainage. In 1988, the Former NHB was retired from service.

In 1994, the Former NHB was proposed as a CAMU in compliance with 40 Code of Federal Regulations (CFR) 264 Subpart S to treat and dispose of remediation wastes generated by corrective actions and closure of the Former NHB at the facility. The engineering design of the CAMU was proposed in May 1995. In 1995, an engineering report for the CAMU was prepared and submitted to the Texas Natural Resource Conservation Commission (now known as the Texas Commission on Environmental Quality [TCEQ]) as part of a permit for closure of the Former NHB and construction and operation of the CAMU. The permit was subsequently granted in 1995 and the facility's Notice of Registration identifies the Former NHB/CAMU as Unit #004.

The CAMU was constructed in August 1996 following stabilization of the sludge in the Former NHB. An engineering certification report, documenting the construction of the CAMU and closure of the Former NHB, was prepared in 1996 by Fugro Environmental, Inc. (Fugro), in accordance with the design and construction specifications and approved permit modification application.

A CAMU Management Plan was prepared in April 1998 by Malcolm Pirnie, and the document specifies waste treatment standards, operation requirements, waste analysis, environmental monitoring, CAMU maintenance, and CAMU closure and post closure plan. CH2M Hill, Inc. (CH2MHill), prepared an Engineering Report

Addendum in 2003 to combine previous and current operation conditions associated with the Former NHB/CAMU as part of the Application for Renewal and Major Amendment of Permit HW-50054 for units operated at the Galena Park facility. The document presented under this cover was prepared to combine all current information pertaining to the Former NHB/CAMU, previously presented within the documents referenced above. Details pertaining to the design specifications and certification are presented within the Fugro Engineering Certification Report for the CAMU under Appendix A.

2.0 Facility Description

The Galena Park Terminal is located at 906 Clinton Drive in Galena Park, Texas. Galena Park is an incorporated suburban community, approximately 9 miles east of downtown Houston (in Harris County), on the north bank of the Houston Ship Channel, and is within the jurisdiction of the Houston Port Authority District, which administers activities on the Ship Channel. The Former NHB/CAMU is located in the western portion of the plant.

As previously described, the Former NHB was an abovegrade surface impoundment that was used to collect wastewater and storm water. The unit was constructed in 1975 and operated up to 1988. The Former NHB consisted of a 480-foot by 276-foot rectangular unit. The average depth of the basin was 18.3 feet from the top of the berm. The total capacity of the basin was approximately 88,000 cubic yards. The floor of the basin is sloped slightly to the east to provide drainage. In 1988, the Former NHB was retired from service.

In 1994, the Former NHB was proposed as a CAMU in compliance with 40 CFR 264 Subpart S to treat and dispose of remediation wastes generated by corrective actions and closure of the Former NHB at the facility. The engineering design of the CAMU includes a clay barrier extending across the base of the Former NHB that was compacted over the stabilized sludge. The clay barrier is composed of a 6-inch thick layer of low-permeability compacted clay. The clay barrier surface is sloped to drain to a sump for leachate collection and removal. The design also includes a truck ramp for loading waste into the CAMU. Design specifications for the CAMU are presented in detail within the Fugro Engineering Report presented in Appendix A.

The CAMU is currently operated according to the procedures provided in the 1998 CAMU Management Plan and as further described within this document. These procedures disallow the placements of any free liquids in the CAMU and limit the

concentrations of contaminant constituents in the wastes that can be placed in the CAMU. These practices, in combination with the CAMU lining design and the underlying closed Former NHB, prevent contaminants from entering the groundwater.

Waste disposed of in the CAMU are derived from five primary sources that include:

- Soil affected historical lead and total petroleum hydrocarbons (TPH) in Tracts B and C of the Galena Park facility;
- Waste accumulated as a result of the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI);
- Affected soil excavated during the remediation of Solid Waste Management Units (SWMUs);
- Soil within identified SWMUs affected by future releases, as allowed under the facility's Hazardous Waste Permit; and
- Tank 100-5 bottom sediments, which accumulated during the time period that the tank was used to contain storm water. The tank has since been converted to service as a product storage vessel.

Any other remediation wastes, as defined in the U.S. Environmental Protection Agency's (USEPA's) CAMU rules, may be placed in the CAMU on a case-by-case basis.

No free liquids are placed within the CAMU. Storm water accumulation within the CAMU is directed to the Gulf Coast Waste Authority for disposal. All remediation wastes placed within the CAMU are evaluated as described within the Waste Analyses Plan (WAP) for the CAMU and must meet the following criteria:

- Compatibility with wastes already placed in the CAMU;
- Ability to be biotreated, stabilized for lead, or meet disposal standards; and
- Absence of contaminants or concentrations that are toxic to the biotreatment/treatment process (applicable to wastes in the treatment area, only).

Compounds and wastes that are generally amenable to bioremediation are listed in Table 1. Remediation wastes that are not compatible or containing concentrations of compounds that cannot be biotreated and/or stabilized will not be place in the CAMU. Incompatible wastes will be placed in containers for off-site disposal to an authorized Treatment, Storage, and Disposal facility. Remediation wastes that meet the disposal standard for CAMU disposal will not require additional treatment. Remediation wastes awaiting treatment are stockpiled separately in an interim storage portion of the CAMU (also shown on Figures 3 and 4). Table 2 includes a listing of constituents associated with soils disposed within the CAMU with corresponding treatment and disposal levels.

3.0 CAMU Treatment Standards

The proposed treatment standards shown in Table 2 are for constituents most likely associated with the waste soils. These treatment standards are selected from among the highest level within the following published criteria:

- Texas Risk Reduction Plan (TRRP) Tier 1 Commercial/Industrial Soil Protective Contaminant Levels (PCLs) for Direct Contact Exposure Pathway ($^{Tot}Soil_{Comb}$); and

- TRRP Tier 1 Commercial/Industrial PCLs for soil-to-groundwater leaching of Constituents of Concern (COCs) to Class 1 and 2 Groundwater ($^{GW}Soil_{Ing}$).

Criteria for TPH, total leachable Benzene, Toluene, Ethylbenzene, and Xylene (BTEX), and leachate lead include the following:

- Soil concentrations for TPH must be at or less than 2,100 milligrams per kilograms (mg/kg), based on the lowest carbon range for the aliphatic/aromatic fractionation of TPH;

- Total leachable BTEX in soil must be at or less than 100 milligrams per liter (mg/L); and

- Total leachable lead in soil must be less than 5 mg/L.

Table 3 provides a listing of soil standards used in the selection of CAMU Treatment Standards. Prior to placement in the CAMU, treatment soil samples representative from each of the primary source areas will initially be collected for analysis every 100 cubic yards. If more than 100 cubic yards of material is removed from the same source, samples will be collected every 500 cubic yards to confirm homogeneity. Samples will be collected and analyzed according to methodologies specified within the WAP and as described in Section 5.3 (Waste Analyses).

4.0 CAMU Treatment and Disposal Process

4.1 Process Overview

The CAMU treatment area is operated as a bioremediation unit for hazardous remediation wastes and non-hazardous remediation wastes that exceed TPH concentrations of 2,100 parts per million (ppm). The CAMU will also be utilized to stabilize lead contamination in soil. It is estimated that approximately 50,000 cubic yards of such wastes will be treated prior to final disposal in the CAMU. The treatment area is constructed as follows:

- Sloping of base of unit (Former NHB floor) to the northeast corner;
- Sump installation in the northeast corner of the Former NHB; and
- Construction of treatment cell(s), as needed.

Excess rainwater from the treatment and stockpile areas in the CAMU are directed to the sump in the northeast corner of the Former NHB/CAMU. Water is transferred to the storm water sump and lift station, located northeast of the Former NHB/CAMU, and discharged directly to the Gulf Coast Waste Disposal Authority.

Soils that are treated in the CAMU are initially placed within lifts in the treatment cells and tilled to promote aeration. As part of biotreatment, nutrients and moisture are added to enhance bioremediation, if necessary. Samples will be collected and analyzed for TPH and BTEX to track the progress of remediation. Confirmation sampling for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), and leachable BTEX will be conducted. Once treatment levels have been reached, another lift of soil is added and the process is repeated.

Lead stabilization will consist of mixing fly ash (or other material, as appropriate) and water in soil. Upon completion of stabilization, samples will be collected for analysis of leachable lead.

4.2 CAMU Equipment, Manpower, and Material List

A partial listing of equipment, manpower, and materials required for CAMU operations is presented as follows:

- Backhoe or trackhoe for excavation;
- Transport trucks;
- Dozer to manage soil for the CAMU;
- Caterpillar SS250B or equivalent for bioremediation tilling and soil stabilization mixing;
- Up to four remediation contractor personnel to be on site during excavation activities. Manpower requirements to drop to two or less during ongoing bioremediation activities;
- Up to two engineering contractor personnel to be on site during excavation and sampling activities. Manpower requirements to drop to one or less during ongoing bioremediation activities; and
- Materials for lead stabilization include water and fly ash. Bioremediation materials include water, fertilizer with nitrogen and phosphorous, and, in extreme cases, microbial inoculums.

4.3 CAMU Treatment and Disposal Process

CAMU operations depend on the concentrations of hazardous constituents (organic chemicals) or lead in the soil and proceed sequentially. The CAMU can be utilized to stabilize and store lead and TPH-affected soil. Figure 3 depicts the CAMU configuration during lead stabilization activities. Figure 4 depicts the CAMU configuration during biotreatment of soil impacted with COCs other than lead. As discussed within Section 3.0 (CAMU Treatment Standards), treatment levels for soil levels are based upon published criteria established by TCEQ and USEPA.

Treatment of lead contaminated soil will be conducted as described below:

- Soils requiring stabilization for lead, or other reasons, will be spread out in 10-inch lifts over approximately one half of the CAMU, allowing for treatment of up to 2,800 cubic yards per batch. The first batch of soil to be treated will be placed directly in Area 1, as shown on Figure 3. The subsequent batch of soils will be stockpiled in Area 2 to await treatment;

- Stabilization will be achieved by mixing the optimal volume of fly ash (or other material, as appropriate), as determined by a pilot test, into the soil by means of the Caterpillar SS2250B and adding the proper quantity of water. Treated soil will then be allowed to cure for 3 days prior to placing additional layers of wastes, as necessary; and

- Once soils have been demonstrated to meet disposal criteria, they will be graded to drain to a sump at the northeastern end of the CAMU.

Following completion of the RFI, additional soils affected by organic compounds and TPH will be placed in the CAMU for disposal. Soils with constituent concentrations above the treatment standards established in Table 2 will be subject to bioremediation or other treatment, prior to final disposal. Soils that meet treatment standards will be placed directly in the final disposal locations.

Management of organics-affected soils include the following:

- Soils that meet the disposal criteria will be disposed in Area 3 of the CAMU, as shown on Figure 4, without further treatment. Area 3 will be gradually and evenly filled with 10-inch lifts during the life of the CAMU;

- Soils requiring bioremediation will be spread out in 10-inch lifts on the treatment pad (Area 4 on Figure 4). A Caterpillar SS250B will be used to mix the soil, nutrients, as necessary, the optimal volume of water, and microbial inoculum (if required). The soil will then be aerated with the Caterpillar SS250B up to three times weekly until remediation concentrations are achieved. Once treatment goals have been reached, additional soils will be placed over the treated soils, resulting in a vertical fill over the entire biotreatment area; and

- Disposal areas will alternate between both sides of the CAMU to balance accumulation of soil. Untreated wastes will not be placed on soils undergoing bioremediation until biotreatment operations are completed for that specific batch of soil. Conversely, biotreatment operations can begin over disposed, untreated waste that meet CAMU operational goals. The entire surface area of the CAMU can also be utilized for either purpose, if waste volumes so indicate (if necessary).

Throughout CAMU operations, the working surface elevation of the CAMU will be graded to maintain drainage of storm water to a sump in the northeastern corner. Storm water will be routed by existing piping to a publicly owned treatment works. If the entire capacity of the CAMU is required to manage affected soils, the sump will be retrofitted with vertically oriented large diameter perforated pipe with surrounding gravel filter pack. The pipe will allow the final cell of the CAMU to be filled while maintaining storm water control for minimal engineering and construction costs.

5.0 Monitoring

5.1 Groundwater

Groundwater monitoring will be conducted at the Former NHB/CAMU as specified within Galena Park's Compliance Plan. The Compliance Plan specifies designated wells, sample frequency, and monitor parameters. Test methodologies, data evaluation, and reporting requirements are also specified within the Compliance Plan (CP-50054). Protocols for sampling are specified within the Sampling and Analyses Plan (SAP) and prepared in accordance with the Compliance Plan. Operations and maintenance protocols for the Former NHB/CAMU groundwater monitoring system are also specified within the associated SAP.

5.2 Air Emissions

In order to minimize dust generated by CAMU activities, an adequate soil moisture level will be maintained during excavation and transport to the CAMU. This will primarily be accomplished by the application of water to soil being managed. Maintaining proper moisture content will also assist in the effectiveness of land farming and the biological treatment of soils within the CAMU. If excess dust is generated on non-public roadways and during related CAMU activities, water will be used to reduce emissions.

No measurable concentrations of organic vapors are expected during CAMU activities. During CAMU-related activities, real-time air monitoring will be performed. This will include an explosimeter, an organic vapor monitor (photoionization detector or flame ionization detector), and all necessary calibration/audit equipment and supplies. All monitoring instruments will be calibrated before use. Periodic calibration checks will be made and documented in the field over the duration of the field activities.

Air monitoring activities will commence daily prior to start up of the CAMU activities in order to establish baseline conditions. Air monitoring shall be provided during excavation, staging, loading, or tilling of potentially contaminated soils. Departures from background levels will trigger an evaluation for employee personal protection and potential air emission impacts. The responses range from shutting down CAMU operations to upgrading levels of protection or initiating emergency response/contingency plans.

5.3 Waste Analyses

If RFI characterization data are not available, soil samples will be collected for analyses prior to placement in the CAMU, during treatment to verify that soil levels meet proposed treatment standards, and upon completion of treatment activities. Soil samples of untreated soil that are representative from each of the primary source areas will initially be collected for analysis every 100 cubic yards. If more than 100 yards of material is removed from the same source, samples will be collected every 500 cubic yards to confirm homogeneity. Sampling procedures include the following:

- Remove covering from the container or stockpile, if applicable;
- Construct a composite sample by collecting a five-point composite sample from the appropriate soil volume (minimum of 100 cubic yards from initial source and every 500 cubic yards to confirm homogeneity);
- Place the composite sample in a clean, decontaminated mix with a stainless steel spoon to form a homogenous sample (agitation will be minimized to reduce aeration of volatiles); and
- A subsample will be place in appropriate sample containers provided by the laboratory, sealed, place in a cooler at 4 degrees Celsius, and picked up by the analytical laboratory for analyses.

The WAP, prepared under separate cover, provides details pertaining to sampling protocols and decontamination. Tables 2 and 3 present a listing of known constituents of concern that are also included in the WAP. Table 4 summarizes the general parameters and test methods that may be used to characterize affected soils. Actual analytical methods will vary based upon data collected during the RFI or from the primary source area regarding the potential constituents present.

In the event that stabilization is necessary to treat soil with elevated lead concentrations, subsequent sampling will be conducted to confirm that soil mixture does not leach lead concentration above proposed lead treatment standards. Verification sampling following lead stabilization will occur every 500 cubic yards and the samples will be analyzed for lead using the Toxicity Characteristic Leaching Procedure. Analytical results will be compared to the corresponding toxicity characteristic (5 mg/L) for lead to determine if stabilization activities have been successful.

In the event that biotreatment is necessary to treat elevated TPH or other organic COCs, subsequent sampling will be conducted to verify that biotreatment has successfully treated soil to the proposed treatment standards. Verification sampling following biotreatment will also occur every 500 cubic yards and samples will be screened for TPH and BTEX. Sample collection protocols for screening biotreated soils will be conducted as follows:

- Collect first set of samples immediately following the initial treatment;
- Collect second set of samples consisting of three samples at the anticipated mid point of biotreatment; and,
- Collect the third set of samples consisting of three samples at the anticipated end of biotreatment.

Once screening data from TPH and BTEX analyses indicate that treatment goals have been reached, confirmatory analyses consisting of collection of one sample per 500 cubic yards for analyses of VOCs, SVOCs, and leachable BTEX will be conducted.

6.0 CAMU Closure

After completion of treatment activities in the CAMU, treated and stockpiled soil will be evenly spread throughout the basin. Additional backfill, consisting of remaining portions of the dikes and clean fill, will be graded over the facility in preparation of final cover placement. Closure activities will be conducted in accordance with the Former NHB/CAMU Closure Plan. Six months prior to final closure, KMLT will provide TCEQ with a proposed final cap design. At that time, the detailed Engineering Plan Specifications and a Construction Quality Assurance Plan will be submitted for approval.

7.0 Certification Statement

This report is a conceptual engineering document is support of the permit modification to an existing permit modification to an existing Part B modification to operate a Former NHB/CAMU. I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person(s) who manages the system, or those persons directly responsible for gathering the information. The information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware of the penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Engineering Certification Report
Corrective Action Management Unit
GATX North Holding Basin
Galena Park, Texas

We are pleased to submit our Engineering Certification Report and Quality Assurance/Quality Control (QA/QC) activities summary during the construction of the Correction Action Management Unit (CAMU) at the North Holding Basin at the above referenced facility. We performed this work for GATX under Blanket Order No. MSA E004 and Purchase Order Nos. 6618-001 and 6618-002.

We appreciate the opportunity to be of service on this project, and look forward to continuing to provide engineering consultation and material testing for other projects. Please call if you have any questions, or when we may be of further service.

Sincerely,
FUGRO ENVIRONMENTAL, INC.

Mark A. Board, P.E.
Supervising Engineer

CERTIFICATION

This is to certify that the following activities have been completed for the following items in conformance with good engineering practices and the design and construction specifications of the approved final closure plan dated March, 1991 and the Class 3 Permit Modification Application dated September, 1994:

Construction of a CAMU as part of the Final Closure of the North Holding Basin at the GATX Terminals Corporation Facility, Galena Park, Texas. This work was authorized under Permit No. HW-50054, EPA No. TXD026481523.

Fugro Environmental Inc.
Mark A. Board, P.E.
Certifying Engineer

1.0 INTRODUCTION

This report contains a brief description of the construction activities and results of the quality assurance/quality control testing during construction of the CAMU at the North Holding Basin at GATX's Galena Park facility. This unit is covered by Texas Natural Resource Conservation Commission (TNRCC) Permit No. HW-50054 and Environmental Protection Agency (EPA) No. TXD026481523. The unit is located as shown in Figures 1-1 and 1-2. Construction activities included solidification and testing of the existing waste, as well as building and testing of the clay barrier and ramp. The construction activities related to building the CAMU were started in June 1996, and completed in August, 1996.

1.1 Background

The North Holding Basin is an above-grade, hazardous waste impoundment. It has a total bottom surface area, of approximately 2.1 acres. The design of the CAMU includes a clay barrier compacted over the solidified waste. The clay barrier is composed of a six-inch thick layer of low-permeability compacted clay. The clay barrier surface is sloped to drain to a sump for leachate collection and removal. The design also includes a truck ramp for dumping waste into the CAMU.

1.2 Project Team

The project team consisted of professionals from various organizations, as follows:

Owner: GATX Terminals Corporation

Third Party CQA Firm: Fugro Environmental, Inc.

Certifying Engineer (CE): Mark Board, P.E. (Fugro Environmental)

General Contractor: Smith Environmental

Third Party Laboratory: Fugro-McClelland (Southwest)

1.3 Report Format

This report presents a brief description of the construction activities as well as the results of quality control/quality assurance testing. Section 2.0 details construction activities, which include waste solidification procedures, soil placement procedures, specifications and equipment. Section 3.0 contains solidified waste and soil material testing methodology. An assessment of field and laboratory test results for solidified waste and soil materials is given in Sections 4.0 and 5.0. Tables and figures follow each section. A copy of an as-built drawing is included in Appendix A. Construction specifications are included in Appendix B.

2.0 CONSTRUCTION ACTIVITIES

This section briefly describes the construction activities performed to build the CAMU. Construction activities included solidification of the waste, building the clay barrier and installation of a ramp. A chronology of the construction activities associated with the CAMU is also presented in this section.

Activities during construction of the CAMU included the following:

- Solidification of existing waste with cement and fly-ash,
- Installation of a six-inch-thick, low permeability (less than 1×10^{-7} cm/sec) clay barrier, and
- Installation of a truck ramp and drainage pipe

2.1 Chronology of Construction Activities

ACTIVITY	BEGINNING DATE	ENDING DATE
Mobilization	6/03/96	6/03/96
Strip Vegetation on Dike Walls	6/04/96	6/04/96
Dewater Basin	6/05/96	6/05/96
Waste Solidification	6/06/96	7/09/96
Demolition of Pump Pit	6/07/96	6/10/96
Place and Compact Six-Inch Clay Barrier	7/10/96	7/18/96
Truck Ramp Construction	7/13/96	7/18/96
Drainage Pipe Installation	7/15/96	7/19/96
Demobilization	7/29/96	7/29/96

2.2 Waste Solidification

The contractor began solidification of the waste on June 6, 1996, and completed solidification on July 9, 1996. The permit specified that the solidified waste should have a minimum compressive strength of 4400 psf. Solidification was accomplished by the addition of

fly-ash and cement. The contractor performed solidification of waste on a small (200 ft x 50 ft) test area to check the proposed addition of cement and fly-ash to the waste. Once laboratory testing confirmed that the specified compressive strength of the solidified waste was being achieved, the contractor proceeded with the solidification of the rest of the waste material. The fly-ash and cement was mixed with the waste using a trackhoe and then spread across the bottom with a bulldozer. The contractor performed the solidification in general accordance with the specifications located in Appendix B. Sampling and testing methodology is discussed in Section 3.0. Laboratory test results are located in Section 4.0.

2.3 Clay Barrier Construction

The contractor began construction of the clay barrier on July 10, 1996 and completed construction on July 18, 1996. The borrow material used for clay barrier construction was prequalified by Fugro after testing of the on-site proposed soils. A Fugro technician was assigned to be on-site during the construction of the clay barrier to observe construction techniques and perform soil testing.

The contractor placed and compacted a six-inch-thick, low-permeability clay barrier over the entire bottom of the North Holding Basin. The clay cap material was placed in approximately nine-inch thick loose lifts which were then compacted to approximately six inches. The clay was walked in by bulldozers and processed by compactors. Loose lifts were compacted with a vibrating drum, pad-foot compactor. A water hose was used for wetting lifts as necessary and as determined by the on-site soil technician.

The clay used for construction of the clay barrier was excavated from the surrounding dike material. The clay obtained from the dikes was tested for Atterberg limits (liquid limit and plasticity index), and percent passing a No. 200 Sieve. Soils were visually observed by a soils technician to check for the absence of roots, grass, refuse, and other objectionable material.

A full-time, on-site soils technician observed the compaction procedure and clod size, collected samples for laboratory testing, and performed nuclear density/moisture content tests. The parameters analyzed included Atterberg limits, percent passing a No. 200 Sieve, density, moisture content, and hydraulic conductivity on field compacted clay cap samples. Testing was done both at an off-site laboratory and in-place at the site. Field density and moisture content tests were performed at randomly selected locations. Sampling and testing methodology is discussed in Section 3.0. Results of tests performed on clay material are presented in Section 5.0 of this report.

3.0 SAMPLING AND TESTING METHODOLOGY

A Quality Assurance and Quality Control (QA/QC) testing program was performed by Fugro Environmental during the construction of the CAMU. The QA/QC program involved on-site surveillance and testing to check that the waste solidification was performed and the clay barrier was constructed in accordance with the approved final "Closure Plan for North holding Basin dated March, 1991" and the "Class Hazardous Waste 3 Permit Modification Application dated September, 1994".

From June 6 to July 19, Fugro's technician performed on-site surveillance and testing during construction of the CAMU. In general, on-site surveillance consisted of observing solidification techniques and observing placement of soil material and moisture conditioning of soils, observing the number of compactor passes, and visually characterizing material to be used as clay barrier. Daily field summary reports documenting all testing, results of testing, and general construction procedures, were maintained during sampling and testing of the solidified waste and during the placement and compaction of the clay barrier.

3.1 Waste Solidification

The waste was solidified and tested in accordance with the approved specifications and procedures outlined in the permit and the permit modification for the CAMU. Unconfined compressive strength testing (ASTM D2166) was performed on samples obtained from the solidified waste material. A minimum of one test was performed for every 10,000 square feet. As required by the permit, four paint filter liquids tests (ASTM D9095) were performed on samples of the solidified waste material. Results of testing performed on solidified waste are presented in Section 4.0.

3.2 Clay Barrier

The low-permeability clay barrier was constructed and tested in accordance with the approved specifications and procedures outlined in the permit and the permit modification for the CAMU. In-place moisture testing (ASTM D3017) and density testing (ASTM D2922) were performed by soil technicians using a nuclear density gauge. This gauge measured the amount of moisture present and the density of the soil at a given location. A minimum of one test was performed for every 10,000 square feet. Duplicate testing of 10% of all nuclear density tests was performed by ASTM D 1556, sand cone density test.

Atterberg Limit (ASTM D 4318) and percent passing the No. 200 sieve (ASTM D1140) tests were performed at least once for every 10 field nuclear density tests. Samples were taken after the soil was spread, and compacted to get samples of mixed material.

A Proctor test (ASTM D698) was conducted on the borrow soil for every 5,000 cubic yards of material to establish optimum moisture content and maximum dry densities for the

borrow soils. Soil samples were collected from soil stockpiles and brought back to the laboratory for testing.

A minimum of six laboratory hydraulic conductivity tests (ASTM D5084) were performed on compacted clay samples. The undisturbed clay samples were obtained using a three-inch diameter drive ring sampler. The samples were extruded in the laboratory and tested in general accordance with ASTM D5084. Clay barrier test results are discussed in Section 5.0.

4.0 RESULTS OF TESTS ON SOLIDIFIED WASTE

Unconfined compressive strength tests (ASTM D 2166) were performed on nineteen (19) samples of the final solidified waste in the laboratory. The compressive strength of the final solidified waste samples ranged from 5,198 psf to 130,896 psf, exceeding the project requirement of 4,440 psf. Four samples of solidified waste were tested and passed the paint filter test. The sample test results are summarized on Table 4-1. Approximate test locations are shown on Figure 4-1. The sampling and testing methodology is explained in Section 3.0 of this report.

Unconfined Compressive Strength ASTM D2166		
Sample Number	Results (PSI)	Results (PSF)
S1	47.1	6,782
S2	44.3	6,379
S3	64.9	9,346
S4	62.4	8,986
S5	60.4	8,698
S6	41.7	6,005
S7	36.1	5,198
S8	316.8	45,619
S9	909.0	130,896
S10	647.5	93,240
S11	694.7	100,037
S12	273.6	39,398
S13	256.9	36,994
S14	398.3	57,355
S15	613.0	88,272
S16	526.0	75,744
S17	601.0	86,544
S18	591.2	85,133
S19	432.0	62,208

Note: A paint filter liquids test (ASTM D9095) was performed on samples No. S15, 16, 17, & 18 with the results of no free liquids after 5 minutes.

5.0 RESULTS OF FIELD AND LABORATORY TESTS ON CLAY

Tests were performed both in the field and in the laboratory on clay barrier material. Moisture content and density of the compacted clay cap were measured in the field with a nuclear density gauge. Lift thickness and slope verifications were also conducted in the field through field measurement and surveying. Tests for Atterberg limits, moisture content, and particle size analysis were conducted both in the laboratory and in the on-site field laboratory. All soil testing frequencies exceeded permit requirements, providing additional quality control. Hydraulic conductivity (permeability) testing was performed in the laboratory on drive ring samples of the field-compacted clay.

5.1 Borrow Source Testing

Standard Proctor tests were performed to establish maximum dry density and optimum moisture content of the materials planned to be used for the construction of the clay barrier. The testing described in Section 3.0 was performed to check that the proposed materials met the project specifications. All soil samples tested were within the project specifications for clay barrier material. The liquid limit ranged from 32 to 51 and the plasticity index ranged from 20 to 38. The percent passing the No. 200 sieve ranged from 67.5 to 77.8. Results of Proctor tests, percent passing the No. 200 sieve (particle size), and Atterberg limits for the clay barrier are summarized in Table 5-1. These test results were used in identifying suitable areas of the dikes for use as clay material. The sampling and testing methodology is explained in Section 3.0 of this report. Appendix B contains the clay barrier specifications used during construction.

5.2 Clay Barrier In-Place Testing

The testing described in Section 3.0 was performed to check that the soil used to construct the clay barrier met the project specifications. All final soil samples tested were within the project specifications for clay barrier material. The liquid limit ranged from 41 to 45 and the plasticity index ranged from 29 to 33. The percent passing the No. 200 sieve ranged from 72.9 to 79.9. Results of Atterberg limits, and percent passing the No. 200 sieve for the clay barrier are summarized in Table 5-1. The sampling and testing methodology is explained in Section 3.0 of this report.

Hydraulic conductivity (permeability) tests were performed on samples of field compacted clay barrier material obtained using drive rings. The final test results gave hydraulic conductivity values ranging from 5.78×10^{-10} to 6.27×10^{-8} cm/sec, which is significantly less than the specified minimum value of 1×10^{-7} cm/sec. The hydraulic conductivity test results on the drive ring samples are summarized in Table 5-1. The sampling and testing methodology is explained in Section 3.0 of this report.

The field moisture content and dry density test results were evaluated against the maximum dry density and optimum moisture content results obtained from laboratory standard Proctor tests. The clay, which did not meet the greater than 95 percent compaction and moisture requirements, was reworked and retested until the density and moisture content requirements were satisfied. Field density and moisture content results are summarized in Table 5-2. Figure 5-1 shows approximate nuclear density/moisture content test locations for the clay barrier. The sampling and testing methodology is explained in Section 3.0 of this report.

A survey was performed by Smith Environmental as part of the construction activities. The purpose of the survey was to verify the elevation of the waste and the clay barrier. Survey results are presented on the as-built drawing located in Appendix A.

APPENDIX B
CONSTRUCTION SPECIFICATIONS
(Provided by GATX)

Section 01050

Quality Control

Part 1: General

1.01 References

1.01.1 ASTM D-698 - Standard Proctor Compaction Test

1.01.2 ASTM D-4318 - Atterberg Limit Determination

1.01.3 Permeability determination for Fine-Grained Soils

1.01.4 ASTM D-1140 - Percent of Soil by Weight Passing No. 200 Sieve Determination

1.01.5 ASTM D-422 - Grain Size Analysis for Course Grained Materials

1.01.6 ASTM D-2922 - Field Nuclear Moisture - Density determination

1.01.7 ASTM D-1556 - Field Moisture and Density Determination Using Sand Cone

1.01.8 ASTM D-2488 - Visual/Manual Classification of Soils

1.02 Submittals

Contractor will provide services of field and laboratory testing personnel to perform all work identified in this section.

The Contractor will submit the following records to the Owner's representative:

A. Daily Construction Diaries produced each day will be submitted on the following work day.

B. The results of laboratory material testing will be submitted no later than the morning of the day when the material will be placed. Certification of the results will be provided in the Construction Certification Report. All material testing results, including those which do not meet specified standards and those from sources which are not used, will be submitted.

C. The results of field material testing will be recorded in the Daily Construction Diary each day. Certification of the results will be provided in the Construction Certification Report.

D. A map showing the locations where field density and moisture content testing was performed and permeability samples collected will be available for viewing by the Owner's representative on request.

E. Field logs of supervisory and technical personnel will be available for review by the Owner's representative on request.

F. The Construction Certification Report will be submitted within 30 days of the completion of work and prior to the acceptance of work by the Owner.

1.03 Qualifications

All Surveying for verification of grades, testing locations and as-built drawings will be performed by a registered land surveyor and the as-built drawings and Construction Certification Report will be stamped by a Professional Engineer registered in the State of Texas.

Contractor will provide Surveyors and Professional Engineer. Contractor will provide two copies of marked up as-built drawings for GATX to convert to CAD format.

Part 2: Products

This section not used.

Part 3: Execution

3.01 Materials Testing

3.01.1 Laboratory Testing

1. Maximum density and optimum moisture content of soil materials will be determined by ASTM D-698, Standard Proctor Test. Testing will be performed at a rate of at least one test for every 5,000 cubic yards of placed fill material, at every visual change in texture and at least twice for every borrow area.

2. Liquid limit and plasticity of index soil materials will be determined by ASTM D-4318, Atterberg Limits Test. Testing will be performed at a rate of one test per ten field nuclear density tests.

3. Percentage of soil passing a #200 sieve will be determined by ASTM D-1140. Testing will be performed at a rate of one test per ten field nuclear density tests.

4. Stabilized sludge strength will be determined by the Unconfined Compression Test ASTM D-2166. Two ~~Three~~ tests will be performed on each of the ~~two~~ samples from the stabilized sludge layer.

3.01.2 Field Testing

1. Field density testing will be performed by ASTM D-2922, Field Nuclear Density Test. Testing will be performed at a rate of once per every 10,000 square feet per lift placed. Duplicate testing of 10% of all density tests will be performed by ASTM D-1156, Sand Cone Density Test.

2. Field moisture content testing will be performed by ASTM D-2922, Field Nuclear Moisture Content Test. Testing will be performed at a rate of once per every 10,000 square feet per lift placed.

3. Field permeability testing will be performed by EM 1110-2-1906, Flex Wall Permeability Test. A minimum of four tests will be performed on the completed cap.

4. All field testing and sampling locations and elevations will be located relative to horizontal and vertical survey control by Contractor.

3.02 Sampling Procedure

3.02.1 Field Testing and Sampling

Locations for field testing, including density and moisture content, and sampling for laboratory permeability testing will be chosen by superimposing a grid over the section to be tested choosing grid coordinates at random. Testing locations will be chosen before the material to be tested is placed. Up to 20% of testing or sampling locations may be chosen after material placement, based on the Contractor's judgement of critical areas. The Owner's representative will specify areas to be tested or sampled. Specific details of the procedures choosing sampling and testing locations will b submitted to the Owner's representative for approval before testing begins.

Samples for permeability testing will be collected using a thin wall sample tube and will be collected from the full depth of the hydraulic barrier layer. The hole created by the removal of the sample will be repaired by filling the hole with a bentonite/soil mixture to the original grade such that the layer's permeability requirements are met.

3.03 Correction Action

3.03.1 Borrow Material

Borrow material from any source which fails to meet the standards presented in these specifications based on the testing procedures presented above will not be used in the construction of this facility. If some test from a borrow area meet the standards while others fail to meet them, no material from that borrow area will be used without written approval from the Owner's representative.

3.03.2 In Place Testing

Any test or sample from the constructed facility which fails the standards presented in these specifications may be re-performed once by the Contractor. If tests at the same location fail again, the Contractor will perform additional testing which will delineate the failed area to the satisfaction of the Owner's representative. This delineated area will be reworked and retested until

it passes the relevant test. If more than 10% of locations fail a particular test, the Owner's representative may require that the Contractor modify procedures or materials to remedy the problem.

3.04 Record Keeping

3.04.1 Field Logs

All supervisory and technical personnel will maintain field logs written in ink in bound books. These logs will contain the following information:

1. The results of field and visual testing of the constructed facility and the borrow materials,

2. Sketch maps showing the locations where samples were collected and tests performed in both the constructed facility and the borrow areas,

3. Descriptions of weather conditions, construction procedures, construction problems and important decisions and problem resolutions,

4. Other important observations.

3.04.2 Daily Construction Diaries

The person responsible for quality assurance for the construction of this facility will write daily diary reports of the progress of construction. These reports will contain a summary of daily construction activities, descriptions of important meetings and discussions.

3.04.3 Construction Certification Report

The Contractor will prepare a Construction Certification Report which will contain the following information:

1. A chronological narrative of the construction process,

2. Laboratory certificates for all analytical work performed, including field and laboratory sampling and testing,

3. Maps and tables showing sampling and testing locations and elevations and as-built drawings of the completed facility.

3.05 Surveying

Horizontal and vertical survey control will be established consisting of a surveyed base line, properly stationed, and one or more benchmarks whose absolute or relative elevation is known. All location measurements will be recorded in terms of station, offset from the base line and elevation relative to an established datum.

The final grade of the subgrade (top of fill material from dike wall and demolished fill material) will be verified by surveying elevations on a 50 foot grid over the entire surface of the facility. The final slope of the perimeter drainage swales will be verified by surveying centerline elevations 100 feet on center.

Section 01120

Hydraulic Barrier Layer

Part 1: General

1.01 Placement of Hydraulic Barrier Layer

The Contractor will furnish all labor, materials and equipment required to place and compact the hydraulic barrier layer on the cap subgrade. GATX will provide field and laboratory material testing service as specified in Section 01050 of these specifications.

Part 2: Products

2.01 Hydraulic Barrier (Clay) Soil

Clay soil used for the hydraulic barrier layer will consist of soil with the following properties:

2.01.1 Liquid Limit: 30 minimum, as determined by ASTM D 4318.

2.01.2 Plasticity Index: 15 minimum, 45 maximum as determined by ASTM D 4318.

2.01.3 Capable of attaining an in place permeability of less than or equal to 1 x 10^{-7} cm/sec as determined by a flex wall permeability test (U.S. Army Corps of Engineers, Engineering Manual EM 1110-2-1906) or other approved method when compacted as specified in this section.

2.01.4 Gradation Passing No. 200 Sieve: 30% minimum, as determined by ASTM D 1140.

2.01.5 Free from trash, vegetation, organic matter, large stones, hard lumps of earth and frozen, corrosive or perishable material.

Hydraulic barrier layer soils will be tested for Standard Proctor maximum density and optimum moisture content, Atterberg limits and percent passing a #200 sieve in accordance with the provisions of Section 01050.

The materials for the hydraulic barrier soil layer will be obtained from the borrow area on GATX property and hauled to the NHB. The location of the borrow area and haul route is shown on the contract drawings.

Locations of soil borings are shown on the contract drawings. The results of the borings are contained in Appendix "B" of the specifications. Contractor will note that some blending of materials will be required for materials to meet above criteria. Contractor will include cost for same in his proposal.

Part 3: Execution

3.01 Placement

The Contractor will place hydraulic barrier soils on the approved subgrade to the lines and grades shown on the construction drawings. Soil will be placed in approximately horizontal lifts with a minimum loose thickness of six inches and a maximum loose thickness of nine inches. If a mechanical hand compactor is to be used, the maximum lift thickness will be four inches. The lifts will be compacted in accordance with the provisions described below. After compaction and immediately prior to the placement of additional lifts of soil, the subgrade and each successive lift of the subgrade will be scarified to a depth of two to four inches to promote bonding between lifts.

It will be the Contractor's responsibility to provide adequate drainage, to protect each completed lift from drying or weather damage and to repair any damage or cracking prior to the placement of additional fill. Any cracking will be repaired by excavating the cap within 10 feet of any crack to the full depth of the crack plus three inches and replacing the clay fill in accordance with the procedures described above. Final thickness after compaction is six inches minimum.

3.02 Compaction

After the placement, each lift of hydraulic barrier soils will be compacted by at least five passes of a self-propelled sheepsfoot roller with a foot at least as deep as the loose

lift thickness to 95% of its Standard Proctor maximum density at a moisture content between 1% dry of optimum and 3% wet of optimum. In place dry density and in place moisture content will be determined for each lift and in place permeability will be determined for the completed layer as specified in Section 01050.

Report

ENGINEERING REPORT FOR CORRECTIVE ACTION MANAGEMENT UNIT

North Holding Basin
Galena Park Terminal

prepared for:

GATX TERMINALS CORPORATION
Galena Park, Texas

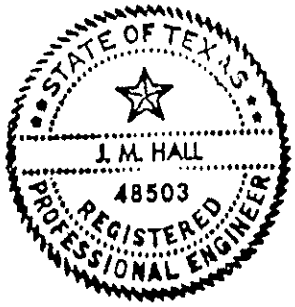
September 1994

This report is a conceptual engineering document in support of the permit modification to an existing Part B permit to construct and operate a Corrective Action Management Unit (CAMU). As described in the report additional design calculations will be performed during the implementation of the CAMU.



J. M. Hall
5-18-95

LIST OF FIGURES

Figure No.	Description	
1	NHB Corrective Action Management Unit	7
2	Remediation Waste Management Decision Tree	7

1.0 Facility Description

The North Holding Basin (NHB) was constructed in 1975 and operated until 1988. The NHB is rectangular with sides of 480 feet and 276 feet (Figure 1). The average depth of the basin is 18.3 feet from the top of the berm. The total capacity of the basin is approximately 18 million gallons (89,000 cubic yards). The floor of the basin slopes slightly to the east to facilitate drainage.

The NHB received wastewater and storm water during the period of 1975 to 1988 from a collection system installed throughout the western portion of the facility. Effluent from the wastewater/storm water collection system passed through an oil/water separator before being discharged to the North Holding Basin. In 1988, the NHB was retired from service.

The NHB is proposed as a Corrective Action Management Unit (CAMU) in compliance with 40 CFR 264 Subpart S to treat and dispose of remediation wastes generated by corrective actions and closure of the NHB at the GATX Galena Park facility. The remediation waste will be soil (generated from RFI and corrective action implementation) and sediment from Tank 100-5 (a stormwater tank to be used for managing wastewater from the NHB closure and CAMU operations). Upon sludge stabilization (in accordance with the procedures outlined in the 1991 Plan), the NHB will be converted to a CAMU, as described below.

A 3 to 6-inch layer of compacted, clay-rich soil will be placed over the stabilized sludge to serve as a sub-base for the treatment and disposal activities in the CAMU. The compressive strength of 4,440 psf, as specified for the stabilized sludge in the 1991 Plan, will be sufficient to support; machinery required for CAMU operations, the maximum amount of soil that can be placed in the CAMU, and the weight of the soil and final cover.

Figure 1 presents a conceptual layout for the NHB/CAMU. One portion of the facility will be used for bioremediation of remediation waste (primarily contaminated soils). The other portion of the facility will be reserved as a stockpile area for interim storage of remediation waste either awaiting treatment or final disposal.

The relative sizes of the two areas described above will be finalized after the completion of the RCRA Facility Investigation (RFI). Data collected during the RFI implementation will be used to estimate the volume of soil that will require bio-remediation relative to the amount of soil that will simply require disposal. Based on a total basin capacity of 89,000 cubic yards it is estimated that 50,000 cubic yards of capacity is available for remediation waste disposal.

2.0 Waste Characterization and Segregation

Effective utilization of the CAMU will depend on appropriate characterization and segregation of remediation waste. Following categories of wastes will be placed in the CAMU:

- Non-hazardous wastes for final disposal in the stockpile area
- Non-hazardous wastes for biotreatment in treatment cells

- Hazardous wastes for final disposal in stockpile area
- Hazardous wastes for biotreatment in treatment cells

All remediation wastes to be placed in the CAMU will be evaluated as described in the Waste Analysis Plan for the CAMU and must meet the following criteria:

- Compatibility with wastes already placed in the CAMU
- Ability to be biotreated or meet disposal standards
- Absence of contaminants or concentrations that are toxic to the biotreatment/treatment process (applicable to wastes in the treatment area only)

Compounds and wastes that are generally amenable to bioremediation are listed in Table 1. Sampling and laboratory analysis will be used to generate more detailed information about the characteristic and amounts of soil to be placed in the stockpile treatment areas.

Remediation wastes that are incompatible or contain concentrations of compounds that cannot be biotreated will not be placed in the CAMU. Incompatible wastes will be placed in containers in the Container Storage Area until proper treatment and/or disposal arrangements can be made. Remediation wastes that meet the disposal standards for CAMU disposal; hence do not require additional treatment, and remediation wastes awaiting treatment will be stockpiled separately in the interim storage portion of the CAMU.

3.0 CAMU Process

3.1 Treatment Process

NH TPH > 1000 mg/Kg

The CAMU treatment area will be operated as a bioremediation unit for hazardous remediation wastes and non-hazardous remediation wastes that exceed TPH of 1,000 ppm. It is estimated that approximately 20,000 cubic yards of such wastes will be biotreated prior to final disposal in the CAMU. The treatment area will be constructed as follows:

- Sloping of the NHB floor to the northeast corner
- Installation of a sump in the northeast corner of the NHB
- Construction of treatment cell(s), as needed

Excess rain-on water from the treatment and stockpile areas will be directed to the sump in the northeast corner of the NHB. Water will be transferred to the stormwater sump and lift station located to the northeast of the NHB and pumped to storage tank 100-5 which discharges to the Gulf Coast Waste Disposal Authority.

Soils to be treated in the CAMU will be placed in lifts in the treatment cells and tilled to promote aeration. Nutrients and moisture will be added to maintain conditions as near to optimum as practical. Micro-organisms will be added to enhance bioremediation, if necessary. Samples will be collected and analyzed for TPH to track the progress of remediation. Once treatment levels have been reached, another lift of soil will be added and the process repeated.

3.2 Stockpile Area

Hazardous remediation wastes and non-hazardous remediation wastes that meet the treatment/disposal standards described in Section 3.3, will be placed directly in the stockpile area for final disposal.

3.3 Treatment and/or Disposal Levels

Hazardous remediation wastes are expected to contain several petroleum and chemical contaminants in varying concentrations. Table 2 represents chemicals that have been stored or are presently stored at the Galena Park Terminal. The proposed treatment standards for such wastes for the constituents on Table 2 and other Appendix VIII constituents that are found (by analysis) in these wastes are selected to be the highest level among the following standards:

1. Groundwater Protection (GWP) Medium Specific Concentration (MSC) calculated considering equilibrium partitioning theory.

2. GWP MSC presented in the TNRCC's Risk Reduction Standards (or calculated using the equations presented in the Risk Reduction Standards), without considering equilibrium partitioning.

3. USEPA Universal Treatment Standard (UTS).

Table 3 presents a listing of the three soils standards described above and used in the selection of proposed treatment/disposal concentrations. The proposed treatment/disposal standards have been compared to the in-situ waste concentrations presently authorized for disposal in the NHB. The comparison revealed that for the compounds analyzed, only benzene was detected in the in-situ sludge at a concentration in excess of the proposed treatment/disposal standards. Section 3.4 describes in detail the justification for the proposed treatment/disposal standards.

Non-hazardous remediation waste treatment standard will be soil TPH $< 1{,}000$ ppm and total leachable BTEX < 100 ppm with levels of benzene below 0.5 ppm. Figure 2 provides a remediation waste management decision tree which summarizes the waste management decision process. It must be noted that any remediation waste that meets the treatment/disposal levels at generation will be stockpiled for final disposal in the CAMU.

Site-specific treatment/disposal levels may be developed for specific contaminants after the completion of the RFI and prior to the start of CAMU operations. The following process will be used to develop the treatment/disposal levels:

- Identification of contaminants of concern.
- Completion of a contaminant-specific risk assessment utilizing CAMU. design criteria and site-specific exposure factors.
- Evaluation of treatability of each contaminant.
- Submittal of proposed Treatment/Disposal levels to TNRCC for approval.

3.4 Regulatory and Risk-Based Justification of Treatment/Disposal Levels

Proposed treatment/disposal soil concentrations have been developed using one of the following three standards: 1) the GWP MSC calculated using equilibrium partition theory; 2) the GWP MSC calculated using the equations presented in the TNRCC's Risk Reduction Standards, without consideration of partitioning; and 3) the UTS presented in the RCRA Land Disposal Restrictions. All three standards present soil concentrations which are protective of groundwater quality considering different assumptions for leachate migration to groundwater. Calculation of constituent concentrations is presented only for the first standard, since the second and third standards are taken from published regulations. Development of these concentrations is described in TNRCC's Risk Reduction Rules and EPA's Land Disposal Regulations, respectively.

Development of Standard Based on Equilibrium Partition Theory. Calculation of the proposed treatment/disposal concentrations using equilibrium partition theory has been performed using the following three step process:

1) *Determination of the maximum concentration in groundwater (GW) MSC*

a) Where available, the MCL was used.

b) If an MCL was not available for a compound, a GW MSC was calculated using the health-based equations presented in the TNRCC's Risk Reduction Standards (30 TAC Chapter 335, Subchapter S, Section 335.559).

c) If no toxicity information was available for a compound in the IRIS database, in HEAST, or in the ATSDR Toxicological profiles, no MSC was calculated. EPA criteria documents are currently being checked to evaluate whether toxicological information is available in these sources.

d) The MSC in groundwater used for the calculations was based on a groundwater with potential beneficial use. 30 TAC Chapter 335, Section 335.559 (d)(3) (Adjustments for Risk Standard No. 2, Groundwater) states that if the groundwater has a naturally occurring total dissolved solids (TDS) concentration in excess of 10,000 milligrams per liter (mg/l), the groundwater MSC may be multiplied by 100. However, the shallow groundwater beneath the GATX facility has a TDS of less than 10,000 mg/l. Therefore, no adjustment was made.

2) *Multiplication of the target groundwater concentration by the dilution attenuation factor (DAF)*

As compounds migrate from the source, through the vadose zone to the water table, and into the groundwater, the chemical concentrations of these compounds decrease due to physical, chemical, and biological processes. The processes include advection, diffusion, dispersion, adsorption, and chemical and biological transformations. The end result is that the concentration in groundwater at the point of compliance is lower than the concentration in the original soil leachate. This natural attenuation process has two components:

- decrease in concentrations in the vadose zone.
- decrease in concentrations below the water table.

The natural attenuation process is accounted for in the GWP MSC by using a DAF. A DAF of 100 is assumed based on 1) regulatory precedence in TNRCC's Risk Based Corrective Action for Leaking Storage Tank Sites, January 1994 Guidance (uses a DAF factor of 100) and 2) EPA's guidance in the Technical Background Document for Soil Screening Guidance (allows for a simple site specific method in which site specific hydrogeologic parameters are used in the dilution factor model. The simple site specific method is the emphasized option in the guidance). The DAF is multiplied by the GW MSC to give the maximum theoretical concentration in the soil leachate which will not cause the GW MSC to be exceeded:

$$[C_L = C_w * 100].$$

3) *Determination of the target soil concentration for each chemical*

Equilibrium partition theory utilizes the ability of organic carbon in soils to adsorb compounds as they leach through the vadose zone. The following equation is used for calculation of this absorptive capacity:

$$C_t = [C_L(BK_d + phi_w + phi_aH')]/B$$

Table 4 describes the parameters used in this equation. The foc (soil organic carbon fraction) is a site specific parameter. Site specific data were not available. Therefore, a value of 0.1 was found in the literature for clay soils and used for the calculation.

The proposed treatment/disposal standard is the highest of the three standards identified in Table 3. The UTS, which is a disposal standard, is used only for benzene and, as stated previously, a review of in-situ sludge concentrations in the NHB after bioremediation revealed that the in-situ benzene concentration approved for disposal exceeds the UTS.

The other two standards are cleanup levels. The higher of the two levels is employed as a treatment/disposal level because the cleanup levels are for compounds that are left in the environment and the proposed treatment/disposal levels are for wastes that will remain in the CAMU, an engineered unit with a RCRA cap. Also, both of the cleanup standards presented are protective of groundwater quality. If approved by the TNRCC, constituent concentrations less than or equal to these standards would be allowed to remain in-place under Risk Reduction Standard No. 2 because these concentrations were placed at levels which would not leach to groundwater in excess of the GW MSC.

4.0 Run-on/Runoff Control

Rainfall that falls on the stockpile area and treatment cells will be collected in a sump and transferred to the stormwater sump and lift station located to the northeast of the NHB and pumped to storage tank 100-5 which discharges to the Gulf Coast Waste Disposal Authority. A 100-year storm event with a 24-hour duration in the Galena Park

area will generate approximately 12.8 inches of rainfall (phone conversation with Harris County Flood District, March 14, 1995). Assuming no infiltration of rainwater, approximately one foot of water will collect in the NHB. Therefore, using a factor of safety of two, operations in the NHB will maintain a minimum of two feet of freeboard. Sludge or sediment that accumulates in Tank 100-5 during CAMU operations will be removed periodically, treated in the CAMU, if necessary, and disposed of in the CAMU prior to closure.

5.0 Monitoring

5.1 Groundwater

The CAMU/NHB will remain subject to groundwater monitoring as described in the Hazardous Waste Permit HW-50054 and Compliance Plan CP-50054. There are currently 15 monitoring wells in the vicinity of the NHB. A downgradient groundwater recovery system is planned for the NHB and is expected to be operational prior to the commencement of CAMU operations. Groundwater samples from monitoring wells in the vicinity of the NHB are regularly analyzed for 1,2-Dichloroethane. Other indicator parameters, such as TOX, TOC, or BTEX can be added to the analytical schedule to detect potential releases from the CAMU. The appropriate indicator parameters will be selected after completion of waste characterization during the RFI.

5.2 Air Emissions

In order to minimize dust generated by CAMU activities, an adequate soil moisture level will be maintained during excavation and transport to the CAMU. This will primarily be accomplished by the application of water to soil being managed. Maintaining proper moisture content will also assist in the effectiveness of land farming and the biological treatment of soils within the CAMU. If excess dust is generated on non-public roadways and during related CAMU activities, water will be used to reduce emissions.

No measurable concentrations of organic vapors are expected during CAMU activities. During CAMU related activities, real-time air monitoring will be performed. This will include: an explosimeter, an organic vapor monitor (photoionization detector or flame ionization detector), and all necessary calibration/audit equipment and supplies. All monitoring instruments will be calibrated before use; periodic calibration checks will be made and documented in the field over the duration of the field activities.

Air monitoring activities will commence daily prior to the start up of CAMU activities in order to establish baseline conditions. Air monitoring shall be provided during excavation, staging, or loading of potentially contaminated soils and tilling. Departures from background levels will trigger an evaluation for employee personnel protection and potential air emission impacts. The response may range from shutting down CAMU operations, to upgrading levels of protection, or initiating emergency response/contingency plans.

6.0 Site Preparation for Closure

After completion of treatment activities in the NHB, treated and stockpiled soil will be evenly spread throughout the basin. Additional backfill consisting of remaining portions of the dikes and clean fill will be graded over the facility in preparation of final cover placement.

TABLE 1

Partial Listing of Compounds/Wastes That Are Known to Have Been Biotreated

- Acetone
- Acrylonitrile
- Anthracene
- Benzene
- Benzopyerene
- Chrysene
- 2,4 - D
- 1,2 - Dichloroethane
- Diesel Fuel
- Ethyl Benzene
- Fluoranthene
- Hexane
- Methanol
- Methylene Chloride
- Methyl Ethyl Ketone
- Napthalene
- Petroleum Hydrocarbons (Misc.)

NOTES:

(1) UTS is based on specific constituents contained in creosote:

-Napthalene: 5.6

-Pentachlorophenol: 7.4

-Phenanthrene: 5.6

-Pyrene: 8.2

-Toluene: 10

-Xylenes: 30

-Lead: 0.37 mg/l TCLP

(2) GW MSC not tabulated in RRSs. Value calculated based on equations in RRSs.

(3) GW MSC not tabulated in RRSs. Value is based on the MCL.
For Creosote, GW MSC based on the value published for pentachlorophenol in RRSs.

GWP MSC = Groundwater Protection Medium Specific Concentration

UTS = RCRA Land Disposal Restrictions: Universal Treatment Standard [40 CFR Part 268 Subpart D (Treatment Standards)]

GWP equil part: GWP calculated using equilibrium partition theory [USEPA Soil Screening Guidance]

GWP RRS eqn: GWP calculated using the equations in the TNRCC Risk Reduction Standards (RRSs) [30 TAC Chapter 335, Section 335.559]

CMBST: Combustion in incinerators, boilers, or industrial furnaces. Concentration not specified.

INCIN: Incineration. Concentration not specified.

1-Butanol	102.2	0.3	30.66
Ethyl Acetate	102.2	0.9	91.98
Cumene	102.2	0.04	4.088
Ethyl Ether	102.2	0.2	20.44

GW = 36.5 * RfDo * 2.8

GW based on:

$$MSC\ (1) = \frac{THI*RfDo*BW*ATs*365\ day/year}{IRw*EF*ED*A} \qquad [=36.5*RfDo]$$

The factor of 2.8 accounts for lower ingestion rates associated with worker exposure.

(1) The parameters, definitions, and values used in this equation are presented in 30 TAC Chapter 335, Subchapter S, Section 335.567. Appendix I

Assumptions
Calculation of GWP MSCs
Using Equilibrium Partioning Theory

Dilution Attenuation Factor & Fraction Organic Carbon

SSL Guidance Assumption	CAMU Location Properties
30 acre property	3 acre CAMU
Residential Use	Non Residential Use
Source extends to water table	Bottom of CAMU will be 10 feet above the water table
Loam soils	Silty clay soils
Well at downgradient edge of source	Public drinking water supply. No known wells. Nearest off-site receptor 2000 feet from CAMU
DAF = 10 foc = 0.002	DAF = 100* foc = 0.1**

* Because of the smaller size of the CAMU, separation between the source and the water table, and no receptor well immediately downgradient of the CAMU, the DAF was increased. A DAF of 100 is used in another regulartory program in Texas. (The TNRCC Leaking Petroleum Storage Tank Division uses a Contaminant Reduction Factor CRF of 100 for equilibrium partioning calculations.

** The soil type beneath the CAMU is silty clay, not loam. Literature values indicate that clays have much higher focs than the default value of 0.002. A paper presented at the 1995 National Ground Water Association's Outdoor Action Proceedings reported literature values of 0.01 to 0.1 for foc in clay soils.

1.0 INTRODUCTION

On behalf of KM Liquids Terminals LLC (Kinder Morgan), Groundwater & Environmental Services, Inc. (GES) has updated the Closure Plan to document the procedures to be implemented at the time the Corrective Action Management Unit (CAMU)/Former North Holding Basin (NHB) no longer treats or is used for the disposal of impacted soils at the Galena Park Terminal. Kinder Morgan intends to close the CAMU/Former NHB as a Class I hazardous waste landfill. This plan has been prepared in accordance with the requirements of the in-place closure requirements presented in Title 40 Code of Federal Regulations (CFR) Part 265 Subpart G and Title 30 Texas Administrative Code (TAC) Section 335.118.

2.0 BACKGROUND

Site Description

The 421.410-acre Galena Park Terminal is located at Clinton Drive in Galena Park, Texas. Galena Park is an incorporated suburban community approximately 9 miles east of downtown Houston in Harris County. The facility is on the north bank of the Houston Ship Channel and is within the jurisdiction of the Houston Port Authority District, which administers activities on the Ship Channel. **Figure 1** presents the site location of the Galena Park Terminal. Administrative Information is presented in **Table 1**.

The Former NHB, located in the northern portion of the west plant, was constructed in 1975 and operated until 1988. The Former NHB was a 480-foot by 276-foot rectangular surface impoundment (**Figure 2**). The average depth of the basin was 18.3 feet from the top of the containment berm. The original design capacity of the basin was approximately 18 million gallons (88,000 cubic yards).

The Former NHB received wastewater and storm water during the period of 1975 to 1988 from a collection system installed throughout the western portion of the facility. Effluent from the wastewater/ storm water collection system passed through an oil/water separator before being discharged to the Former NHB. In 1988, the Former NHB was retired from service. At the time of closure, the sludges present in the Former NHB were solidified and a 6-inch compacted clay cap was constructed over the solidified material.

After the closure of the Former NHB, the CAMU was constructed within the original containment levee system in compliance with 40 CFR 264 Subpart S to treat and dispose of remediation wastes generated by corrective actions at the Kinder Morgan Galena Park Terminal. Remediation waste treated in the CAMU generally consists of soils generated during the facility's Resource Conservation and Recovery Act (RCRA) Facility Investigations (RFI) and subsequent actions, as well as sediment from tank 100-5 (a storm water tank used for managing wastewater from the Former NHB closure and CAMU operations).

As previously mentioned, a 6-inch layer of compacted, clay-rich soil was constructed over the Former NHB stabilized sludge and serves as a sub-base for the treatment and disposal activities in the CAMU. **Figures 3-1A** and **3-1B** presents the as-built conditions of the CAMU prior to receiving any additional waste. One portion of the facility is used for stabilization of lead-impacted soils and the bio treatment of remediation waste (primarily contaminated soils). The other portion of the facility is used as a stockpile area for interim storage of remediation waste either awaiting treatment or final disposal.

Site Operations

Kinder Morgan obtained permission from the Texas Water Commission (now known as the Texas Commission on Environmental Quality [TCEQ]), to biologically treat waste material in the Former NHB in May 1990 and continued the treatment through October 1990. In 1994, the unit was reclassified as the CAMU and continues to receive hazardous and non-hazardous remediation waste. The CAMU will be closed under the Texas Risk Reduction Program (TRPP), 30 TAC Chapter 350, when corrective action and related activities have been completed. The unit will be Closed under Remedy Standard B.

Description, Identification, and TCEQ classification of Waste Managed in the Former NHB/CAMU

Waste stored and/or processed in the Former NHB/CAMU was generated from the following general sources:

- Former NHB Surface Impoundment (prior to 1988):
    1. Loading/unloading facilities;
    2. Transfer manifolds;
    3. Storm water; and
    4. Lubripac
- **CAMU:**
    - Soil affected by historical lead and total petroleum hydrocarbons;
    - Waste accumulated as a result of the RFI;
    - Affected soils within identified Solid Waste Management Units (SWMUs)/Areas of Concern (AOC) impacted by releases; and
    - Tank bottoms

CAMU operations depend on the concentrations of hazardous constituents (organic Chemicals) or inorganic lead present in the soil and proceed sequentially. The CAMU can be utilized to stabilize and store lead-impacted soils as well as soils affected by total petroleum hydrocarbons. Soils impacted by lead will undergo stabilization until the inorganic lead leachability concentrations do not exceed the treatment levels previously approved by USEPA and TCEQ. Soils impacted with hydrocarbon will undergo bioremediation until concentrations do not exceed treatment standards listed in the CAMU/Former NHB Engineering Report and Waste Analysis Plan (WAP), presented under separate attachments. **Figure 4** presents the CAMU soils during lead stabilization.

The initial phase of the disposal process will include the placement of the lead-impacted soils in the lower portion of the CAMU. After the majority of the lead-impacted soils have been placed in the CAMU,

Kinder Morgan will begin the placement of biologically treated soils on top of the lead-impacted soils. Soils that do not require biological treatment will be placed directly on top of previously placed lead-impacted soils. **Figure 5** presents the CAMU operations during biotreatment.

3.0 CURRENT UNDERSTANDING OF SUBSURFACE CONDITIONS

Information presented in the following sections has been obtained from the facility's Geology Report, which is presented as Appendix M of the *Application for Renewal of Permit HW 50054 (July 2024)*.

Regional Physiography and Topography

The Kinder Morgan Galena Park Terminal is located within the Gulf Coast Plain physiographic province of North America. The Gulf Coast Plain is characterized as a nearly smooth, featureless depositional plain, which borders the Gulf of Mexico. The Gulf Coast Plain extends approximately 150 miles inland from the coast.

Figure 1 presents the boundaries of the Galena Park Terminal on a topographic map. The Houston Ship Channel forms the southern boundary of the facility. The western portion of the plant site is separated from the central portion by Panther Creek. Hunting Bayou is immediately adjacent to most of the northern facility boundary. Surface elevations across the facility range from 4 to 24 feet above mean sea level (msl). Surface water runoff in the northern portion of the facility (north of Clinton Drive) generally flows to the north and Hunting Bayou. Berms and ditches control surface water runoff in the southern portion of the site. Generally, the land in the southern portion of the plant is flat lying or gently sloping to the south toward the Houston Ship Channel.

Regional Geology

The Galena Park Terminal is underlain by a thick sequence (greater than 3,000 feet) of sedimentary deposits. These deposits crop out in belts parallel to the Gulf Coast and dip at low angles, thickening down-dip toward the Gulf of Mexico. The surface geologic units underlying the Galena Park Terminal are the Recent Alluvium and the Pleistocene age Beaumont Formation. The alluvial material consists of clay, silt, and sand, which may be up to 30 feet thick. The Beaumont Formation in this area is characterized by clay, silt, and occasional sand layers and is on the order of 100 feet thick. The Beaumont Formation is generally poorly bedded, calcareous clay of various colors, containing thin, discontinuous stringers and lenses of silt and fine sand. Concretions of calcium carbonate, iron oxide, and iron manganese oxides are found in zones of weathering. The unit contains mainly stream channel, point bar, natural levee, and back swamp deposits.

Well logs in the Galena Park area indicate that alternating clays, silts, and infrequent sands of the Beaumont, Montgomery, Bentley, and Willis Formations extend to depths of approximately 700 feet. All these formations are thought to have formed by the discharge of sediments from stream gaps. These deposits are deltaic and fluvial in origin and difficult to distinguish between because of their similarities. Each formation dips gently gulfward. The Montgomery Formation underlies the Beaumont Formation and is comprised of clay, silt, sand, and very minor amounts of gravel of granule to small pebble size. The Bentley Formation is also comprised largely of clay, silt, and sand with minor amounts of gravel. The gravel in the Bentley Formation is generally coarser than the gravel of the Montgomery Formation. The Bentley and Montgomery Formations are both somewhat greater than 100 feet in thickness. The Willis

Formation underlies the Bentley Formation and is comprised of clay, silt, sand, and minor gravel of granule to pebble size. The maximum thickness of this unit is 75 feet.

Below a depth of 700 feet, shales, sandstones, and other indurate sedimentary facies are encountered that alternate with clays, "sticky" shales, and sands to depths in excess of 3,000 feet. The Goliad Sand of Pliocene age, so called because of the relative preponderance of sand, underlies the Willis Formation. The Goliad Sand is underlain by the Miocene age Fleming Formation.

Regional Aquifers

The regional aquifers found beneath the Kinder Morgan Galena Park facility include the Chicot and Evangeline aquifers. The Chicot aquifer is composed of the Recent Alluvium, Beaumont Formation, Montgomery Formation, Bentley Formation, and Willis Sand. The Evangeline aquifer is composed of the Goliad Sand and the upper portion of the Fleming Formation. The Burkeville confining layer within the upper Fleming Formation marks the base of the Evangeline aquifer. The Chicot aquifer is approximately 700 feet thick and the Evangeline aquifer is approximately 1,700 feet thick. The aquifers are thought to be hydraulically connected on a regional scale.

The Chicot and Evangeline aquifers supply several hundred million gallons per day of fresh water in Harris County. Yields of large-capacity wells average about 1,800 gallons per minute (gpm), but some wells can produce up to 3,000 gpm. Groundwater production is generally greater in the Evangeline aquifer and it has been more heavily developed as a groundwater source. The total dissolved solids (TDS) concentration of the water produced ranges from less than 500 parts per million (ppm) to about 1,000 ppm. Transmissivities of the aquifers range from 2.7 square feet per day (ft^2/day) to 5,200 ft^2/day, the estimated porosity is 30 percent, and storage coefficients range from 6.2×10^{5} to 5×10^{-4}. Groundwater is used for drinking water and industrial supply.

Unconfined conditions occur in the shallow portions of the aquifers in outcrop areas. Confined conditions prevail elsewhere in the aquifers. Recharge to the aquifers occurs from precipitation on the outcrop and from cross-formational flow. Aquifer discharges occur to the Gulf of Mexico, or via evapotranspiration and groundwater pumping. Regional groundwater flow is toward the Gulf of Mexico in the Down-dip direction. However, extensive groundwater production in the Houston and Pasadena areas had modified groundwater flow directions. Groundwater flow directions in the Galena Park area in the 1970s and early 1980s were to the east and south toward the large pumping center in Pasadena. Water levels in the Chicot aquifer declined more than 100 feet in the Pasadena area between 1950 and the late 1970s. Water levels recovered approximately 60 feet after pumping was reduced in the late 1970s after the introduction of surface water sources for supply.

CAMU/Former NHB Specific Geology and Hydrology

Several subsurface investigations have been conducted at CAMU/Former NHB and the information is presented in detail in the Geology Report. However, portions of the report have been briefly summarized below.

Site Specific Geology and Hydrology

The maximum depth of subsurface investigation at the Former NHB was to approximately 80 feet below land surface. Sediments encountered during the investigation are the result of fluvial deposition, both during the late Pleistocene and recent Holocene epochs. Layers of sand, silt, and clay were deposited, scoured, removed, and re-deposited in lobate and linear bands that generally trend south to southeast.

Four stratigraphic units were identified during previous investigations. The surface deposits were characterized and differentiated based on texture, consistent, color, vertical and lateral extent, and hydrogeologic significance. From shallowest to deepest the units are:

- Zone I (recent fill);
- Zone II (upper silty and sandy clays with silts silty sand, and clayey sand lenses)
- Zone III (silty and clayey sands)
- Zone IV (lower silty and sandy clays)

These zones and the shallow subsurface of the Former NHB are presented on the geologic cross sections (**Figures 7** and **8** of **Appendix A**). A plan view presenting the location of the cross sections in has been included as **Figure 9** in **Appendix A**. Zone I fill materials are laterally extensive and composed of road base (limestone gravel, shell, and asphalt), below which are reworked silty clays and sandy clays. The thickness of the fill ranges from 15 feet along the road on the south margin of the Former NHB to 2 feet on the east side of the CAMU/Former NHB. A thin unit of brown silty sand, which was encountered over most of the area, is also included in this zone This unit is apparently an undisturbed, natural unit, which occurs above the bottom of the Former NHB.

Zone II is comprised of the uppermost natural silty and sandy clays that are laterally extensive in the area of the CAMU/Former NHB. The top of Zone II is generally encountered about -5 to -8 feet msl. The silty and sandy days of Zone Il are typically stiff and of low to medium plasticity. The maximum thickness of the Zone II unit is approximately 12 feet on the western edge of the Former NHB. The stratum thickness of 4 to 6 feet occurs on the northern boundary of the Former NHB. An organic soil containing black silts, silty sand, clayey silts, and silty clay of high organic content is found intermittently within Zone II. The thickness of this soil ranges from less than l foot to almost I 0 feet on the eastern side of the CAMU/Former NHB area. The deposit appears to be low energy fluvial sediments that were deposited as channel fill.

Zone III is saturated and the monitor wells at the Former NHB are screened in this zone. The top of the unit is generally-3 to -5 feet msl and its average thickness is 15 to 20 feet. Zone III is composed of silty sands with minor amounts of clayey sand.

Zone IV is defined as the silty clay to sandy clay zone immediately below Zone III. Zone IV is encountered at approxirnately-25 feet msl. The total thickness of this zone was not penetrated during the Former NHB investigation. This zone is stiff and medium to highly plastic. In its upper portion, it contains pockets and seams of fine silty sand.

Groundwater Flow Conditions

The hydraulic gradients for both vertical and horizontal migration were calculated for the CAMU/Former NHB using groundwater data collected during the first quarter of 2002. The average horizontal gradients calculated in Zones III and IV are 0.016 and 0.83 foot per foot (ft/ft). The vertical gradient calculated between Zones III and IV is 0.19 ft/ft.

Previous investigations indicate that Zones III and IV, located beneath the CAMU/Former NHB, have been previously impacted. These units are hydraulically connected with each other, but are not hydraulically connected to the underlying regional aquifer. The upper limit of Zone IV is 40 feet below ground surface (ft bgs) and the lower limit is 80 ft bgs.

4.0 CLOSURE PLAN

The following sections outline the procedures that will be implemented to complete an in place closure of the CAMU. The CAMU/Former NHB will be closed in a manner that:

- Complies with the standards for closure set forth in 40 CFR Part 264 Subpart G, 40 CFR 264 Subpart S, 30 TAC Chapter 350 (TRRP), and 30 TAC Section 335.118, and
- Minimizes the need for further maintenance.

The unit will be closed under TRRP Remedy Standard B. Pursuant to 30 TAC Section 335.118(b), Kinder Morgan will publish a notice of closure activities for the CAMU/Former NHB in a local newspaper, affording the public the opportunity to submit written comments and request modifications to the Closure Plan. Issues during this period will be clarified between TCEQ and Kinder Morgan prior to final approval of the Closure Plan. Following receipt of the approval from TCEQ, Kinder Morgan will notify TCEQ 10 days prior to implementing the Closure Plan to afford TCEQ personnel the opportunity to observe closure activities and split any samples.

Summary of Closure Activities to Date

A Closure Plan for the Former NHB was submitted to the TCEQ, formerly the Texas Water Commission, in March 1991. In September 1994, an addendum to the original Closure Plan was submitted to allow the construction and operation of the CAMU under 40 CFR 264 Subpart S and included modifications to the original final cap design.

In October 1990, the biological treatment of sludges present in the Former NHB was completed. Treated sludges were allowed to settle and the clarified water was transferred to the Gulf Coast Waste Disposal Authority for disposal. All ancillary equipment (i.e., pumps, sumps, piping, and two solid waste tanks) associated with the management of the storm water in the Former NHB were decontaminated and removed from service. In accordance with the 1991 Closure Plan, two additional units (DAF and Equalization Tanks) were closed in November 1994.

In July 1996, Kinder Morgan completed the biological treatment of sludges and contaminated soils adjacent to the interior of the Former NHB containment berm. Stabilization of the residual sludges in the Former NHB was performed in-place before construction of the cap. A 10 percent admixture by volume of Portland cement and 10 percent by volume of fly ash were used to solidify the material. The sludges were solidified in batches in an open pit and stabilized with a backhoe. After the stabilized sludges met a compressive strength of 4,200 pounds per square foot, the material was placed in even lifts across the bottom of the Former NHB. An intermediate clay cover (approximately 6 inches thick) was then constructed over the solidified material.

Maximum Inventory of Hazardous Waste Within the CAMU/Former NHB

The total maximum capacity of the CAMU/Former NHB is approximately 88,000 cubic yards. When the closure is completed, the CAMU/Former NHB will contain approximately 6,700 cubic yards of stabilized sludge (generated prior to construction of the CAMU) and an estimated 50,000 cubic yards of remediation waste.

Final Closure of the CAMU/Former NHB

Kinder Morgan will cover the CAMU/Former NHB with a final cover that is designed and constructed to provide long-term minimization of the migration of liquids through the closed impoundment; function with minimum maintenance; promote positive drainage and minimize erosion or abrasion of the cover; accommodate settling and subsidence so that the cover's integrity is maintained; and have a permeability less than or equal to the permeability of the bottom liner system separating the CAMU and Former NHB.

Three capping scenarios may be utilized at the time of closure. Kinder Morgan will select a final cap configuration based on implementability, relative cost, and materials that are available at the time of closure. The three capping scenarios are as follows:

- Scenario 1 - Installation of 3 feet of compacted clay liner covered by a 1-foot sand drainage layer and 1-foot topsoil layer capable of maintaining vegetation;

- Scenario 2 - Installation of a combination 1 foot of compacted clay and geosynthetic clay liner covered by a 6-inch sand drainage layer and 6-inch topsoil layer capable of supporting vegetation; or

- Scenario 3 - Installation of composite liner comprised of 18 inches of compacted clay liner and a high-density polyethylene (HDPE) flexible membrane covered by a 1-foot sand drainage layer and 1-foot topsoil layer capable of supporting vegetation.

A final cap configuration has not yet been determined. The final cap configuration is dependent of the final volume of waste laced in the CAMU/Former NHB. Six months (180 days) prior to beginning closure of the unit, this closure plan will be amended to include details on the final cap configuration to be implemented at the time of closure. The amendment will take the form of a Permit modification and will include detailed engineering plans, specifications, and a Construction Quality Assurance Plan.

Detailed engineering plans will provide an accurate representation of the volume of material present in the CAMU at the time of closure and specify final grades for the waste material, compacted clay, and topsoil layers. Engineering specifications will establish the performance criteria for the components of the cap and installation procedures. Additionally, the Construction Quality Assurance Plan will establish sampling frequencies to verify the cap is constructed in accordance with the approved Closure Plan.

Decontamination Procedures

Prior to leaving the unit, all equipment used in the closure of the CAMU/Former NHB will be decontaminated using a high-pressure wash, detergent wash, or another appropriate method. Fluids

produced during the decontamination procedure will be collected and placed into the on-site wastewater treatment system prior to discharge to the Gulf Coast Waste Disposal Authority for disposal or will be containerized (i.e., 55- gallon drums, vacuum trucks) and shipped off site to an authorized treatment, storage, and disposal (TSD) facility. Any equipment, including personal protective equipment that cannot be decontaminated, will be disposed of at an authorized TSD facility.

Authorized TSD Facilities

All waste generated during the closure activities (i.e., soils, wastewater, decontamination water, liner components, etc.) will be managed on site or at TCEQ authorized TSD facilities. These facilities may include, but are not limited to, incinerators, wastewater treatment tanks, container storage areas, fuels blenders, industrial furnaces, injection wells, or landfills. Waste to be temporarily managed on site will be collected in drums, rolloff boxes, vacuum trucks, or other appropriate collection devices. Contaminated soil generated during closure will be placed in the CAMU and the soil will have to meet the standards for the CAMU if it is to be left in place.

Documentation Reporting

In accordance with 40 CFR Part 264.115, a Closure Documentation Report will be submitted to TCEQ. The report will include data summaries of all the test results collected during the implementation and other documents necessary to demonstrate closure activities were completed in compliance with the approved plan. A representative of Kinder Morgan and a registered engineer in the State of Texas will sign the closure documentation report.

5.0 SCHEDULE

The closure activities will be initiated for the CAMU/Former NHB when capacity is achieved. Once capacity is reached, approximately 6 months will be required to complete the closure of the CAMU/Former NHB.

6.0 CLOSURE COST SUMMARY

A summary of the cost associated with closing the CAMU/Former NHB has been included as **Table 2**. This cost estimate is based on Scenario 1: 3-feet of compacted clay, a 1-foot sand drainage layer and 1-foot of vegetative topsoil.

7.0 POST-CLOSURE CARE

CAMU Maintenance

Once the closure activities have been completed at the CAMU, long-term maintenance of the cover will be required. A 30-year post-closure maintenance plan is proposed. CAMU maintenance is assumed to be a Kinder Morgan activity (an alternative would be to hire a third-party grounds crew contracted to Kinder Morgan that is Occupational Safety and Health Administration trained).

Initial post-closure maintenance will include:

- Routine monthly inspections of the engineered cap to identify erosion, evaluate continuity of the vegetative cover, and prevent weed infestation;
- Additional monitoring of the engineered cap and vegetative cover after severe storms with heavy rainfall;
- Annual fertilizing of the vegetative cover to maintain its vigor;
- Regular mowing of the vegetative cover to minimize fire hazards and to preserve aesthetics; and
- Topsoil replacement in areas of erosion followed by seeding and/or hydromulching to re-establish the vegetative cover.

Once the vegetative cover has been effectively established, long-term maintenance will then be limited to annual inspections, periodic fertilizing, and routine mowing.

Post Closure Groundwater Monitoring

The post-closure schedule of groundwater monitoring will be conducted in accordance with the Industrial Hazardous Waste Permit No. 50054.

Deed Recordation

Deed recordation has been completed in accordance with Section 3.17 of the 1991 Closure Plan and will be updated upon closure of the CAMU.

			Subtotal:	$2,238,000
			Contingency (30%):	$448,000
			Total Cost:	$2,686,000

Notes:

1. This estimate represents a high-level/conceptual estimate, consistent with AACE 17R-97 Class 5 cost estimate guidelines, for preliminary budgetary purposes and is based on 2023 dollars.
2. Final cover surface area is approximately 3.1 acres (265' x 510').
3. Final cover outside building assumed to consist of clay, geomembrane, geotextile, sand, general fill, geotextile and crushed stone.
4. Final cover inside building assumed to consist of clay, geomembrane, geotextile, sand, geotextile and gravel.
5. Proposed building footprint is assumed to be 150' x 250' and all areas within the building are considered to be "occupied."
6. Engineering costs may vary significantly depending upon final design building foundation type, a shallow foundation has been assumed.
7. Construction quality assurance assumes resident representative on-site for 10 weeks.
8. Perimeter and personal air monitoring is assumed to be unnecessary.
9. Laboratory Testing is for imported materials only. Chemical analysis of existing materials is excluded.

1.0 INTRODUCTION

GATX Terminals Corporation, Galena Park facility, operates a bulk storage terminal at 906 Clinton Drive, approximately nine miles east of Houston on the north side of the Houston Ship Channel. A variety of products have been stored at this 800-acre tank farm since 1935.

The southeast holding basin formerly received stormwater from approximately five (5) acres in the southeast portion of the GATX property. This acreage includes run off from five (5) tank car and truck loading/unloading stations. At one time, the basin contained both liquids and sludges from the operation as a stormwater collection basin.

In September, 1986, GATX submitted to the Texas Water Commission a revised closure plan for the southeast holding basin. The closure plan was implemented in the Spring of 1987 and entailed the following activities:

- Removal of all liquids
- Chemical stabilization/solidification of sludges
- Excavation and off-site disposal of sludges
- Excavation and off-site disposal of underlying aggregate and soil layers
- Confirmation sampling
- Excavation backfilling
- Installation of a clay cap
- Installation of an asphalt parking lot cover.

All closure activities were carried out in accordance with the approved closure plan. This report documents those activities.

2.0 LIQUID REMOVAL

Prior to the beginning of closure activities, GATX emptied the basin of liquids by using the basin pump. The liquid was pumped from the basin to Tank 29, until the pump lost suction. Approximately, 6000 gallons of liquid remained in the basin.

On March 16, 1987 Shamrock Farrell welders, GATX contract maintenance, removed an inactive 12" pipeline, from the pipe rack immediately north of the basin. Approximately 500 gallons of oily liquid drained into the west end of the basin during the pipeline removal. All piping removed from the basin area was flushed with water before "PIGS" were used to swab the interior of the pipes.

On March 17, 1987 Allstate Vacuum Services, subcontractor to Rollins Environmental Services, emptied the basin of all liquid. Approximately 6500 gallons of liquid was removed and transported to EMPAK, Inc. for disposal. Attachment 1 contains copies of the manifests used to record these shipments.

3.0 SLUDGE AND SOIL REMOVAL

Following the removal of the liquids, the sludge was stabilized. A trackhoe was used to blend Cement Kiln Dust (CKD) and the sludge. The mixture solidified and was removed and transported to Rollins Environmental Services in Deer Park, Texas. In addition to the stabilized material, the following items were transported to Rollins Environmental Services:

- 4" sump pump discharge piping.
- 8" basin pump discharge piping.
- 20'-12" abandoned pipe that was removed from the basin.
- 6" x 60' x 6' reinforced concrete fixed baffle and base.
- Soil excavated by manual methods beneath the west and north pipe racks to a depth 12".

During the first day of excavation, a layer of concrete/limestone aggregate was uncovered beneath the sludge. The aggregate covered the entire basin bottom and extended up the side slopes of the basin. The aggregate was approximately 18" thick on the bottom and 6" thick on the side slopes. The aggregate was removed and transported to Rollins Environmental Services.

Following the removal of the aggregate liner, 6" of soil was removed from the bottom before excavation was halted. Again, this soil was transported to the Rollins Environmental Services landfill. Table 3-1 is a summary of the waste manifests documenting off-site shipment of materials resulting from the stabilization and excavation operation. Attachment 2 contains copies of these manifests.

*This shipment contained piping.

Excavation was halted when seeping liquids entered the excavated basin from the bottom. Also, liquid entered the excavation from the side walls in the northeast corner of the basin. A berm was built to contain seepage from the northeast side wall. Figure 3.1 indicates the areas of major bottom seepage and the northeast side wall seepage.

Due to the basin's close proximity to the ship channel the water table occurs at a shallow depth. The seepage encountered indicates that the excavation extended approximately to the top of the water table. During high tides in the ship channel seepage into the bottom of the excavated increased.

Also, subsequent investigation indicated that the sump in the northeast corner was leaking. A 12" drain line had not been completely welded into the sump. The sump was repaired and the leak stopped.

All liquids that seeped into the excavation were collected and pumped to Tank 29 for discharge to the plant wastewater system.

CHK'D BY:	REVISED:	DWG NO.:

4.0 CONFIRMATION SAMPLING

4.1 Sampling Program

Soil sampling was conducted in accordance with Section 4.3 of the closure plan. Due to high tides during the period of excavation, water seeped into the bottom of the basin and some sample locations were revised from those proposed. With concurrence from Mr. Cliff Hall of the TWC, confirmation samples were collected from dry areas on the bottom of the excavation to exclude influences from the infiltrating water. One additional sample point was added at the north sidewall at the request of Mr. Jerry Spetseris, the TWC representative present during sampling activities. Sample locations are presented in Figure 4.1.

All sample points were composited into one sample for analysis of all priority pollutants, E.P. Toxicity metals and pesticides, free cyanides and hexavalent chromium. Samples were collected with a stainless steel sampling trowel, composited in a stainless steel sampling mixing bowl, thoroughly mixed and split with the TWC representative. The sample was then transferred to an appropriate container, placed on ice and transported under chain-of-custody procedures to the Resource Engineering Laboratory. The sample for volatiles analysis was not composited; one grab sample was collected from the center of the excavation.

4.2 Analytical Results

The closure plan specified three sets of criteria that had to be met to achieve an "environmentally clean closure." These criteria included the EP Toxicity test standards, the "California

DRAWN BY: LMG	DATE: 6-22-87	PROJECT NO.: 321-01
CHK'D BY: GLB	REVISED:	DWG.NO.:

List" land disposal restriction standards and compound-specific restrictions based on Drinking Water Standards, SNARL[S] or LD_{50} values (oral, rat). Tables 4.2.1, 4.2.2, and 4.2.3 present the analytical results in comparison to these criteria. Attachment 3 contains the complete chemical analysis data.

A review of the analytical results indicates that the remaining soils surrounding the excavation meet the standards imposed by the EP Toxicity test and the "California List" restrictions. They do not, however, pass all of the SNARL and LD_{50} restrictions. Since an "environmentally clean" closure could not be effectuated, the closure plan allows provisions to complete closure consistent with TWC guidance for Class II materials.

The priority pollutant analysis was used to calculate the cumulative LD_{50} (oral, rat) of the remaining soils. As defined by TWC Technical Guidance Document #1, a material meets Class II definition if it has an LD_{50} of greater than 500 mg/kg.

Finney's model for joint additive toxicity was calculated as specified in the closure plan:

$$\text{Predicted } LD_{50} = \frac{100}{\sum_{i=1}^{n} \frac{Pi}{LD_{50i}}}$$

where,

Pi = fractional concentration of constituent i, and
$LD_{50i} = LD_{50}$ (oral, rat) of constituent i.

The cumulative LD_{50} of the remaining soils was calculated to equal 802,209 mg/kg. This meets the previously stated definition of having an LD_{50} value of greater than 500 mg/kg. Any residuals remaining following liquid and soil removal would be classified as a Class II Solid Waste according to TAC § 335.1 definition. Supporting calculations are presented in Attachment 4.

5.0 CLOSURE OF EXCAVATION

After the excavation and sampling activities were completed the basin was backfilled with dredge material resulting from dock construction. The dredge material was sampled for priority pollutant analysis prior to using it for fill material. The results were within normal background ranges with one exception. Aliphatic hydrocarbons similar to jet fuel were found at a concentration of 13.24 mg/kg. This was well within the standards specified for an environmentally clean closure, so the material was deemed acceptable as backfill material. Attachment 5 contains the chemical analysis of backfill material.

The backfill was completed in five 12" lifts of the dredge material. Figure 5.1 provides the elevations of the top of backfill as recorded April 6, 1987 by George Lamb and Associates.

After surveying the top of backfill, the 3-foot clay cap with a 2% slope was installed in five 8-inch lifts. Attachment 6 contains the field notes of the geologist monitoring the installation of the clay cap. Figure 5.2 illustrates the elevation of the top of clay, as recorded April 9, 1987 by George Lamb and Associates.

Following installation of the clay cap the top 12" of the clay was stabilized with lime slurry to yield a 6% lime-stabilized clay. The lime stabilized clay was cured for 2 days and compacted and re-surveyed. Figure 5.3 illustrates the elevation of the top of the lime stabilized clay, as recorded by George Lamb and Associates on April 15, 1987. Attachment 6 contains the field notes of the geologist, monitoring the stabilization.

6.0 DEED RECORDATION

A permanent notice identifying the location and the material remaining at closure will be placed in the property description of the Harris County Deed Records. The notice will include this description of survey:

Description of Survey

Beginning at a point, a concrete Texaco monument, the Northwest corner of the Texas Company property as described in Volume 1163 Page 515 of the Harris County Deed Records, said point also being the Northeast corner of a tract of land described in Volume 6324 Page 409 of the Harris County Deed Records and located in the South line of Clinton Drive, based on a right-of-way width of 100';

Thence S01°49'38"E at a distance of 690.22' pass a 3/4" iron pipe located in the North line of the T & N.O. Railway Company, based on a right-of-way width of 80' and continuing S01° 49'38"E for a total length of 1858.62' along the West line of the afore-mentioned Texas Company property to a point;

Thence N87°46'32"W a distance of 152.41' to a 60d nail, set for corner, THE PLACE OF BEGINNING OF THIS SURVEY;

Thence N87°46'32"W a distance of 87.10' to a 60d nail set for corner;

Thence N02°18'07"W a distance of 62.51' to a 60d nail set for corner;

Thence N82°01'17"E a distance of 4.23' to a 60d nail set for corner;

Thence N02°27'45"E a distance of 12.65' to a 60d nail set for corner;

Thence N84°42'49"E a distance of 82.31' to a 60d nail set for corner;

Thence S01°52'59"E a distance of 86.70' to THE PLACE OF BEGINNING.

This Survey may be further described as being a tract of land containing 6997 sq. ft. (0.16063 acres) out of a 31.96 acre tract as described in Volume 1163 Page 515 of the Harris County Deed Records in the Ezekiel Thomas Survey-Abstract No. 73, Harris County, Texas.

Any residuals remaining following liquid and soil removal will be classified as a Class II Solid Waste according to TAC §§ 335.1 definition.

More specific information can be secured from the terminal manager, GATX Terminals Corporation, 906 Clinton Drive, Galena Park, Texas.

A copy of the boundary survey is included in Attachment 7.

7.0 CONCLUSION

Based upon the data presented in the previous sections and the attachments in this report, the following can be concluded:

1. The SE Holding Basin has been closed in accordance with the closure plan filed with the Texas Water Commission in September, 1986 and in accordance with the letter of approval from the TWC dated December 15, 1986.

2. The site meets all requirements for a Class II landfill and has been deed recorded in accordance with 31 Texas Administrative Code (TAC) 335.5 as such a facility.

8.0 CERTIFICATION

I am a registered professional engineer in good standing with the Texas Engineering Practice Act, Article 3271a, Vernon's Texas Civil Statutes. I certify that the verification of closure activities described by this report presents an accurate summary of the activities performed and that this facility has been closed in accordance with the specification contained in the approved closure plan.

ATTACHMENT M

Geology Report

Geology Report

The geology report is presented in three sections, Section M1 – Geologic Report - Former North Holding Basin (NHB) and Former Southeast Holding Basin (SEHB), Section M2 – Supplemental Information, and M3 – Tabular Summary. The Section M1 contains the geological information and the historical hydrogeologic data for the Corrective Action Management Unit (CAM)/Former NHB (NOR 004) and the SEHB (NOR017). Section M2 contains information illustrating current groundwater contaminant distribution and potentiometric surface configurations at the SEHB and CAMU/Former NHB and current information related hydraulic gradients in and around the units. Also included is supplemental information related to geologic processes, boring logs, and historical groundwater elevation data. Section M3 contains tabulated geological/hydrogeological information for the SEHB and CAMU/Former NHB. The information includes; major geologic formations (Tables II.2a and II.2b), stratigraphic unit characteristics (Tables II.3a and II.3b), and aquifer characteristic information (Tables II.4a and II.4b).

The geologic discussion/data/information presented in this document have been previously submitted to the Texas Commission on Environmental Quality (TCEQ) and/or its predecessors (e.g., Texas Natural Resource Conservation Commission, TNRCC and/or the Texas Water Commission, TWC) as part of the initial RCRA permit and subsequent renewal applications, RCRA facility investigations, environmental assessment reports, and/or groundwater monitoring reports.

I certify have reviewed this document in sufficient depth to accept full responsibility for its contents related to the geologic discussion/data/information contained herein.

1.0 Regional Physiography and Topography

The GATX Terminal Corporation Galena Park Terminal is located at 906 Clinton Drive in Galena Park, Texas. Galena Park is an incorporated suburban community approximately nine miles east of downtown Houston in Harris County. The facility is on the north bank of the Houston Ship Channel and is within the jurisdiction of the Houston Port Authority District which administers activities on the Ship Channel

The GATX Galena Park Facility is located within the Gulf Coast Plain physiographic province of North America. The Gulf Coast Plain is characterized as a nearly smooth, featureless depositional plain which borders the Gulf of Mexico. The Gulf Coast Plain extends approximately 150 miles inland from the coast.

Figure 1 presents the boundaries of the GATX facility on a topographic map. The Houston Ship Channel forms the southern boundary of the GATX plant site. The western portion of the plant site is separated from the central portion by Panther Creek. Hunting Bayou is immediately adjacent to most of the northern facility boundary. Surface elevations across the facility range from 24 to 4 feet above mean sea level. Surface water runoff in the northern portion of the facility (north of Clinton Drive) generally flows to the north and Hunting Bayou. Surface water runoff in the southern portion of the site is controlled by berms and ditches. Generally the land in the southern portion of the plant is flat lying or gently sloping to the south toward the Houston Ship Channel.

2.0 Regional Geology

The GATX Galena Park facility is underlain by a thick sequence (greater than 3,000 feet) of sedimentary deposits. These deposits crop out in belts parallel to the Gulf Coast and dip at low angles, thickening down-dip toward the Gulf. The surface geologic units underlying the GATX Galena Park facility are the Recent Alluvium and the Pleistocene age Beaumont Formation (see Figure 2). The alluvial material consists of clay, silt, and sand which may be up to 30 feet thick. The Beaumont Formation in this area is characterized by clay, silt, and occasional sand layers and is on the order of 100 feet thick. The Beaumont Formation is generally a poorly bedded, calcareous clay of various colors, containing thin, discontinuous stringers and lenses of silt and fine sand. Concretions of calcium carbonate, iron oxide and iron-manganese oxides are found in zones of weathering. The unit contains mainly stream channel, point bar, natural levee and backswamp deposits.

Well logs in the Galena Park area indicate that alternating clays, silts, and infrequent sands of the Beaumont, Montgomery, Bentley and Willis formations extend to depths of approximately 700 feet. All these formations are thought to have formed by the discharge of sediments from stream gaps. These deposits are deltaic and fluvial in origin and difficult to distinguish between because of their similarities. Each formation dips gently gulfward. The Montgomery Formation underlies the Beaumont Formation and is comprised of clay, silt, sand, and very minor amounts of gravel of granule to small pebble size. The Bentley Formation is also comprised largely of clay, silt, and sand with minor amounts of gravel. The gravel in the Bentley Formation is generally coarser than the gravel of the Montgomery Formation. The Bentley and Montgomery formations are both somewhat greater than 100 feet in thickness. The Willis formation underlies the Bentley Formation and is comprised of clay, silt, sand, and minor gravel of granule to pebble size. The maximum thickness of this unit is 75 feet.

Below a depth of 700 feet, shales, sandstones, and other indurated sedimentary facies are encountered that alternate with clays, "sticky" shales, and sands to depths in excess of 3,000 feet.

The Goliad Sand of Pliocene age, so called because of the relative preponderance of sand, underlies the Willis Formation. The Goliad Sand is underlain by the Miocene age Fleming Formation.

3.0 Active Geologic Processes

Faults

Development of subsurface fault zones is a recognized method of stress relief in an actively growing/subsiding basin, such as the margin of the Gulf Coast. As sediments are carried and deposited beyond the continental shelf, stresses build up near shore due to the increased weight of the accumulating sediments. The faults created, called growth faults, are usually very long, but produce little surficial expression. This is due to the limited displacements at depth and the general plastic character of the overlying sediments. Arcuate and smaller radiating faulting may also be associated with salt domes.

Approximately 1.5 to 2.5 miles to the north of the GATX Galena Park facility several small faults radiate from the Clinton Salt Dome. The faults form an east-west band nearly 3 miles long. None of these faults are observed at the facility. A small singular fault has been detected approximately 2.5 miles to the west of the facility. Two long, northwest trending faults radiate from the periphery of the Mykawa and South Houston Salt domes. However, any surface manifestation of the faults die out more than 2.5 miles to the southwest of the Galena Park facility. No surface expressions of faults are detected at the GATX Galena Park facility, and no evidence of faults is seen in aerial photographs of the area immediate adjacent to the facility.

Subsidence

The Pasadena area which adjoins Galena Park has long been recognized as an area with a high rate of land subsidence. This subsidence is due to the compaction of clay units in response to the rapid withdrawal of large quantities of ground water. As much as 10 feet of subsidence in the Pasadena area is estimated to have occurred between 1906 and 1978. Regional maps indicate that subsidence in excess of 8 feet may have occurred in the Galena Park area. Ground water withdrawal in the Pasadena area reached its peak in 1968 and then leveled off and slightly decreased until 1976. Ground water use declined rapidly after 1976 because of the introduction of surface water from Lake Livingston into the supply system. The rate of subsidence in the area decreased markedly after 1976 due to the decrease in ground water pumping. The latest data reviewed showed that approximately 0.1 feet of additional subsidence had occurred between 1978 and 1984.

Erosion

The flat lying to gently sloping nature of the topography at the GATX facility, coupled with extensive vegetation outside of the plant area results in little potential for large-scale erosion and scouring. No large scale erosional features are seen in the vicinity of the plant site, and erosion is highly localized. The Houston Ship Channel is a major navigation channel and is controlled throughout its length for the benefit of shipping traffic. The banks of the Channel that form the southern boundary of the plant site are armored by various means to protect against erosion.

Wetlands

A preliminary field reconnaissance of the GATX facility indicates that the GATX property has several wetlands. The majority of the extreme northern portion of the GATX property near Hunting Bayou is composed of natural wetlands as well as artificial impoundments formed by the dredge/fill operation several years ago. The remainder of the property apparently contains small, scattered wetlands often located on fill material. Several of these sites require additional characterization to confirm the presence of wetlands.

4.0 Regional Aquifers

The regional aquifers which are found beneath the GATX Galena Park facility include the Chicot and Evangeline Aquifers. The Chicot aquifer is composed of the Recent Alluvium, Beaumont Formation, Montgomery Formation, Bentley Formation, and Willis Sand. The Evangeline aquifer is composed of the Goliad Sand and upper portion of the Fleming Formation. The Burkeville confining layer within the upper Fleming Formation marks the base of the Evangeline aquifer. The Chicot aquifer is approximately 700 feet thick and the Evangeline aquifer is approximately 1,700 feet thick. The aquifers are thought to be hydraulically connected on a regional scale. Figure 3 presents a hydrostratigraphic section demonstrating the correlation of the aquifer units across Harris County.

The Chicot and Evangeline aquifers supply several hundred million gallons per day of fresh water in Harris County. Yields of large-capacity wells average about 1,800 gallons per minute (gpm), but some wells can produce up to 3,000 gpm. Ground water production is generally greater in the Evangeline aquifer and it has been more heavily developed as a ground water source. The total dissolved solids (TDS) concentration of the water produced ranges from less than 500 ppm to about 1,000 ppm. Transmissivities of the aquifers range from 2.7 ft^2/day to 5,200 ft^2/day, the estimated porosity is 30%, and storage coefficients range from 6.2×10^{-5} to 5×10^{-4}. Ground water is used for drinking water and industrial supply.

Unconfined conditions occur in the shallow portions of the aquifers in outcrop areas. Confined conditions prevail elsewhere in the aquifers. Recharge to the aquifers occurs from precipitation on the outcrop and from cross-formational flow. Aquifer discharges occur to the Gulf of Mexico, or via evapotranspiration and ground water pumping. Regional ground water flow is towards the Gulf of Mexico in the downdip direction. However, extensive ground water production in the Houston and Pasadena area have modified ground water flow directions. Ground water flow directions in the Galena Park area in the 1970s and early 1980s were to the east and south toward the large pumping center in Pasadena. Water levels in the Chicot aquifer declined more than 100 feet in the Pasadena area between 1950 and the late 1970s. Water levels recovered approximately 60 feet after pumping was reduced in the late 1970s after the introduction of surface water sources for supply.

5.0 Waste Management Area Subsurface Conditions

Subsurface Soils Investigation Report

Several subsurface investigations have been conducted at the waste management units that are covered by this post closure care permit, the North Holding Basin (NHB) and the Southeast Holding Basin (SEHB). This section of the geology report will briefly summarize the results of these investigations and will extensively reference the existing reports to provide information regarding methodologies used and the data collected. Subsurface investigations at each waste management are discussed below.

Southeast Holding Basin

The subsurface conditions at the SEHB are described in two reports, the Southeast Holding Basin Groundwater Monitoring Report (ENSR, October 1988) and the Expanded Groundwater Quality Assessment of the Former Southeast Holding Basin (ENSR, June 1990). The principal objective of the 1988 Groundwater Monitoring Report was to install ground water monitoring wells as part of an approved closure plan for the SEHB. The monitor wells were used to determine the impact of the SEHB on ground water quality. A summary of the field activities completed as a part of the monitor well installation are summarized in Chapter 2.0 of the report. Ten cone penetrometer (CPT) tests were conducted near the SEHB. Four monitor wells were installed.

The CPT logs are included in Appendix A of the 1988 Groundwater Monitoring Report. Appendix B contains the boring logs and E-logs for the monitor well boreholes, as well as the well construction details. Hydrographs for these four initial monitor wells are included in Appendix E.

Sampling of the four initial monitor wells revealed the presence of dense non-aqueous phase liquid (DNAPL) in the downgradient wells. A phased program of additional ground water investigation was undertaken to characterize the nature and extent of ground water contamination in the areas immediately surrounding the former SEHB and to evaluate sources of contamination other than the SEHB. The results of these additional investigations are presented in the Expanded Groundwater Quality Assessment.

Field activities performed during the expanded assessment are described in Chapter 3.0 of the Expanded Groundwater Quality Assessment. The assessment included a CPT investigation at 26 additional locations. The CPT logs are included in Appendix C of the assessment report. A soil boring and sampling program consisting of 31 borings to approximately 40 feet below land surface and 3 borings to 65 feet below land surface was also completed. Soil samples were collected for both geotechnical and chemical analysis. The boring logs are found in Appendix D. Results of geotechnical testing are presented in Appendix E and laboratory data is included in Appendix B. A total of 22 additional monitor wells and four piezometers were installed during the expanded assessment. In addition, three of the initial monitor wells have been replaced and two DNAPL recovery wells have been installed. Lithologic logs and well construction details for the monitor wells and piezometers are presented in Appendix H. The expanded assessment also included aquifer testing as a portion of the scope of work. The aquifer testing program consisted of one constant discharge pump test, 19 slug tests, and three bail-down tests. Aquifer test calculations and results are found in Appendix J.

Sediments encountered during subsurface investigations are the result of fluvial deposition during both the Recent Holocene and Later Pleistocene Epochs. Layers of sand, silt, and clay were deposited, scoured, removed and redeposited in lobate to linear bands that generally trend south to southeast following the rivers and streams which deposited them. Generally, the finer grained clays and silts were laid down as overbank and interdistributary deposits between stream channels where coarser sand predominates. As the streams or rivers moved laterally so did their deposits, creating complex sequence of interbedded sands, silts, and clays. ENSR identified eight distinct stratigraphic units in the subsurface in the vicinity of the SEHB. Beginning with the shallowest they are:

- Unit I - Uppermost Recent Fill (URF)
- Unit II - Sandy Channel Fill (SCF)
- Unit III - Uppermost Clayey Sand/Clayey Silt Unit (UCS/CSU)
- Unit IV - First Silty Clay/Clay Unit (FSCU)

- Unit V - Uppermost Natural Transmissive Unit (UNTU)
- Unit VI - Second Silty Clay/Clay Unit (SSC/CU)
- Unit VII - Lowermost Natural Transmissive Unit (LNTU)
- Unity VIII - Third Silty Clay/Clay Unit (TSC/CU)

The stratigraphic relationship of these zones in the vicinity of the SEHB are shown on east-west and north-south cross sections (Figures 4 through 6). Unit I (URF) is fill material consisting of asphalt, limestone gravel, shell fragments, rubble, and reworked clay, silt and sand. The thickness of the unit varies from 2 to 21 feet. It is thickest along roads, tank firewalls, and near the GATX docking slip.

Unit II (SCF) is probably derived from dredging operations in the Houston Ship Channel. It is uniformly present across the site and consists of very fine grained silty sand with decaying organic material. This unit is thought to provide a vertical and lateral pathway for contaminants. Its thickness ranges from 1 to 15 feet, with the thickest portions adjacent to the Ship Channel. In several locations the SCF is underlain by Unit III, in other locations Unit III is absent and Unit IV is the underlying unit. The SCF is often saturated near its base.

Unit III (UCS/CSU) appears to be an undisturbed natural deposit which is much finer grained than the SCF. It is composed of very fine grained to fine grained clayey sands and clayey silts. Thin interbeds of silty clay are present in parts of this unit. The UCS/CSU is relatively thin, ranging from less than 1 foot to a maximum of 6 feet. Unit III is thought to be hydraulically connected to Unit II.

Unit IV (FSCU) is the uppermost naturally occurring, low permeability geologic unit encountered beneath the plant site. It is laterally extensive and overlies Unit V. Thickness of this unit varies widely from less than 1 foot to almost 30 feet. It appears that portions of the FSCU have been removed by previous plant activities. The composition of the FSCU varies from a very plastic clay with little sand or silt to a low plasticity sandy clay or silty clay. Generally, the FSCU becomes slightly coarser towards its base and grades vertically into Unit V.

Unit V (UNTU) is the first granular, relatively transmissive natural material in the shallow subsurface. The UNTU has been the main focus of monitoring activities. In some cases, the UNTU directly underlies the SCF where Units III and IV are absent. The UNTU varies from 1 to 20 feet thick and is heterogeneous in nature. It is composed of clayey sands, silts, sandy silts, silty sands, sands, and clays. The contact with underlying Unit VI is generally sharp.

Unit VI (SSC/CU) was encountered in every boring completed in the vicinity of the SEHB. It is very competent, laterally extensive clay unit and is considered to be fairly effective in isolating the underlying LNTU. The unit is relatively uniform with a range of thickness from 13 to 21 feet. The SSC/CU is characterized as a clay to silty clay of moderate to high plasticity. Its physical appearance is characteristic of the Beaumont Formation.

Unit VII (LNTU) is the second continuous granular saturated zone. It is approximately 9 to 15 feet thick in the study area. The LNTU contains very fine grained to fine grained clayey silts, sandy silts, and silty sands with a trace of clay.

Unit VIII (TSC/CU) is defined as the lowermost relatively low permeability unit encountered. this unit was not fully penetrated during field investigations. It directly underlies Unit VII and appears to be similar in composition to the clays of the SSC/CU. The unit is a very stiff clay of medium to high plasticity with minor amounts of silt.

North Holding Basin

The subsurface conditions at the NHB are described in the North Holding Basin Groundwater Monitoring System Installation report (ENSR, July 1990). The principal objective of this investigation was to install a detection ground water monitoring system, however, the shallow subsurface was characterized to assist in siting of the wells. An overview of the field program is presented in Chapter 2.0 of the report. Eleven cone penetrometers (CPTs) were installed to investigate subsurface stratigraphy. The CPT logs are included in Appendix B of the report. Five soil borings were completed to obtain additional subsurface information and five monitoring wells were installed. The boring logs for the soil borings and monitoring wells are found in Appendices D and E of the report, respectively.

The maximum depth of subsurface investigation at the NHB was 45 feet below land surface. Sediments encountered during the investigation are the result of fluvial deposition, both during the late Pleistocene and recent Holocene epochs. Layers of sand, silt, and clay were deposited, scoured, removed, and redeposited in lobate and linear bands that generally trend south to southeast. Four stratigraphic units were identified by ENSR. The subsurface deposits were characterized and differentiated based on texture, consistency, color, vertical and lateral extent, and hydrogeologic significance. From shallowest to deepest the units are:

- Zone I (recent fill)
- Zone II (upper silty and sandy clays with silts, silty sand, and clayey sand lenses)
- Zone III (silty and clayey sands)
- Zone IV (lower silty and sandy clays)

These zones and the shallow subsurface of the NHB are presented on the geologic cross-sections (Figures 7 and 8). A plan view presenting the location of the cross-sections in given in Figure 9. Zone I fill materials are laterally extensive and composed of road base (limestone gravel, shell, and asphalt) below which are reworked silty clays and sandy clays. The thickness of the fill ranges from 15 feet along the road on the south margin of the NHB to two feet on the east side of the NHB. A thin unit of brown silty sand which was encountered over most of the area is also included in this zone. This unit is apparently an undisturbed, natural unit which occurs above the bottom of the NHB.

Zone II is comprised of the uppermost natural silty and sandy clays that are laterally extensive in the area of the NHB. The top of Zone II is generally encountered about 5 to 8 feet below MSL. The silty and sandy clays of Zone II are typically stiff and of low to medium plasticity. The maximum thickness of the Zone II unit is approximately 12 feet on the western edge of the NHB. The minimum thickness of 4 to 6 feet occurs on the northern boundary of the NHB. An organic soil containing black silts, silty sand, clayey silts, and silty clay of high organic content is found intermittently within Zone II. The thickness of this soil ranges from less than 1 foot to almost 10 feet on the eastern side of the NHB. The deposit appears to be low energy fluvial sediments that were deposited as channel fill.

Zone III is saturated and the monitor wells at the NHB are screened in this zone. The top of the unit is generally -3 to -5 feet MSL and its average thickness is 15 to 20 feet. Zone III is composed of silty sands with minor amounts of clayey sand.

Zone IV is defined as the silty clay to sandy clay zone immediately below Zone III. Zone IV is encountered at approximately -25 feet MSL. The total thickness of this zone was not penetrated during the NHB investigation. This zone is stiff and medium to highly plastic. In its upper portion,

it contains pockets and seams of fine silty sand.

6.0 Ground Water Investigation Report

Southeast Holding Basin

Information on ground water conditions at the SEHB is contained in several reports issued since 1988. The reports are the Southeast Holding Basin Groundwater Monitoring Report (ENSR, October 1988), Expanded Groundwater Quality Assessment of the Former Southeast Holding Basin (ENSR, June 1990), 1990 Annual Groundwater Monitoring Report for the Southeast Holding Basin (ENSR, January 1991), and the Semi-Annual Ground Water Monitoring Report (Malcolm Pirnie, July 1991). Boring logs noted the occurrence of saturated conditions in the subsurface are found in Appendix B of the Groundwater Monitoring Report and Appendix E of the Expanded Groundwater Quality Assessment Report. Water levels are noted on the cross sections in Figures 4 and 5. Water level measurements for the first and second quarter 1991 are presented in Table 1.

The first saturated sediments encountered below the land surface in the vicinity of the SEHB are found in Unit II - Sandy Channel Fill (SCF). The SCF has been characterized as an artificial ground water zone caused by the perching of rain water and facility water on top of the relatively impermeable first Silty Clay Unit (FSCU). The saturated thickness of the SCF ranges from less than 2 feet to more than 14 feet. The saturated thickness is greatest where the underlying FSCU has been partially removed and filled with channel dredge material. ENSR (1990) calculated a mean hydraulic conductivity value of 0.077 based on several slug tests. A mean potentiometric surface map for the SCF is presented in Figure 10. Calculated linear velocities for various areas are also shown on this figure. Hydraulic gradients and ground water flow velocities generally increase from the central portion of the plant toward the Houston Ship Channel and GATX docking slip. The docking slip and Ship Channel act as constant head boundaries for the SCF and ground water flows toward the shoreline.

The uppermost continuous water bearing zone in the area of the SEHB is Unit V - Uppermost Natural Transmissive Unit (UNTU). This unit is generally separated from the SCF by the First Silty Clay Unit (FSCU). Where the FSCU is absent, the UNTU hydrogeologic unit includes the SCF. The UNTU is a confined aquifer where it is overlain by the FSCU. A thickness map of the UNTU is presented in Figure 11. The UNTU is up to 20 feet thick in the vicinity of the SEHB. The calculated maximum mean hydraulic conductivity of the UNTU is 1.67 feet/day based on several slug tests and a pump test conducted in monitor wells in the UNTU. A mean potentiometric surface map of the UNTU is presented in Figure 12. The calculated linear velocity at various locations is also shown on this map. Hydraulic gradients and ground water flow velocities generally increase from the central portion of the plant area toward the Houston Ship Channel and the GATX docking slip. Ground water flow directions are toward these discharge points for the UNTU.

The vertical hydraulic conductivity of the FSCU has been calculated at 0.000104 feet/day from laboratory testing. The calculated vertical flow rate from the SCF through the FSCU to the UNTU ranges from 0.00013 to 0.000014 feet/day. The vertical gradient was downward at all locations except one on site. The low vertical flow rate indicates that where the FSCU is present, it should impede the vertical migration of contaminated ground water. However, high levels of contamination have been detected in the UNTU. This indicates that vertical migration is occurring through natural or manmade pathways in the FSCU.

The Lower Natural Transmissive Unit (LNTU) occurs below the UNTU and is separated from it by the Second Silty Clay/Clay Unit (SSC/CU). No ground water monitoring wells have been installed in the LNTU, to date.

North Holding Basin

Information on ground water conditions at the NHB is contained in the Monitoring System Installation report referenced above and two other annual ground water monitoring reports for 1990. These are the 1990 Annual Groundwater Monitoring Report for the North Holding Basin (ENSR, February 1991) and the Addendum Report for the North Holding Basin Groundwater Monitoring Program 1990 Annual Report (ReTec, June 1991). Boring logs noting the degree of saturation encountered during drilling are found in Appendices D and E of the Monitoring System Installation report. Available water level data is noted on the cross-sections in Figures 7 and 8.

Zone III is the uppermost continuous water-bearing zone in the vicinity of the NHB. Saturated sediments are found in Zone II in silty sand and clayey sand units above Zone III but they are not continuous. Field observations indicate that Zone III is capable of sustaining pumping at 10 gpm without significant drawdown. However, no pump tests have been performed. The nature of connection with deeper hydrostratigraphic units is unknown at this time.

Ground water levels for 1990 and the 1st Quarter of 1991 are presented in Table 2. The ground water flow direction in the shallow subsurface has been consistently toward Panther Creek east of the NHB. Figure 13 presents the most recent piezometric surface map (1st Quarter 1991). Shallow ground water appears to discharge to Panther Creek, where a steepening of the hydraulic gradient is apparent. The lateral hydraulic gradient across the NHB is 0.006. Assessment of hydraulic properties have not be completed to date, so no information is available regarding ground water flow rates. Measurement of water levels in a well pair (MW-3, Zone II and MW-2, Zone III) indicate an upward vertical gradient.

CH2MHILL

EXPLANATION

Fill and spoil

Fill, F, material dredged for raising land surface above alluvium and barrier-island deposits and for creating land. Spoil, S, dredged material along waterways

Alluvium

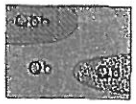
Clay, silt, and sand, organic matter abundant locally; includes point-bar, natural levee, stream channel, backswamp, coastal marsh, mud flat, and narrow beach deposits that are shown by line symbol

Barrier-island deposits

Sand, silt, and clay; mostly sand, well-sorted, fine-grained, abundant shells and shell fragments; interfingers with clay and silt in landward direction; includes beach ridge, spit, tidal channel, tidal-delta, and sand dune deposits

Deweyville Formation

Sand, silt, and clay, some gravel; includes point bar, natural levee, stream channel, and backswamp deposits at a level only slightly above that of the present floodplain; sand coarser than that in alluvium; surface characterized by relict meanders of much larger radius of curvature than those of present streams, some scattered pimple mounds, thickness locally more than 50 feet. High-level Deweyville, Qdt, surfaces cut into the Beaumont Formation, and high-level Deweyville deposits along Trinity River are intermediate in position between the surface of the Beaumont and the level of most Deweyville deposits



Beaumont Formation

Beaumont Formation, Qb, with barrier-island and beach deposits, Qbb, mapped separately. Beaumont Formation, Qb, mostly clay, silt, and sand; includes mainly stream channel, point-bar, natural levee, backswamp, and to a lesser extent coastal marsh and mud-flat deposits; concretions of calcium carbonate, iron oxide, and iron-manganese oxides in zone of weathering; surface almost featureless, characterized by relict river channels shown by meander patterns and pimple mounds on meanderbelt ridges, separated by areas of low, relatively smooth, featureless backswamp deposits without pimple mounds; thickness ± 100 feet. The stippled overprint (source shown in Index to Geologic Mapping) shows areas that are "Dominantly clay and mud of low permeability, high water-holding capacity, high compressibility, high to very high shrink-swell potential, poor drainage, level to depressed relief, low shear strength, and high plasticity; geologic units include interdistributary muds, abandoned channel-fill muds, and overbank fluvial muds." The nonstippled areas are "Dominantly clayey sand and silt of moderate permeability and drainage, low to moderate compressibility and shrink-swell potential, level relief with local mounds and ridges, and high shear strength; geologic units include meanderbelt, levee, crevasse splay, and distributary sands"

Holocene

Holocene or late (?) Pleistocene

Pleistocene

QUATERNARY

Barrier-island and beach deposits, Qbb, mostly fine grained sand normally without shell material; surface slightly higher than that of surrounding deposits, characterized by numerous pimple mounds and rounded depressions; probably part of "Ingleside" barrier-island system; thickness less than 80 feet
Physical properties: "Dominantly sand, high to very high permeability, low water-holding capacity, low compressibility, low shrink-swell potential, good drainage, low ridge and depressed relief, high shear strength, and low plasticity. Geologic units include beach, foredunes, barrier-strandplain-chenier vegetated flats, Pleistocene barrier and strandplain sands"

Lissie Formation

Upper part, clay, silt, sand, and very minor siliceous gravel of granule and small pebble size, gravel more abundant northeastward, locally calcareous, concretions of calcium carbonate, iron oxide, and iron-manganese oxides common in zone of weathering; fluviatile; surface fairly flat and featureless except for numerous rounded shallow depressions and pimple mounds. Lower part, clay, silt, sand, and minor amount of gravel; gravel slightly coarser than in upper part, noncalcareous, iron oxide concretions more abundant than in upper part; fluviatile; very gently rolling; thickness ± 200 feet

Willis Formation

Clay, silt, sand, and minor siliceous gravel of granule to pebble size including some petrified wood; sand coarser than in younger units. Deeply weathered and lateritic, indurated by clay and cemented by iron oxide locally, concretions of iron oxide numerous, noncalcareous; fluviatile, maximum thickness 25 feet

Tertiary rocks on Hockley salt dome

Sandstone, very fine grained, hard, abundant porcellaneous to opaline cement, poorly bedded, jointed, greyish white; possibly Catahoula Formation (Stenzel, 1946) (See Index of Geologic Mapping for reference.)

Pleistocene

Miocene

Section M2 – Supplemental Information

This Section information detailing current groundwater contaminant distribution and potentiometric surface configurations at the SEHB and CAMU/Former NHB and current information related hydraulic gradients in and around the units. Also included is supplemental information related to geologic processes, boring logs, and historical groundwater elevation data.

Active Geologic Processes

The active geologic processes are discussed in detail in *Section 3.0 Active Geologic Processes* of the Geology Report contained in Section M1. As a supplement to the geologic process information provided in the Geology Report, a map identifying all the active and inactive faults in the area of the facility has been attached in this section.

Contaminant Plume and Potentiometric Surface Maps

Groundwater data collected for the SEHB and Former NHB during the 2023 was used to update area contaminant plume and potentiometric surface maps. These maps were taken from the *Annual Corrective Action Program Report, Reporting January 1, 2023 to December 31, 2023* (AECOM. February, 2024). These maps are provided to the TCEQ through the ongoing corrective action program at the facility in association with the regulatory requirements. Groundwater potentiometric elevation maps, LNAPL distribution maps and concentration maps for SEHB and Former NHB for 2023 are provided in this section.

Boring Logs

Attached to this addendum is Appendix M1 which contains boring logs from each of the waste management areas. The logs include all the soil boring data collected for the installation of all the monitoring wells associated with each waste management area.

Historic Groundwater Level Measurements

Appendix M2 is attached to this addendum and contains the historical groundwater level data that was collected annually in conjunction with the compliance groundwater sampling. These tables include depth below the top of casing and corrected depth to water shown in feet above or below mean sea level (MSL). Water level elevations are corrected (adjusted) to account for density difference between water and LNAPL. Groundwater elevation data from 2023 for each well in both the CAMU/Former NHB and the SEHB can be found in Appendix M2.

Updated Site Hydraulic Gradients

The hydraulic gradients for both vertical and horizontal migration were calculated for the SEHB and the CAMU/Former NHB. Both areas' gradients were calculated from groundwater data collected during 2023 and are included in this section. For groundwater elevation data from 2023 please refer to Appendix M2.

Site Aquifer Characteristics

SEHB

The two impacted hydrologic units found beneath the SEHB are SCF and UNTU. These units are hydraulically connected with each other part, but are not hydraulically connected to the underlying regional aquifer. The upper limit of these two units is 5 feet below ground surface (bgs) and the lower limit is 35 feet bgs.

CAMU/Former NHB

The two impacted hydrologic units found beneath the CAMU/Former NHB are Zone III and Zone IV. These units are hydraulically connected with each other part, but are not hydraulically connected to the underlying regional aquifer. The upper limit of these two units is 40 feet bgs and the lower limit is 80 feet bgs.

Migration Pathways

Contaminants entering the uppermost aquifers will migrate laterally toward the respective surface water bodies (Panther Creek for CAMU/Former NHB and the Houston Ship Channel/Docking Slip for SEHB). Under natural conditions, groundwater discharges to the surface water bodies; however, the Corrective Action Program has intercepted the pathway making the natural migration pathway incomplete.

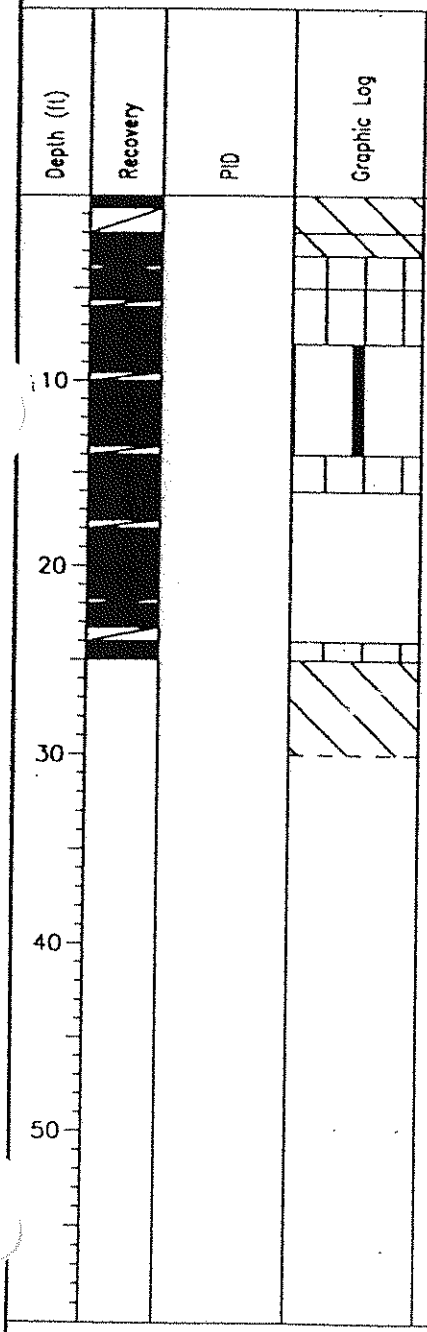
ARCADIS
GERAGHTY & MILLER

Project Number: HT000297.0001
Project Name: GATX
Borehole Dia.: 10.75in
Total Depth: 30.00'
Elevation: 13.68'
Logged By: B. Nelson
Contractor: Fugro Geosciences
Drilling Method: Hollow Stem Auger
Date Started: 11/14/88
Date Completed: 11/14/88

Site Id: RW01
Location: GATX Terminal, Galena Park, TX
Consulting Firm: ENSR
Remarks:



Material Description

SILTY CLAY, reddish brown, several thin black seams
SILTY CLAY, dark gray to black
SILTY SAND, black, shell fragments, dry
SILTY SAND, grayish green, saturated with hydrocarbons
CLAYEY SILT, gray, mottled iron staining, black seams, soft, dry to moist
SILTY SAND, gray, moist with hydrocarbons
SAND, light gray, very fine sand, saturated with water
few clay stringers
SILTY SAND
SILTY CLAY, light gray to buff, hard

ENSR CONSULTING & ENGINEERING

SUBSURFACE EXPLORATION — LITHOLOGIC LOG OF MW-1

Client : GATX TERMINALS CORPORATION
Project Name : SE HOLDING BASIN CLOSURE PLAN
Project Location : GALENA PARK, TEXAS
Job Number : 521-02-04 Boring No : MW-1
Logged By : S. BAIRD
Approved By : J. BARRINGER
Drilled By : GULF COAST CORING, ROSENBERG, TX

DRILLING AND SAMPLING INFORMATION
Date Started : 05/27/87 Date Completed : 05/27/87
Method : ROTARY WASH Total Depth : 35.0 FT

WELL COMPLETION INFORMATION
Screen Dia : 4 IN I.D. Length : 12.7 FT
Slot Size : 0.010 IN Type : PVC SCH40
Casing Dia : 4 IN I.D. Length : 21.3 FT

DEPTH IN FEET	DESCRIPTION TOP OF CASING ELEVATION: 21.58 FT. MSL SURFACE ELEVATION : 21.7 FT. MSL
5	ROAD AND DIKE FILL
10	SILTY SAND (SM) – Sandy Channel Fill, loose dark gray and tan, non-plastic, wet.
15	CLAYEY SILT/SILTY CLAY (ML/CL), firm, light gray with orange mottling, medium plastic, slightly moist.
20	VERY CLAYEY SAND (SC), some silt layers, soft, light gray and tan, v.f.g. sand, moist to wet.
25	SILTY SAND (SM), loose, cream and tan, non-plastic, saturated.
30	
35	SILTY CLAY (CL), very stiff, dark brownish-red with gray mottling.
40	T.D. – 35.0 ft. Bore drilled with a 4-inch drag bit on a rotary wash swamp buggy using potable water with a bentonite based drilling mud. Bore washed in first major clay at 35.0 due to close proximity to CB and CPT-6. Ran electric log (gamma, resistance, spontaneous potential) to ascertain lithologic layers. Bore overreamed with 8 inch drag bit to 34.0. Drilling fluids pumped into labeled drums. Well set with flush valve, Triloc screen and casing; sand pack 16-30 screened and washed silica sand; sealed with 1/2" bentonite pellets and tremied cement bentonite slurry. Top of casing set below grade with an aluminum locking cap and a water tight manhole cover.

ASPHALT and ROAD FILL

Sandy Channel Fill – Silty Sand, loose to soft, dark brown with black staining, oyster shell fragments, clayey pockets, strong hydrocarbon odor, very moist.

--From 4.5 to 8.0 ft. wet, very strong odor, hydrocarbon sheen.

SILTY CLAY (CL), soft to firm, light gray with orange mottling, medium plasticity, with occasional silty fine sand partings and black carbonaceous material, slightly moist, strong hydrocarbon odor.

CLAYEY SILT (ML), soft, light gray with orange mottling, slight plasticity, very moist, strong hydrocarbon odor.

CLAYEY SAND (SC), soft, light gray, slight plasticity, v.f.g. sand, slight odor, very moist.

SILTY SAND (SM), loose to soft, light brown, gray and buff with orange mottling, little clay, non to slight plasticity, occasional carbonaceous material, very strong odor and black staining, wet.

FILL, asphalt and road base.

FILL – Clayey Silt – soft, dark brown to black and light red, abundant oyster shell fragments, strong odor, moist.

FILL – Silty Clay – soft, dark red with gray mottling, medium plasticity, moist.

Sandy Channel Fill – Silty Sand – loose, gray to dark brown, non-plastic, v.f.-f.g. sand, abundant micaceous mineral fragments, little clay, with occasional decomposed vegetation from 6-14 ft., wet and oily from 6-10 ft.
-- from 6 to 22 ft. HNu readings range from 10 to 105 ppm.

From 10 to 16 ft. saturated.

CLAYEY SAND (SC), soft and compact, light gray and buff, slight to medium plasticity, slight odor, very moist to wet.

--from 22.5 to 23 ft., HNu reading 40 ppm.

FILL, sand ramp, lime stabilized silty sand, cream and light brown.

FILL, lime stabilized clay, soft, light red brown and gray, with calcareous gravel, no odor from 5.3'-7.0'.

Sandy Channel Fill, loose, dark tan, slightly wet, very strong odor, contaminated with creosote from 7.5'-8.5'.

CLAYEY SAND (SC), soft and compact, light gray with black stained mottling and slight ferrous mottling, v.f.g. to f.g. sand, silty, black areas are oily, non-plastic, wet, very strong odor.

SANDY CLAY (CL), soft to firm, mottled medium gray, orange and black, with occasional roots, numerous sandy pockets, v.f.g. sand, slightly plastic, very moist.

SANDY SILT (ML), compact to soft, light gray and olive gray with pinpoint black staining, v.f.g. sand, clayey, non to slightly plastic, wet, medium odor, no oil observed.
13.8' - Becomes sandier, v.f.g. sand.

16.0' - Grading to clayey silt, less sandy, very moist.

18.0' - Light gray and olive gray with olive ferrous mottles, sand increasing, v.f.g. with v.f.g.-f.g. pockets, with clayey silt seams and pockets, non-plastic, moist to very moist.

21.0' - Becoming sandier, slightly dense, v.f.g.-f.g. sand, grades to silty sand.

SILTY SAND (SM), compact to dense, homogeneously light gray, little clay, non-plastic, wet to saturated, medium odor.

DESCRIPTION
TOP OF CASING ELEVATION: 21.65 FT. MSL
SURFACE ELEVATION : 19.7 FT. MSL

FILL
0'-1.0' - Limestone gravel with beige sand and clay
1.0'-4.0' - Silty clay, dark brown, moist, with black stained silty sand, strong odor.

4.0'-13.0' - Sandy Channel Fill, silty sand, dark brown to black.

5.0'-6.0' - Silty sand, medium brown with some black stains, moist with odor.

6.0'-10.5' - Becomes brown to gray with rootlets, moist.

10.5' - Dark gray, very moist to slightly wet.
11.0' - Oil in some pockets, strong odor.

CLAYEY SAND (SC), medium gray and slightly blue gray, some apparent cohesion, grades to sandy clay, heavy odor.

SANDY CLAY (CL), med gray to blue gray, silty v sandy, moist, odor.

SILTY CLAY (CL), firm, light blue gray and dark gray with occasional green blue mottles, some v.f.g. sand pockets, slightly plastic.

19.0'-22.0' - Very silty with v.f.g. sand pockets, slight odor.

22.0'-24.0' - Silty to very silty, with iron nodules and staining along planes and seams.

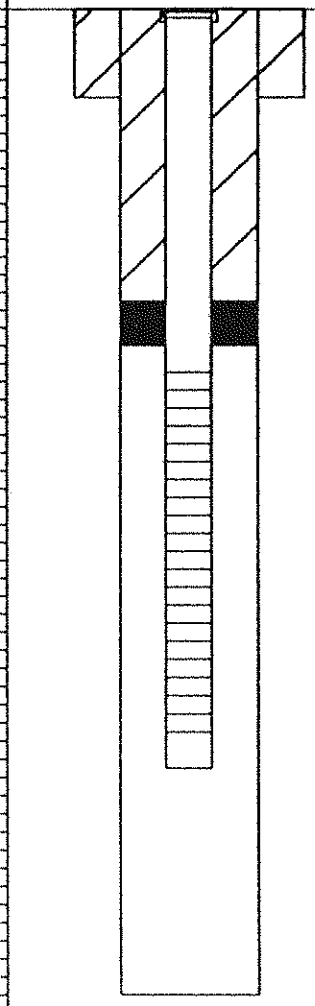
	type: Bentonite Pellets fm: 16.50' to: 19.00'
	type: Sand Filter fm: 19.00' to: 55.00'



Material Description

Fill
0"-3" - Asphalt.
3"-1.0' - Beige/tan clayey sand.
1' - Dk brown olive gray silt and clay.

SILTY CLAY (CL), red brown with med. gray.

SILTY SAND (SM), medium brown, beige, slightly red brown, clayey to 4.7', moist.

6.0' - Compact to slightly dense, v.f.g.-f.g.
6.7' - Becomes wet.

SILTY CLAY (CL), firm, red brown and medium dark brown, plastic, grades to very sandy clay.
10-11' - Calcareous.

CLAYEY SAND (SC/CL), light gray, v.f.g., very moist, grades to sandy clay.
SANDY CLAY (CL), firm, light gray with beige ferrous oxide staining with some buff mottles, v.f.g., calcareous, slightly plastic, moist.

18.0' - With numerous sandy silt and sand pockets.
19.0' - Grading to very sandy.

SILTY SAND (SM), v.f.g.-f.g., clayey to 22.0', light gray, red brown and buff.
22.0' - Becomes wet.

24.0' - Less compact to loose, very wet, light gray with red brown, with occasional clay laminae.

Material Description

Fill
0'-3.0' - Silty clay, red brown, with minor gravel and sand, some root material, very moist.

3.0'-4.0' - Red brown light gray and brown silty clay with black staining.

SILTY SAND (SM), medium brown, fine silty sand, moist.

SILTY CLAY (CL/CH), very firm to stiff, dark brown, with some beige sand pockets and black organic stain, very plastic, moist.

SILTY CLAY/SILTY SAND/CLAYEY SILT (CL w/SM/ML), red brown SICL thinly interbedded with red brown clayey silt seams and silty sand seams. Plastic very moist to wet.
SILTY CLAY (CL/OL), dk brn/gray, very silty, organic clay, low to medium, plastic, gummy, very moist to wet.
10.0'-10.5' - Very clayey, becoming light gray, wet.
CLAYEY SAND (SC), soft, medium gray to light gray, with organic material, f.-v.f.g., very clayey, wet to saturated.
12.0' - Soft, very silty, wet to saturated.

13.0' - Becomes firmer, very clayey, with some cohesion, very slightly plastic, very moist to wet.
14.0' - Loose to soft, wet.

CLAYEY SILT (ML/OL), dark gray to black/gray, with v.f.-f. sand pockets, high organic content, very moist to slightly wet.
16.0' - Charcoal gray with light gray, v.f.g. sand pockets numerous, high organic content.

CLAYEY SAND (SC), Becomes firmer, light to medium gray, clayey, v.f.g.-f.g., with less organic material, very moist.

20.0' - Soft, light to medium gray, with minor to some organic material, slifhtly cohesive, very moist to slightly wet.
21.0'-21.5' - Very loose, soft, less clayey, saturated.
21.5' - Soft to very slightly dense, medium gray, with occasional small blue gray clay pockets (fragments), less clayey.

24.0' - Clay fragments more numerous.

SILTY SAND (SM), slight red brown/buff, with interbedded light gray, silty sand with ferrous staining, v.f.g.-f.g., wet to saturated.
26.0' - Dense to very dense, buff and ferrous brown with light gray seams, with indurated calcareous clay clasts.

29.7' - Becoming slightly clayey.

Material Description

FILL
0'-3.0' - Red brown, silty clay with minor gravel and sand, some root material, very moist.

3.0'-4.0' - Red brown, light gray and brown silty clay with black staining.

SILTY SAND (SM), medium brown, fine silty sand, moist.

SILTY CLAY (CL/CH), very firm to stiff, dark brown, with some beige sand pockets and black organic stain, very plastic, moist.

SILTY CLAY/SILTY SAND/CLAYEY SILT (CL w/SM/ML), red brown SICL thinly interbedded with red brown clayey silt seams and silty sand seams. Plastic, very moist to wet.

SILTY CLAY (CL/OL), dk brn/gray, very silty, organic clay, low to medium plastic, gummy, very moist to wet.

CLAYEY SAND (SC), soft, medium gray to light gray, with organic material, f.-v.f.g., very clayey, wet to saturated.
12.0' - Soft, very silty, wet to saturated.

13.0' - Becomes firmer, very clayey, with some cohesion, very slightly plastic, very moist to wet.
14.0' - Loose to soft, wet.

CLAYEY SILT (ML/OL), dark gray to black/gray, with v.f.-f. sand pockets, high organic content, very moist to slightly wet.
16.0' - Charcoal gray with light gray, v.f.g. sand pockets numerous, high organic content.

CLAYEY SAND (SC), Becomes firmer, light to medium gray, cleyey, v.f.g.-f.g., with minor organic material, very moist.

20.0' - Soft, light to medium gray, with minor to some organic material, slightly cohesive, very moist to slightly wet.
21.0'-21.5' - Very loose, soft, less cleyey, saturated.
21.5' - Soft to very slightly dense, medium gray, with occasional small blue gray clay pockets (fragments), less clayey.

Material Description

FILL
0'-2.0' - Asphalt and road base.
2.0'-4.0' - Silty clay, black brown with sand and gravel (minor).

SILTY CLAY (CL), very firm, light gray to slightly olive gray, with black organic material, medium plastic, with v.f.g. sandy seams and pockets.

SANDY CLAY (CL), firm, light gray, some ferrous staining, slightly plastic.
7.0' - Becomes very ferrous stained, minor calcareous nodules.

10.0' - Becomes very sandy, grading to clayey sand, very moist.

CLAYEY SAND (SC), light gray with ferrous stain, v.f.g.-f.g. and silty, with app. cohesion, very moist to 12', v. moist/wet below 12'.
12.0' - Very ferrous stained along seams, breaks, and pockets, less clayey with depth, very silty.

SILTY SAND (SM), medium dense, light gray with ferrous stain, slight buff beige, trace to minor clay, very moist/wet.

16.0' - with occasional sandy clay breaks, saturated.

17.0'-19.0' - Dense, less ferrous staining.

20.0' - Dense, light gray, buff, with some red brown, v.f.g.-f.g.

CLAY (CL/CH), very stiff to hard, red brown and light gray mottled, highly slickensided, blocky, with minor calcareous nodules, very plastic.

SILTY SAND (SM), slightly dense, light gray with buff, v.f.g.-f.g.

26.0' - Very dense, v.f.g.-f.g., with occasional silty clay pockets and seams.

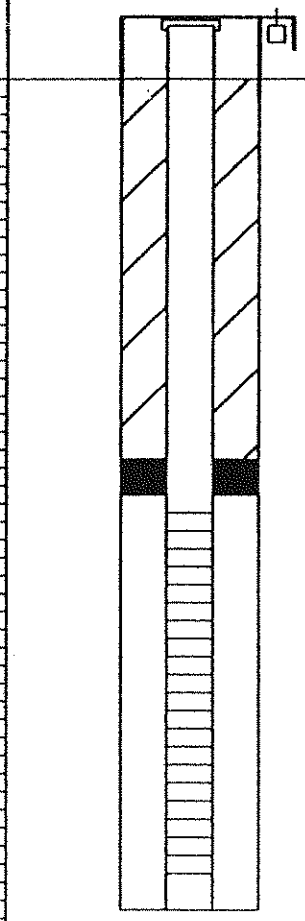
	type: Bentonite Pellets fm: 21.50' to: 23.50'
	type: Sand Filter fm: 23.50' to: 46.50'



Material Description

FILL, dark brown to light brown beige, sandy clay with limestone gravel and sand.

4.0'-8.0' - Silty clay, reddish brown, light gray, reworked.
4.5'-5.5' - Stained black, slight odor.

8.0'-14.5' - Some dry sand seams and pockets, with slight to moderate odor, to 14' with some black stain.

SILTY SAND (SM), loose to compact, dk to med brn, tr. clay, moist.
SILTY CLAY (CL), dark brown, plastic, very moist.
SILTY CLAY (CL/OL), black/gray, very silty, organic clay.

CLAYEY SILT (OL), organic, with v.f.g. sand, very clayey with organic material and decaying roots, wet.
19.5 - With ferrousnodes, less organic material, becoming very clayey, less wet.
CLAYEY SAND (SC/CL), medium gray, very clayey, v.f.g. to silty, non-plastic to v. slightly plastic, very moist.

SANDY CLAY (CL), firm, medium to light gray, with olive ferrous mottling and some nodules, v.f.g. & v. sandy, slightly plastic, very moist, sand increases with depth. Grades to silty sand with clay, light gray with red brown.

SILTY SAND (SM), medium dense, light gray, 30' - becomes beige, ferrous stained, with some app. cohesion, very moist/wet.

Material Description

CLAY: Red-brown, silty, slightly to mod. plastic, damp, bioturbation. no odor, no stain

CLAY: Red-brown as above with increasing silt, moderately plastic, damp no odor, no stain

SAND: Gray, very fine grained, well sorted, silty, wet, some black stain no odor

SILT: Gray to brown, clayey, moderately plastic

CLAY: Black, dense, plastic, no odor, no stain

SILT: Black, clayey, moderately plastic, no odor, possible sheen.
CLAY: Black, organics, peaty, interbedded silt, no odor

CLAY: Black, as above

SILT: Black, clayey, possible sheen, organics, no odor
CLAY: Black, increasing sand content, silty, no odor

CLAY: Black, as above
SILT: Black to gray, sandy, moderately plastic, medium dense, no odor

SAND: Gray, occasionally buff, fine grain, well sorted, silty, wet, no odor

SAND: Gray, fine grained, well sorted, decreasing clay and silt, no odor

SAND: As above

SAND: As above with increasing clay content

SAND: As above

SAND: As above
CLAY: Red, orange, some black, dense, plastic, no odor

Notes:
MSL - Mean Sea Level
TOC - Top-of-casing
NAPL - Non-aqueous phase liquid
-- - NAPL not observed
ft. - Feet
* - May 2019 well Survey
Corrected Groundwater Elevation = (NAPL Thickness X 0.87) + Depth to Groundwater
NM (RW) - not measured, recovery wells are only measured when the pump is removed for maintenance
** - The MW-5 well pad was reconstructed on July 2, 2019. To accommodate the new well pad, 6.65" (0.55') of the top of the well casing was removed yielding an approximate new TOC measurement of 20.88'-0.55' = 20.25'. 20.25' is the assumed TOC until surveyed again.
*** - the groundwater level was below the pump assembly, making it inaccessible to be measured.

TABLE II.3a
STRATIGRAPHIC UNIT CHARACTERISTICS
CAMU/Former (NHB) Area (Page 1 of 2)

STRATIGRAPHIC UNITS FROM LAST COLUMN OF TABLE II.2	STRATIGRAPHIC UNIT THICKNESS (in Feet)	DEPTH TO TOP OF STRATIGRAPHIC UNIT		LITHOLOGY CLASSIFICATION (e.g., sand, silt, clay, etc.)	AVERAGE PERCENT CLAY OF THE STRATIGRAPHIC UNIT	HYDROGEOLOGIC UNIT?[3] (YES OR NO)
		(Feet/MSL[1])	(Feet/BGS[2])			
1.1 Zone I	~ 2 to 15	~ 15	0	Fill & silty sand	Minimal to none	No
1.2 Zone II	~ 15 to 25	~ -5	~ 20	Silty & sandy clay	High discontinuous	No
1.3 Zone III	~ 7 to 25	~ -25	~ 40	Silty & clayey sands	low	Yes
1.4 Zone IV	~ 25 to 28	~ -50	~ 60	Silty & sandy clay	High	Yes
1.5 Below Zone IV	>40	~ -75	~ 80 to 100	Silty & sandy clay	High	No

1) MSL = Mean Sea Level
2) BGS = Below Ground Surface
3) HYDROGEOLOGIC UNIT = A stratigraphic unit which meets the definition of an aquifer. As defined in 40 CFR 260.10, an aquifer is a geologic formation, group of formations, or part of a formation, capable of yielding a significant amount of ground water to wells or springs.

As further defined in U.S. EPA RCRA Ground-Water Monitoring Technical Enforcement Guidance Document, September 1986, an uppermost aquifer is a "geologic formation, group of formations, or part of a formation that is the aquifer nearest to the ground surface and is capable of yielding a significant amount of ground water to wells or springs and may include fill material that is saturated. The identification of the confining layer or lower boundary is an essential facet of the definition of uppermost aquifer. There should be very limited interconnection, based upon pumping tests, between the uppermost aquifer and lower aquifers. If the lower zones of saturation capable of yielding significant amounts of water are interconnected with the uppermost aquifer within the facility's property boundary, they all comprise the uppermost aquifer. Quality and use of ground water are not factors in the definition. Even though a saturated formation may not be presently in use, or may contain water not suitable for human consumption, it may deserve protection because contaminating it may threaten human health or the environment. Identification of formations capable of significant yield must be made on a case-by-case basis." The hydrogeologic units of this column will be listed in the first column of Table II.4.

~ Approximate depth.

TABLE II.3a
STRATIGRAPHIC UNIT CHARACTERISTICS
CAMU/Former (NHB) Area (Page 2 of 2)

STRATIGRAPHIC UNITS FROM LAST COLUMN OF TABLE II.2	STRATIGRAPHIC UNIT THICKNESS (in Feet)	DEPTH TO TOP OF STRATIGRAPHIC UNIT		LITHOLOGY CLASSIFICATION (e.g., sand, silt, clay, etc.)	AVERAGE PERCENT CLAY OF THE STRATIGRAPHIC UNIT	HYDROGEOLOGIC UNIT?[3] (YES OR NO)
		(Feet/MSL[1])	(Feet/BGS[2])			
2.1 Montgomery Formation (Lower Chicot Aquifer)	~200; not differentiated	~ -140	~ 160	Clay, silt and sand layers	Unknown	Yes,; major regional aquifer
3.1 Bentley Formation (Lower Chicot Aquifer)		~ -140	~ 160	Clay, silt and sand layers	Unknown	Yes,; major regional aquifer
4.1 Willis Sand (Lower Chicot Aquifer)	Approximately 75 ft.	~ -340	~ 360	Coarse sand and siliceous gravel with silty or clayey zone	Unknown	Yes
5.1 Goliad Sand (Evangeline Aquifer)	~1300; not differentiated	~ -435	~ 435	Sand with silty or clayey zones	Unknown	Yes,; major regional aquifer
6.1 Upper Fleming Formation (Evangeline Aquifer)		~ -435	~ 435	Fine to coarse sand, silt and calcareous clay	Unknown	Yes

1) MSL = Mean Sea Level
2) BGS = Below Ground Surface
3) HYDROGEOLOGIC UNIT = A stratigraphic unit which meets the definition of an aquifer. As defined in 40 CFR 260.10, an aquifer is a geologic formation, group of formations, or part of a formation, capable of yielding a significant amount of ground water to wells or springs.

As further defined in U.S. EPA RCRA Ground-Water Monitoring Technical Enforcement Guidance Document, September 1986, an uppermost aquifer is a "geologic formation, group of formations, or part of a formation that is the aquifer nearest to the ground surface and is capable of yielding a significant amount of ground water to wells or springs and may include fill material that is saturated. The identification of the confining layer or lower boundary is an essential facet of the definition of uppermost aquifer. There should be very limited interconnection, based upon pumping tests, between the uppermost aquifer and lower aquifers. If the lower zones of saturation capable of yielding significant amounts of water are interconnected with the uppermost aquifer within the facility's property boundary, they all comprise the uppermost aquifer. Quality and use of ground water are not factors in the definition. Even though a saturated formation may not be presently in use, or may contain water not suitable for human consumption, it may deserve protection because contaminating it may threaten human health or the environment. Identification of formations capable of significant yield must be made on a case-by-case basis." The hydrogeologic units of this column will be listed in the first column of Table II.4. Approximate depth.

Re: Financial Disclosure Letter for KM Liquids Terminals LLC

Permit Renewal
Hazardous Waste Permit No. 50054 / Compliance Plan No. 50054
Industrial Solid Waste Registration No. 30573
EPA ID No. TXD026481523
RN100237452/CN603254707

Dear Ms. Aki:

This letter is furnished to you in response to financial disclosure requirements as applicable under Texas Health and Safety Code Section 361.085 and Title 30, Texas Administrative Code (30 TAC), Section 305.50 to provide assurance that KM Liquid Terminals has sufficient financial resources.

In keeping with the above law and rule requirements I hereby certify that KM Liquids Terminals LLC is adequately capitalized and has sufficient financial resources to operate, close, provide post-closure care for and perform corrective action for the above-referenced facility in a safe manner, and in compliance with the permit and all applicable rules.

KM Liquids Terminals LLC currently provides a letter of credit financial assurance mechanism as set out in 30 TAC, Chapter 37, Subchapter C to meet KM Liquid Terminal's financial assurance obligations.

I am authorized to make these statements on behalf of KM Liquids Terminals LLC. I understand that the TCEQ may request additional information as part of their review.

Sincerely,

Chris Graeter

Vice President and Treasurer

STATUS AND HISTORY OF PRELIMINARY REVIEW TO DATE

The original RCRA Facility Assessment (RFA) was completed and a report of findings was issued May 26, 1992. The units included in the 1992 RFA are listed below and RCRA Facility Investigations (RFIs) or the equivalent began in 1993 to address these units. The preliminary review checklists for the RFA units listed below was updated during the 2002-2004 Part B renewal and nine (9) additional units were added. These units are listed below. This submittal updates the information provided in the 2002-2004 renewal. Managed waste information for NOR Unit Nos. 021 through 029 is included in Tables 1 through 9. Discussions related to evidence of release and pollutant dispersal pathways for Units 021 through 029 are included in Appendix III and IV, respectively.

UNITS INCLUDED IN ORIGINAL RFA	
NOR No.	**Description**
NOR001	Drum Storage Building
NOR002	Tank 29
NOR003	Tank 10-12
NOR004	North Holding Basin (CAMU)
NOR005	Tank 100-5
NOR006	Tank 100-6
NOR007	Tank 50 WW Treatment Tank
NOR008	Tank 51 WW Treatment Tank
NOR009	Tank 116 WW Treatment Tank
NOR010	Tank 117 WW Treatment Tank
NOR011	Tank 25-1 WW Treatment Tank
NOR012	Tank 32 WW Treatment Tank
NOR013	Tank 3-9 Product Recovery
NOR014	Tank (Surface) Above Ground Oil/Water Separator
NOR015	Tank Below Ground Oil/Water Separator
NOR016	North Pit - Tract A
NOR017	Southeast Holding Basin (SEHB)
NOR018	Tank 5-20 Wastewater Tank
NOR019	DAF Tank
NOR020	Equalization Tank
No NOR #	Impoundment #3
No NOR #	T/TR Storm Water Drainage
No NOR #	Lift Station #4
No NOR #	SEHB Sump
No NOR #	Tract B
No NOR #	North Spoils Area
No NOR #	Texaco Impoundment #4
No NOR #	Impoundment #2
No NOR #	Tank 82

UNITS INCLUDED IN ORIGINAL RFA	
NOR No.	**Description**
No NOR #	Impoundment #1
No NOR #	East Plant Tank Car Rack
No NOR #	WPWMA Groundwater Plume
No NOR #	Tract C
No NOR #	Tank 28
No NOR #	EPWMA Benzene Release
No NOR #	Texaco Landfill #3
No NOR #	Tank 26
UNITS ADDED SINCE THE RFA WAS COMPLETED	
NOR No.	**Description**
NOR021	Container Storage Area (Rolloffs used to store hazardous and nonhazardous wastes)
NOR022	Container Storage Area (Rolloffs, vacuum boxes used to manage hazardous and nonhazardous wastes)
NOR023	Miscellaneous Storage Containers (including drums, roll-offs, and vacuum boxes)
NOR024	Tank 3-10 (Recovered Groundwater Tank)
NOR025	Tank (Surface) (Aboveground 250-gallon storage tank behind laboratory)
NOR026	Distill/Solvent Recovery (Safety-Kleen parts cleaner)
NOR027	WWTP (Building which houses the groundwater treatment units)
NOR028	Miscellaneous Storage Containers (9-yard trash dumpsters used to manage non-hazardous plant trash)
NOR029	East Plant Turn Around Container Storage
NOR030	Wastewater/product recovery tank 31

PRELIMINARY REVIEW UNIT CHECKLIST

Preliminary Review Unit Checklist

Facility: KM Liquid Terminals, LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Container Storage Area

B. NoR No: 001

C. Description: Drum Storage Building, S06

D. Dates of Operation: 1981 - current

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Storage, bulking, and/or transfer off site – no treatment/recovery, fuel blending or disposal at this site, 11,200 gallon capacity, <90 day storage.

I. Recommended Action: In 2000, the unit was added to the SWMU Group C4. A response action under the TRRP has been implemented for the SMWU Group C4.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 29

B. NoR No: 002

C. Description: Wastewater Tank

D. Dates of Operation: 1938-1990

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 1,095,730 gallon capacity, Inactive

I. Recommended Action: An Remedial Facility Investigation workplan was required by the Agreed Order between GATX and TWC issued January 31, 1990. This workplan was submitted September 13, 1990, revised July 18, 1991, and was approved on December 18, 1991. In 1999, Tank 29 was included in SWMU Group C1. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 10-12

B. NoR No: 003

C. Description: Wastewater Tank (RCRA Exempt) , S02

D. Dates of Operation: 1968-1990

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 420,000 gallon capacity, Inactive

I. Recommended Action: In 2000, Tank 10-12 was added to SWMU Group W3. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: North Holding Basin

B. NoR No: 004

C. Description: Surface Impoundment, Corrective Action Management Unit (CAMU), Completed 1996 (GATX North Basin CAMU Remediation Report November 9, 2001)

D. Dates of Operation: 1974-1988

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: CAMU with capacity of 6000 CY

I. Recommended Action: In 1999, CAMU (North Holding Basin) was added to SWMU Group W1. The CAMU remains active. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 100-5

B. NoR No: 005

C. Description: Product Service Tank – S02, Prior storage of storm water (RCRA Exempt), Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment)

D. Dates of Operation: 1988-Current

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Product Service Tank 4,200,000 gallon capacity

I. Recommended Action: In 2000, Tank 100-5 was added to SWMU Group W2. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 100-6

B. NoR No: 006

C. Description: Product Service Tank – So2, Prior storage of storm water (RCRA Exempt), Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment)

D. Dates of Operation: 1988-Current

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Product Service Tank 4,200,000 gallon capacity

I. Recommended Action: In 2000, Tank 100-6 was added to SWMU Group W2. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 50

B. NoR No: 007

C. Description: Wastewater Treatment Tank (RCRA Exempt), Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1938 – 1990

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 30,080 gallon capacity, Inactive

I. Recommended Action: In 1999, Tank 50 was added to SWMU Group C1. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 51

B. NoR No: 008

C. Description: Wastewater Treatment Tank (RCRA Exempt), Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1938 – 1990

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 22,560 gallon capacity, Inactive

I. Recommended Action: In 1999, Tank 51 was added to SWMU Group C1. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 116

B. NoR No: 009

C. Description: Wastewater Treatment Tank (RCRA Exempt) , Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1938 – 1990

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 15,227 gallon capacity, Inactive

I. Recommended Action: In 1999, Tank 116 was added to SWMU Group C1. A response action under the TRRP has been implemented for this SWMU group. No further action..

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 117

B. NoR No: 010

C. Description: Wastewater Treatment Tank (RCRA Exempt) , Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1938 – 1990

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 15,250 gallon capacity, Inactive

I. Recommended Action: In 1999, Tank 117 was added to SWMU Group C1. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 25-1

B. NoR No: 011

C. Description: Wastewater Treatment Tank (RCRA Exempt) , Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1938 – 1990

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 1,076,982 gallon capacity, Inactive

I. Recommended Action: In 2000, Tank 25-1 was added to SWMU Group C4. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 32

B. NoR No: 012

C. Description: Wastewater Tank (RCRA Exempt), S02

D. Dates of Operation: 1938 – Present

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 1,050,000 gallon capacity

I. Recommended Action: In 2000, Tank 32 was added to SWMU Group C3. Tank 32 is currently active. A response action under the TRRP has been implemented for SWMU Group C3. No further action is recommended at this time.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 3-9

B. NoR No: 013

C. Description: Product Recovery Tank, Un-recoverable water is discharged to GCWD A (POTW), S02

D. Dates of Operation: 1989 – Present

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: Wastewater Tank 126,000 gallon capacity

I. Recommended Action: In 2000, Tank 3-9 was added to SWMU Group C3. Tank3-9 is currently active receiving groundwater from the groundwater recovery system. A response action under the TRRP has been implemented for SWMU Group C3. No further action is recommended at this time.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Above-Ground Oil/Water Separator

B. NoR No: 014

C. Description: Above-Ground Oil/Water Separator, Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1989 – 1994

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: 10,180 gallon capacity

I. Recommended Action: In 2000, the above-ground oil/water separator was added to SWMU Group C3. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Belowground Oil/Water Separator

B. NoR No: 015

C. Description: Belowground Oil/Water Separator, Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1938 – 1989

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: 12,000 gallon capacity

I. Recommended Action: In 1999, the belowground oil/water separator was added to SWMU Group C1. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tract A (North Pit)

B. NoR No: 016

C. Description: Subsurface impoundment that will be closed as landfill (to include on-site treatment and/or stabilization), D83

D. Dates of Operation: 1945 – 1981. Unit closed and capped after 1991.

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: 6,400 CY (est.)

I. Recommended Action: The RFI for this SWMU was approved by TCEQ in 1999. This unit is expected to close under RRS3. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Southeast Holding Basin

B. NoR No: 017

C. Description: Subsurface impoundment that formerly received stormwater from the southeast part of the Central Plant. All liquids and sludges were removed in 1987. D83

D. Dates of Operation: 1975 – 1985. The SEHB has been closed in accordance with the closure plan filed with the Texas Water Commission in September 1986 and in accordance with the letter of approval from the TWC dated December 15, 1986. The site meets all requirements for a Class II landfill and has been deed recorded in accordance with 31 Texas Administrative Code 335.5.

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: 3,110 CY capacity

I. Recommended Action: This unit is currently in "Post Closure Care." No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 5-20

B. NoR No: 018

C. Description: Wastewater Tank, Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1975 – 2010

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: 210,000 gallon capacity

I. Recommended Action: Tank 5-20 was incorporated in the West Plant Waste Management Area. A response action under the TRRP has been implemented for SWMU in this area. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: DAF (Dissolved Air Floatation) Tank

B. NoR No: 019

C. Description: Wastewater Treatment Tank, Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1980 – 1988

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: 18,500 gallon capacity

I. Recommended Action: The DAF Tank was added to SWMU Group W1 in 1999. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Equalization (EQ) Tank / EQ Basin

B. NoR No: 020

C. Description: Wastewater Treatment Tank, Discharge to sewer/POTW or NPDES (with prior storage – with or without treatment), S02

D. Dates of Operation: 1980 – 1988

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992 and the facility NOR (dated June 13, 2012) included in Appendix II of this report.*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: 18,500 gallon capacity

I. Recommended Action: The EQ Tank was added to SWMU Group W1 in 1999. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Container Storage Area

B. NoR No: 021

C. Description: Rolloffs used to store hazardous and non-hazardous wastes, S06

D. Dates of Operation: approximately 1993 – 2010 (from June 12, 2012 NOR, Inactive Status 2/26/2010)

E. Wastes Managed: *See Table 1*

F. Evidence of Release: *No evidence or knowledge of release.*

G. Pollutant Dispersal Pathways: *Not applicable*

H. Summary: No applicable

I. Recommended Action: No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Container Storage Area

B. NoR No: 022

C. Description: Rolloffs, Vacuum boxes used to manage haz and non-hazardous wastes, S06.

D. Dates of Operation: approximately 1993 – 2010 (from June 12, 2012 NOR, Inactive Status 2/26/2010)

E. Wastes Managed: *See Table 2*

F. Evidence of Release: *No knowledge or evidence of release.*

G. Pollutant Dispersal Pathways: *Not applicable*

H. Summary: Not applicable

I. Recommended Action: No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Miscellaneous storage containers

B. NoR No: 023

C. Description: Miscellaneous containers including drums, rolloffs, and vacuum boxes, S06

D. Dates of Operation: 1994 – Present

E. Wastes Managed: See Table 3

F. Evidence of Release: No knowledge or evidence of release.

G. Pollutant Dispersal Pathways: Not applicable

H. Summary: Not applicable

I. Recommended Action: No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 3-10

B. NoR No: 024

C. Description: Recovered groundwater storage tank, S02

D. Dates of Operation: 1994 – Present

E. Wastes Managed: See Table 4

F. Evidence of Release: No knowledge or evidence of release.

G. Pollutant Dispersal Pathways: Not applicable

H. Summary: Not applicable

I. Recommended Action: No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank

B. NoR No: 025

C. Description: Above ground 250 gallon storage tank behind laboratory. Receives lab waste streams 00592191, 0060219H, 0061205H. Generates stream 0058205H, which is transferred to tank 32(NOR-12), S02

D. Dates of Operation: 1997- 2022

E. Wastes Managed: See Table 5

F. Evidence of Release: No knowledge or direct evidence of release.

G. Pollutant Dispersal Pathways: Not Applicable

H. Summary: Not applicable

I. Recommended Action: WMU is closed. TCEQ issued No Further Action letter dated 3/26/2024.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Distillation/Solvent recovery unit

B. NoR No: 026

C. Description: Safety-Kleen solvent parts cleaner. Now part of the Continuous Use Program (CUP) and no longer considered a waste management unit, T04

D. Dates of Operation: 1994 – 2003

E. Wastes Managed: See Table 6

F. Evidence of Release: No knowledge or direct evidence of release.

G. Pollutant Dispersal Pathways: Not applicable

H. Summary: Not applicable

I. Recommended Action: No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Waste Water Treatment Plant

B. NoR No: 027

C. Description: Building which houses the groundwater treatment units, T04

D. Dates of Operation: 1995 - 2010 (from June 12, 2012 NOR, Inactive Status 3/3/2010)

E. Wastes Managed: See Table 7

F. Evidence of Release: No direct evidence of release was observed.

G. Pollutant Dispersal Pathways: See Attachment A

H. Summary: Not applicable

I. Recommended Action: No further action recommended at this time.

Preliminary Review Unit Checklist

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Miscellaneous storage containers

B. NoR No: 028

C. Description: 9-yard plant trash dumpsters located throughout the plant to manage non-hazardous plant trash. S99

D. Dates of Operation: 2000 – Present

E. Wastes Managed: See Table 8

F. Evidence of Release: No knowledge or direct evidence of release.

G. Pollutant Dispersal Pathways: Not applicable

H. Summary: Not applicable

I. Recommended Action: No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Container Storage Area

B. NoR No: 029

C. Description: East Plant Turnaround Container Storage Area, S99

D. Dates of Operation: 1997 - 2010

E. Wastes Managed: See Table 9

F. Evidence of Release: No evidence of release from the activities associated with the unit. Documented in Closure Report, East Plant Turnaround Container Storage Aare, TCEQ Permit Unit # 3, dated May 3, 2010.

G. Pollutant Dispersal Pathways: Not applicable

H. Summary: Unit closed in accordance with an approved closure plan.

I. Recommended Action: Closed. Closure approved by TCEQ 10/21/10. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Impoundment #3

B. NoR No: No NOR number

C. Description: Surface Impoundment/Landfill – Disposal - D8

D. Dates of Operation: 1918 – 1981. Waste removed by Texaco in 1980.

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992, Page 39*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: *See RFIs and APAR*

I. Recommended Action: This SWMU was added to East Plant Waste Management Area. A response action under the TRRP has been implemented for this SWMU. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Stormwater Drainage System

B. NoR No: No NOR number

C. Description: Drainage system associated with SEHB

D. Dates of Operation: 1945 - Current

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992, Page 41*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: *See RFIs and APAR*

I. Recommended Action: This SWMU was added to SWMU Group C2. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Lift Station #4

B. NoR No: No NOR number

C. Description: T04 – other treatment

D. Dates of Operation: 1985 - Current

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992, Page 42*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: *See RFIs and APAR*

I. Recommended Action: This SWMU was added to SWMU Group C2. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Southeast Holding Basin Sump

B. NoR No: No NOR number

C. Description: T04 – Other Treatment - Sump

D. Dates of Operation: 1985 - 1987

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992, Page 43*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: *See RFIs and APAR*

I. Recommended Action: This SWMU was added to SWMU Group C2. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: North Spoils Area

B. NoR No: No NOR number

C. Description: Dredge spoil placement area

D. Dates of Operation: Begin late 1980 or Jan. 1981. Kinder Morgan no longer owns the land at which this unit is located.

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992, Page 45*

F. Evidence of Release: *No evidence of a release.*

G. Pollutant Dispersal Pathways: *Not applicable*

H. Summary: *Unit granted NFA status on June 14, 1999*

I. Recommended Action: No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: North Texaco Impoundment #4

B. NoR No: No NOR number

C. Description: Surface Impoundment – S04 – Storage, Impoundment for oily wastewater

D. Dates of Operation: 1952 – 1980/1981

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992, Page 45*

F. Evidence of Release: *No evidence of release*

G. Pollutant Dispersal Pathways: *Not Applicable*

H. Summary: *Unit granted NFA status on June 14, 1999*.

I. Recommended Action: No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Impoundment No. 2

B. NoR No: No NOR number

C. Description: SO4 – Surface Impoundment – Storage – Impoundment for oily wastewater

D. Dates of Operation: 1920 – 1981. Texmark presently operates its wastewater impoundment within the foot print of this SWMU.

E. Wastes Managed: *See Galena Park Terminal RCRA Facility Assessment, 1992, Page 47*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: *See RFIs and APAR. Impoundment #2 was excavated and removed.*

I. Recommended Action: This SWMU was added to the Texmark Chemical Inc. (TCI) SWMU Group. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 82

B. NoR No: No NOR number

C. Description: So2 – Product Storage

D. Dates of Operation: Unknown - 1990

See *Southeast Holding Basin and, SWMU Group* C2 *in RFI Addendum Report, Arcadis Geraghty* & *Miller, March 2000* for the following requested unit information

E. Wastes Managed: *Not Known*

F. Evidence of Release: *See RFI Report*

G. Pollutant Dispersal Pathways: *See RFI Report*

H. Summary: See RFI Report

I. Recommended Action: This SWMU was added to SWMU Group C2. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: Tank 28

B. NoR No: No NOR number

C. Description: S02 Tank

D. Dates of Operation:

E. Wastes Managed: *See RFI Report*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: *See RFIs and APAR. This tank has been removed and impacted soil in the area has been excavated and removed.*

I. Recommended Action: This SWMU was added to the Texmark Chemical Inc. (TCI) SWMU Group. A response action under the TRRP has been implemented for this SWMU group. No further action.

Preliminary Review Unit Checklist

Facility: KM Liquids Terminals LLC City: Galena Park

ISW Reg No: 30573 Date: 7/24/2024

Permit No: HW-50054 Reviewer: _____

EPA ID No: TXD026481523

A. Waste Management Unit: EPWMA Benzene Release

B. NoR No: No NOR number

C. Description: The East Plant Waste Management Area was identified during the RFA. It was noted in the RFA that the area had been part of a former Texaco refinery. Benzene impacted groundwater was discovered during the Phase II RFI. The impact was observed over a broad area. The area was designated at the EPWMA Benzene Release in 1999.

D. Dates of Operation: *1920's – 1950's (approximate Texaco Refinery operational dates)*

E. Wastes Managed: *Unknown*

F. Evidence of Release: *Evidence of a release in documented in the site-wide RFIs and the site-wide affected property assessment report (APAR)*

G. Pollutant Dispersal Pathways: *See RFIs and APAR*

H. Summary: *See RFIs and APAR*

I. Recommended Action: This SWMU was added to East Plant Waste Management Area SWMU group. A response action under the TRRP has been implemented for this SWMU group. TCEQ approved No Further Action in letter dated April 11, 2013.

APPENDIX II
Wastes Managed

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX[1]	benzene	**EYE CONTACT:** Causes mild eye irritation. **SKIN CONTACT:** Causes mild skin irritation. Causes skin irritation on prolonged or repeated contact. Harmful when absorbed through the skin. **INHALATION:** Cancer hazard. Can cause blood disorders. Inhalation causes headaches, dizziness, drowsiness, and nausea, and may lead to unconsciousness. See "Toxicological Information" section (Section 11.0). **INGESTION:** Harmful or fatal if liquid is aspirated into lungs. See "Toxicological Information" section (Section 11.0).	**FLASHPOINT:** 12°F(-11°C) **UEL:** 8.0% **LEL:** 1.5% **AUTOIGNITION TEMPERATURE:** 928°F (498°C) **FLAMMABILITY CLASSIFICATION:** Extremely Flammable Liquid. **EXTINGUISHING MEDIA:** Agents approved for Class B hazards (e.g., dry chemical, carbon dioxide, foam, steam) or water fog. **UNUSUAL FIRE AND EXPLOSION HAZARDS:** Extremely flammable liquid. Vapor may explode if ignited in enclosed area. **FIRE-FIGHTING EQUIPMENT:** Firefighters should wear full bunker gear, including a positive pressure self-contained breathing apparatus. **PRECAUTIONS:** Keep away from sources of ignition (e.g., heat and open flames). Keep container closed. Use with adequate ventilation. **HAZARDOUS COMBUSTION PRODUCTS:** Incomplete burning can produce carbon	See Baseline Risk Assessment (Arcadis, 1998)

[1] COC from 40 CFR Part 261 Appendix VIII and Part 264 Appendix IX

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX	methyl ethyl ketone	**Inhalation:** Causes irritation to the nose and throat. Concentrations above the TLV may cause headache, dizziness, nausea, shortness of breath, and vomiting. Higher concentrations may cause central nervous system depression and unconsciousness. **Ingestion:** May produce abdominal pain, nausea. Aspiration into lungs can produce severe lung damage and is a medical emergency. Other symptoms expected to parallel inhalation. **Skin Contact:** Causes irritation to skin. Symptoms include redness, itching, and pain. May be absorbed through the skin with possible systemic effects. **Eye Contact:** Vapors are irritating to the eyes. Splashes can produce painful irritation and eye damage. **Chronic Exposure:** Prolonged skin contact may defat the skin and produce dermatitis. Chronic exposure may cause central nervous system effects. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems or impaired respiratory function may be more susceptible to the effects of the substance.	**Flash point:** -9C (16F) CC **Autoignition temperature:** 404C (759F) Flammable limits in air % by volume: **LEL:** 1.4; **UEL:** 11.4 **Flammability Classification:** Extremely Flammable. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Vapors can flow along surfaces to distant ignition source and flash back. Contact with strong oxidizers may cause fire. Sealed containers may rupture when heated. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Water spray may be used to keep fire exposed containers cool, dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. This highly flammable liquid must be kept from sparks, open flame, hot surfaces, and all sources of heat and ignition.	See Baseline Risk Assessment (Arcadis, 1998)
COC[2]	methyl isobutyl ketone	**Inhalation:** Causes irritation to the nose and throat. Concentrations above the TLV may cause headache, dizziness, nausea, shortness of breath, and vomiting. Higher concentrations may cause central nervous system depression and unconsciousness. **Ingestion:** May produce abdominal pain, nausea. Aspiration into lungs can produce severe lung damage and is a medical emergency. Other symptoms expected to parallel inhalation. **Skin Contact:** Causes irritation to skin. Symptoms include redness, itching, and pain. **Eye Contact:** Vapors can irritate the eyes. Splashes cause severe pain and irritation. **Chronic Exposure:** Prolonged skin contact may defat the skin and produce dermatitis. Based on animal studies, chronic exposure may affect liver and kidneys. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders, eye problems, impaired respiratory function or central nervous system conditions may be more susceptible to the effects of this substance.	**Fire:** Flash point: 14C (57F) CC Autoignition temperature: 448C (838F) Flammable limits in air % by volume: lel: 1.2; uel: 8.0 Flammable Liquid **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Vapors can flow along surfaces to distant ignition source and flash back. Contact with strong oxidizers may cause fire. Sealed containers may rupture when heated. Sensitivity to mechanical impact: Yes, if peroxides are formed. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Water may be ineffective. Water spray may be used to keep fire exposed containers cool, dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode.	See Baseline Risk Assessment (Arcadis, 1998)

[2] Contaminant of Concern (COC) obtained from CAMU Management Plan Table 1: Commodities Stored at Galena Park Terminal

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
COC	methyl t-butyl ether	**Eyes:** May cause irritation, experienced as mild discomfort and seen as slight excess redness of the eye. **Skin:** Brief contact may cause slight irritation. Prolonged contact, as with clothing wetted with material, may cause more severe irritation and discomfort, seen as local redness and swelling. Other than the potential skin irritation effects noted above, acute (short-term) adverse effects are not expected from brief skin contact; **Inhalation:** Vapors or mist, in excess of permissible concentrations, or in unusually high concentrations generated from spraying, heating the material or as from exposure in poorly ventilated areas or confined spaces, may cause irritation of the nose and throat, headache, nausea, and drowsiness. Inhalation may cause dizziness, drowsiness, euphoria, loss of coordination, disorientation, headache, nausea, and vomiting. In poorly ventilated areas or confined spaces, unconsciousness and asphyxiation may result. **Ingestion:** May cause abdominal discomfort, nausea, and diarrhea. Aspiration may occur during swallowing or vomiting, resulting in lung damage. **Sensitization Properties:** Unknown. **Chronic:** No adverse effects have been documented in humans as a result of chronic exposure. **Medical Conditions Aggravated by Exposure:** Because of its irritating properties, repeated skin contact may aggravate an existing dermatitis (skin condition).	**Ignition Temperature** - AIT (degrees F): 815 **Flash Point (degrees F):** -43.6 (TCC) **Flammable Limits (%):** Lower: .9 Upper: 9.5 **Recommended Fire Extinguishing Agents And Special Procedures:** Water may be ineffective on flames but should be used to cool fire-exposed containers and provide protection for persons atempting to stop the leak. Use water spray, dry chemical, alcohol resistant foam or carbon dioxide to extinguish fire. **Unusual or Explosive Hazards:** Danger! Extremely flammable materials may release vapors that travel long distances, ignite, and flash back. Containers may explode in a fire. Do not expose to heat, sparks, flame, static, or other sources of ignition. When handling, use non-sparking tool, ground and bond all containers. Explosive air-vapor mixtures may form. **Special Protective Equipment for Firefighters:** Wear full protective clothing and positive pressure breathing apparatus.	See Baseline Risk Assessment (Arcadis, 1998)
VIII, IX	toluene	**EYE CONTACT:** Causes mild eye irritation. **SKIN CONTACT:** Prolonged or repeated contact can defat the skin and lead to irritation and/or dermatitis. Harmful when absorbed through the skin. Cancer hazard. Can cause blood disorders. **INHALATION:** Inhalation causes headaches, dizziness, drowsiness, nausea, and respiratory irritation. See "Toxicological Information" section (Section 11.0). **INGESTION:** If swallowed, causes headaches, dizziness, drowsiness and nausea, and may lead to unconsciousness. Harmful or fatal if liquid is aspirated into lungs.	**AUTOIGNITION TEMPERATURE:** 997°F (536°C) **FLAMMABILITY CLASSIFICATION:** Flammable Liquid. **EXTINGUISHING MEDIA:** Agents approved for Class B hazards (e.g., dry chemical, carbon dioxide, foam, steam) or water fog. **UNUSUAL FIRE AND EXPLOSION HAZARDS:** Flammable liquid. Vapor may explode if ignited in enclosed area. **FIRE-FIGHTING EQUIPMENT:** Firefighters should wear full bunker gear, including a positive pressure self-contained breathing apparatus. **PRECAUTIONS:** Keep away from sources of ignition (e.g., heat and open flames). Use with adequate ventilation. Keep container closed. **HAZARDOUS COMBUSTION PRODUCTS:** Incomplete burning can produce carbon monoxide and/or carbon dioxide and other harmful products.	See Baseline Risk Assessment (Arcadis, 1998)

Source	Parameter	Health	Safety	Risk
IX	o-xylene	**Inhalation:** Inhalation of vapors may be irritating to the nose and throat. Inhalation of high concentrations may result in nausea, vomiting, headache, ringing in the ears, and severe breathing difficulties which may be delayed in onset. Substernal pain, cough, and hoarseness are also reported. High vapor concentrations are anesthetic and central nervous system depressants. **Ingestion:** Ingestion causes burning sensation in mouth and stomach, nausea, vomiting and salivation. Minute amounts aspirated into the lungs can produce a severe hemorrhagic pneumonitis with severe pulmonary injury or death. **Skin Contact:** Skin contact results in loss of natural oils and often results in a characteristic dermatitis. May be absorbed through the skin. **Eye Contact:** Vapors cause eye irritation. Splashes cause severe irritation, possible corneal burns and eye damage. **Chronic Exposure:** Chronic inhalation can cause headache, loss of appetite, nervousness and pale skin. Repeated or prolonged skin contact may cause a skin rash. Repeated exposure of the eyes to high concentrations of vapor may cause reversible eye damage. Repeated exposure can damage bone marrow, causing low blood cell count. May damage the liver and kidneys. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney, blood, or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Flash point: 32C (90F) CC Autoignition temperature: ca. 463C (ca. 865F) Flammable limits in air % by volume: lel: 1.0; uel: 7.0 Flammable. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Contact with strong oxidizers may cause fire. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Water spray may be used to keep fire exposed containers cool, dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Vapors can flow along surfaces to distant ignition source and flash back.	See Baseline Risk Assessment (Arcadis, 1998)

Repeated exposure can damage bone marrow, causing low blood cell count. May damage the liver and kidneys. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney, blood, or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Flash point: 27.2C (81F) CC Autoignition temperature: ca. 528C (ca. 982F) Flammable limits in air % by volume: lel: 1.1; uel: 7.0 Flammable. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Contact with strong oxidizers may cause fire. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Water spray may be used to keep fire exposed containers cool, dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Vapors can flow along surfaces to distant ignition source and flash back.	See Baseline Risk Assessment (Arcadis, 1998)
COC	ethyl acetate	**Inhalation:** Inhalation can cause severe irritation of mucous membranes and upper respiratory tract. Symptoms may include burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea and vomiting. High concentrations may cause lung damage. An irritant to the nose, throat, and upper respiratory tract. Exposure to high concentrations have a narcotic effect and may cause liver and kidney damage. **Ingestion:** Causes irritation to the gastrointestinal tract. Symptoms may include nausea, vomiting and diarrhea. **Skin Contact:** Causes irritation to skin. Symptoms include redness, itching, and pain. Repeated or prolonged contact with the skin has a defatting effect and may cause dryness, cracking, and possibly dermatitis. **Eye Contact:** Causes irritation, redness, and pain. **Chronic Exposure:** Chronic overexposure may cause anemia with leukocytosis (transient increase in the white blood cell count) and damage to the liver and kidneys. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Flash point: -4C (25F) CC Autoignition temperature: 426C (799F) Flammable limits in air % by volume: lel: 2.0; uel: 11.5 Flammable Liquid and Vapor! Contact with strong oxidizers may cause fire. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Sealed containers may rupture when heated. Sensitive to static discharge. **Fire Extinguishing Media:** Water spray, dry chemical, alcohol foam, or carbon dioxide. Water may be ineffective. Water spray may be used to keep fire exposed containers cool. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Water may be used to flush spills away from exposures and to dilute spills to non-flammable mixtures. Vapors can flow along surfaces to distant ignition source and flash back.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
IX	acetone	**Inhalation:** Inhalation of vapors irritates the respiratory tract. May cause coughing, dizziness, dullness, and headache. Higher concentrations can produce central nervous system depression, narcosis, and unconsciousness. **Ingestion:** Swallowing small amounts is not likely to produce harmful effects. Ingestion of larger amounts may produce abdominal pain, nausea and vomiting. Aspiration into lungs can produce severe lung damage and is a medical emergency. Other symptoms are expected to parallel inhalation. **Skin Contact:** Irritating due to defatting action on skin. Causes redness, pain, drying and cracking of the skin. **Eye Contact:** Vapors are irritating to the eyes. Splashes may cause severe irritation, with stinging, tearing, redness and pain. **Chronic Exposure:** Prolonged or repeated skin contact may produce severe irritation or dermatitis. **Aggravation of Pre-existing Conditions:** Use of alcoholic beverages enhances toxic effects. Exposure may increase the toxic potential of chlorinated hydrocarbons, such as chloroform, trichloroethane.	**Fire:** Flash point: -20C (-4F) CC Autoignition temperature: 465C (869F) Flammable limits in air % by volume: lel: 2.5; uel: 12.8 Extremely Flammable Liquid and Vapor! Vapor may cause flash fire. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Vapors can flow along surfaces to distant ignition source and flash back. Contact with strong oxidizers may cause fire. Sealed containers may rupture when heated. This material may produce a floating fire hazard. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, alcohol foam or carbon dioxide. Water may be ineffective. Water spray may be used to keep fire exposed containers cool, dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode.	See Baseline Risk Assessment (Arcadis, 1998)
VIII, IX	acetonitrile	**Inhalation:** Effects of overexposure are often delayed, possibly due to the slow formation of cyanide anions in the body. These cyanide anions prevent the body from using oxygen and can lead to internal asphyxiation. Early symptoms may include nose and throat irritation, flushing of the face, and chest tightness. Higher concentrations may produce headache, nausea, vomiting, respiratory depression, weakness, blood changes, thyroid changes, irregular heart beat, abdominal pain, convulsions, shock, unconsciousness and death, depending on concentration and time of exposure. This highly toxic material has insufficient warning properties to prevent personnel from working in contaminated atmospheres. **Ingestion:** Gastric irritation may occur. Other symptoms parallel those from inhalation exposure. **Skin Contact:** May cause irritation. May be absorbed through skin with health effects to parallel those of inhalation. **Eye Contact:** Splashes may cause eye irritation with redness and pain. **Chronic Exposure:** Long term exposures may affect liver, kidneys, and central nervous system. **Aggravation of Pre-existing Conditions:** Workers using cyanide should have preplacement and periodic medical exams. Those with history of central nervous system, heart or lung diseases, or liver, kidney, or thyroid problems may be more susceptible to the effects of this substance.	**Fire:** Flash point: 2C (36F) CC Autoignition temperature: 524C (975F) Flammable limits in air % by volume: lel: 4.4; uel: 16.0 Flammable Liquid and Vapor! Contact with strong oxidizers may cause fire. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Vapors can flow along surfaces to distant ignition source and flash back. Sealed containers may rupture when heated. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Water spray may be used to keep fire exposed containers cool. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. If a leak or spill has not ignited, use water spray to disperse the vapors, to protect personnel attempting to stop leak, and to flush spills away from exposures. May emit toxic and flammable fumes of cyanide if involved in a fire.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX	acrylonitrile	**INHALATION:** Dizziness. Headache. Nausea. Vomiting. Weakness. Tremor and uncoordinated movements. Closed system and ventilation. Fresh air, rest. Refer for medical attention. **SKIN :** MAY BE ABSORBED! Redness. Pain. Blisters (Further see Inhalation). Protective gloves. Protective clothing. First rinse with plenty of water, then remove contaminated clothes and rinse again. Refer for medical attention. **EYES :** Redness. Pain. Blurred vision. Safety goggles or eye protection in combination with breathing protection. First rinse with plenty of water for several minutes (remove contact lenses if easily possible), then take to a doctor. **INGESTION:** Abdominal pain. Headache. Nausea. Shortness of breath. Vomiting. Weakness (further see Inhalation). Do not eat, drink, or smoke during work. Rinse mouth. Give a slurry of activated charcoal in water to drink. Induce vomiting (ONLY IN CONSCIOUS PERSONS!). Refer for medical attention.	**FIRE;** Highly flammable. Gives off irritating or toxic fumes (or gases) in a fire. NO open flames, NO sparks, and NO smoking. NO contact with strong oxidants, strong bases. Powder, alcohol-resistant foam, water spray, carbon dioxide. **EXPLOSION:** Vapour/air mixtures are explosive. Risk of fire and explosion upon polymerization on contact with strong bases and strong oxidants. Closed system, ventilation, explosion-proof electrical equipment and lighting. In case of fire: keep drums, etc., cool by spraying with water.	See Baseline Risk Assessment (Arcadis, 1998)
VIII, IX	chloroform	**Inhalation:** Acts as a relatively potent anesthetic. Irritates respiratory tract and causes central nervous system effects, including headache, drowsiness, dizziness. Exposure to higher concentrations may result in unconsciousness and even death. May cause liver injury and blood disorders. Prolonged exposure may lead to death due to irregular heart beat and kidney and liver disorders. **Ingestion:** Causes severe burning in mouth and throat, pain in the chest and vomiting. Large quantities may cause symptoms similar to inhalation. **Skin Contact:** Causes skin irritation resulting in redness and pain. Removes natural oils. May be absorbed through skin. **Eye Contact:** Vapors causes pain and irritation to eyes. Splashes may cause severe irritation and possible eye damage. **Chronic Exposure:** Prolonged or repeated exposure to vapors may cause damage to the nervous system, the heart and the liver and kidneys. Contact with liquid has defatting effect and may cause chronic irritation of skin with cracking and drying, and corresponding dermatitis. Chloroform is a suspected human carcinogen. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Slight fire hazard when exposed to high heat; otherwise, practically not flammable. **Explosion:** Sealed containers may rupture when heated. **Fire Extinguishing Media:** Use any means suitable for extinguishing surrounding fire. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
IX	1,2-dichloroethane	**Inhalation:** Inhalation of vapors irritates the respiratory tract. May cause headache, weakness, cyanosis, nausea, vomiting, and diarrhea. These symptoms may be followed by central nervous system effects, liver damage, kidney damage, adrenal gland damage, cyanosis, weak and rapid pulse and unconsciousness. Death can occur from respiratory and circulatory failure. **Ingestion:** Causes irritation to the gastrointestinal tract. Symptoms may include nausea, vomiting and diarrhea. Toxic effects parallel those of inhalation. Doses of 0.5 - 1.0 g/kg can be fatal. **Skin Contact:** Causes irritation, rash and blister formation. Prolonged contact can cause skin burns. Can be absorbed through skin with toxic effects. **Eye Contact:** Vapors cause eye irritation. Splashes cause severe irritation, possible corneal burns and eye damage. **Chronic Exposure:** Repeated or prolonged exposure may cause weight loss, low blood pressure, jaundice, reduced urinary output, dermatitis, eye damage and anemia. Dichloroethane is a suspected human carcinogen based on animal data. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney, cardiovascular, neurological or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Flash point: 13C (55F) CC Autoignition temperature: 413C (775F) Flammable limits in air % by volume: lel: 6.2; uel: 15.9 Flammable. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Sealed containers may rupture when heated. Contact with strong oxidizers may cause fire. Vapors can flow along surfaces to distant ignition source and flash back. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Water spray may be used to keep fire exposed containers cool, dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Combustion by-products include phosgene and hydrogen chloride gases.	See Baseline Risk Assessment (Arcadis, 1998)
COC	cumene	**Inhalation:** Vapors or mist irritates the mucous membranes and upper respiratory tract. Affects the central nervous system; symptoms may include dizziness, drowsiness, slight incoordination and unconsciousness. **Ingestion:** Swallowing can cause symptoms of sore throat, coughing, abdominal pain, and vomiting. Central nervous system effects may occur; see inhalation. Swallowing may cause droplets to enter the lungs (aspiration) with the risk of pneumonia. Aspiration can be fatal. **Skin Contact:** May cause skin irritation with redness. Skin absorption can occur; absorption through the skin proceeds slowly. **Eye Contact:** Vapor or mist irritates the eyes. **Chronic Exposure:** Prolonged or repeated exposure may cause skin rash. Damage to the lungs, liver, and kidneys may occur. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance. The use of alcoholic beverages enhances the toxic effects.	**Fire:** Flash point: 36C (97F) CC Autoignition temperature: 424C (795F) Flammable limits in air % by volume: lel: 0.9; uel: 6.5 Flammable Liquid and Vapor! **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Closed containers exposed to heat may explode. Sensitive to static discharge. **Fire Extinguishing Media:** Water spray, dry chemical, alcohol foam, or carbon dioxide. Water may be ineffective. Use water spray to cool fire-exposed containers, to dilute liquid, and control vapor. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Vapors can flow along surfaces to distant ignition source and flash back.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX	cyclohexane	**Inhalation:** Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath. High concentrations have a narcotic effect. **Ingestion:** May produce abdominal pain, nausea. Aspiration into lungs can produce severe lung damage and is a medical emergency. Other symptoms expected to parallel inhalation. **Skin Contact:** Causes irritation to skin. Symptoms include redness, itching, and pain. **Eye Contact:** Causes irritation, redness, and pain. **Chronic Exposure:** Chronic exposure may cause skin effects. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Flash point: -18C (0F) CC Autoignition temperature: 245C (473F) Flammable limits in air % by volume: lel: 1.3; uel: 8.0 Extremely Flammable. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Vapors can flow along surfaces to distant ignition source and flash back. Sealed containers may rupture when heated. Contact with strong oxidizers may cause fire. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Water may be ineffective. Water spray may be used to keep fire exposed containers cool, dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. This highly flammable liquid must be kept from sparks, open flame, hot surfaces, and all sources of heat and ignition.	See Baseline Risk Assessment (Arcadis, 1998)
IX	ethylbenzene	**INHALATION:** Cough. Dizziness. Drowsiness. Headache. Ventilation, local exhaust, or breathing protection. Fresh air, rest. Refer for medical attention. **SKIN:** Dry skin. Redness. Protective gloves. Remove contaminated clothes. Rinse and then wash skin with water and soap. **EYES:** Redness. Pain. Blurred vision. Face shield or eye protection in combination with breathing protection. First rinse with plenty of water for several minutes (remove contact lenses if easily possible), then take to a doctor. **INGESTION:** (further see Inhalation). Do not eat, drink, or smoke during work. Rinse mouth. Give a slurry of activated charcoal in water to drink. Refer for medical attention.	**FIRE:** Highly flammable. NO open flames, NO sparks, and NO smoking. Powder, AFFF, foam, carbon dioxide. **EXPLOSION:** Vapor / air mixtures are explosive. Closed system, ventilation, explosion-proof electrical equipment and lighting. Do NOT use compressed air for filling, discharging, or handling. In case of fire: keep drums, etc., cool by spraying with water.	See Baseline Risk Assessment (Arcadis, 1998)

Source	Parameter	Health	Safety	Risk
VIII, IX	naphthalene	**Inhalation:** Inhalation of dust or vapors can cause headache, nausea, vomiting, extensive sweating, and disorientation. The predominant reaction is delayed intravascular hemolysis with symptoms of anemia, fever, jaundice, and kidney or liver damage. **Ingestion:** Toxic. Can cause headache, profuse perspiration, listlessness, dark urine, nausea, vomiting and disorientation. Intravascular hemolysis may also occur with symptoms similar to those noted for inhalation. Severe cases may produce coma with or without convulsions. Death may result from renal failure. **Skin Contact:** Can irritate the skin and, on prolonged contact, may cause rashes and allergy. "Sensitized" individuals may suffer a severe dermatitis. **Eye Contact:** Vapors and solid causes irritation, redness and pain. Very high exposures can damage the nerves of the eye. **Chronic Exposure:** Has led to cataract formation in eyes. May cause skin allergy. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin, blood or vascular disorders or impaired respiratory function may be more susceptible to the effects of the substance. Particularly susceptible individuals are found in the general population, most commonly in dark skinned races.	**Fire:** Flash point: 87C (189F) CC Autoignition temperature: 526C (979F) Combustible. May be ignited by heat, sparks or flame. May burn rapidly with flare-burning effect. Fire may produce irritating or poisonous gases. **Explosion:** Explosive limits, volume % in air: lel: 0.9; uel: 5.9. Above flashpoint, vapor-air mixtures are explosive within flammable limits noted above. Closed containers exposed to heat may explode. Contact with strong oxidizers may cause fire or explosion. **Fire Extinguishing Media:** Dry chemical, foam, water or carbon dioxide. Foam or direct water spray on molten naphthalene may cause extensive foaming. Molten napthalene spatters in contact with water; apply water from as far a distance as possible. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Vapors can flow along surfaces to distant ignition source and flash back.	See Baseline Risk Assessment (Arcadis, 1998)
COC	ethyl ether	**Inhalation:** Irritant. General anesthesia by inhalation can occur. Continued exposure may lead to respiratory failure or death. Early symptoms include irritation of nose and throat, vomiting, and irregular respiration, followed by dizziness, drowsiness, and unconsciousness. **Ingestion:** Irritating to the mucous membranes. Ingestion of 1 or 2 ounces may be fatal. Because of volatility the stomach becomes distended, which may cause belching. Other symptoms can include vomiting, unconsciousness, and coma. **Skin Contact:** Irritating to the skin and mucous membranes by drying effect. Can cause dermatitis on prolonged exposure. May be absorbed through skin. **Eye Contact:** May cause irritation, redness and pain. Prolonged exposures to high concentrations of vapor can cause eye damage. **Chronic Exposure:** Repeated exposures may be habit forming. Prolonged exposures may result in headache, drowsiness, excitation, and psychic disturbances. Teratogenic effects are possible. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems or impaired liver, kidney or respiratory function may be more susceptible to the effects of this substance. Alcoholic beverage consumption can enhance the toxic effects of this substance.	**Fire:** Flash point: -45C (-49F) CC Autoignition temperature: 160C (320F) Flammable limits in air % by volume: lel: 1.9; uel: 36.0 Dangerous highly flammable liquid. **Explosion:** Containers may explode when involved in a fire. Above flash point, vapor-air mixtures are explosive within flammable limits noted above. May form explosive peroxides on long standing or after exposure to air or light. May explode when brought in contact with nitric acid. Sensitivity to mechanical impact: Yes, if peroxides are formed. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Treat as a flammable gas in a fire situation. Water spray may be used to keep fire exposed containers cool. Water is ineffective as an extinguishing agent. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. This highly flammable liquid must be kept from sparks, open flame, hot surfaces, and all sources of heat and ignition. Vapors can flow along surfaces to distant ignition source and flash back.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX	tetrachloroethylene	**Inhalation:** Irritating to the upper respiratory tract. Giddiness, headache, intoxication, nausea and vomiting may follow the inhalation of large amounts while massive amounts can cause breathing arrest, liver and kidney damage, and death. Concentrations of 600 ppm and more can affect the central nervous system after a few minutes. **Ingestion:** Not highly toxic by this route because of low water solubility. Used as an oral dosage for hookworm (1 to 4 ml). Causes abdominal pain, nausea, diarrhea, headache, and dizziness. **Skin Contact:** Causes irritation to skin. Symptoms include redness, itching, and pain. May be absorbed through the skin with possible systemic effects. **Eye Contact:** Causes irritation, redness, and pain. **Chronic Exposure:** May cause liver, kidney or central nervous system damage after repeated or prolonged exposures. Suspected cancer risk from animal studies. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems or impaired liver or kidney function may be more susceptible to the effects of the substance. The use of alcoholic beverages enhances the toxic effects.	**Fire:** Not considered to be a fire hazard but becomes hazardous in a fire situation because of vapor generation and possible degradation to phosgene (highly toxic) and hydrogen chloride (corrosive). Vapors are heavier than air and collect in low-lying areas. **Explosion:** Not considered to be an explosion hazard. Containers may explode when involved in a fire. **Fire Extinguishing Media:** Use any means suitable for extinguishing surrounding fire. Water spray may be used to keep fire exposed containers cool. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode.	See Baseline Risk Assessment (Arcadis, 1998)
IX	1,1,1-trichloroethane	**INHALATION:** Ataxia. Dizziness. Drowsiness. Headache. Nausea. Unconsciousness. Ventilation, local exhaust, or breathing protection. Fresh air, rest. Artificial respiration if indicated. Refer for medical attention. **SKIN:** Dry skin. Redness. Protective gloves. Remove contaminated clothes. Rinse and then wash skin with water and soap. **EYES:** Redness. Safety goggles, or eye protection in combination with breathing protection. First rinse with plenty of water for several minutes (remove contact lenses if easily possible), then take to a doctor. **INGESTION:** Diarrhoea. Nausea. Vomiting (further see Inhalation). Do not eat, drink, or smoke during work. Rinse mouth. Give a slurry of activated charcoal in water to drink. Do NOT induce vomiting. Refer for medical attention.	**FIRE:** Combustible under specific conditions. Heating will cause rise in pressure with risk of bursting. See Notes. Gives off irritating or toxic fumes (or gases) in a fire. In case of fire in the surroundings: all extinguishing agents allowed. **EXPLOSION:** In case of fire: keep drums, etc., cool by spraying with water.	See Baseline Risk Assessment (Arcadis, 1998)
VIII, IX	1,1,2-trichloroethane	**EXPOSURE:** PREVENT GENERATION OF MISTS! **INHALATION:** Dizziness. Drowsiness. Headache. Nausea. Shortness of breath. Unconsciousness. Ventilation, local exhaust, or breathing protection. Fresh air, rest. Refer for medical attention. **SKIN:** MAY BE ABSORBED! Dry skin. Protective gloves. Protective clothing. Remove contaminated clothes. Rinse and then wash skin with water and soap. Refer for medical attention. **EYES:** Safety spectacles, or face shield. First rinse with plenty of water for several minutes (remove contact lenses if easily possible), then take to a doctor. **INGESTION:** (Further see Inhalation). Do not eat, drink, or smoke during work. Rinse mouth. Induce vomiting (ONLY IN CONSCIOUS PERSONS!). Refer for medical attention.	**FIRE:** Combustible under specific conditions. Heating will cause rise in pressure with risk of bursting. NO open flames. NO contact with hot surfaces. Powder, water spray, foam, carbon dioxide. In case of fire: cool drums, etc., by spraying with water but avoid contact of the substance with water.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX	O – cresol	**Eye:** Contact with eyes may cause severe irritation, and possible eye burns. May cause conjunctivitis and keratitis. **Skin:** May be absorbed through the skin in harmful amounts. May cause skin sensitization, an allergic reaction, which becomes evident upon re-exposure to this material. Causes severe skin irritation and burns. **Ingestion:** Causes gastrointestinal irritation with nausea, vomiting and diarrhea. May cause liver and kidney damage. Causes severe digestive tract burns with abdominal pain, vomiting, and possible death. May cause hemorrhaging of the digestive tract. Cresols may cause abnormalities of the central nervous system, respiratory system, spleen, and **Inhalation:** Causes respiratory tract irritation. May cause breathing difficulty, headache, nausea, muscle weakness, and possible respiratory tract abnormalities. **Chronic:** May cause liver and kidney damage. May cause appetite loss, diarrhea, skin abnormalities, and digestive tract disturbances.	**General Information:** As in any fire, wear a self-contained breathing apparatus in pressure-demand, MSHA/NIOSH (approved or equivalent), and full protective gear. Vapors can travel to a source of ignition and flash back. **Extinguishing Media:** Use water spray, dry chemical, or foam. **Auto-ignition Temperature:** 1038 deg F (558.89 deg C) **Flash Point:** 187 deg F (86.11 deg C) **Explosion Limits, lower:** Not available. **Explosion Limits, upper:** Not available.	See Baseline Risk Assessment (Arcadis, 1998)
VIII, IX	M & P – cresol	**Inhalation:** Breathing vapor, dust or mist results in digestive disturbances (vomiting, difficulty in swallowing, diarrhea, loss of appetite). Will irritate, possibly burn respiratory tract. Other symptoms listed under ingestion may also occur. **Ingestion:** Poison. Symptoms may include burning pain in mouth and throat, abdominal pain, headache, dizziness, muscular weakness, irregular breathing, weak pulse, lung damage, liver damage, pancreas damage, kidney damage, coma, and possibly death from circulatory or cardiac failure. **Skin Contact:** Corrosive. Causes severe pain followed by numbness. May be absorbed through the skin with systemic poisoning effects to follow. Discoloration and severe burns may occur. **Eye Contact:** Corrosive! Vapors are irritating and may cause damage to the eyes. Contact may cause severe burns and permanent eye damage. **Chronic Exposure:** Repeated exposure may cause symptoms described for acute poisoning as well as liver damage. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems or impaired liver or kidney function may be more susceptible to the effects of the substance.	**Fire:** Flash point: 86C (187F) CC **Autoignition temperature:** 559C (1038F) **Flammable limits in air % by volume:** **LEL:** 1.1 Combustible Liquid and Vapor! Contact with strong oxidizers may cause fire. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. **Fire Extinguishing Media:** Water spray, dry chemical, alcohol foam, or carbon dioxide. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode.	See Baseline Risk Assessment (Arcadis, 1998)
COC	analine	**Route Of Entry** Inhalation: YES Skin: YES Ingestion: YES Carcinogenicity NTP: NO **Effects of Exposure:** ACUTE EFFECTS: MAY BE HARMFUL BY INHALATION, INGESTION OR SKIN ABSORPTION. MAY CAUSE IRRITATION. THE TOXICOLOGICAL PROPERTIES HAVE NOT BEEN THOROUGHLY INVESTIGATED.	**Extinguishing Media:** WATER SPRAY. CARBON DIOXIDE, DRY CHEMICAL POWDER OR APPROPRIATE FOAM. **Fire Fighting Procedures:** USE NIOSH APPROVED SCBA AND FULL PROTECTIVE EQUIPMENT (FP N) TO PREVENT CONTACT WITH SKIN AND EYES. **Unusual Fire/Explosion Hazard:** EMITS TOXIC FUMES UNDER FIRE CONDITIONS.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED

VIII	creosote	LD50 LC50 Mixture: LD50 (ORAL RAT) IS 1,700 MG/KG **Route Of Entry** Inhalation: YES Skin: YES Ingestion: NO Carcinogenicity - NTP: YES **Effects of Exposure:** ACUTE: MODERATE EYE IRRITATION. SEVERE SKIN IRRITATION. PHOTOTOXIC REACTION. THERMAL BURNS. RESPIRATORY TRACT IRRITATION. GASTROINTESTINAL DISTURBANCES. CHRONIC: RESPIRATORY DIFFICULTIES, CENTRAL NERV OUS SYSTEM EFFECTS, CIRCULATORY COLLAPSE, COMA, DEATH. MAY CAUSE CANCER. **Explanation Of Carcinogenicity:** BENZENE IS LISTED BY NTP, IARC AND OSHA. CREOSOTE IS LISTED BY IARC. **Signs And Symptoms Of Overexposure:** EYES: MODERATE IRRITATION. SKIN: SEVERE IRRITATION, SKIN REACTION, BURNS. INHALATION: RESPIRATORY IRRITATION, RESPIRATORY DIFFICULTIES, HEADACHE, DROWSINESS, DIZZINESS, WEAKNESS, INCOORDINATION, COMA, DEATH. INGESTION: IRRITATION, NAUSEA, VOMITING, ABDOMINAL PAIN. **Medical Cond Aggravated By Exposure:** PERSONS WITH PRE-EXISTING DISEASE IN OR A HISTORY OF AILMENTS INVOLVING THE SKIN OR BLOOD-FORMING ORGANS MAY BE AT A GREATER RISK OF DEVELOPING ADVERSE HEALTH EFFECTS WHEN EXPOSED TO THIS MATERIAL.	**Flash Point Text:** >200F,>93C **Lower Limits:** UNKNOWN **Upper Limits:** UNKNOWN **Extinguishing Media:** USE WATER FOG, CARBON DIOXIDE, FOAM, OR DRY CHEMICAL. WATER OR FOAM MAY CAUSE FROTHING, IF MOLTEN. **Fire Fighting Procedures:** WEAR COMPLETE FIRE SERVICE PROTECTIVE EQUIPMENT,INCLUDING FULL-FACE MSHA/NIOSH APPROVED SELF-CONTAINED BREATHING APPARATUS.USE WATER TO COOL CONTAINERS BY FIRE. **Unusual Fire/Explosion Hazard:** TOXIC VAPORS/DECOMPOSITION PRODUCTS MAY BE RELEASED FORMING FLAMMABLE/EXPLOSIVE MIXTURES IN AIR. CLOSED CONTAINERS MAY EXPLODE WHEN EXPOSED TO EXTREME HEAT.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX	phenol	The major hazard of phenol is its ability to penetrate the skin rapidly, particularly when liquid, causing severe injury which can be fatal. Phenol also has a strong corrosive effect on body tissue causing severe chemical burns. Due to its local anesthetizing properties, skin burns may be painless. **Inhalation:** Breathing vapor, dust or mist results in digestive disturbances (vomiting, difficulty in swallowing, diarrhea, loss of appetite). Will irritate, possibly burn respiratory tract. Other symptoms listed under ingestion may also occur. **Ingestion:** Poison. Symptoms may include burning pain in mouth and throat, abdominal pain, nausea, vomiting, headache, dizziness, muscular weakness, central nervous system effects, increase in heart rate, irregular breathing, coma, and possibly death. Acute exposure is also associated with kidney and liver damage. Ingestion of 1 gram has been lethal to humans. **Skin Contact:** Corrosive. Rapidly absorbed through the skin with systemic poisoning effects to follow. Discoloration and severe burns may occur, but may be disguised by a loss in pain sensation. **Eye Contact:** Corrosive. Eye burns with redness, pain, blurred vision may occur. May cause severe damage and blindness. **Chronic Exposure:** Repeated exposure may cause symptoms described for acute poisoning as well as eye and skin discoloration. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin, eye or central nervous system disorders, or impaired liver, kidney, or pulmonary function may be more susceptible to the effects of this substance.	**Fire:** Flash point: 79C (174F) CC Autoignition temperature: 715C (1319F) Flammable limits in air % by volume: lel: 1.3; uel: 8.6 Combustible. Contact with strong oxidizers may cause fire. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Sealed containers may rupture when heated. **Fire Extinguishing Media:** Water spray, dry chemical, alcohol foam, or carbon dioxide. Water spray may be used to keep fire exposed containers cool. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Structural firefighter's protective clothing is ineffective for fires involving this material. Stay away from sealed containers.	See Baseline Risk Assessment (Arcadis, 1998)
VIII, IX	picoline	**Eye:** Causes eye irritation. **Skin:** Causes skin irritation. Harmful if absorbed through the skin. **Ingestion:** May cause irritation of the digestive tract. May be harmful if swallowed. Intoxication may include weight loss, diarrhea, weakness, ataxia, and unconsciousness. **Inhalation:** Causes irritation of mucous membrane. Vapors may cause dizziness or suffocation. Exposure may give rise to flushing of face, skin rash, an increase in heart and respiration rates, headaches, giddiness, nausea, and vomiting. **Chronic:** No information found.	**General Information:** As in any fire, wear a self-contained breathing apparatus in pressure-demand, MSHA/NIOSH (approved or equivalent), and full protective gear. Vapors may form an explosive mixture with air. Vapors can travel to a source of ignition and flash back. Will burn if involved in a fire. Use water spray to keep fire-exposed containers cool. Containers may explode in the heat of a fire. Flammable liquid and vapor. Vapors may be heavier than air. They can spread along the ground and collect in low or confined areas. **Extinguishing Media:** For small fires, use dry chemical, carbon dioxide, water spray or alcohol-resistant foam. For large fires, use water spray, fog, or alcohol-resistant foam. Use water spray to cool fire-exposed containers. Water may be ineffective. Do NOT use straight streams of water. **Autoignition Temperature:** Not available. **Flash Point:** 40 deg C (104.00 deg F) **Explosion Limits,** lower:1.40 vol % **Explosion Limits,** upper:8.60 vol % **NFPA Rating:** (estimated) Health: 2; Flammability: 2; Reactivity: 0	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
COC	Furfural	**Inhalation:** Causes irritation to the mucous membranes and upper respiratory tract. Symptoms may include sore throat, labored breathing, and headache. Higher concentrations act on the central nervous system and may cause lung congestion. Inhalation may be fatal. **Ingestion:** Highly toxic. May cause gastrointestinal disorders. Can cause nerve depression and severe headache. May be fatal. Other effects are not well known. **Skin Contact:** Irritant to skin. May cause dermatitis and possibly eczema, allergic sensitization and photosensitization. May be absorbed through the skin with possible systemic effects. **Eye Contact:** Vapors irritate the eyes, causing tearing, itching, and redness. Splashes may cause severe irritation or eye damage. **Chronic Exposure:** Can cause numbness of the tongue, loss of sense of taste, headache. Other effects are not well-known. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Flash point: 60C (140F) CC Autoignition temperature: 316C (601F) Flammable limits in air % by volume: lel: 2.1; uel: 19.3 Flammable Liquid and Vapor! **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Reacts violently with oxidants. Reacts violently with strong acids and bases causing fire and explosion hazards. Sealed containers may rupture when heated. Sensitive to static discharge. **Fire Extinguishing Media:** Water spray, dry chemical, alcohol foam, or carbon dioxide. Water spray may be used to keep fire exposed containers cool. Water may be used to flush spills away from exposures and to dilute spills to non-flammable mixtures. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode.	See Baseline Risk Assessment (Arcadis, 1998)
COC	methanol	**Inhalation:** A slight irritant to the mucous membranes. Toxic effects exerted upon nervous system, particularly the optic nerve. Once absorbed into the body, it is very slowly eliminated. Symptoms of overexposure may include headache, drowsiness, nausea, vomiting, blurred vision, blindness, coma, and death. A person may get better but then worse again up to 30 hours later. **Ingestion:** Toxic. Symptoms parallel inhalation. Can intoxicate and cause blindness. Usual fatal dose: 100-125 milliliters. **Skin Contact:** Methyl alcohol is a defatting agent and may cause skin to become dry and cracked. Skin absorption can occur; symptoms may parallel inhalation exposure. **Eye Contact:** Irritant. Continued exposure may cause eye lesions. **Chronic Exposure:** Marked impairment of vision has been reported. Repeated or prolonged exposure may cause skin irritation. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems or impaired liver or kidney function may be more susceptible to the effects of the substance.	**Fire:** Flash point: 12C (54F) CC Autoignition temperature: 464C (867F) Flammable limits in air % by volume: lel: 6.0; uel: 36 Flammable Liquid and Vapor! **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Moderate explosion hazard and dangerous fire hazard when exposed to heat, sparks or flames. Sensitive to static discharge. **Fire Extinguishing Media:** Use alcohol foam, dry chemical or carbon dioxide. (Water may be ineffective.) **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Use water spray to blanket fire, cool fire exposed containers, and to flush non-ignited spills or vapors away from fire. Vapors can flow along surfaces to distant ignition source and flash back.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX	isobutyl alcohol	**Inhalation:** Causes irritation to respiratory tract. Effects from overexposure include headache, dizziness, muscle weakness, drowsiness, incoordination, confusion, and coma. High concentrations can cause central nervous system damage, pulmonary edema, and liver damage. Death may occur from respiratory failure. **Ingestion:** Ingestion may cause nausea, vomiting, and diarrhea. Large doses may cause central nervous system damage, pulmonary edema, and liver damage. Death may occur from respiratory failure. **Skin Contact:** Skin contact causes irritation, redness, and pain. May be absorbed through the skin; symptoms of absorption may be similar to those from ingestion exposure. **Eye Contact:** Vapors cause irritation, redness, and blurred vision. Splashes may cause severe irritation or eye damage. **Chronic Exposure:** Prolonged or repeated skin exposure may cause dermatitis. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Flash point: 28C (82F) CC Autoignition temperature: 415C (779F) Flammable limits in air % by volume: lel: 1.7; uel: 10.6 Flammable Liquid and Vapor! **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Containers may explode in heat or fire. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Do not use a solid stream of water, since the stream will scatter and spread the fire. Water spray may be used to keep fire exposed containers cool. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Vapors can flow along surfaces to distant ignition source and flash back.	See Baseline Risk Assessment (Arcadis, 1998)
COC	n-butyl alcohol	**Inhalation:** Butyl alcohols have produced few cases of poisoning in industry because of their low volatility. Causes irritation to upper respiratory tract. Difficult breathing, coughing, headache, dizziness, and drowsiness may occur. May be absorbed into the bloodstream with symptoms similar to ingestion. **Ingestion:** May have narcotic effect. May cause abdominal pain, nausea, headache, dizziness, and diarrhea. Large doses may affect kidneys and liver. May affect hearing. Estimated mean lethal dose is 3 - 7 ounces. **Skin Contact:** An irritant to the skin, causing a loss of natural oils. Can be absorbed through skin with symptoms paralleling those from ingestion. **Eye Contact:** Vapors can be irritating, causing tearing and pain. Splashes cause inflammation and blurred vision. **Chronic Exposure:** Prolonged skin contact may cause drying and cracking of skin. Hearing loss has been reported in workers chronically exposed to butyl alcohol. May affect sense of balance, liver and kidneys. **Aggravation of Pre-existing Conditions:** Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.	**Fire:** Flash point: 37C (99F) CC Autoignition temperature: 343C (649F) Flammable limits in air % by volume: lel: 1.4; uel: 11.2 Flammable. Dangerous fire hazard when exposed to heat or flame. **Explosion:** Above flash point, vapor-air mixtures are explosive within flammable limits noted above. Vapors can flow along surfaces to distant ignition source and flash back. Sensitive to static discharge. **Fire Extinguishing Media:** Dry chemical, foam or carbon dioxide. Water spray may be used to keep fire exposed containers cool. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Water may be used to flush spills away from exposures and to dilute spills to non-flammable mixtures.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
VIII, IX	2,4-D	**EXPOSURE:** PREVENT DISPERSION OF DUST! STRICT HYGIENE! AVOID EXPOSURE OF (PREGNANT) WOMEN! **INHALATION:** Headache. Nausea. Weakness. Local exhaust or breathing protection. Fresh air, rest. Refer for medical attention. **SKIN:** Redness. Protective gloves. Protective clothing. Remove contaminated clothes. Rinse and then wash skin with water and soap. **EYES:** Redness. Safety goggles or eye protection in combination with breathing protection. First rinse with plenty of water for several minutes (remove contact lenses if easily possible), then take to a doctor. **INGESTION:** Abdominal pain. Burning sensation. Diarrhea. Headache. Nausea. Unconsciousness. Vomiting. Weakness. Do not eat, drink, or smoke during work. Wash hands before eating. Rinse mouth. Give a slurry of activated charcoal in water to drink. Refer for medical attention.	**FIRE** Not combustible. Liquid formulations containing organic solvents may be flammable. Gives off irritating or toxic fumes (or gases) in a fire. NO contact with oxidants. In case of fire in the surroundings: all extinguishing agents allowed. **EXPLOSION** Risk of fire and explosion if formulations contain flammable/explosive solvents.	See Baseline Risk Assessment (Arcadis, 1998)
COC	Total Petroleum Hydrocarbons (TPH)	**LD50 LC50 Mixture:** NONE SPECIFIED BY MANUFACTURER. **Route Of Entry** Inhalation: YES Skin: YES Ingestion: YES Carcinogenicity - NTP: NO **Effects of Exposure:** PRIMARY IRRITANT. IRRITATES & DEFATS THE SKIN. BURNS & IRRITATES THE EYES. MAY CAUSE COUGH, UPPER AIR WAY IRRITATION. **Signs And Symptoms Of Overexposure:** IRRITATION & BURNING & REDNESS IN EYES. IRRITATION & DEFATS THE SKIN. COUGH & CHEST PAIN. **Medical Condition Aggravated By Exposure:** DERMATITIS, BRONCHITIS.	**Flash Point Text:** NOT IGNITABLE **Extinguishing Media:** MEDIA SUITABLE FOR SURROUNDING FIRE (FP N). **Fire Fighting Procedures:** USE NIOSH/MSHA APPROVED SCBA & FULL PROTECTIVE EQUIPMENT (FP N). **Unusual Fire/Explosion Hazard:** NONE.	See Baseline Risk Assessment (Arcadis, 1998)

APPENDIX II - WASTES MANAGED
HW-50054 Permit Renewal Application
Part B, Section IX

Source	Parameter	Health	Safety	Risk
COC	Lead (total)	**Inhalation:** Lead can be absorbed through the respiratory system. Local irritation of bronchia and lungs can occur and, in cases of acute exposure, symptoms such as metallic taste, chest and abdominal pain, and increased lead blood levels may follow. See also Ingestion. **Ingestion:** POISON! The symptoms of lead poisoning include abdominal pain and spasms, nausea, vomiting, headache. Acute poisoning can lead to muscle weakness, "lead line" on the gums, metallic taste, definite loss of appetite, insomnia, dizziness, high lead levels in blood and urine with shock, coma and death in extreme cases. **Skin Contact:** Lead and lead compounds may be absorbed through the skin on prolonged exposure; the symptoms of lead poisoning described for ingestion exposure may occur. Contact over short periods may cause local irritation, redness and pain. **Eye Contact:** Absorption can occur through eye tissues but the more common hazards are local irritation or abrasion. **Chronic Exposure:** Lead is a cumulative poison and exposure even to small amounts can raise the body's content to toxic levels. The symptoms of chronic exposure are like those of ingestion poisoning; restlessness, irritability, visual disturbances, hypertension and gray facial color may also be noted. **Aggravation of Pre-existing Conditions:** Persons with pre-existing kidney, nerve or circulatory disorders or with skin or eye problems may be more susceptible to the effects of this substance.	**Fire:** Not considered to be a fire hazard. Powder/dust is flammable when heated or exposed to flame. **Explosion:** Not considered to be an explosion hazard. **Fire Extinguishing Media:** Use any means suitable for extinguishing surrounding fire. Do not allow water runoff to enter sewers or waterways. **Special Information:** In the event of a fire, wear full protective clothing and NIOSH-approved self-contained breathing apparatus with full facepiece operated in the pressure demand or other positive pressure mode. Can produce toxic lead fumes at elevated temperatures and demand or other positive pressure	e.□See Baseline Risk Assessment (Arcadis,

Chemicals of concern that have been stored at the Kinder Morgan Liquid Terminals, LLC facility in Galena Park, Texas are listed in Appendix II of Section IX of this permit application to renew permit number HW-50054. Currently permitted treatment standards for disposal within the former NHB/CAMU (NOR 004) can be found in Table 1 of the CAMU Management Plan (Malcolm Pirnie, Inc., 1998) (See **Attachment N**). Chemical concentrations in waste or affected soils must be reduced to these concentrations in order to meet current CAMU permitting requirements. Section 3.3 of the Engineering Report (See **Attachment J**) provides additional treatment standards. The current treatment standard for TPH is <1,000 mg/kg. The combined treatment standard for leachable benzene, touluene, ethylbenzene, and xylenes (BTEX)) in <100 mg/L. The treatment standard for leachable benzene is <0.5 mg/L. A treatment standard for lead concentrations in soil placed in the CAMU had not been developed at the time the CAMU Management Plan was written. Based on permit conditions, characteristic hazardous waste that exceeds lead levels of 5 mg/L, as per the toxicity characteristic leaching potential (TCLP) test, is authorized for disposal in the CAMU. A treatment standard of 1.5 mg/L, as measured by the Synthetic Precipitation Leaching Procedure (SPLP) was selected by the facility as the treatment standard for lead disposal in the CAMU.

This application proposes to amend these treatment standards to reflect current risk-based standards in the Texas Risk Reduction Program (TRRP). The proposed treatment standards are provided in Revised Tables 2 and 3 in the Addendum to the Engineering Report (**Attachment J**). These standards represent values that are protective of human health and the environment using TRRP, Universal Treatment Standards (UTS), Risk Reduction Standards (RRS) for groundwater protection calculated using equilibrium partition theore or equations in Risk Reduction Standards (30 TAC 335.559).

023	Miscellaneous storage containers	ACTIVE	05/25/1994	1 / NA	NA	NA	13 RCRA Pmt Exempt - Accumulation Time	YES /

Description from Company: Miscellaneous containers including drums, rolloffsl, and vacuum boxes.

System Types: 050 Energy recovery at this site - use as fuel (includes on-site fuel blending) 061 Fuel blending prior to energy recovery at another site 141 Storage, bulking, and/or transfer off site - no treatment/recovery, fuel blending or disposal at this site.

Wastes Currently Managed at Unit:
0001319H Contaminated soil, sludge, protective clothing & rags, & fabric tank seals fromspills, tank cleanings, tank seal repair/replacement & remediation projects.
0013609H Sludges; removal of sludge, sediments, or slag from tanks, piping and sumps
00173021 Soil contaminated with organics, contaminated soil from remedial activities. Waste will be recycled off site into TxDOT Spec items. jds 11-18-99.
00283892 Nonhazardous soil and Sand Blasting Waste. Per anotification from the generator, this waste will be recycled by being used to make TxDOT Spec Items 247 and 276.
00293111 Asbestos, removal of tank and/or pipeline asbestos; 5/26/95
00313191 Non-hazardous tank/sump bottoms and debris from the cleaning of petroleum storage tanks and terminal operations.including spill clean up
00363191 PLANT TRASH AND DEBRIS
00374891 PLANT TRASH, PPE, ROCKS AND SOIL CONTAMINATED WITH PETROLEUM PRODUCTS FROMCLEAN UP ACTIVITIES
0039301H contaminated soil from remedial activities in the West Plant.
0042301H Contaminated soils from remedial activities in the Central Plant.
00463112 Nonfriable asbestos. Associated with the demolition or maintenance of equipment coated with or containing non-friable asbestos material.
00503902 Nonhazardous concrete/cement/construction debris ie wood,plastic,rubber,styrofoam/weathered rail road ties; from demolition and construction activities
00529992 Plant Trash non-contaminated which includes paper, cardboard, plastic, wrappings, wood, aluminum cans, and scrap metal.
0055119H Tank bottoms such as rust,scale,sediments and sludge. Generated from the cleaning of storage tanks and lines.
00632191 Glycols containing up to 25% water.493
0065310H Spent activated carbon from vapor scrubbing operations.
05042971 Electrical Transformers/Rectifiers being Decommissioned which contained >50 ppm-<500 ppm PCB's
05085142 Spoils Generated by means of Hydroexcavation/drilling activities through out facility
60912101 waste generated from the removal of storage tank adhesives or epoxies liners
6092609H Tank bottoms from the cleaning of storage tanks and piping.

Wastes Currently Managed at Unit: 0015119H Wastewater generated from pipelining flushings, tank cleaning, spills, water coming in contact with product, docks, tank car and tank truck racks, and groundwater. Wastewater is shippe
Wastes Previously Managed at Unit: 0058205H

As of 05/07/2024, The next unassigned sequence number for UNITS is 031

APPENDIX III
Evidence of Release

Evidences of releases for the SWMUs documented in the 1992 RFA effort can be found in the RFA (Attachment M to the Part B Permit renewal) or the subsequent RFI/APA deliverables as referenced on the checklists for these units. At this time, there are no known releases, nor evidence of release at the SWMUs identified on the Kinder Morgan NOR as NOR Units 021 through 029. Additionally, SWMUs Nor 021 through 029 are located in areas currently being addressed under the TRRP and/or the current Corrective Action Program and a release from the these units, if present, would be captured by an ongoing response action.

APPENDIX IV
Pollutant Dispersal Pathways

Pollutant dispersal pathways for the SWMUs documented in the 1992 RFA effort can be found in the RFA (Attachment M to the Part B Permit renewal) or the subsequent RFI/APA deliverables as referenced on the checklists for these units. At this time, there are no known releases, nor evidence of release and thus no defined pollutant dispersal pathways at the SWMUs identified on the Kinder Morgan NOR as NOR Units 021 through 029.

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

March 26, 2024

Via email

Mr. Johnny Salinas
Senior EHS Specialist
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Approval of Closure Report – No Further Action
Closure Report, Waste Management Unit Numbers 025, January 30, 2024
Kinder Morgan Liquids Terminals, LLC – Galena Park
906 Clinton Drive, Galena Park, Harris County
TCEQ SWR No. 30573; TCEQ Hazardous Waste Permit/Compliance Plan 50054;
EPA ID No. TXD026481523; CN601545940; RN100237452

Dear Mr. Salinas:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above-referenced submittal requesting the closure of the following waste management unit (WMU) listed on the facility's Notice of Registration (NOR) for SWR No. 30573:

- NOR Unit 025 – 250-gallon Above Ground Storage Tank.

The TCEQ understands that the tank was taken out of service in October 2023, cleaned out and triple rinsed, and the wastes and tank were disposed of at an off-site authorized facility. The above-referenced report stated that no spills or releases occurred from the WMU. ***Therefore, the TCEQ accepts the closure of the above-referenced NOR Unit such that no further action is required under Title 30 Texas Administrative Code (TAC) §335.8.***

A copy of this letter has been forwarded to the TCEQ's Registration and Reporting Section to update your NOR. For questions regarding the NOR, please contact the Registration and Reporting Section at (512) 239-6833 or at [redacted]

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the activities described in the report fail to comply with these requirements, please take any necessary and

authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of the site to determine compliance with the report.

Questions concerning this letter should be directed to me at (512) 239-2034. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals. Note that the electronic and hard copies should be identical, complete copies. A Correspondence ID Form (TCEQ Form 20428) must accompany each document submitted to the Remediation Division and should be affixed to the front of your submittal. The Correspondence ID Form helps ensure that your documents are identified correctly and are routed to the applicable program for a timely response.

Sincerely,

Maureen M. Hatfield, P.G., Project Manager
VCP-CA Section, Remediation Division
Texas Commission on Environmental Quality

Re: RCRA Facility Assessment (RFA) GATX Terminals
Solid Waste No. 30573

Dear Mr. Hibbs:

Enclosed are preliminary comments to the RCRA Facility Assessment dated April 13, 1992.

I have made changes and included the specific pages in which the correction should be made.

If you need any additional information do not hesitate to contact me.

Sincerely,

Tom Rigg
Terminal Manager

1. Agreed Order Dated January 31, 1990.

2. Order dated May 20, 1986.

E. Correspondence File Number 30573.

F. Aerial Photographs Dated 1944, 1945, 1953, 1972 and 1990.

III. Summary:

GATX Terminals Inc. (GATX) has been required to apply for a Post-Closure Permit as a result of an Agreed Final Order dated January 31, 1990. GATX was found to have two hazardous waste surface impoundments that did not have Interim Status nor an Industrial and Hazardous Waste permit, and therefore GATX was required by TWC to close the units as hazardous waste landfills. During the required monitoring of the impoundments, GATX discovered groundwater contamination underneath the Southeast Holding Basin and the North Holding Basin. It has been determined that the contaminants may be discharging into the Houston Ship Channel from a perched, near-surface groundwater source at the southeast corner of the facility. A Compliance Plan application has been filed with the TWC as a result of this Agreed Final Order. Also addressed in the Agreed Order of January 31, 1990 was the wastewater treatment system connected with Tank 29, for which a Remedial Facility Investigation workplan was required. Additionally, a Supplemental Soils Investigation for T/R No. 4, and Tanks 26 and 82 was required, with results to be included in the final report for the Expanded Groundwater Quality Assessment Plan submitted in August, 1989. Part of the site currently owned and operated by GATX was previously owned and operated by Texaco as a refinery. Several previously undocumented industrial solid waste management units have been discovered at the site.

IV. Recommended Actions

Possible releases from GATX solid and hazardous waste management units were discovered between 1986 and 1990. Two Texas Water Commission Orders have been issued regarding known groundwater contamination at the site. The Orders specifically address the North Holding Basin (NHB), Southeast Holding Basin (SEHB), and tanks 29, 50, 51, 116, 117, the oil/water separator and 25-1. Investigations are currently being performed for the NHB and the SEHB. A Remedial Facility Investigation workplan for tanks 29, 50, 51, 116, 117, the oil/water separator and 25-1, required by Provision 3.d of the January 31, 1990 Order as part of a facility wide Remedial Facility Investigation, was approved by letter dated December 18, 1991. Investigation plans have been submitted and remediations have began for the T/R No.4 and T/R No. 6. Tracts A and B are also currently undergoing preliminary studies to determine the contaminant types and levels at those sites. This action can be considered equivalent to the draft Corrective Action Process (CAP) developed by EPA in response to HSWA. The draft guidance currently describes RCRA Facility Assessment (RFA) reports, RCRA Facility Investigations (RFI), Corrective Measures Studies (CMS) and Corrective Measures Implementations (CMI) for SWMUs

which have had a release of hazardous waste or hazardous constituents. Given the previous work at GATX to date, the following are recommended to formally implement HSWA for the units and waste management areas of concern.

1. Tract A - Initial investigations have indicated that this unit is a source of groundwater and soil contamination. An investigation should be performed to determine the lateral extent and the depth of soil and groundwater contamination emanating from this unit in conjunction with the actions recommended below for the North Plant Area.

2. Tract B - preliminary investigations have indicated that this unit may be a source of soil contamination and possibly a source of groundwater contamination. An investigation should be performed to determine the lateral extent and the depth of soil and groundwater contamination which may emanate from this unit in conjunction with the actions recommended below for the North Plant Area.

3. Central Plant Area - This area includes the SEHB, tanks 32, 3-9, 29, 50, 51, 116, 117, the oil/water separator, 25-1, Lift Station No.4, the SEHB sump, the container storage area, all tank car loading racks and secondary containment areas in the central plant, and all areas between the T/TR #4 Rail Right of Way and Clinton Drive, including area currently leased to CXI. This unit is shown in Attachment B. Aerial photos from 1944 and 1945 show what may have been two surface impoundments on the northwest corner of this area. These impoundments did not appear in later photographs. Groundwater and soil contamination is documented to exist in this area. Compliance Plan CP-50054, written in response to the application submitted by GATX, and the RFI workplan approved on December 18, 1991, will require the investigation and remediation of much of this area. GATX has proposed an expansion of the approved RFI workplan by letter dated February 26, 1992 to include part of the Central Plant Area, not including the segment between the T/TR #4 area and Clinton Drive. An investigation into the degree of soil and groundwater contamination should be performed to determine the volume, lateral and vertical extent and the types of contaminants present in soils and groundwater in this area. The Compliance Plan will address groundwater contamination and corrective action as a direct result of activities at the Southeast Holding Basin.

4. North Holding Basin - The NHB is a documented source of groundwater and soil contamination. Currently, this unit is undergoing closure. This unit is scheduled to be addressed in Compliance Plan CP-50054, and all remediation plans for groundwater contaminated by this unit should be addressed through the Compliance Plan. The final report on the Groundwater Quality Assessment for the North Holding Basin is to be submitted to TWC prior to September 1, 1992. Within 180 days of the submittal of the Groundwater Quality Assessment for the North Holding Basin, GATX shall submit an amendment to Compliance Plan CP-50054.

why ?

5. East Plant Area - The East Plant was the site of a Texaco refinery and tank farm from before 1920 until the 1950's. This area is shown in Attachment B. It appears that an unknown surface impoundment appears on old aerial photographs just north of the known Texaco Impoundment. An investigation should be performed to determine the presence of any undocumented waste disposal units, and if found, then the contaminant type and the lateral and vertical extent of soil and/or groundwater contamination should be determined. When this determination is completed, a CMS/CMI program that is appropriate to remediate any contamination found should be instituted.

= swmus inactive — or active are part of CERCLA

6. North Plant Area - The North Plant was the site of a Texaco tank nfarm from pre - 1920 until the 1950's. The tanks currently in the area were constructed by Texaco. Tracts A and B are within this area. This area is shown in Attachment B. An investigation should be performed to determine the presence of any undocumented waste disposal units, and if found, then the contaminant type and the lateral and vertical extent of contamination should be determined. When this determination is completed, a CMS/CMI program that is appropriate to remediate any contamination found should be instituted.

- ?

The TWC did not have the room in the computer to include all the waste codes requested for each waste stream. Therefore the Notice of Registration (NOR) only contained the first 24 waste codes from the following list previously submitted. Table 1 is an all inclusive list for waste streams generated at GATX Galena Park as identified.

RCRA FACILITY ASSESSMENT UNIT CHECKLIST

Facility : GATX Terminals Inc.
EPA I.D.#: TXD026481523
ISW Reg.#: 30573

Reviewer : William J. Shafford
Hazsit # : None
Section : H&SW Permits

Proposed Permit No. HW-50054-000

I. Waste Management Unit:

N.O.R. Facility No.: 01, Container Storage Area, RCRA, Active
Service: 1981 - current
Type : <90-Day Storage
I. D. No.: Container Storage Area
Status : Storage
Capacity : 11,220 gallons

II. Evidence of Release: No evidence of release was observed or reported.

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
001	Wastewater Treatment Sludge	II	249000	--
002	Oil Trappings/ Oil Skimmings	II	210690	--
003	Tank Bottoms	I	152180	--
004	Tank Bottoms	IH	952180	D0(01-24)*
005	Pipeline Flushings	IH	906110	D0(01-24)*
006	Pipeline Flushings	I	106110	--
007	Absorbent, Hydro-carbon Contaminated	IH	981510	D0(01-24)*
013	Soil, Creosote Contaminated	IH	978980	U051
015	Stryene Monomer	IH	919470	D001

V. Target Populations of Concern: See Attachment A

* Waste codes on NOR are not inclusive of all submitted to TWC see attached list. (See Table 1)

VI. Summary: This unit is a less than 90 day storage unit. No evidence of release was reported or observed.

VII. Recommended Action: This unit will be included in the Central Plant Waste Management Area RFI by proximity.

RCRA FACILITY ASSESSMENT UNIT CHECKLIST

Facility : GATX Terminals Inc.
EPA I.D.#: TXD026481523
ISW Reg.#: 30573

Reviewer : William J. Shafford
Hazsit # : None

Proposed Permit No. HW-50054-000

I. Waste Management Unit:

N.O.R. Facility No.: 02, Wastewater Tank RCRA, Inactive
Service: 1938 - 1990
Type : Tank (Surface)
I. D. No.: Tank 29
Status : WW tank
Capacity : 1,095,730 gallons

II. Evidence of Release: No direct evidence of release was observed, however, some remediation and closure activities have occurred at this unit.

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
001	Wastewater Treatment Sludge	II	249000	--
005	Pipeline Flushings	IH	906110	D0(01-24) *
006	Pipeline Flushings	I	106110	--
008	Tank Washings	IH	906330	D0(01-24) *
009	Stormwater, Contaminated	IH	906330	D0(01-24) *
010	Organic Liquid, Mixed Wastestream	IH	906330	D0(01-24) *

V. Target Populations of Concern: See Attachment A

VI. Summary: An Remedial Facility Investigation workplan was required by the Agreed Order between GATX and TWC issued January 31, 1990. This workplan was submitted September 13, 1990, revised July 18, 1991, and was approved on December 18, 1991. This unit is undergoing closure under a TWC approved closure plan.

* See table 1

VII. Recommended Action: Continued investigative work as prescribed in the Agreed Order dated January 31, 1990 and the approved Remedial Facility Investigation Workplan.

Should be Taken out of RFI

ISW Reg.#: 30573

Reviewer : William J. Shafford
Hazsit # : None
Section : H&SW Permits

Proposed Permit No. HW-50054-000

I. Waste Management Unit:

N.O.R. Facility No.: A^, Tract A, SWMU Closed
Service: 1945-1981
Type : Landfill
I. D. No.: Tract A
Status : Disposal
Capacity : 6,400 CY (est.)

II. Evidence of Release: A preliminary Site Characterization Report dated May, 1990 documents soil and groundwater contamination at this unit. Analyses of samples taken from this area turned up several Appendix VIII constituents, such as Trichloroethylene, vinyl chloride, benzene, naphthalene, and dibenzofuran. Elevated levels of metals were also found. See Attachment F.

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
	Wastes unknown at this time			

V. Target Populations of Concern: See Attachment A

VI. Summary: This unit was apparently used over a long period as a disposal pit. Aerial photographs showed this unit in operation in 1944 and 1945, but the area appeared closed in a photo from 1953. Extensive contamination appears to be present at this unit, with contamination consisting of VOA's, semi-volatiles, and possibly metals. No recovery system or remediation plan has yet been proposed. The unit was not presented as a permittable unit in the Part B permit application, and was not mentioned as a Compliance Plan unit.

VII. Recommended Action: This unit should be assessed in an RFI. A plan for remediation of soil and groundwater should be proposed as part of a CMS plan upon completion of the RFI phase of the CAP at this unit. The RFI for groundwater beneath this unit should be addressed in the Groundwater Compliance Plan.

I. Waste Management Unit:

N.O.R. Facility No.: B^, Tract B
SWMU, Inactive
Type : Landfill/Pit

Service: Unknown
I. D. No.: Tract B

Status : Disposal

Capacity : Unknown

II. Evidence of Release: During excavations for a fence, construction debris and what appeared to be tank bottoms were encountered. A preliminary investigation by the facility has begun, but no results have yet been reported.

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
	Unknown at this time			

V. Target Populations of Concern: See Attachment A

VI. Summary: Apparently, this area was used as a disposal site for construction debris and tank bottoms, and may have been used to dispose of other wastes which are as yet unknown. A preliminary facility investigation has began, but no results have yet been reported.

VII. Recommended Action: The preliminary investigations should continue, and the unit should be addressed in an RFI. A groundwater RFI should be required by Compliance Plan CP-50054.

N.O.R. Facility No.: E^, Stormwater Drainage System, SWMU Active

Service: 1945 - Current

Type :

I. D. No.: Stormwater Drainage System

Status : Disposal

Capacity : Unknown

II. Evidence of Release: Dead and distressed vegetation was noted directly adjacent to several drainage ditches. Soil in the Drainage Ditches appeared oil-stained. A sheen was noticed on the surface of water within the ditch. The Drainage facilities for T/T Racks No. 3 and No. 4 have been established as possible contributing sources for the subsurface soil and groundwater contamination in the southeast portion of the GATX facility

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
009	Stormwater, Contaminated	IH	906330	D0(01-24) *

V. Target Populations of Concern: See Attachment A

VI. Summary: This unit is used to convey stormwater to an NPDES outfall or to stormwater processing units prior to discharge to a POTW. Possible evidence of waste or waste constituents was present at the time of inspection. This unit has been used for a very long time.

VII. Recommended Action: This unit should be included in the Central Plant RFI. The plan should address soil and groundwater contamination from this unit. The groundwater compliance plan should require a groundwater investigation for this unit.

* See Table 1

Proposed Permit No. HW-50054-000

I. Waste Management Unit:

N.O.R. Facility No.: H^, East Plant Area
Type : Waste Management Area
Status : Disposal

Service: Pre - 1920's - 1950's
I. D. No.: East Plant
Capacity : Unknown

II. Evidence of Release: No evidence has been discovered concerning releases in this area. The area was used as a Texaco refinery for a long period of time. A closed impoundment, Texaco Impoundment #4, is located within this area at the far eastern edge. It appears that another impoundment was present just north of Texaco Impoundment #4.

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
Unknown				

V. Target Populations of Concern: See Attachment A

VI. Summary: This area may be contaminated by years of refinery and tank farm operations. No known survey of possible contamination has been performed. The refinery appeared to have been removed from the site prior to 1953, as shown by an aerial photograph.

VII. Recommended Action: An investigation should be performed to determine whether or not soil and/or groundwater contamination is present beneath the area. If contamination is discovered, then the lateral and vertical limits of the contamination should be determined, and an appropriate CMS/CMI program instigated.

ATTACHMENT A

I. Pollutant Dispersal Pathways:

Three pathways exist for the transport of waste or waste constituents from the GATX - Galena Park facility. Wastes may be transported via groundwater, air or surface water. Groundwater contaminant transport is the primary waste transport mechanism because of known groundwater contamination at the facility, and discharge of contaminated groundwater to the Houston Ship Channel. Air contaminant transport is the secondary concern, as strong chemical odors were noted during the VSI. Surface water transport is also a concern, as water with a sheen was noticed in a discharge ditch headed toward a facility outfall. ?

A. Groundwater

Releases to groundwater have been documented from the Southeast Holding Basin, the North Holding Basin and Tract A. A release to groundwater may have also occurred from Tract B, but no information exists on any release from this pre-RCRA SWMU at this time.

Contamination is known in two aquifers below the facility. One aquifer, denoted in the Groundwater Compliance Plan as the Sandy Channel Fill (SCF), is a shallow perched aquifer consisting primarily of dredge spoils from the Houston Ship Channel. Below this aquifer is a discontinuous clay unit denoted as the First Silty Clay Unit (FSCU), and below that is the Uppermost Natural Transmissive Unit (UNTU), consisting primarily of silty and clayey sands. The SCF and UNTU appear to be hydraulically connected. Below the UNTU lie thickly bedded clays of Second Silty Clay/Clay Unit (SSC/CU). Contamination is known in both the SCF and the UNTU. Waters in the SCF discharge to the Houston Ship Channel, as do waters in the UNTU in the area of the Expanded Groundwater Quality Assessment[1]. Groundwaters may also discharge to Hunting Bayou on the east side of the facility. Groundwater gradients generally tend to be toward the Houston Ship Channel, with some gradients trending toward Hunting Bayou.

North

B. Surface Water

Releases to surface water are believed to be occurring from groundwaters in the SCF and UNTU at the GATX facility. Possibly contaminated runoff was noted in a drainage ditch near Outfall 003, which discharges into the Houston Ship Channel.

C. Air

Releases to air of waste and waste constituents is also a possibility at the GATX facility. Vapors resulting from contamination of soil and groundwater by volatile organics may be released to the air through the soil. Air releases may also result from the storage areas through fugitive emissions, and from loading

emissions from tanks and containers. Prevailing winds are probably from the south and southeast.

II. Target Populations of Concern:

The GATX facility is not a critical wildlife habitat area, or an area designated state or federal wilderness. Parts of the GATX facility appear to qualify as wetlands.

yes if yes wh path

To the north of GATX is a tract of land owned by the ARCO Pipeline Company. ~~East~~ West of the facility is Pak - Tank. ~~East~~ East of the facility is the ~~Gulf Coast Waste Disposal Authority~~ Water Treatment Plant. South of the facility is the Houston Ship Channel. Across the Ship Channel is A City of Houston Power Generation Station. & Gulf Coast Waste Disposal Authority.

City of Houston

NOTES

1 Groundwater Compliance Plan Application, Part One, ENSR, 1989, Chapter 3.

According to the company hydrocarbon fractions are removed from tank 29 and sent offsite to a fuel blender. Ms. McFaddin stated that based on an EPA clarification of "Wastewater Treatment Unit" as stated in VOL. 53 No. 171, (Sept. 2, 1988) of the Federal Register it appears that tank no. 29 may be considered a RCRA regulated unit. GATX representatives indicated that they would review the cited EPA regulation and respond in writing concerning the regulatory status of tank no. 29. Ms. McFaddin also indicated that it appears that tank no. 10-12 is not a regulated unit based on use of the tank.

Michelle briefly reviewed the procedures involved concerning issuance of a commission order. The company was informed that all violations resolved prior to issuance of the order would not be included in the order. The company was also informed that administrative penalties would be proposed in the Petition.

Re: GATX Terminals Corporation
TWC Solid Waste Registration No. 30573
EPA I.D. No. TXD026481523

Dear Dr. Davis:

Pursuant to agreements between Texas Water Commission (TWC) representatives and Environmental Protection Agency (EPA) Region VI representatives during a conference held on May 4, 1989, the TWC has determined that an alternate schedule will be necessary for GATX Terminals, a high priority violator which was scheduled for formal action on September 21, 1989. The justification for the alternate schedule includes, but is not limited to, the fact that the current case load exceeds TWC's resources. As of August 31, 1989, the TWC has scheduled 62 petitions and 74 orders to be issued, and the staff is also involved in approximately 38 Attorney General cases.

Therefore, an alternate schedule has been established for this case. According to the alternate schedule, a petition will be filed by October 31, 1989. If you have any questions regarding this matter, please contact Anne Dobbs or Russell Kimble at 512/463-8425.

Sincerely,

Daniel J. Eden

Re: GATX Terminals Corp. - Solid Waste Registration No. 30573
Wastewater System: Process Flow Description

Dear Mr. Posnick:

As we discussed at our meeting August 23, 1989, we are forwarding process flow sheets and summary sheets of the terminal wastewater system. Two scenarios are presented:

* Past Operating Practices
* Present (Future) Operating Practices -- After all new construction is complete.

Mixed Organic - Waste No. 913370 - Past Operating Practices

Additionally, concern was raised over the fate of the "mixed organic portion of the wastewater system", that the TWC identified as a hazardous waste in January, 1988.

The mixed organic is an emulsion of materials resulting from loading/unloading operations and water (i.e. line cleaning, hose cleaning, etc...). In the past, the wastewater was heated in Tk 29 and the water was separated out of the mixed organic and processed to GCWDA. The resulting neat organic was handled separately.

Recently, difficulties with the Tank 29 steam system contributed to inefficient emulsion breaking. Therefore, other tanks were used to accumulate the mixed organic for treatment at Tk 29. These tanks served as flow thru tanks. Table 1 is a data summary of the materials in these tanks.

Furthermore, the material in these tanks will be processed thru Tank 32, which contains a new steam heating system for emulsion breaking, with the water going to GCWDA and the neat organic being processed to Tank 3-9 for handling.

GATX

Finally, we are revising the handling procedures for the "mixed organic" in Tk 3-9 and will update the agency as soon as the revisions are complete. Please direct any questions or comments to my attention at 713-475-9235.

Sincerely,

R. E. Butler

GATX

9-14-89

WASTEWATER SYSTEM
OPERATING SUMMARY
COLLECTION SYSTEM

Lift Station 4

Collects water from Corkscrew Hill, "10's" Manifold, MTBE Manifold, Valve Manifold Pit 1, Central Plant T/C tracks #1 and #2, Central Plant T/T racks 1, 2, 3, and 4. Transfers all collected water to tank 32 by pipeline.

Line 8F

Collects water from West Plant T/T racks, West Plant gasoline manifold, T/C racks, Barge Dock #2, and Ship Dock #2, for transfer to tank 32.

Line GPC - GPE

Collects water from Ship Dock #1, Valve Manifold Pit 2, Ship Dock #3, East Plant gasoline manifold, Barge Dock #3 and East Plant T/C racks for transfer to tank 32.

Lubripac

6" line for transfer of fluid from Lubripac, Inc. manufacturing plant.

Tank S-11-300

Collects water and oil at West Plant fuel oil manifold.

Tank S-11-3500

Collects water and oil at East Plant fuel oil manifold.

GATX

9-14-89

WASTEWATER SYSTEM
FUTURE OPERATING PRACTICES
PROCESS SUMMARY

Tank 29 (Flow-through from Barge Dock #1)

Receives wastewater from Barge Dock #1 and transfers wastewater to tank 32.

Tank 32

Receives wastewater from plant loading, unloading, and manifolds (i.e. see attached Operating Summary - Collection System). Wastewater can be heated by steam coils, agitated with nitrogen, or treated with injected chemicals prior to transfer to oil/water separator.

Oil/Water Separator

Receives liquid from tank 32 for gravity separation and transfer of the wastewater to either tanks 5-20, 3-9, or 32 for reprocessing. Wastewater, lighter than water (i.e. less than 8.33#/gal.), flow thru to tank 3-9. Wastewater, equal to the weight of water, flow, thru to tank 5-20.

Tank 3-9

Receives wastewater from oil water separator and further treats the wastewater by steam treating, agitation, or chemical treatment. Waste water is transferred back to tank 32 for reprocessing and the recovered product is stored for less than 90 days.

Tank 5-20

Receives wastewater from oil/water separator and transfers wastewater to GCWDA, a NPDES permitted outfall (POTW). Oil/water separator upsets can be returned to tank 32 for reprocessing.

Tank 100-5 and 100-6

Removed from wastewater service and collect stormwater from lift station 1, 2, and 3 for the discharge through NPDES Outfall 006.

Tanks 117, 116, 50, 51 and 25-1

Removed from wastewater service and converted to product service.

GATX

9-14-89

WASTEWATER SYSTEM
PAST OPERATING PRACTICES
PROCESS SUMMARY 5-09-89

Tank 29

Received wastewater from all plant operations (i.e. contact water includes loading racks, barge docks, ship docks, pipeline manifolds, and laboratory samples).

Several years ago, the steam coil became inoperative. Therefore, separation (by heating the tank and breaking the emulsion) became very difficult. And, when necessary, wastewater was removed to Tanks 117, 116, 50, 51, 25-1, in addition to the oil/water gravity separator.

Additionally, since January 1988 no organic has been transferred offsite.

Tanks 117, 116, 50, 51, and 25-1

These tanks were storage tanks converted to wastewater surge capacity, due to operating difficulties in tank 29 and oil/water separator. Wastewater was received from the tank 29, plant operations, or the oil/water separator and transferred back to tank 29 or oil/water separator for treatment, as operating demands allowed.

Oil/Water Gravity Separator - Associated with Tank 29

Received wastewater from Tank 29 and surge tanks - 117, 116, 50, 51, and 25-1. Wastewater was separated into two fractions:

Oil/Wastewater -- lighter than 8.33#/gallon
Wastewater -- equal to 8.33#/gallon

The light fraction was pumped back to Tk 29 or surge tanks for reprocessing.

The wastewater fraction was pumped to Lift Station 1 for transfer to GCWDA, through 100-5 and 100-6.

Lift Station 1

Receives wastewater from oil/water separator and transfers wastewater to Tanks 100-5 and 100-6.

Tanks 100-5 and 100-6

Receives wastewater from Lift Station 1 and transfers wastewater to Gulf Coast Waste Disposal Authority, a permitted NPDES outfall.

Re: Letter of Intention for Closure of Tank 29 Area GATX Terminals Corporation, Galena Park, Texas Harris Co.

Dear Mr. Beinke:

The purpose of this letter is to notify the Texas Water Commission (TWC) of GATX Terminals Corporation's intention of closing the Tank 29 area. As part of the closure, the following tanks will be closed: Tanks 29, 50, 51, 116, 117 and 25-1.

It appears from discussions with the TWC staff that an order will be written in the near future which will require GATX to close these units. GATX believes that it is in the best interest of the environment and of the company to not delay the initiation of these closure activities. The Tank 29 area was taken off-line, effective October 31, 1989.

A closure plan meeting the requirements of 40 Code of Federal Regulations (CFR) Part 265 Subpart G and 40 CFR Part 265.197 will be submitted for the above mentioned units by December 29, 1989.

If you have any questions regarding this letter, please feel free to contact Bernadette Johnson of Environmental Consulting Associates at (512) 346-0978 or myself at (713) 455-1231.

Sincerely,

Lynn R Jones

WARNING LETTER

Mr. Lynn Jones
Environmental Coordinator
GATX Terminals Corporation
Post Office Box 486
Galena Park, Texas 77547-0486

Re: GATX Terminals Corporations
EPA I.D. No. TXD026481523

Dear Mr. Jones:

This Warning Letter is to notify you that your facility may be violating legal requirements of the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. Sections 6901 et seq.

During the August 15, 1989, Environmental Protection Agency (EPA) inspection of your facility, several violations pertaining to the RCRA land disposal restrictions were noted. The regulations which set the prohibitions on management of hazardous wastes containing spent solvents (F001-F005) became effective on November 8, 1986 (51 Fed. Reg. 40636). The regulations which set the prohibitions on management of the California List wastes became effective on July 8, 1987 (52 Fed. Reg. 25787). The regulations which set the prohibitions on management of the First-Third of listed hazardous wastes became effective on August 17, 1988 (53 Fed. Reg. 31211). The regulations which set the prohibitions on management of the Second-Third of listed hazardous wastes became effective on June 23, 1989 (54 Fed. Reg. 26647). These regulations can be found at 40 CFR Part 268 and revisions to Parts 250-265 and 270.

The State of Texas is authorized by EPA to conduct a hazardous waste program under Section 3006 of RCRA, 42 U.S.C. §6926. However, the authorized State program does not include the provisions of Hazardous and Solid Waste Amendment (HSWA), Public Law No. 98-616., 98 Stat. 3221 (1984), and regulations promulgated thereunder. Therefore, EPA implements and enforces those regulations which are promulgated pursuant to HSWA, including the land disposal restrictions.

The EPA inspector noted that GATX Terminals Corporation made shipments of restricted wastes to Rollins Environmental Services, Inc., without attaching the proper notification form. Failure to attach notifications constitutes a violation of §268.7, which states in part:

(a) Except as specified in §268.32 or §268.43 of the part, the generator must test his waste, or test an extract developed using the test method described in Appendix I of this part, or use knowledge of the waste, to determine if the waste is restricted from land disposal under this part.

(1) If a generator determines that he is managing a restricted waste under this part and the waste does not meet the applicable treatment standards set forth in Subpart D of this part or exceeds the applicable prohibition levels set forth in §268.32 or RCRA §3004(d), with each shipment of waste the generator must notify the treatment or storage facility in writing of the appropriate treatment standards set forth in Subpart D of this part and any applicable prohibition levels set forth in §268.32 or RCRA §3004(d). The notice must include the following information:

(i) EPA Hazardous Waste Number;
(ii) the corresponding treatment standards and all applicable prohibitions set forth in §268.32 or RCRA §3004(d);
(iii) the manifest number associated with the shipment of waste; and
(iv) waste analysis data, where available.

The inspector also noted that GATX had one hazardous waste drum in storage without an accumulation start date. Failure to mark each container with the date accumulation began constitutes a violation of §268.50, which states in part:

(a) (2) An owner/operator of a hazardous waste treatment, storage, or disposal facility stores such waste in tanks or containers solely for the purpose of the accumulation of such quantities of hazardous waste as necessary to facilitate proper recovery, treatment, or disposal; and

(i) each container is clearly marked to identify its contents and the date each period of accumulation begins; and

(ii) each tank is clearly marked with a description of its contents, the quantity of each hazardous waste received, and the date each period of accumulation begins, or such information for each tank is recorded and maintained in the operating record at that facility. Regardless if whether the tank itself is marked, an owner/operator must comply with the operating record requirements specified in §264.73 or §265.73.

EPA requires adherence to the regulations found in 40 CFR §268. If you have not already done so, you must take immediate remedial action to implement the 40 CFR (§265 and §268) requirements. You must submit, within thirty (30) days of receipt of this letter, documentation, and a description of the actions you have taken to correct the violations noted above, and to implement the regulations of 40 CFR (§265 and §268). Failure to comply with the requirements of this Warning Letter may subject you to liability for the imposition of penalties of up to twenty-five thousand dollars ($25,000) for each day of continued non-compliance, in accordance with §3008 of RCRA, 42 U.S.C. §6928.

All information required by this Warning Letter should be submitted to:

RESPONSE I

Violation: GATX Terminals Corporation made shipments of restricted wastes to Rollins Environmental Services, Inc. without attaching the proper notification as required in 268.7.

Response:

Restricted wastes are transported to Rollins Environmental Services and are accompanied by a Uniform Hazardous Waste Manifest and the form, "Land Disposal Restriction Information - Restricted Waste for Incineration".

The information form includes:

1) EPA Hazardous Waste Number;

2) Corresponding Treatment Standards and all applicable prohibitions set forth in 268.32 or RCRA 3004d;

3) The manifest number associated with the shipment of waste;

4) Waste analysis data.

Attachment "A" contains a blank form.

After the manifest and certification are completed, a copy of the certification is placed in the file and the original accompanies the manifest to the TSD facility (Rollins Environmental Services). Since the LDR inspection, GATX has processed two shipments of restricted waste. Copies of the manifest and LDR certification are in Attachment "B".

GATX

U. S. Environmental Protection Agency
November 13, 1989

RESPONSE II

Violation: GATX had one hazardous waste drum in storage without an accumulation start date.

Response:

Restricted hazardous wastes are stored in thirty (30) gallon and twenty (20) gallon fibre drums to facilitate incineration. Each drum has the label found in Attachment "C", and:

1) Each container is clearly marked to identify the contents and the date each period of accumulation begins.

2) The container labels provide the following information:

* WARNING: "HAZARDOUS"
WASTE
FEDERAL LAW PROHIBITS IMPROPER DISPOSAL.
IF FOUND, CONTACT THE NEAREST POLICE, OR
PUBLIC SAFETY AUTHORITY OR THE
U.S. ENVIRONMENTAL PROTECTION AGENCY

* Proper D.O.T. Name

* UN or NA #

* Generator Information:
  - Name
  - Address
  - City
  - State
  - Zip
  - EPA I.D. Number
  - EPA Waste Number
  - Accumulation Start Date
  - Manifest Document Number

* Warning: "HANDLE WITH CARE! CONTAINS HAZARDOUS OR TOXIC WASTE"

Attachment "D" contains completed labels typically used for the restricted waste stream. Additionally, photographs of drums in accumulation are presented.

LAND DISPOSAL RESTRICTION INFORMATION

RESTRICTED WASTE FOR INCINERATION

LAND DISPOSAL RESTRICTIONS INFORMATION
RESTRICTED WASTE FOR INCINERATION

Customer Name: _____
Customer EPA ID Number: _____
Customer Address: _____
_____
_____

Reference Number: BR/HO/L _____

Under manifest number _____ we are shipping to you for incineration, a waste stream classified by EPA Hazardous Waste Number(s) _____.

A. The EPA land disposal restriction regulations (40 CFR 268)

_____ Apply to this stream, under the following category or categories:

_____ Solvent/dioxin (see Attachment 1)
_____ California list, specifically (see Attachment 2): _____
_____ "First Third" list (see Attachment 3)
_____ "Second Third" list (see Attachment 3A)

_____ Do not apply to this stream. (Skip following questions. Sign on p. 2)

B. The stream must be incinerated because (check one):

_____ 1. Incineration is the treatment technology prescribed by 40 CFR 268.42. (PCBs*; wastes, except wastewaters, containing Halogenated Organic Compounds in total concentration of 1000 ppm or more; and specified first and second third wastes, per Attachments 3 and 3A.)

_____ 2. The stream is an F001-F005 solvent, or a "First Third" or "Second Third" waste with organic or other non-metal treatment standards (Attachment 3 or 3A, Item 1). The following constituents identified in Table CCW or Table CCWE (see Attachment 4) of 40 CFR 268, must be treated to at least the level specified below (use reverse side for additional constituents):

Constituent	Treatment Standard	Per Table CCW	Per Table CCWE

*Only RES (TX) accepts PCBs, for incineration.

_____ 3. The stream is a liquid hazardous waste that is primarily water and contains HOCs in total concentration greater than or equal to 1,000 mg/l and less than 10,000 mg/l HOCs. It must be treated to less than 1,000 mg/l.

_____ 4. The stream is a "Soft Hammer" waste containing organics or other non-metals (Attachment 3 or 3A, Item 5) and must be treat by the best treatment practically available. Enclosed is a copy of the signed and dated demonstration and certification which we have submitted to the EPA Regional Administrator pursuant to 40 CFR 268.8(a)(2)(ii). (For subsequent shipments the same stream, only the certification below need be signed.)

CERTIFIED MAIL NO. P 714 663 087
RETURN RECEIPT REQUESTED

Mr. Allen P. Beinke, Jr.
Executive Director
Texas Water Commission
P. O. Box 13087, Capitol Station
Austin, Texas 78711-3087

Re: GATX Terminals Corporation: SWR 30573 -- Response to the Executive Director's Preliminary Report and Petition for Texas Water Commission Order Assessing Administrative Penalties and Requiring Certain Actions

Dear Mr. Beinke:

In accordance with § 8b(f) of the Texas Solid Waste Disposal Act, 26.136 of of the Texas Water Code, and 31 T.A.C. § 337.35, GATX Terminals Corporation hereby requests an evidentiary hearing before the Texas Water Commission on both the occurrence of certain violations alleged and the amount of the penalty recommended in the above-referenced matter. Each contested violation noticed in the TWC petition of October 31, 1989 is addressed separately below.

I. Violation of § 26.121 of the Texas Water Code.

GATX challenges the occurrence of a § 26.121 violation and the proposed fine for the alleged violation. Specifically, GATX contests the conclusion that the results of the Comprehensive Monitoring Evaluation (hereinafter "CME") on April 13, 1989 first revealed that the hydrocarbon plume at GATX's facility has reached the Houston Ship Channel.

GATX has complied with all applicable groundwater monitoring requirements and worked cooperatively with the Commission to establish an appropriate groundwater monitoring program. GATX began extensively monitoring the groundwater at its plant site in 1987 pursuant to a TWC approved program. Many modifications have been made since that time. On August 2, 1989, GATX submitted an Expanded Groundwater Quality Assessment Plan to help better define the source(s), rate, and extent of

GATX

groundwater contamination. This plan was approved by TWC on August 8, 1989 and is underway. Recent refinements to that plan, expanding the program, also have been incorporated into GATX's groundwater monitoring system. GATX strongly believes that, under the circumstances, it is inappropriate to impose a penalty on GATX for an alleged violation of § 26.121 of the Texas Water Code.

II. Violation of 31 T.A.C. § 335.43.

GATX contests the alleged occurrence of a violation of 31 T.A.C. § 335.43 and the amount of penalty recommended for the alleged violation. The violation and penalty arise out of the alleged operation of the North Holding Basin (hereinafter "NHB") and Tank No. 29.

Contrary to the allegations of the petition, the appropriate regulatory status of the NHB was not resolved in January of 1988. The TWC did not respond to GATX's brief of May 31, 1988 regarding the proper regulatory status of the NHB until May 17, 1989, and even then the staff provided only a verbal response. Meanwhile, on June 22, 1988, GATX submitted a closure plan for the NHB, but the Commission never formally commented on the proposal set forth in that document.

With respect to Tank 29, GATX contests the assertion that the tank is a RCRA unit. EPA cannot effect a regulatory change through references in a preamble as EPA may have attempted to do in its September 2, 1988 preamble to the Hazardous Waste Management System; Standards for Hazardous Waste Storage and Treatment Tank System, 53 Fed. Reg. 34079 (September 2, 1988). If TWC or any agency desires to modify a regulation, it must do so by rulemaking. It has not done so here.

GATX maintains that the penalty proposed for this item is grossly excessive.

GATX

GATX has always cooperated and has in the past worked successfully with the Commission to resolve differences. I believe this is reflected by our previous actions and our ongoing technical activities. Also, GATX has always been in technical accord with the TWC staff and has always responded promptly to TWC matters. In light of our past relationship with your agency and the successful facts meeting on August 23, 1989, GATX was shocked to learn that you were recommending a penalty against us in excess of $200,000. We are in the hope that further conferences may lead to agreement on any outstanding technical issues and the penalty question. If a compromise is reached prior to December 14, 1989, we will amend this answer and withdraw our request for a hearing.

GATX looks forward to working with you in an effort to reach an agreement on these matters.

Very truly yours,

GATX TERMINALS CORPORATION

By: R.E. Butler

Dear Mr. Posnick:

Please find enclosed a Supplemental Soils Investigation for Rail Car and Tank Truck Loading Station No. 4, Tank 26, and Tank 82. This investigation is a supplement to the Expanded Groundwater Quality Assessment Plan (August 1989).

If you have any questions with regard to this proposed scope of work, please feel free to contact me at 512/346-0978.

Sincerely,

David H. Sorrells, P.E.
Vice President

SUPPLEMENTAL SOILS INVESTIGATION FOR T/R NO. 4, TANK 26, AND TANK 82

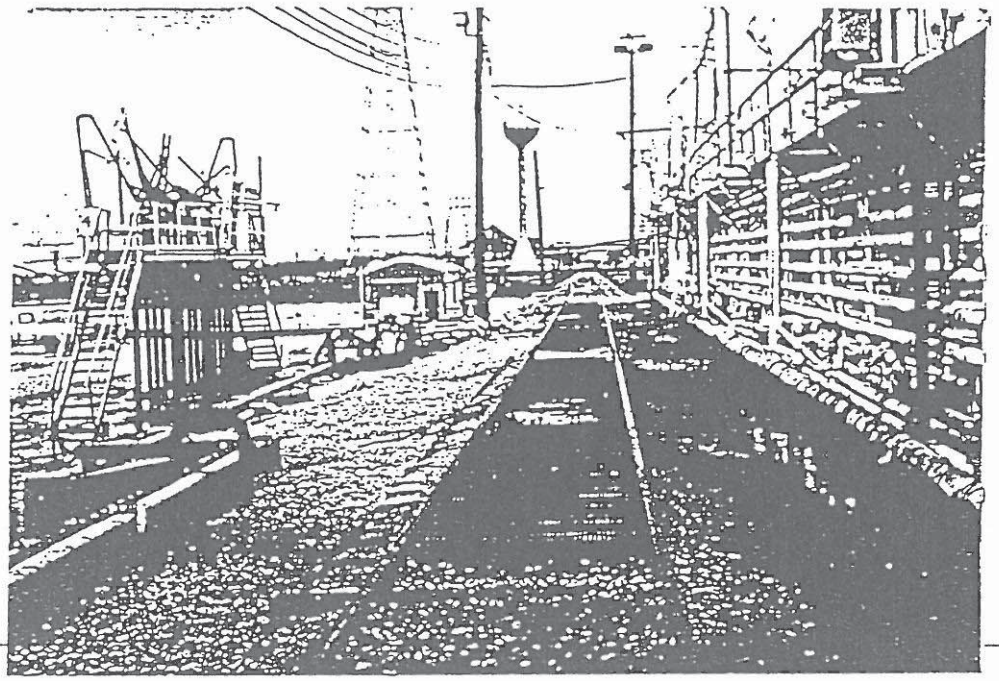
In accordance with the discussions in our December 6, 1989 meeting regarding the RFI scope of work for the GATX/Galena Park facility, it was agreed that a Soil Sampling and Analysis Plan would be submitted immediately for Rail Car and Tank Truck Loading Station No. 4 (T/R No. 4). It is our understanding that the primary area of concern at T/R No. 4 is the manifold area adjacent to the truck loading/unloading station where the soils are visually stained from spillage. This area is shown in Photographs No. 1 and No. 2.

1.0 Objectives and Proposed Scope of Work

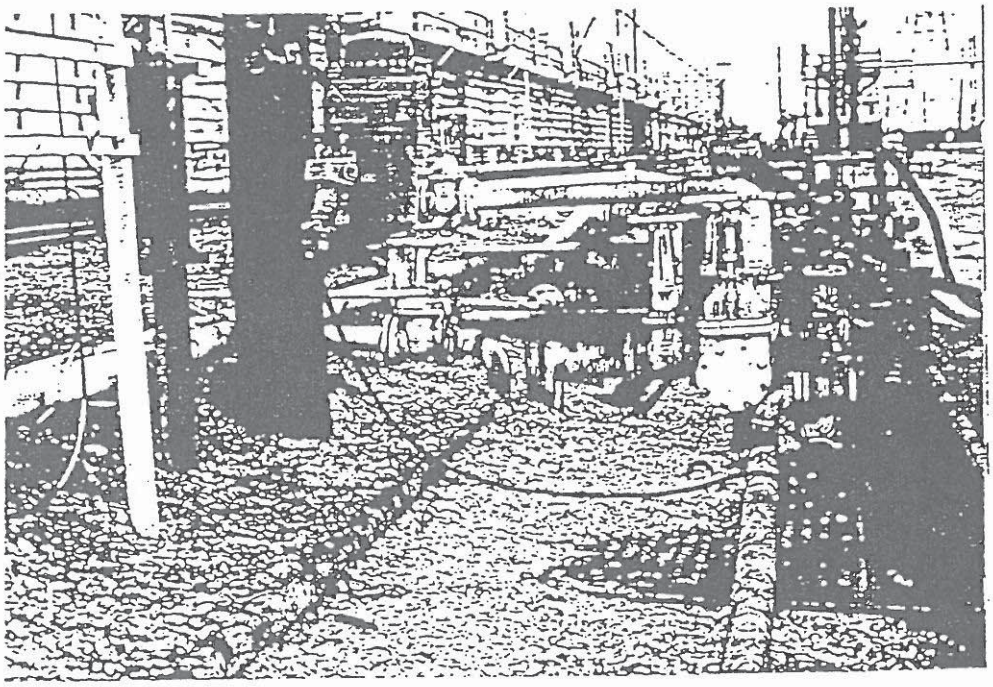
It is the intent of GATX to develop a soil sampling and analysis plan for the T/R No. 4 area and other areas that are of immediate concern to GATX. The activities for these tasks are to be incorporated into the Expanded Groundwater Quality Assessment Plan (EGQAP) which was submitted to the Texas Water Commission in August 1989.

1.1 T/R No. 4

In October 1989, 2 soil borings were advanced directly downgradient (south and east) from T/R No. 4 during the on-going EGQAP. Advancement of a boring directly upgradient (north) of T/R No. 4 was attempted. Drilling ceased at 18 inches when a concrete slab was encountered and was impassable with a conventional drill bit. As part of this supplemental soils investigation, the area around the manifold will be sampled in order to determine the environmental impacts posed at this location. The results of the sampling activities will be used to further characterize the site under the EGQAP and to assist in the decision making process regarding remediation.



Photograph No. 1- Photo of T/R No. 4 looking east. Truck loading/unloading area to left of picture; manifold is in the center of the picture.



Photograph No. 2- Closeup of T/R No. 4 manifold area

1.2 Tank No. 26/No. 82 Areas

GATX has removed Tank No. 26 and Tank No. 82 from the central plant. It is proposed that the soils beneath and in the vicinity will be investigated to determine the vertical and horizontal extent of contamination. In November 1989, 3 soil borings were advanced and one monitor well was installed in this area during activities associated with the on-going EGQAP. The borings were advanced to a depth where the soils, by field determination methods, appeared not to be contaminated. Approximately 30 soil samples were collected for chemical analysis.

To further identify the chemical constituents in the uppermost soils and define the horizontal extent of contamination, a supplemental soils investigation is proposed. Information from the investigation will be used to expand the base of knowledge of the EGQAP. This information may also have direct bearing upon the identification of sources of groundwater contamination observed in the Southeast Holding Basin (SEHB).

2.0 Groundwater Quality Assessment - Investigative Approach

Due to physical restraints at the areas to be investigated, different techniques will be employed to meet project objectives.

2.1 Methods

2.1.1 T/R No. 4

The T/R No. 4 area is not accessible with a conventional drilling rig in the manifold area. It will be necessary to perform borings with a hand auger or portable trailer mounted rig at this location. It is possible that the hand auger

method will preclude the ability to collect an undisturbed sample of the subsurface soils and may result in the loss of some volatile organics from the samples collected for analysis. The losses are not expected to be significant and since the levels of volatile organics are expected to be greatly in excess of detection limits, the use of the hand auger technique is deemed appropriate. Sampling using these methods is limited to approximately 15 feet below ground surface.

A conventional hollow-stem auger rig will be used to advance a boring directly upgradient or north of T/R No. 4. Prior to drilling, a special bit and saw for cutting concrete will be used to remove a portion of the concrete slab.

2.1.2 Tank No. 26/No. 82

The areas where Tanks No. 26 and No. 82 were formerly located are both accessible with a drilling rig. For these areas, it is proposed that the portable trailer mounted rig be used for boring and sampling to 15 feet below ground surface.

2.2 Proposed Soil Boring and Sampling Investigation

The soil boring and sampling activities for this investigation will be performed by ENSR as part of the on-going EGQAP. The tentative locations of proposed borings are shown in Figure 2-1. This figure also provides the location of existing borings in the area. Figure 2-2 shows the subject area of this investigation in relation to the comprehensive investigation map identified as Figure 4-1 in the EGQAP.

2.2.1 T/R No. 4 Area

A total of 3 borings are proposed for the T/R No. 4 area. One will be located directly north of the loading rack. Due

DRAWN BY CS	DATE 5-30-89	PROJECT NO. 2870-0
CHKD BY	REVISED 6-1-89	DWG NO.

to impaired access in the manifold area, thus necessitating the need for hand augering or use of a portable drill rig, it is recommended that the soils investigation be limited to three borings.

Prior to commencing boring activities, it will be necessary at these locations to remove the large rocks that are part of the railway subgrade. It is not proposed that samples of the rinsate from these rocks be analyzed. From a point immediately below the subgrade, the borings will be advanced to an approximate depth of 15 feet. Continuous soil samples will be obtained for the entire depth of penetration.

Discrete samples for each one foot interval will be collected from the auger or from a Shelby tube if the portable drill rig is utilized. At a minimum, two soil samples will be selected for chemical analysis from specific depth intervals in each boring. In accordance with the sampling approach utilized in the EGQAP, samples selected for analysis will be determined by a combination of visual, olfactory, and high PID reading determinations. PID head space reading will be for each sample collected and the results of those readings will be recorded. Relative levels of contamination can be inferred by comparing PID readings to chemical analysis data.

2.2.2 Tanks No. 26 and 82 Areas

The soil investigation for these areas will be performed using a portable trailer mounted drill rig which utilizes solid flight augers. As the boring is advanced, a 4-inch PVC casing will be driven with the hydraulics of the portable rig to maintain an open hole during drilling. The casing is advanced to minimize the influence of cuttings or slough and undisturbed samples. Samples will be obtained in Shelby

tubes which are advanced ahead of the PVC casing. The tentative locations of soil borings are shown on Figure 2-1. It is proposed that four additional borings be placed in the former tank area. With the existing borings in this area, this will then be a total of 8 borings in the former tank area.

At a minimum, two or three soil samples for chemical analysis will be obtained from specific depth intervals in each of the 4 borings. The specific chemical analysis procedures will be the same as those described in Section 4.2 of the EGQAP.

All borings will be immediately grouted from the bottom of the hole to surface with a bentonite/cement grout mixture.

3.0 Soil Sampling and Analysis Plan

All soil samples selected for analysis will be submitted to the ENSR Houston laboratory. Procedures will be the same as those described in Section 6.0, Tables 6-1 and 6-2, and Appendix B of the EGQAP.

4.0 Procedures for Evaluating Soil Data

The evaluation and reporting procedures to be used for this investigation will be the same as those identified in Section 8.0 of the EGQAP.

Although it is intended for the information from this investigation to be incorporated into the EGQAP, a preliminary report of findings from the investigation of the T/R No. 4 area will be submitted within 6 weeks from the date of sample collection.

Re: Spill Incident Report -
Tk 4 - Creosote Storage Tank
GATX Terminals Corporation
Galena Park, Texas 77547
Harris County

Dear Ms. Metters:

Pursuant to section 26.039 of the Texas Water Code, we are providing written notification of a spill of approximately 100 barrels of Creosote from Tank 4.

Discussion

On February 8, 1990, 100 barrels of Creosote was released accidentally from Tank 4. The spill was contained to the dike wall area and did not enter the stormwater system, lift station 1 or the state's waterways.

As the reportable quantity of Creosote is 1 pound, the spill was reported to the National Response Center. The incident report number is 7613 and the reporting officer was Jeff Grimes, United States Coast Guard. Following notification of the NRC, GATX Terminals notified Ms. Marcia Hill of your office.

Once the operational situation stabilized, GATX Terminals began remediation. Remediation included recovery of all flowable liquids and the removal of all affected soil sand solidified product. The liquids were recovered and the affected soils and solidified product are being packaged for incineration. The soil and solidified product are hazardous waste EPA No. U051), and hence fall under the First Third - Land Disposal Restrictions.

Enclosed is a plant plot which indicates the affected area and which remediation efforts are being directed.

If you have any questions or comments please do not hesitate to contact us at (713) 455-1231.

Sincerely,

Lynn R. Jones
Environmental Engineer

P. O. Box 1700
Houston, Texas 77251

Re: Request for As-Built Drawings
Expand Groundwater Quality Assessment Investigation Beneath
HL & P Tower
GATX Terminals Corporation - Galena Park, Texas

Dear Mr. Sullivan:

As a result of a phone conversation with Mr. Jim Spurgeon, GATX Terminals requests one complete set of as-built drawings for the HL & P transmission tower, that serves as channel crossing, directly across from the Deepwater Plant. We are particularly interested in all records and drawings of the foundations and underground support systems. We would provide reimbursement for technical services.

We believe that the transmission tower underground supports may serve as a conduit for the shallow groundwater contamination to proceed to other groundwater zones.

Again, this investigation is directed by an agreed administrative order with the Texas Water Commission, and GATX Terminals is making every effort to define the extent of the groundwater contamination at our facility.

We sincerely appreciate your consideration of our request. Please contact us at (713)455-1231 with any questions.

Sincerely,

Lynn R. Jones
Environmental Engineer

Re: Spill Incident Report
Tank 10-4: DMA-6 (2,4,Dichloro-phenoxyacetic acid, dimethylamine salt)
Storage Tank
GATX Terminals Corporation
Galena Park, Texas 77547
Harris County

Dear Ms. Metters:

Pursuant to Section 26.039 of the Texas Water Code, GATX Terminals is providing written notification of a spill of approximately 500 pounds of DMA-6 (2,4,Dichloro-phenoxyacetic acid, dimethylamine salt).

Discussion:

On February 28, 1990, 500 pounds of DMA-6 was released accidentally from Tank 10-4. The spill was contained to the dike wall and did not enter the stormwater system or the State's waterways.

As the reportable quantity of 2,4,Dichloro-phenoxyacetic acid, dimethylamine salt is 100 pounds, the spill was reported to The National Response Center. The Incident Report Number is 10218 and the reporting officer was James Heard, United States Coast Guard. Following notification of the NRC, GATX Terminals notified Mr. Ata Rahman of your office.

Once the operational situation stabilized, GATX Terminals began remediation. Remediation included recovery of all flowable liquids and the removal of all affected soils. The liquids were recovered and the affected soils are being packaged for incineration. The soil is hazardous waste (i.e. EPA Waste No. U240), and hence falls under the Third Third - Land Disposal Restriction.

GATX

If you have any questions, please do not hesitate to contact us at 713-455-1231.

Sincerely,

Lynn R. Jones
Environmental Engineer

Ms. Anne C. Dobbs, Chief
Texas Water Commission
Hazardous & Solid Waste Division
P. O. Box 13087, Capitol Station
1700 North Congress Avenue
Austin, TX 78711-3087

Dear Ms. Dobbs:

Attention: Mr. Robert Hahn:

I would like to take this opportunity to confirm your phone conversation of July 10, 1990 with Mr. Jon Simpson of ENSR and summarize for you the results of groundwater sampling to date, at the North Holding Basin (NHB). These data are presented in tabular form by well number and parameter. Also attached is an updated potentiometric surface map for the unit depicting monitor well locations.

The first groundwater sampling event at the NHB included analysis of volatile and semi-volatile organics in MW 3, 4 and 5, and the full scan of Appendix IX constituents in the upgradient (MW-1) and most downgradient well (MW-2): Tables 4-5 through 4-9 present these results.

In the subsequent sampling event, volatile and semi-volatile organic analysis was repeated, in addition to groundwater contamination indicator parameters, groundwater quality parameters and drinking water standards of Appendix III. These results are presented in Tables 4-10 through 4-12.

As Mr. Hahn has discussed with Mr. Simpson, GATX will continue quarterly sampling at the NHB for the following parameters:

- -- GW indicator parameter (pH, specific conductance, total organic carbon, total organic halogens)
- -- Volatile organic compounds (By Method 8240)
- -- Semi-volatile organic compounds (B/N Fraction by Method 8270)

These analyses are being performed so that an accelerated determination of possible hazardous constituents released from the NHB can be made. This allows GATX to comply with requirements set forth in 40 CFR 265.92 and 265.93, to establish background groundwater chemistry. We also understand that this represents an amended groundwater monitoring program.

GATX

A report on well installation and discussion of stratigraphy and the results of sampling will be submitted the final week of July, 1990. Should you have any questions or recommendations after reviewing these data, please call me at (713) 999-6905 or Jonathan Simpson at (713) 520-9900.

Sincerely,

GATX Terminals Corporation

Hazardous & Solid Waste Enforcement Section
1700 North Congress Avenue
Austin, Texas 78701

Re: GATX Terminals Corporation - Galena Park Facility SWR No. 30573-Enforcement Order Dated January 31, 1990.

Dear Ms. Dobbs:

Pursuant to the above - referenced Enforcement Order, I am hereby submitting the following documents on behalf of GATX Terminals Corporation for filing with the Texas Water Commission:

1. A Part B hazardous waste permit application for the Southeast Holding Basin and the North Holding Basin;

2. A groundwater compliance plan application; and

3. A Remedial Facility Investigation Workplan for tanks Nos. 29, 50, 51, 116, 117, 25-1 and oil/water separator. (3 COPIES (2-TWC-AUSTIN, 1-TWC-DIST. 7)

In order for the Part B permit application to be considered complete, I am also hereby submitting the following material:

(a) original and four (4) copies of the completed Parts A and B permit application;

(b) original and four (4) copies of all associated reports and documentary materials;

(c) six (6) additional copies of Section I of the application;

(d) the appropriate application and notice fee of $2937.00, check # 13532 established by 31 T. A. C., 305.53 which appears in Section X of the Part B application and which supersedes the Part A fee instructions; and

(e) the appropriate application fee of $150.00, check # 13533 for the Compliance Plan Application.

In accordance with the Enforcement Order, I am submitting duplicate copies of the above - referenced materials to:

Texas Water Commission
District 7 Southeast Region
5144 East Sam Houston Pkwy. North
Houston, Texas 77015

Thank you for your prompt attention to this matter. If you should have any questions, please do not hesitate to contact me at (713) 455-1231.

Sincerely,

Paula Murph

CR

CONFERENCE RECORD

Project: GATX Terminals Corporation, ISW No.30573

Conference Date: February 19, 1991 Place: SFA Building

Type of Conference: Compliance Plan Ground-Water Monitoring

Attendance: See Attached.

Summary:

Terminal Environmental Manager Paula Mrozek and Regional Environmental Manager Terry McAdams of GATX Terminals Corporation met with TWC staff in regard to the proposed modifications to the ground-water monitoring program submitted in the Compliance Plan dated September 14, 1990.

The major points of discussions are listed below:

1. GATX is not required to implement the proposed Compliance Plan ground-water monitoring program until the Permit and the Compliance Plan are issued; however, GATX may implement the proposed reduction in number and parameters of ground-water sampling pending a review of relevant reports by TWC.

2. The priority at this site is to remediate aqueous and non-aqueous phase contaminants in the ground water and in the soils, and to ascertain the sources of these contaminants for rapid and effective remediation. The 2 recovery wells on-site are not effective in extracting DNAPLs. GATX will submit a 10 page ENSR proposal for upgrading these recovery wells.

3. Part 2 of the Compliance Plan application concerns risk assessment studies and establishing an Alternative Concentration Limit (ACL). TWC's position is that all non-aqueous phase liquid contaminants must be cleaned-up before ACL is applicable since ACL only applies to dissolved-phase contaminants.

4. Part 3 of the Compliance Plan application outlines the corrective action program that will be implemented based on the Preliminary Engineering Feasibility Assessment Study. This part will be submitted by GATX according to the proposed schedule.

5. An assessment of all tanks at the central portion of the GATX facility is currently being conducted. Soil vapor surveys have also been conducted around several tanks. GATX may also need to implement a soil boring program to further assess vertical extent of soil contamination and to delineate possible sources.

6. Additional source investigation of the areas west and northwest of MW-15, MW-16, MW-17, GWAB-4, and GWAB-5 was recommended by ENSR in the Expanded Groundwater Quality Assessment of the Former Southeast Holding Basin report dated June 14, 1990. This investigation will assess possible sources upgradient of the areas with known ground-water and soil contamination, but GATX has not initiated this investigation.

7. GATX was not able to clean-close the North Holding Basin. A bioremediation project has been conducted and a report will be sent to Allan Posnick for review. A closure plan for this basin will also be sent to Allan.

8. The North Holding Basin (NHB) is currently under interim ground-water monitoring status. The ground-water samples are analyzed for indicator parameters and volatile organics (Method 8240) on a quarterly basis, and the semi-volatiles are analyzed on an annual basis. GATX is required to perform statistical analyses on VOCs and indicator parameters. If they fail the t-test, then GATX will have to submit a proposal for assessment of the NHB.

9. GATX has indicated that dichloroethane (DCA) is present in the ground water samples taken from monitor wells along the perimeter of the NHB. DCA is found in highest concentration in the upgradient well and GATX suggests that the DCA may have originated from a drum recycling facility upgradient of the NHB. It is GATX's responsiblity to prove such a claim and until it is proven, GATX needs to submit an assessment plan to TWC and they also need to submit a Compliance Plan application for the NHB after its closure certification.

10. GATX is not aware of the reasons that prompted the investigations of Tract A Solid Waste Management Unit that is located on the north side of the property. The Tract A area was used as a general dumping ground and also had received tank bottoms. There are 7 or 8 monitor wells around the unit that were installed by IT Corporation when it conducted a preliminary investigation. It will be acceptable to TWC that GATX submit these previous results to Bill Shafford of the Permits Section for review.

Re: Notification under 40 CFR 265.93

Dear Executive Director:

As required by 40 CFR 265.93(d)(1) GATX has determined there is a statistically significant increase in groundwater conditions in the area of the North Holding Basin (NHB) at the Galena Park facility. The NHB is inactive and is undergoing closure activities per TWC guidance & approvals.

It has not yet been determined if the NHB is affecting the groundwater; however, interim status groundwater monitoring has indicated a release of one component: 1-,2-Dichlorethane.

An Annual Groundwater Summary Report outlining the groundwater activities conducted was submitted to TWC on February 15, 1991.

Within 15 days of this notice an outline for a Groundwater Assessment Program will be submitted to your agency.

If you need additional information, do not hesitate to contact me at (713) 455-1231.

Sincerely,

Paula Mrozek

Re: GATX Galena Park Facility
North Holding Basin
Ground Water Monitoring Activities

Dear Executive Director:

This letter addresses a number of topics relevant to GATX's ground water monitoring program in the North Holding Basin (NHB) area of its Galena Park facility. A discussion of all planned reporting and sampling activities is presented with a schedule timeline. The Ground Water Assessment Plan Outline, which fulfills the requirements in 40 CFR 265.93(a), is presented as an attachment.

A schedule timeline is included with this letter illustrating GATX's intended activities in the NHB towards complying with the established requirements. All sampling events have been entered on the timeline with their tentative dates. Similarly, reporting dates are listed.

GATX intends to comply with the guidelines specified in 40 CFR 265 and 31 TAC. In addition to these requirements, the Texas Water Commission (TWC) has specified, through written and phone correspondence, analytical parameters that GATX must analyze for. These parameters are not specified in 40 CFR 265. GATX believes these requirements are as stringent or more so in complying with 40 CFR 265. The Texas Water Commission has also allowed variance by recommending to GATX the installation of new monitoring wells to collect more ground water contamination and gradient information in the NHB area.

These additional wells will be installed as part of an information gathering effort and not as part of a ground water assessment program, as agreed upon by Robert Hahn (TWC) and GATX. The proposed locations of these wells are to the northwest, north and southeast of the NHB. The purpose of these new wells is to better identify the direction of ground water flow in the vicinity of the NHB, as well as to provide additional information on potential sources of ground water contamination.

Proposed future sampling activities include two quarters of sampling (June and September, 1991) on the new wells. Water level measurements will be taken in all seven monitoring wells during these additional two quarterly sampling events. The three new monitoring wells will be sampled during both the June and September, 1991 sampling events; the existing monitoring wells will be sampled only during the September 1991 sampling event. The September 1991 sampling event will satisfy GATX's semi-annual ground water monitoring requirements.

The samples will be analyzed for the same contaminant parameters currently monitored in wells MW-1 through MW-5. The information provided will assist in determining whether the NHB is the source of ground water contamination or if its source is another facility in the upgradient direction. The existing wells lie too close to the NHB for GATX to make this determination.

Water level data collected from the June and September sampling events will be used to generate potentiometric surface maps for the area. The data from these two quarters of sampling on the three new wells will be qualitatively compared to the four quarters of data obtained from MW-1 through MW-5 during the period from April, 1990 to March, 1991. Statistical comparisons will be made if appropriate. The information provided by these wells will assist GATX in determining the origination of ground water contamination and developing a final Assesssment Plan.

Sampling of wells MW-1 through MW-5 in the NHB area will be done on March 26-27 to obtain a fourth quarter of sampling data for statistical analyses (in accordance with 40 CFR 265.92). Samples will be analyzed for the following parameters:

- Ground Water Indicator Parameters; and
- Volatile Organic Compounds.

This parameter list was agreed upon by the TWC and GATX over the phone and mentioned in a letter to Ms. Anne Dobbs (TWC) from GATX, dated July 17, 1990.

The data from the fourth quarter sampling event will be combined with the first three quarters of data to arrive at mean and variance data for the upgradient and downgradient data sets. The upgradient data will then be compared to the downgradient data to determine if statistically significant levels of ground water contaminants have been detected. An addendum report, which will include the fourth quarter data, is required to supplement the data presented in ENSR Consulting and Engineering's report entitled "1990 Annual Ground Water Monitoring Report for the NHB".

The previously mentioned two quarters of sampling (June and September, 1991) will also be used in a statistical analysis to determine whether ground water has been impacted (The second sampling event will fulfill the semi-annual sampling criteria). If so, a confirmation sampling event will be necessary.

If confirmation samples are needed, as specified in 40 CFR 265.93(c)(2), sampling will take place immediately after the second of the two additional quarters of sampling (semi-annual). Its approximate date would be in the second week in October.

If statistically significant increases in ground water concentrations of constituents in the upgradient or downgradient over the upgradient wells are observed, as specified in 40 CFR 265.93(d)(1), GATX will notify the EPA Regional Administrator in writing and development of a Ground Water Assessment Plan will be completed based on the attached outline. Written notification was submitted to the TWC on February, 1991, stating that statistically significant levels of 1,2-dichloroethane (1,2-DCA) were found in the downgradient wells in the NHB area. Formal notification of the EPA Regional Administrator has not been performed because GATX lacks four full quarters of data.

GATX's Ground Water Assessment Plan Outline has been prepared in accordance with 40 CFR 265.93(a) and is designed to help determine the following:

- Whether hazardous waste or hazardous waste constituents have entered the ground water;
- The rate and extent of migration of hazardous waste or hazardous waste constituents in the ground water; and
- The concentrations of hazardous waste or hazardous waste constituents in the ground water.

This Ground Water Assessment Plan Outline is subject to change should results of the proposed three new wells reveal a different scenario from that expected. Also, should confirmation sampling be necessary, the results will be used in determining the best Ground Water Assessment Plan.

In submitting this letter and Assessment Plan Outline, GATX Terminals Corporation believes that they are within the guidelines of 40 CFR 265, 31 TAC and TWC recommendations. Please notify me with questions regarding the content of this letter or the Assessment Outline at (713)455-1231. GATX is willing to meet with the TWC in Austin to discuss any matters that require more attention.

Sincerely,

GATX Terminals Corporation

Paula Mrozek
Environmental Manager

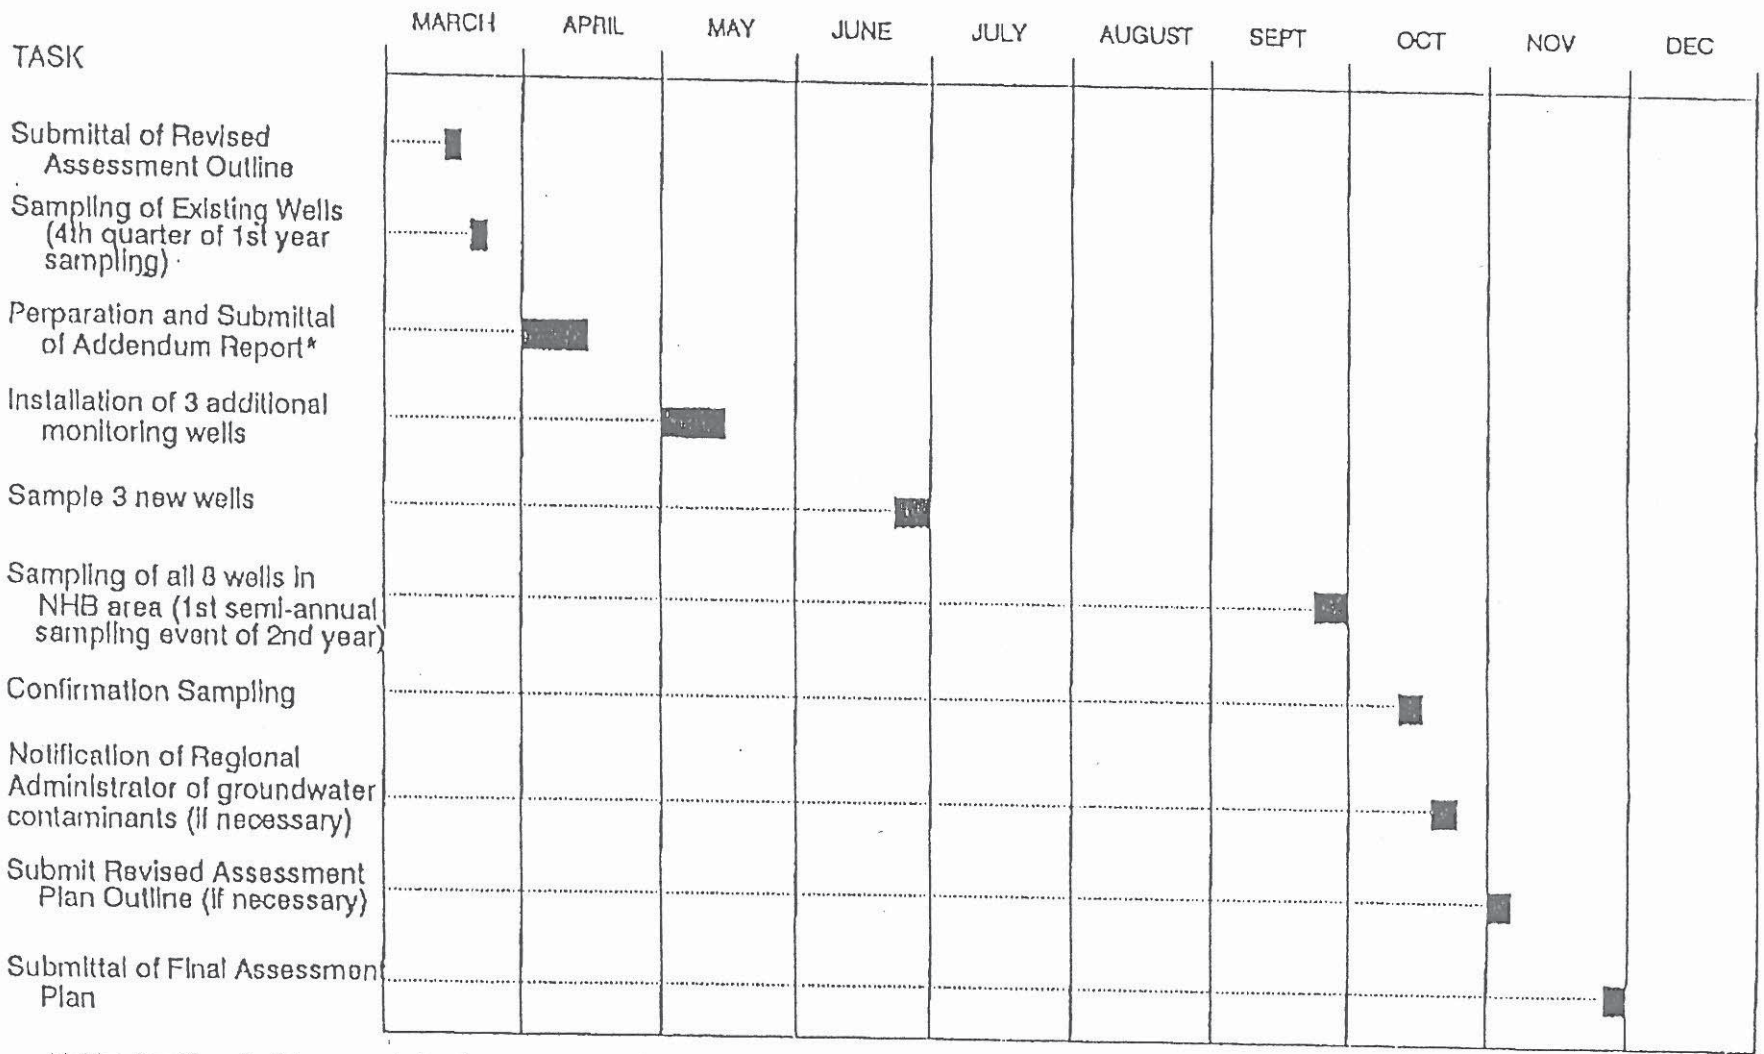
NHB GROUNDWATER ACTIVITIES SCHEDULE



*Addendum Report will incorporate fourth quarter groundwater sampling data into ENSR's 1990 report.

GATX

GROUNDWATER QUALITY ASSESSMENT OUTLINE
GATX GALENA PARK FACILITY
NORTH HOLDING BASIN

1.0 Introduction

- 1.1 Objectives of Assessment Activities (40 CFR 265.93(a))
  - 1.1.1 Determination of the Source of Groundwater Contamination
  - 1.1.2 Determination of the Rate and Extent of Migration of Groundwater Contamination
  - 1.1.3 Determination of the Magnitude of Groundwater Contamination

2.0 Background Information

- 2.1 General Site Description
  - 2.1.1 Location
  - 2.1.2 Regional Geology and Hydrogeology
- 2.2 Facility Description
  - 2.2.1 GATX Galena Park Facility
  - 2.2.2 North Holding Basin
    - 2.2.2.1 Operation
    - 2.2.2.2 Closure
- 2.3 Groundwater Conditions - North Holding Basin
  - 2.3.1 Existing Groundwater Monitoring System
    - 2.3.1.1 Previous Investigations
    - 2.3.1.2 Monitoring Well Specifications
    - 2.3.1.3 Shallow Geologic Conditions

2.3.2 Groundwater Flow Conditions

2.3.2.1 Direction of Groundwater Flow (Potentiometric Surface Maps)
2.3.2.2 Surface Water - Groundwater Relationship

2.3.3 Groundwater Quality Conditions

2.3.3.1 Historical Groundwater Quality Data
2.3.3.2 Up-gradient Groundwater Quality Evaluations
2.3.3.3 Down-gradient Groundwater Quality Evaluations

2.4 Evaluation of Existing Data Relative to Groundwater Quality Objectives

2.4.1 Source of Groundwater Contamination

2.4.2 Rate and Extent of Migration of Groundwater Contamination

2.4.3 Magnitude of Groundwater Contamination

2.5 Rationale for Implementation of Groundwater Quality Assessment

3.0 Groundwater Quality Assessment Activities

3.1 Identification of Specific Activities Required to Satisfy Groundwater Quality Contamination Objectives (specific activities selected from potential activities identified in the following sub-subsections based on available background data)

3.1.1 Potential Activities to Identify Source of Groundwater Contamination

3.1.1.1 Facility Record Review and Sampling of Potential Facility or Other Contamination Sources and Comparison of Potential Source Characteristics with Available Groundwater Quality Data
3.1.1.2 Soil Sampling and Comparison of Results with Available Groundwater Quality Data
3.1.1.3 Groundwater Sampling of Existing Monitoring Wells
3.1.1.4 Installation and Sampling of Additional Monitoring Wells

3.1.2 Potential Activities to Determine the Rate of Migration of Groundwater Contamination

3.1.2.1 Water Level Measurements in Existing Monitoring Wells for Potentiometric Surface Map Development
3.1.2.2 Installation and Water Level Measurements in Additional Monitoring Wells for Potentiometric Surface Map Development
3.1.2.3 Determination of Hydraulic Characteristics of Contaminated Aquifer - Literature Review or Testing (slug or pump tests in existing or additional monitoring wells)

3.1.2.4 Determination of Groundwater - Surface Water Interactions (additional wells, monitoring of water levels in surface water bodies)

3.1.3 Potential Activities to Determine the Extent and Magnitude of Groundwater Contamination

3.1.3.1 Groundwater Sampling of Existing Monitoring Wells
3.1.3.2 Installation and Sampling of Additional Monitoring Wells

3.1.4 Selection of Analytical Parameters for Potential Sampling Activities

3.1.4.1 Waste Sampling (Section 3.1.1.1)
3.1.4.2 Soil Sampling (Section 3.1.1.2)
3.1.4.3 Groundwater Sampling (Sections 3.1.1.3, 3.1.1.4, 3.1.2.1 and 3.1.2.2)

3.1.5 Field QA/QC Sampling Requirements

3.1.5.1 Waste Sampling (Section 3.1.1.1)
3.1.5.2 Soil Sampling (Section 3.1.1.2)
3.1.5.3 Groundwater Sampling (Sections 3.1.1.3, 3.1.1.4, 3.1.2.1 and 3.1.2.2)

3.1.6 Field Sampling Plan

3.1.6.1 Waste Sampling (Section 3.1.1.1)
3.1.6.2 Soil Sampling (Section 3.1.1.2)
3.1.6.3 Groundwater Sampling (Sections 3.1.1.3, 3.1.1.4, 3.1.2.1 and 3.1.2.2)

3.1.7 Field QA/QC Sampling Requirements

3.1.7.1 Waste Sampling (Section 3.1.1.1)
3.1.7.2 Soil Sampling (Section 3.1.1.2)
3.1.7.3 Groundwater Sampling (Sections 3.1.1.3, 3.1.1.4, 3.1.2.1 and 3.1.2.2)

3.1.8 Development and Submittal of a Groundwater Quality Assessment Plan as required by 40 CFR 265.93(d)(2) - specifics of required activities including type, location, number of samples, etc. based on result of Sections 3.1.1 through 3.1.7

3.2 Implementation of Groundwater Assessment Field Activities Specified in Groundwater Quality Assessment Plan (Section 3.1.4) - (All potential activities identified in the following sub-subsections, however only activities specified in Groundwater Assessment Plan will be performed. Specifics of each activity will also be defined in the Groundwater Assessment Plan).

3.2.1 Facility Records Review

3.2.2 Selection of Analytical Parameters for Sampling Activities

3.2.3 Sampling of Facility or Other Potential Contamination Sources

3.2.4 Soil Sampling

3.2.5 Additional Monitoring Well Installation

3.2.6 Monitoring Well Water Level Measurements

3.2.7 Aquifer Testing

3.2.8 Surface Water Level Measurements

3.2.9 Groundwater Sampling

3.2.10 Field QA/QC Sampling

3.2.11 Schedule for Field Assessment Activities

3.3 Data Evaluation with Respect to Assessment Objectives (Section 1.1)

3.3.1 Compile, Compare and Review All Analytical Data to Determine the Source, Extent and Magnitude of Groundwater Contamination

3.3.1.1 Facility or Other Potential Source Samples
3.3.1.2 Soil Samples
3.3.1.3 Groundwater Samples
3.3.1.4 Laboratory and Field QA/QC Samples

3.3.2 Review All Groundwater Flow Data to Determine Groundwater Flow Conditions

3.3.2.1 Groundwater Water Level Data
3.3.2.2 Aquifer Hydraulic Characteristics Data
3.3.2.3 Surface Water Level Data

3.4 Groundwater Quality Assessment Report Preparation

3.4.1 Report Contents

3.4.1.1 Discussion of Background Information (Section 2.0)
3.4.1.2 Summary of Groundwater Assessment Field Activities (Section 3.2)
3.4.1.3 Evaluation of All Data in Terms of Assessment Objectives (Section 1.1)
3.4.1.4 Recommendations for Future Activities (ie. monitoring, additional investigations, remediation, etc.)
3.4.1.5 Submittal of Report to TWC (within 15 days of completion)

PRELIMINARY SITE CHARACTERIZATION REPORT
FIELD AND ANALYTICAL ACTIVITIES
FORMER PIT
GALENA PARK, TEXAS

1.0 INTRODUCTION

IT Corporation (IT) is pleased to submit this preliminary report of field and analytical activities conducted for GATX Terminals Corporation (GATX) for the characterization of a former waste disposal pit in Galena Park, Texas. The site is located north of Clinton Drive, west of Hunters Bayou and east of Panther Creek as shown on Figure 1.

The purpose of this investigation was to characterize the chemical constituents in the disposal pit, determine the vertical and horizontal extent of contamination, determine the impact of contaminants on the shallow groundwater, prepare an estimate of the volume of impacted material within the pit, and to evaluate remediation alternatives.

The scope of work contained in our proposal of May, 1989 divided our work effort into two categories: (1) Field and Analytical work and (2) an evaluation of remedial alternatives. The field and analytical effort included:

- Excavate nine shallow trenches;
- Drill eleven soil borings;
- Install six shallow groundwater monitor wells;
- Chemical analyses of 21 waste and soil samples and 6 groundwater samples; and
- A report on the field and analytical work.

The evaluation of remedial alternatives included the following:

- In-place closure;

- On-site treatment, bioremediation and waste fixation;
- Clean closure;
- Cost estimates for the alternatives; and
- Remediation evaluation report.

Based on the initial field investigation it was determined that additional field work would be needed to determine the extent of the pit and its effects on the soils and groundwater. Two additional trenches were excavated on the south side of the pit, two additional monitor wells were installed south of the pit, and additional chemical analyses were conducted of soils and ground water.

The site served as an active disposal pit during at least two distinct time periods. The pit received unknown types and volumes of materials during the 1950's to early 1960's. From the early 1970's until 1980 or 1981, the pit received mainly phenolic tank bottoms and other wastes. No records were kept of materials disposed of in the pit, but preliminary evidence and storage records from the terminal suggests a high probability of creosote wastes and phenols being present in the pit. Aerial photographs from 1980 show the pit as being partially filled, and in January, 1981 an aerial photo shows the pit as completely filled.

A 1989 preliminary investigation of the former waste disposal pit confirmed the presence of phenolic wastes in the pit. Other results of that investigation found constituents of fuel oils, creosote and coal tar. Fragments of steel drums were also found during that field phase of the investigation. The soil was affected by the wastes to a depth 11 feet below grade and the estimated volume of wastes and impacted soils was approximately 6,600 cubic yards.

The remainder of this report provides detailed discussions regarding the field activities and analytical work performed by IT for this project. Section 2.0 provides data on the site area survey. Section 3.0 discusses the details of

the field investigation, while sections 4.0 and 5.0 discuss the geology and hydrogeology of the region and site. Section 6.0 and 7.0 discuss the analytical program and the analytical results, respectively. Conclusions are presented in Section 8.0 and Section 9.0 discusses recommendations for additional work.

The results of this phase of the investigation indicates that the pit contains a wide variety of chemical contaminants, that the volume of affected soils is approximately 6,350 cubic yards, that the soils within the pit are affected to a depth of approximately 18 feet, that groundwater beneath the pit has been contaminated, and that groundwater contamination has moved beyond the boundaries of the pit.

We recommend the following course of action in terms of this site.

1. Notification of the Texas Water Commission.
2. Additional soil borings and monitor wells to define the extent of contaminant migration in the groundwater.
3. Additional chemical analyses of soils from the soil borings and monitor wells.
4. An additional round of groundwater analyses.
5. Computer modeling of groundwater flow and contaminant migration.

2.0 SITE AREA SURVEY

The site is located north of Clinton Drive in Galena Park, Texas (Figure 1). It is less than a mile north of the Houston Ship Channel. Hunting Bayou is approximately a half mile to the northeast and Panther Creek is a quarter mile to the southwest of the site. Hunting Bayou and Panther Creek both empty into the Houston Ship Channel.

2.1 LAND USE

Land use in the vicinity of the site can be classed as multiuse. Shipping and transportation industries generally dominate land use south of Clinton Drive and includes the location of the GATX terminal. Several large above ground storage tanks owned by GATX are located directly east of the site. A municipal water treatment plant is located at the intersection of Federal Road and Clinton Drive approximately a half mile east of the site. Residential areas of Galena Park are found within a quarter mile to the west of the site. Numerous buried petroleum and natural gas pipelines pass within a quarter mile on the south, west, and north of the site. A Texaco crude oil pipeline passes through the south side of the site (Figure 2).

2.2 CLIMATE

Climate in the region is dominated by the warm waters of the Gulf of Mexico. Prevailing winds are from the south or southeast throughout the year except for occasional cold fronts from the north in December and January. The mean daily maximum temperature is 79°F and the mean daily minimum is 59°F on an annual basis. On average 7 to 15 days per year have a reported low of 32°F or less. These low temperatures usually last only a few hours. On a monthly basis, rainfall is evenly distributed throughout the year. March is the "driest" month with approximately 2.67 inches of rain while December is usually the wettest with almost 4.5 inches of rain. The rain often occurs in the form of thunderstorms. The area is frequently subject to tropical storms and occasional hurricanes. Average annual rainfall is 46 inches.

3.0 FIELD INVESTIGATION

The field investigation of the former waste disposal pit site was conducted between November and December, 1989 and included three activities: trenching, soil borings, and monitor well installation and sampling. The trenching was undertaken to define the horizontal and possibly the vertical extent of the former pit and to assist in determining the type or types of buried wastes. Soil borings were drilled and sampled to further assess the vertical and horizontal extent of wastes, determine the extent of impacted soils beneath and surrounding the pit area, to define the site stratigraphy, and to define the depth of groundwater occurrence. Groundwater monitoring wells were installed inside the pit area and around the pit perimeter to determine the extent groundwater has been impacted by the wastes buried in the former pit. The monitor wells were later sampled. Results of the groundwater sampling are discussed in Section 6.0. Each of these field activities is discussed in detail in the following subsections.

3.1 TRENCHING

Trenching was done to determine the horizontal extent of the former waste disposal pit. Trenching operations began on November 16, 1989 and were completed on November 20, 1989. A Case 580K backhoe (Photograph 1, Appendix A) with a one eighth cubic yard capacity bucket, an operator and helper were supplied by GATX and worked under the supervision of an IT field geologist on the excavation of ten trenches at the site. The trench locations are shown in Figure 2.

The length of trenches varied from approximately 22 feet to 50 feet. Depth of the trenches reached approximately 10 feet at some locations, the maximum reach of the backhoe. Trenching was conducted by working radially from outside the pit to inside the pit boundary to eliminate the potential of contaminating areas outside the known boundaries of the pit and to more easily detect the first presence of organic vapor using the HNu. The trenches were backfilled with the excavated soil after they had been examined. The backhoe was decontaminated by high pressure steam wash after completion of each trench. Soil samples from the trenches were randomly selected and analyzed for organic vapors with an HNu meter.

Wastes discovered in the pit area included a black oily coating found on soils near the surface, lumber and metal debris, and bricks (Photographs 2 and 3, Appendix A). Strong organic odors were common. HNu readings reached 27 ppm in the visibly contaminated soils. Heaviest contamination was found in trenches 3 and 4 on the north east side of the pit (Photograph 2-4 Appendix A). Building material debris was also found mainly in trenches on the north and east sides of the pit. A previously unknown underground pipeline was discovered in trench number 7. (Photographs 5-6). The pipeline is oriented such that it may cross or intersect the main Texaco pipeline which crosses the southern portion of the site. The pipeline is believed to be currently inactive, however that has not been confirmed. Areal extent of the pit as determined by the trenching program is depicted in Figure 3.

3.2 SOIL BORINGS

The objectives of the soil boring program were to define the vertical extent of any contamination and to define the site stratigraphy, the depth of groundwater occurrence, and the aquifer thickness for the proper determination of screen intervals for the monitor wells. A drilling rig, crew and auxillary equipment were mobilized to the site on December 1, 1989 and worked under the supervision of an IT field geologist.

In order to meet the above stated objectives, a total of five soil borings were completed within the pit area. The borings were advanced by solid stem auger and terminated between 25 and 30 feet below the surface. Boring logs were constructed for each soil boring and are presented in Appendix B. Upon completion, the borings were grouted to the surface and the locations marked for surveying.

Shelby tubes were used to collect soil samples for lithologic examination. Samples were taken on three foot intervals or at the discretion of the field geologist. The samples were also used to define the vertical extent of the soil/waste mixture zone, the impacted soil zone and the "clean" soil zone. One sample from each of these zones in each soil boring was retained for chemical analysis. All samples were examined for lithology and visible presence of waste and were screened with an HNu meter for organic vapors.

Descriptions of the samples and the results of the HNu examinations are recorded on the soil boring logs in Appendix B. Drilling cuttings and discarded samples were placed in fiber pack drums and disposed of by GATX.

3.3 MONITOR WELL INSTALLATION

Installation of the monitor wells began immediately following the completion of the soil boring program. The eight monitor wells were screened in the first water bearing transmissive zone below the ground surface. A total of six monitor wells were installed around the outside perimeter of the pit and two wells were installed within the pit boundaries.

The monitor wells outside the boundaries of the pit were constructed using four inch Schedule 40 flush threaded PVC casing and screen. Slot size for the screen was 0.010 inch. The well boreholes were advanced with 11 inch O.D. hollow stem augers. The casing and well filter pack were installed through the hollow stem auger. A filter pack of No. 3 sand was placed adjacent to the well screen to a height approximately two feet above the top of the screen. The filter pack was then sealed with a one to two foot thick layer of bentonite pellets. The wells were then grouted to the surface with a cement/bentonite grout. A six inch steel locking protective cover was cemented in place over the top of the riser pipe. A 3 foot by 3 foot concrete pad was constructed around the base of the protective well cover. Construction detail diagrams for the monitoring wells are presented in Appendix C. The location of the monitor wells are shown on Figure 2.

Isolation surface casing was installed in the two wells (MW-1 and MW-2), located within the pit area to protect the borehole from any uphole contamination from the soil/waste mixture zone. A nominal 16 inch borehole was advanced from the surface to approximately 9.5 feet. A ten foot length of 12 inch I.D. schedule 40 PVC was placed in the borehole and driven to a depth of 10 feet. The PVC casing was then tremie grouted in place until grout reached the surface outside the isolation casing. The grout was allowed to set for a minimum of 12 hours before drilling continued. The monitor wells were then completed using the same methods as those located outside the pit boundaries.

Soil samples were collected from the monitor well borings on 3 foot intervals or at the discretion of the field geologist to determine the proper screening interval. Samples from the soil/waste mixture zone, impacted soil zone and the "clean" zone were collected from the two well bores inside the pit area and retained for chemical analysis. Samples were collected by Shelby tube.

During the soil boring and monitor well installation programs, all drilling and sampling equipment (augers, drill rods, Shelby tubes, etc.) were thoroughly cleaned between uses. Cleaning was by high pressure soapy steam wash and rinse.

Wells were developed by removing multiple well volumes of groundwater until the well was dry or until the water was clear and free of particulates. Removed water was stored in marked 55 gallon drums and left on site for disposal by GATX.

3.4 GROUNDWATER SAMPLING

Groundwater samples were collected from the site monitor wells on January 18, 1990. The water level in each well was measured and the well purged of three volumes or until dry prior to sample collection. Organic odors were detected in all wells except MW-3 and MW-4 on the north perimeter of the site. A flaky waxy white substance was noted on the water level probe from MW-1 and MW-2 (located within the pit boundary). Samples were field tested for pH.

Samples were collected from each well for priority pollutant volatile organic analysis and for acid base/neutral extractable organic compound analysis. These samples were sent to the IT analytical laboratory in Austin, Texas for analysis. A second set of samples collected from MW-1, MW-2, MW-4 and MW-8 was sent to the IT technology development laboratory in Knoxville, Tennessee for bioremediation studies. All samples were kept on ice after collection and shipped by overnight courier for next day delivery to their respective destinations.

4.0 GEOLOGY

4.1 REGIONAL GEOLOGY

The site is located in the western section of the Gulf Coastal Plain. The site is underlain by the Beaumont Formation of Pleistocene age which is composed of fluvial and deltaic deposits and small areas of coastal marsh and lagoon deposits.

4.2 SITE GEOLOGIC CONDITIONS

The area surrounding the site is generally low and flat. The site is located on relatively high ground between Hunting Bayou and Panther Creek. Area drainage is generally to the south and east toward the Houston Ship Channel. The bench mark elevation of the Clinton Drive bridge over Panther Creek is 12 feet, MSL, and the nearest bench mark elevation along the ship channel is 11 feet, MSL. Highest elevation at the site is 28.9 feet, MSL, at B-3. Lowest elevation at the site is along the west side near MW-3. Water is ponded in this vicinity through much of the year. Details of the area and site topography are shown on Figures 1 and 2, and the location of cross sections are shown on Figure 4.

Soils at the site have been mapped as belonging to the Midland soil series. The Midland series consists of silty clay loams with very slow internal drainage and surface runoff. The soils are deep and acidic. They are found predominately in southeast Harris County. (U.S.D.A., 1976, Soil Survey of Harris County, Texas)

The site specific geology is depicted on cross sections A-A' and B-B' (Figure 5 and 6). The soils immediately below the surface are composed of hard, stiff clays. A native dark brown clay extends from the surface to approximately 8 feet below grade. This clay is underlain by a red/brown very stiff, blocky, desiccated clay which continues downward to approximately 17 or 18 feet. The clay becomes very silty below 18 feet. Distinct tan silt and very fine grained sand layers were observed in MW-5, MW-6, MW-7 and MW-8. The tan silts are underlain by a light gray medium grain unconsolidated saturated sand.

This sand is up to 7 feet thick and becomes clay prone toward the base at approximately 29 feet below grade. The sand is saturated across the site and the overlying silt and clay is usually wet or moist at about 19 feet below the surface. Below the sand is a light gray clay in which the soil borings terminated.

4.3 ESTIMATED VOLUME OF WASTE AND IMPACTED SOIL

The volume of contaminated in place soil and waste is estimated at approximately 6,350 cubic yards. The estimate is based on the areal extent of the pit as determined by the trenching program and on the depth of observed contamination during the soil boring program. Observation may be by either visual, olfactory senses or by field instrumentation. The pit was estimated to be 55 feet in radius and the depth of waste and impacted soil was determined to be approximately 18 feet.

5.0 HYDROGEOLOGY

5.1 SITE HYDROGEOLOGY

The uppermost water being transmissive zone at the site occurs below the red clay zone, at between 1 and 4 feet, MSL. The base of the aquifer ranges from -3 feet to -6 feet, MSL in the pit area as depicted in Figure 7. The transmissive zone consists lithologically of a light gray to white silty to fine grained sand with occassional clay. The red clay above is frequently underlain by a reddish brown silt which may be either wet or dry. Thickness of the uppermost transmissive zone ranges from 6 to 9 feet. An isopach map of the uppermost transmissive zone illustrating the thickness distribution is shown on Figure 8.

Water levels in the monitor wells were measured on January 17, 1990. The measurements were converted to elevations relative to mean sea level. Figure 9 illustrates the groundwater potentiometric surface at the site. The potentiometric surface is considerably higher than the elevation of the uppermost transmissive zone indicating artesian conditions at the site and an upward vertical gradient. As depicted on the potentiometric map the groundwater surface is quiet flat. Flow is generally to the southeast, toward the Houston Ship Channel. The gradient on the eastern side of the site is calculated at 0.00174 and along the western edge at 0.000721. Due to the low gradient groundwater velocity to the southeast is estimated between 6.8×10^{-5} ft/day and 1.64×10^{-4} ft/day (0.025 ft/yr and 0.06 ft/yr).

6.0 ANALYTICAL PROGRAM

6.1 SOIL SAMPLING

Three soil samples from each of the seven boreholes completed within the pit area (five soil borings and two monitor wells) were collected for chemical analysis. Sample selection criteria and strategy was based on the following guidelines:

- One sample of waste material or a soil/waste mixture was selected based on visual observation and soil vapor screening;
- A second sample from the zone of impacted soil was selected, again, based on visual observation and soil vapor screening;
- A third soil sample was to be selected from either the "clean" soil zone or a final soil sample from the bottom of the boring.

The soil samples were collected and placed in clean wide mouth jars with teflon lined lids. The samples were kept on ice in coolers and shipped to IT's analytical laboratory in Austin, Texas by overnight courier. These samples were analyzed for Hazardous Substance List (HSL) priority pollutants and acid and base/neutral extractable organics and for lead, chromium and barium (Table 1).

A second set of samples from 4 of the borings/monitor well boreholes was collected using the previously outlined criteria and forwarded by overnight courier to IT's technology development laboratory in Knoxville, Tennesee for bioremediation studies. These samples were collected and kept in sterile glass jars and stored on ice for overnight delivery.

Sample collection and preparation was carried out using only clean equipment (Shelby tubes, clean knives, spatulas, etc.). All equipment was cleaned after each use to minimize cross contamination between samples.

6.2 GROUNDWATER SAMPLING

Following installation and development of the eight monitoring wells, groundwater samples were obtained for analysis of volatile and semi-volatile organic compounds by EPA Methods 624 and 625. The well sampling procedures were as follows:

- A clean plastic liner was placed on the surface around the well to provide a clean dry surface;
- The static water level was measured with a calibrated electric probe water level sensor;
  - Presence of oil or organics, if any, on the probe was recorded.
- A volume of water equal to three times the volume of water initially contained in the well was removed (purged) or the well was purged to dryness. Two bailers were used. One bailer was used on the wells outside the pit area and the other was used only on the wells within the pit area. Each bailer was properly decontaminated between uses.
- The water purged from the well was retained in a designated waste storage container (55 gallon drums). The water was disposed by GATX following receipt of the laboratory results.
- Within a period of 24 hours after purging, when the water level in the well had recovered to near its original level, samples were collected using a bailer. Typically the samples were collected immediately after purging.
- Groundwater was field tested for pH, and the data recorded on the sample collection logs.
- The samples were carefully transferred into appropriate containers. Prolonged exposure (of the sample) to air and agitation during transfer was avoided. VOA vials contained no visible bubbles.

A summary of the waste characterization analytical program is presented in Table 1.

All samples (soil and groundwater) were kept on ice in coolers and shipped by overnight courier to their respective laboratory destinations. Samples were sent using proper chain of custody and request for analysis procedures. Each sample was labeled with a pre-printed sample identification number. Sample collection logs were kept for each sample.

7.0 ANALYTICAL RESULTS

A suite of analyses were performed on soil, sludge, and groundwater samples to characterize the chemical contaminants in the former pit and the groundwater beneath the pit. The soil and sludge samples were analyzed for Hazardous Substances List volatile organics, acid/base extractable organics, lead, chromium, and barium. The groundwater was analyzed for Priority Pollutant volatile organics and acid, base/neutral extractable organics. The analytical procedures were dictated because of a previous report on the pit and the nature of chemicals stored at the terminal.

All soil and sludge samples analyzed were from soil borings and monitor wells located within the known perimeter of the former pit. A total of 17 soil and sludge samples were analyzed.

Groundwater samples were taken from all eight monitor wells and therefore represent complete coverage across the pit area from upgradient to downgradient conditions.

7.1 SOILS AND SLUDGES

The analytical results for the soil and sludge samples are summarized in Table 2. The complete analyses are provided in Appendix D. Seven volatile components from the Hazardous Substance List were identified: benzene, trans-1,2-dichloroethylene, ethylbenzene, methylene chloride, methyl chloride, toluene, and xylenes (total). In general, higher concentrations were present in the uppermost samples with concentration decreasing with increasing depth. The highest concentration of contamination were found in samples from the 2-3 foot depth in borings B-1 and B-2. Concentration of some contaminants were so high that several dilutions were required thus greatly increasing the detection limits for the other compounds. The concentration levels drop appreciably with depth. For example, in Boring B-2 total xylenes in the 2 - 3 foot sample are 61,000 µg/kg, but decrease to 41 µg/kg between 14 to 15 feet, and reach a value of 9.4 µg/kg between 23 and 24 feet.

Seventeen extractable organic compounds were identified from the soil and sludge samples taken from within the pit boundaries. Soil samples from outside the pit area were not analyzed. The highest concentrations were found in borings B-2 and B-4. Concentrations decrease with increasing depth and most contaminants are below detectable limits at a depth of 23-24 feet. The highest concentration were for napthalene, phenanthrene, fluoranthene, and fluorene.

Metal concentrations in the uppermost soil samples within the pit area are relatively high, as shown in Table 3. This is especially true for surficial soils at Boring B-2 which has a total lead content of 210 mg/kg, barium at 540 mg/kg, and chromium at 15 mg/kg. Although analytical testing was not conducted on deeper samples, it is anticipated that metal concentrations will decrease with depth.

In addition, relatively high concentration of dibenzofuran was present in the borings. Additional analyses determined that chlorinated furans and dioxins were not present. The results of these analyses are shown in Table 4 and the complete analyses are provided in Appendix D.

7.2 GROUNDWATER

Groundwater samples from each of the monitor wells were analysed for volatile organics (EPA 624) and acid base/neutral extractable organics (EPA 625). Seven volatile organics were detected in the groundwater. These are listed on Table 5 and included with the analytical results in Appendix D.

The analytical results from the wells north, and upgradient of the pit show no significant levels of groundwater contamination. Groundwater from MW-4 is below the detection limits for all compounds and the only contaminant detected in MW-3 is 1,1,2,2-tetrachloroethane at 5.4 µg/l.

Monitor wells within the boundaries of the pit display much higher concentrations of organic chemicals. Monitor well MW-1 shows elevated levels of benzene, 8.2 µg/l, toluene, 16 µg/l, and napthalene, 12 µg/l. Monitor well MW-2 however, shows very high levels of both volatile and extractable

organics. Of particular concern is vinyl chloride, 82 µg/l. The extractable organics show high concentration of napthalene (4000 µg/l), acenapthane (340 µg/l) and dibenzofuran (320 µg/l).

Four monitor wells were placed downgradient of the pit in order to define the extent of downgradient contaminant migration. Monitor wells MW-6 and MW-8 showed the absence of contaminants at detection limits of 10 to 20 µg/l. Monitor well 5 detected a small amount of trichloroethylene, 16 µg/l. A high concentration of trichloroethylene, 20,000 µg/l, was detected in monitor well 7. The only other contaminant detected in MW-7 was napthalene, 160 µg/l. The napthalene is present in high concentrations in the pit and its presence in MW-7 could be anticipated.

The source of the trichloroethylene (TCE) in MW-7 is uncertain. TCE is present at detectable limits in the groundwater at one other monitor well, MW-5, at a concentration of 16 µg/l. It has not been detected in upgradient soil borings within the pit, B-5, nor is it present in the upgradient monitor well, MW-8. Additional field work will be required to define the extent of the TCE contamination and to ascertain its source.

8.0 CONCLUSIONS

Based on the data generated as a result of this investigation and the results from a previous investigation we conclude the following:

- The pit contains a wide variety of chemical contaminants;
- The in place volume of affected soils is approximately 6,350 cubic yards;
- The soils are affected to a depth of approximately 18 feet;
- Groundwater upgradient of the pit is virtually free of contaminants;
- Groundwater contamination is present beneath the pit at MW-2, however the groundwater contamination is not as extensive as could be expected; and
- Some groundwater contamination is present in MW-7, downgradient of the pit, however, the principal contaminant has not been found at detectable limits within the pit.

Austin, Texas 78711-3087

Attention: Hazardous Waste and Solid Waste Division,
Reports and Management Group

Gentlemen:

The purpose of this letter is to inform you that GATX Terminals Corporation's Galena Park facility is proceeding with the implementation of the ground water monitoring program for the former SEHB and the supplemental ground water monitoring program. The components of each of these programs were described in "Groundwater Compliance Plan Application, Part I: Investigation Report (Compliance Monitoring Program) Southeast Holding Basin Area" submitted to the TWC in September 1990, and hereafter referred to as the Compliance Plan. We anticipate that field work necessary to install additional monitor wells will commence the week of April 22, 1991. Collection of ground water samples and water level measurements will begin the week of April 29, 1991.

We are proceeding with the implementation of the compliance and supplemental monitoring programs with the approval of TWC staff, although final approval has not been granted for the Compliance Plan. Conversations with TWC staff have indicated that there is general agreement about the scope of the monitoring programs and they have suggested that implementation proceed.

The following changes have been made to the methods and procedures described in the Compliance Plan during the planning stages of our implementation. The changes have been made for both logistical and technical reasons, as described below.

LOCATION OF WELL MW-29

Figure 8.1 in Section 8.0 indicates that well MW-29 will be placed immediately adjacent to well MW-10 on the east side of the pipe rack. Because of the difficulty in gaining access to this location and safety concerns, the location of MW-29 will be moved approximately 20 feet west, to the west side of the pipe rack. The new well location is shown on the attached Figure 8-1. This change in location will not affect the monitoring network.

WELL CONSTRUCTION MATERIALS

Section 8.1.2, page 8-5 and Section 8.2.2, page 8-11 indicate that replacement well MW-2R and new supplemental monitor wells MW-28,

casing and screen. Because of the need to carefully position the screened intervals adjacent to the correct hydrostratigraphic unit, GATX may utilize short lengths (2' to 5') of PVC casing on the uppermost part of the casing string. The use of the PVC will not adversely impact the strength of the well or the quality of the data collected.

WELL INSTALLATION PROCEDURE

The Stage 1 procedure for the installation of surface casing described in Section 8.2.2, page 8-11 will be modified slightly. A 16-inch (OD) auger will be used to sample through the silty clay. A 10 1/4-inch (ID) steel surface casing will then be installed inside the hollow stem augers and pressure grouted in place as the augers are removed. The steel surface casing will be stronger than the PVC originally proposed. The use of a large diameter auger will provide a neater installation than the use of mud rotary methods.

MODIFICATION TO SAMPLE COLLECTION PROCEDURES

Section 10.3, page 10-6 currently states that there will be no changes to sample handling procedures outlined in Section 3.0 of the Compliance Plan. However, GATX will make one change in the well purging and sampling procedures described in Section 3.6.4, page 3-6. GATX has previously utilized one Teflon bailer to purge and sample wells and decontaminated the bailer between use in each well. This procedure will be modified by dedicating a single bailer for use in each well. In other words, each well in the compliance and supplemental ground water monitoring network will be sampled with a dedicated bailer that is assigned to that well. This will reduce the possibility of cross-contamination between wells and improve the quality of data.

GATX will keep your apprised of the progress of the implementation of our monitoring program, as it proceeds.

Sincerely,

Paula Mrozek
Terminal Environmental Manager

Attention: Hazardous Waste and Solid Waste Division,
Reports and Management Group

Gentlemen:

The purpose of this letter is to inform you of the progress of the implementation of the ground water monitoring program for the former SEHB and the supplemental ground water monitoring program at the GATX Terminals Corporation's Galena Park facility. The components of each of these programs were described in "Groundwater Compliance Plan Application, Part I: Investigation Report (Compliance Monitoring Program) Southeast Holding Basin Area" submitted to the TWC in September 1990, and hereafter referred to as the Compliance Plan.

During the field work for installation of additional monitor wells, it was discovered that access to the proposed location for well MW-28 (Figure 8.1 of the Compliance Plan) was blocked and the well could not be reasonably installed on the east side of the pipe rack. A monitoring well of similar construction (MW-8) is already in place to the west of the pipe rack. Therefore, well MW-28 was not installed.

One of the primary purposes of well MW-28 is to monitor the effectiveness of ground water remediation measures that will be constructed in the future. Therefore, not installing MW-28 at this time will not have a significant affect on the overall monitoring network. The location, design, and need for well MW-28 will be re-evaluated when the final design of the ground water remediation system is completed.

The remainder of the implementation of the monitoring program is proceeding as outlined in the Compliance Plan, as modified by our letter of April 23, 1991.

GATX will continue to keep your apprised of the progress of the implementation of our monitoring program, as it proceeds.

Sincerely,

Paula Mrozek
Terminal Environmental Manager

Re: GATX Terminals Corporation - Galena Park, Texas
Solid Waste Registration No. 30573
Southeast Holding Basin Closure Certification

Dear Ms. Dobbs:

Enclosed is a closure certification prepared by GATX Terminals Corporation, which documents the closure of the Southeast Holding Basin at the above referenced facility in full compliance with the approved closure plan dated May 15, 1986 (as amended September 12, 1986) and the Agreed Order between GATX and the Texas Water Commission dated January 31, 1990. The certification from a registered professional engineer had previously been submitted and is therefore not included.

The Southeast Holding Basin closure plan was approved by the Texas Water Commission on December 15, 1986. A closure report was submitted in August of 1987, which contained a certification that closure was completed in accordance with the approved closure plan. In an October 31, 1989 Executive Director's Preliminary report, the Commission stated that it did not accept the closure certification because the report stated that the waste remaining in the unit after the closure was Class II nonhazardous, but the Commission believed the site evidenced groundwater and soil contamination. In the January 31, 1990 Agreed Order, GATX agreed to treat the closed unit as a Class I hazardous waste management unit and submit a post-closure care permit application for the unit to maintain the unit as Class I hazardous. The post-closure care permit application for the Class I hazardous unit was submitted on September 15, 1990, as required by the Agreed Order.

GATX

GATX has complied with the Texas Water Commission regarding maintaining the closed unit as a Class I hazardous waste management unit and has applied for a post-closure care permit for the unit. Therefore, GATX asks that the Commission acknowledge acceptance of the closure certification. Please call me at (713) 455-1231 if you have any questions. We appreciate the Commission's time and attention to this matter.

Sincerely,

Paula Mrozek
Terminal Environmental Manager

OWNER CERTIFICATION

I, Roger C. Swift, do hereby certify that the GATX Terminals Corporation Galena Park Facility Southeast Holding Basin located in Galena Park, Texas was closed in accordance with the closure/post closure care plan dated May 15, 1986, as modified September 12, 1986, which was approved by the Texas Water Commission's letter of December 15, 1986. I also certify that the closure activities described by the August 1987 closure report present an accurate summary of the activities performed with the following additions: the wastes remaining after closure are being maintained as Class I hazardous waste; deed recordation for the unit was amended to Class I hazardous on September 10, 1990; and a post-closure permit application for the unit was submitted on September 15, 1990.

Executed this 8TH day of MAY, 1991.

GATX TERMINALS CORPORATION

By Roger C Swift

RE: Industrial Solid Waste Registration No. 30573
Remedial Facility Investigation (RFI) Work Plan Review
Proposed Hazardous Waste Permit No. HW-50054-001

Dear Mr. Baker:

The Texas Water Commission (TWC) has reviewed the RFI Work Plan dated September 13, 1990 for work to be performed at Tanks 29 (N.O.R. No. 02), 50 (N.O.R. No. 07), 51 (N.O.R. No. 08), 116 (N.O.R. No. 09), 117 (N.O.R. No. 10), Oil/Water Separator (N.O.R. No. 15), and 25-1 at the GATX Terminals Corporation Galena Park Facility, and the GATX response dated July 18, 1991 to the Notice of Deficiency dated May 22, 1991. Pursuant to the Agreed Enforcement Order dated January 31, 1990, the Work Plan must outline the actions taken to determine whether hazardous constituents listed in 40 Code of Federal Regulations (CFR) Part 261 Appendix VIII have been released into the environment.

This letter constitutes approval of the RFI workplan as amended. Should you have any questions or comments, please contact Bill Shafford of the Permits Section, Industrial and Hazardous Waste Division at AC512/475-2339

Sincerely,

Susan S. Furguson for

INTEROFFICE MEMORANDUM

TO : The File
Industrial Solid Waste Registration No. 30573

DATE: February 3,1992

THRU :

FROM : Bill Shafford, Facility Unit III, Permits Section
Industrial and Hazardous Waste Division

SUBJECT: Meeting Notes, January 31, 1992 Meeting

Attendees - See Attached List

Representatives of the TWC I&HW Permits Section met with GATX Terminals Inc. (GATX) environmental staff to discuss RFI and groundwater monitoring issues. GATX proposed the following:

1. Consolidate all SWMU's in the Central Plant Area into a single Waste Management Area (WMA). This WMA would include the SEHB, the tanks included in the Jan. 31 1990 Agreed Enforcement Order, and all other SWMU's in that area.

2. Construct a Corrective Action System along the western, northern and southern boundary of the area.

3. Place background wells on the north side of the CXI lease near Clinton Dr.

This proposal prompted concern from TWC staff that no investigation would be performed to determine areas of contamination on the western half of the WMA. The CAP proposed would not address source identification and reduction, but would only address the cleanup at the property boundary. GATX has done no investigative work to date in that area.

The following agreements were made between staff and GATX:

1. GATX would need to perform investigative actions prior to instituting Corrective Action in the western section of the proposed WMA, and that these investigations should be geared to determining the locations of contaminant sources and the removal of contaminated groundwater prior to the groundwater migrating off-site.

2. Staff would determine what administrative and technical requirements to expand the scope of the RFI imposed by the Agreed Order dated January 31, 1990 to include the west side of the Central Plant WMA.

3. Upon determination of administrative and technical requirements, staff would notify GATX.

GATX also raised concerns about scheduling of expanded RFI activities, and was curious about whether an extension of the implementation of the RFI workplan would be needed. Staff determined that the answer to this concern would depend on the requirements for the expanded RFI.

Staff raised concerns about the location of monitoring wells at the NHB. The Closure Plan for this unit specified placing of cover materials over two monitoring wells. GATX replied that information concerning new wells would be included in the annual report.

GATX also wanted to know when they should turn investigation information (non-RFI) on Tract B. Staff replied that the draft permit would require an RFI on Tract B.

V. Target Populations of Concern: See Attachment A

VI. Summary: An Remedial Facility Investigation workplan was required by the Agreed Order between GATX and TWC issued January 31, 1990. This workplan was submitted September 13, 1990, revised July 18, 1991, and was approved on December 18, 1991. This unit is undergoing closure under a TWC approved closure plan. **

* See Table 1

** This tank was not included in the workplan

See attached Note

Tank 10-12 was not included in the approved RFI workplan. This tank is not undergoing closure and was placed back into commodity (product) service on 5/18/92.

identified in your RFA attachment August 23, 1989 Conference Record, . Mc Faddin (TWC Attorney) indicated the tank was not a regulated unit.

GATX therefore would like to request that this tank be removed from the RFA program.

V. Target Populations of Concern: See Attachment A

VI. Summary: This unit is currently undergoing closure. ~~GATX is currently preparing a Groundwater Compliance Plan for this unit.~~ Appendix VIII constituents have been discovered in groundwater plumes emanating from this unit.

** → A closure plan has been subm. Health program

** A groundwater assessment is currently being implemented. A compliance plan application is not being prepared at this time.

* See TABLE 1

The North Holding Basin is not currently undergoing closure, however a closure plan has been submitted. A groundwater assessment program is currently being implemented. A compliance plan application is not being prepared at this time.

It has not yet been determined if the NHB is the source of the Appendix VIII constituents in the groundwater plumes.

Proposed Permit No. HW-50054-000

I. Waste Management Unit: (RCRA Exempt 1975)

N.O.R. Facility No.: 18, Wastewater Tank RCRA Active Service: 1938 - Current

Type : Tank (Surface) I. D. No.: Tank 5-20 **

Status : WW tank Capacity : 210,000 g

II. Evidence of Release:

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	
005	Pipeline Flushings	IH	906110	
006	Pipeline Flushings	I	106110	
008	Tank Washings	IH	906330	
009	Stormwater, Contaminated	IH	906330	D0(01-24) *
010	Organic Liquid, Mixed Wastestream	IH	906330	D0(01-24) *
014	Water Containing Misc. Organics	IH	906990	D0(01-21), * U037, U220, U228

V. Target Populations of Concern: See Attachment A

VI. Summary: This unit is currently used in the facility wastewater treatment system. No releases were observed or reported.

VII. Recommended Action: This unit should be included in the Central Plant ** ? RFI.

* See Table 1

** 5-20 is not included in the Central Plant. It is located in the west plant

Tank 5-20 is not located in the Central Plant. This tank is located in the West Plant. As this unit has not evidenced any releases as is a wastewater unit, could it be recommended that no further action be taken at this time ?

Proposed Permit No. HW-50054-000

I. Waste Management Unit:

N.O.R. Facility No.: ~~A~~ 16, Tract A, SWMU Closed Service: 1945-1981

Type : Landfill I. D. No.: Tract A

Status : Disposal Capacity : 6,400 CY (est.)

II. Evidence of Release: A preliminary Site Characterization Report dated May, 1990 documents soil and groundwater contamination at this unit. Analyses of samples taken from this area turned up several Appendix VIII constituents, such as Trichloroethylene, vinyl chloride, benzene, naphthalene, and dibenzofuran. Elevated levels of metals were also found. See Attachment F.

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
	Wastes unknown at this time			

V. Target Populations of Concern: See Attachment A

VI. Summary: This unit was apparently used over a long period as a disposal pit. Aerial photographs showed this unit in operation in 1944 and 1945, but the area appeared closed in a photo from 1953. Extensive contamination appears to be present at this unit, with contamination consisting of VOA's, semi-volatiles, and possibly metals. No recovery system or remediation plan has yet been proposed. The unit was not presented as a permittable unit in the Part B permit application, and was not mentioned as a Compliance Plan unit.

VII. Recommended Action: This unit should be assessed in an RFI. A plan for remediation of soil and groundwater should be proposed as part of a CMS plan upon completion of the RFI phase of the CAP at this unit. The RFI for groundwater beneath this unit should be addressed in the Groundwater Compliance Plan.

I. Waste Management Unit:

N.O.R. Facility No.: C^, Texaco Impoundment #3, SWMU, Closed
Service: 1918-1981
Type : Surface Impoundment
I. D. No.: Texaco Impoundment #3
Status : Disposal
Capacity : 400 CY

II. Evidence of Release: No evidence of release was observed

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
N/A	Wastewaters with Various Organics	--	--	--

V. Target Populations of Concern: See Attachment A

VI. Summary: This unit was certified closed in 1958. The Post-Closure period was ended in 1981.. No evidence of any release was found or observed.

VII. Recommended Action: This area will be included in the RFI recommended for the ~~North Plant~~ * by proximity.

* This impoundment is in the east plant

See attached note

We propose recommended actions for Texaco Impoundments #3 and #4 NOR C and D, be changed to requiring no further action as there is no evidence of groundwater or surface water impacts from these closed impoundments. We make this recommendation based on a review of EPA's files in Region VI office where we found a work plan which was developed by the Region VI field investigation team. Section 1.2 of the plan in paragraph 3 acknowledged that no adverse groundwater effects were found in wells installed by TWC. We are enclosing this section of the work plan with our submission. Since both impoundments were capped, we do not anticipate surface water runoff from these impoundments to be contaminated. Therefore, we propose that these impoundments require no further investigation.

I. Waste Management Unit:

N.O.R. Facility No.: E^, Stormwater Drainage System, SWMU Active

Service: 1945 - Current

Type :

I. D. No.: Stormwater Drainage System

Status : Disposal

Capacity : Unknown

II. Evidence of Release: Dead and distressed vegetation was noted directly adjacent to several drainage ditches. Soil in the Drainage Ditches appeared oil-stained. A sheen was noticed on the surface of water within the ditch. The Drainage facilities for T/T Racks No. 3 and No. 4 have been established as possible contributing sources for the subsurface soil and groundwater contamination in the southeast portion of the GATX facility

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
009	Stormwater, Contaminated	IH	906330	D0(01-24) *

V. Target Populations of Concern: See Attachment A

VI. Summary: This unit is used to convey stormwater to an NPDES outfall or to stormwater processing units prior to discharge to a POTW. Possible evidence of waste or waste constituents was present at the time of inspection. This unit has been used for a very long time.

VII. Recommended Action: This unit should be included in the Central Plant RFI. The plan should address soil and groundwater contamination from this unit. The groundwater compliance plan should require a groundwater investigation for this unit.

* See Table 1

I. Waste Management Unit:

N.O.R. Facility No.: H^, East Plant Area
Type : Waste Management Area
Status : Disposal

Service: Pre - 1920's - 1950's
I. D. No.: East Plant
Capacity : Unknown

II. Evidence of Release: No evidence has been discovered concerning releases in this area. The area was used as a Texaco refinery for a long period of time. A closed impoundment, Texaco Impoundment #4, is located within this area at the far eastern edge. It appears that another impoundment was present just north of Texaco Impoundment #3

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
Unknown				

V. Target Populations of Concern: See Attachment A

VI. Summary: This area may be contaminated by years of refinery and tank farm operations. No known survey of possible contamination has been performed. The refinery appeared to have been removed from the site prior to 1953, as shown by an aerial photograph.

VII. Recommended Action: An investigation should be performed to determine whether or not soil and/or groundwater contamination is present beneath the area. If contamination is discovered, then the lateral and vertical limits of the contamination should be determined, and an appropriate CMS/CMI program instigated.

Type : Surface Impoundment I. D. No.: Impoundment No. 2

Status : Disposal Capacity : Unknown

II. Evidence of Release: No evidence of release was observed.

III. Pollutant Dispersal Pathways: See Attachment A

IV. Waste Characteristics:

N.O.R. Waste No.	Waste Description	Class	Code	EPA Waste No.
	Unknown			

V. Target Populations of Concern: See Attachment A

VI. Summary: This unit appeared on aerial photographs dating from 1944 and 1945. The unit appeared to be an impoundment on the west side of what is now the CXI leased-area of the Central Plant. No evidence of release was found or observed.

VII. Recommended Action: This unit will be included in the RFI recommended for the Central Plant by proximity. Should be eliminated

This area is currently leased to TXI & is being investigated by TXI under an approved RFI with TWC. GATX is not the operator of the property & will rely on TXI to implement further actions.

The property in which Impoundment # 2 is located is leased to Texmark and is currently being investigated under an approved RFI with TWC by the property operators (Texmark). As GATX is not the operator of the property and an RFI is currently being implemented it is proposed that this unit be moved from this RFA.

ATTACHMENT A

I. Pollutant Dispersal Pathways:

Three pathways exist for the transport of waste or waste constituents from the GATX - Galena Park facility. Wastes may be transported via groundwater, air or surface water. Groundwater contaminant transport is the primary waste transport mechanism because of known groundwater contamination at the facility, and discharge of contaminated groundwater to the Houston Ship Channel. Air contaminant transport is the secondary concern, as strong chemical odors were noted during the VSI. Surface water transport is also a concern, as water with a sheen was noticed in a discharge ditch headed toward a facility outfall.

A. Groundwater

Releases to groundwater have been documented from the Southeast Holding Basin, the North Holding Basin and Tract A. A release to groundwater may have also occurred from Tract B, but no information exists on any release from this pre-RCRA SWMU at this time.

Contamination is known in two aquifers below the facility. One aquifer, denoted in the Groundwater Compliance Plan as the Sandy Channel Fill (SCF), is a shallow perched aquifer consisting primarily of dredge spoils from the Houston Ship Channel. Below this aquifer is a discontinuous clay unit denoted as the First Silty Clay Unit (FSCU), and below that is the Uppermost Natural Transmissive Unit (UNTU), consisting primarily of silty and clayey sands. The SCF and UNTU appear to be hydraulically connected. Below the UNTU lie thickly bedded clays of Second Silty Clay/Clay Unit (SSC/CU). Contamination is known in both the SCF and the UNTU. Waters in the SCF discharge to the Houston Ship Channel, as do waters in the UNTU in the area of the Expanded Groundwater Quality Assessment[1]. Groundwaters may also discharge to Hunting Bayou on the ~~east~~ North side of the facility. Groundwater gradients generally tend to be toward the Houston Ship Channel, with some gradients trending toward Hunting Bayou.

B. Surface Water

Releases to surface water are believed to be occurring from groundwaters in the SCF and UNTU at the GATX facility. Possibly contaminated runoff was noted in a drainage ditch near Outfall 003, which discharges into the Houston Ship Channel.

C. Air

Releases to air of waste and waste constituents is also a possibility at the GATX facility. Vapors resulting from contamination of soil and groundwater by volatile organics may be released to the air through the soil. Air releases may also result from the storage areas through fugitive emissions, and from loading

emissions from tanks and containers. Prevailing winds are probably from the south and southeast.

II. Target Populations of Concern:

The GATX facility is not a critical wildlife habitat area, or an area designated state or federal wilderness. Parts of the GATX facility appear to qualify as wetlands.

To the north of GATX is a tract of land owned by the ARCO Pipeline Company. ~~East~~ West of the facility is Pak - Tank. ~~West~~ East of the facility is the ~~Gulf Coast Waste Disposal Authority~~ City of Houston Water Treatment Plant. South of the facility is the Houston Ship Channel. Across the Ship Channel is A City of Houston Power Generation Station. & Gulf Coast Waste Disposal Authority.

ATTACHMENT Q

General Site Information

ATTACHMENT Q

GENERAL SITE INFORMATION
KM Liquids Terminals LLC – Galena Park Terminal

1.0 INTRODUCTION

The KM Liquids Terminals LLC (Kinder Morgan) Galena Park Terminal is located at 906 Clinton Drive in Galena Park, Texas. The facility is located approximately 9 miles east of Houston, on the north side of the Houston Ship Channel, in Harris County (Figure 1). The facility is a contract liquid storage terminal for bulk quantities of diverse chemical products. Loading/unloading facilities at the Galena Park facility can accommodate tank trucks, tank cars, barges, and ships. The facility consists of more than 100 storage tanks, four dock loading areas and several tank truck and rail car loading and unloading areas. In addition, the facility operates wastewater and stormwater collection tanks. Figure 2 shows the plan view of the facility.

Historically, the facility operated two wastewater/surface water impoundments –Southeast Holding Basin (SEHB) and North Holding Basin (NHB). The SEHB was closed in accordance with Texas Water Commission (TWC) technical guidelines in August 1987 and the NHB was taken out of operation in November 1988. The sludge in the NHB has been stabilized in place and the impoundment is permitted for operation as a Resource Conservation and Reclamation Act (RCRA) corrective action management unit (CAMU) under the closure and post-closure permit for the facility (Permit HW 50054)

In practice, the Kinder Morgan facility is divided into four areas: Central Plant, East Plant, West Plant, and North Plant. There are 37 solid waste management units (SWMUs) at the facility. The Texas Commission on Environmental Quality (TCEQ) created four designations as they weighed the possibility of allowing Kinder Morgan to group their SWMUs as whole plants. These four administrative creations were designated the East Plant Waste Management Area (EPWMA), the West Plant Waste Management Area (WPWMA), the North Plant Waste Management Area (NPWMA), and the Central Plant Waste Management Area (CPWMA). The TCEQ abandoned the concept of grouping SWMUs by plant and administratively deleted the NPWMA and the CPWMA in 1999. However, the WPWMA and EPWMA were left on the list to delineate and address benzene plumes discovered in the East Plant and West Plant. These SWMUs were designated as EPWMA Benzene Release and the WPWMA Groundwater Plume and cover less than the total area of their respective plants. A total of 37 SWMUs are located within the EPWMA and the WPWMA.

The release or potential release of contaminants from the SWMU were orignally investigated and reproted in the Phase I and Phase II RCRA Facility Investigations (RFI). In 2003, Kinder Morgan submitted a Notice of Intent to Switch to TRRP and subsequent corrective action investigation and reporting activities at the facility was completed under the TRRP. Affected Property Assessment Reports (APARs) were submitted for various groupings of SWMUs in 2004 through 2006. Upon approval of the APARs by the TCEQ, Response Action Plans (RAPs) were prepared and submitted. The RAPs for West Plant, Central Plant, and East Plant were approved November 2007; the RAP for the SWMU in the Texmark Chemical was approved in June 2008. Additionally, Areas of Concern (AOCs) were incorporated into the Hazardous Waste Permit as part of the 2018 Class 3 Permit and Compliance Plan Modification, which was issued by the TCEQ on November 18, 2019. The locations of the SWMUs and AOCs are shown in Figure 3. This attachment summarizes the operational history of the SWMUs associated with the Kinder Morgan Galena Park Terminal. The SWMUs are organized by plant in the following sections and the AOCs are grouped together.

2.0 CENTRAL PLANT WASTE MANAGEMENT AREA

There are 18 SWMUs in the Central Plant. The SWMUs are categorized into four (4) groups for the purpose of accomplishing delineation of affected media for the RFI process. The Central Plant SWMUs are discussed by SWMU Group.

2.1 SWMU Group C1

There are six (6) SWMUs in the SWMU group C1. None of these SWMUs are in service today. All SWMUs were located in the southwest corner of the Central Plant. SWMU Group C1 consists of Tank 29, Tank 50, Tank 51, Tank 116, Tank 117, and the Belowground Oil/Water Separator. The SWMUs are discussed separately below.

2.1.1 Tank 29

Tank 29 has a designated NOR of 002. This unit was converted from product storage in 1974. Waste codes stored in this tank were 106110, 249000, 906110, 906330, 906870, and 913370. Estimated capacity of this tank was 1,095,730 gallons. None of the waste is left, because Tank 29 no longer exists. Waste has not been placed here since 1988. The tank was removed on February 19, 1993. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.1.2 Tank 50

Tank 50 has a designated NOR of 007. This unit was converted from product storage in 1980. Waste codes stored in this tank were 106110, 906110, 906330, 906870, and 913370. The estimated capacity of this tank was 30,080 gallons. There is no waste remaining, as Tank 50 no longer exists. Waste has not been placed here since 1988. The tank was taken out of service in 1989 and subsequently removed. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.1.3 Tank 51

Tank 51 has a designated NOR of 008. This unit was converted from product storage in 1980. Waste codes stored in this tank were 106110, 906110, 906330, 906870, and 913370. The estimated capacity of this tank was 26,560 gallons. There is no waste remaining, as Tank 51 no longer exists. Waste has not been placed here since 1988. The tank was taken out of service in 1989 and subsequently removed. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.1.4 Tank 116

Tank 116 has a designated NOR of 009. This unit was converted from product storage in 1980. Waste codes stored in this tank were 106110, 906110, 906330, 906870, and 913370. The estimated capacity of this tank was 15,227 gallons. There is no waste remaining, as Tank 116 no longer exists. Waste has not been placed here since 1988. The tank was taken out of service in 1989 and subsequently removed. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.1.5 Tank 117

Tank 117 has a designated NOR of 010. This unit was converted from product storage in 1980. Waste codes stored in this tank were 106110, 906110, 906330, 906870, and 913370. The estimated capacity of this tank was 15,250 gallons. There is no waste remaining, as Tank 117 no longer exists. Waste has not been placed

here since 1988. The tank was taken out of service in 1989 and subsequently removed. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.1.6 Belowground O/W Separator

The Belowground Oil/Water Separator can be classified as a tank (NOR 015). This unit was installed in 1980. Waste codes stored in this tank were 106110, 906110, 906330, 906870, and 913370. Estimated capacity of this tank is not known. There is no waste remaining, as the unit no longer exists. Waste has not been placed here since 1988. The tank was taken out of service in 1989 and subsequently removed. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.2 SWMU Group C2

There are six (6) SWMUs in SWMUs Group C2. None of these SWMUs are in service today. All of them were located in the southeast part of the Central Plant. SWMU Group C2 consists of the former SEHB, the SEHB Sump, the Stormwater Drainage System, Lift Station No. 4, Tank 26, and Tank 82.

2.2.1 Southeast Holding Basin

The SEHB was a surface impoundment, but it is classified on the NOR as a landfill (NOR 017). It operated as part of the Wastewater Treatment System (WTTS) from 1974 to 1985. The capacity was approximately 3,000 cubic yards. Waste codes stored in this unit were 106110, 906110, 906330, 906870, and 913370. The SWMU is certified as closed and is in post-closure care. A Corrective Action Program is in place to address the release from the unit.

2.2.2 SEHB Sump

The SEHB Sump was associated with the SEHB and handled the same materials. It does not have a NOR number. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.2.3 T/TR Stormwater Drainage

The Stormwater Drainage System was a set of surface drains and underground piping associated with the SEHB. It operated during the same time period and handled stormwater. It did not have a NOR number. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.2.4 Lift Station #4

Lift Station #4 was a part of the WTTS, associated with the SEHB. It did not have a NOR number. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.2.5 Tank 26

Tank 26 was a tank. It was not assigned a NOR number. The Phase I RFI states that this tank was used only for product storage. Therefore, there are no waste codes associated with this tank. The tank was removed prior to 1990. Estimated capacity of this tank was 1,050,000 gallons. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.2.6 Tank 82

Tank 82 was not assigned a NOR number. The Phase I RFI states that this tank was used only for product storage. Therefore, there are no waste codes associated with this tank. The tank was removed prior to 1990.

Estimated capacity of this tank was 1,050,000 gallons. The SWMU is not certified as closed. A response action under the TRRP has been implemented.

2.3 SWMU Group C3

There are three SWMUs in SWMU Group C3. They are located in the same diked area toward the center of the Central Plant. SWMU Group C3 consists of the Aboveground Oil/Water Separator, Tank 32, and Tank 3-9.

2.3.1 Aboveground O/W Separator

The Aboveground Oil/Water Separator is a tank (NOR number 014). This unit discharges to a sewer/publicly owned treatment works (POTW). No dates are listed to indicate when the unit went into or out of service, but it has not been used since January 5, 1994, at the latest. No waste codes are given. The SWMU is not certified as closed. A response action under TRRP has been implemented.

2.3.2 Tank 32

Tank 32 is an active tank (NOR number 012). The tank was built in 1938, but it was not used as part of the new wastewater treatment system until 1989. The wastes that are in this tank are 0006205H, 0007206H, 0015119H, 106110, 906110, 906330, 906870, 906990, and 913370. The capacity of this tank was 1,050,000 gallons. Wastewater and other wastes flow to this tank regularly. There is no date of projected closure for this unit. A response action under TRRP has been implemented.

2.3.3 Tank 3-9

Tank 3-9 is an active tank (NOR number 013). The tank came into use as part of the new wastewater treatment system in 1989. The wastes that are in this tank are 0006205H, 0007206H, 0015119H, 106110, 906110, 906330, 906870, 906990, and 913370. The capacity of this tank is 126,000 gallons. Wastes flow to this tank regularly. There is no date of projected closure for this unit. A response action under TRRP has been implemented.

2.4 SWMU Group C4

There are three SWMUs in SWMU Group C3. They are located in the same diked area in the northwest corner of the Central Plant. SWMU Group C4 consists of Tank 25-1, the Drum Storage Building, and Impoundment # 2.

2.4.1 Tank 25-1

Tank 25-1 has a designated NOR number of 011. Tank 25-1 was constructed in 1956, and was placed in wastewater service in 1980. Waste codes for wastes that were in this tank are 106110, 906110, 906330, 906870, 906990, and 913370. The estimated capacity of this tank is 1,076,982 gallons. All waste was removed and the tank was returned to product storage service in 1989. The RFI for this unit was only conditionally accepted by TCEQ. A response action under the TRRP has been implemented.

2.4.2 Drum Storage Building

The Drum Storage Building is a container storage area (NOR number 001). The unit was placed in service in 1989. Wastes previously managed in this unit include 00273192, 906330, 906870, and 913370. Wastes currently managed in this unit include 000131H, 0008319H, 009319H, 0010301H, 0011404H, 0012219H,

0013609H, 00144891, 00173021, 00186091, 00192191, 00203192, 00213192, 00220091, 0023009H, 00253011, 00263191, 00283892, 00293111, 00303901, 00313191, 0032319H, 0033319H, 00343192, 0035609H, 0036191, 00374891, 00383192, 0039301H, 00412071, 0042301H, 0043319H, 0044409H, 00472061, 0048209H, 0049319H, 00503902, 00513101, 160110, 150950, 151950, 152180, 152920, 180490, 210690, 249000, 906110, 919470, 950950, 952180, 977990, 978980, 980490, 981510, and 983710. Drums are presently stored in this building, but for periods of less than 90 days. The unit is active. A response action under TRRP has been implemented.

2.4.3 Impoundment #1

Impoundment #1 is a Surface Impoundment. It was not assigned a NOR number and it no longer exists. It was placed on the RFA list due to its appearance on an old aerial photograph. It was constructed before 1920. Little is known about the history or use of this triangular feature. A response action under TRRP has been implemented.

3.0 EAST PLANT WASTE MANAGEMENT AREA

There are four (4) SWMUs in the East Plant. The SWMUs in the East Plant were not grouped. The SWMUs are the East Plant Tank Car Rack (EPTCR), Texaco Landfill No. 3, Impoundment #3, and the EPWMA.

3.1 East Plant Tank Car Rack

The EPTCR is an area of concern due to the discovery of soil contamination. This SWMU was self-reported when environmental impacts were found; therefore, there is no NOR number for the EPTCR. The RFI was completed and the EPTCR was approved for closure under Risk Reduction Standard 2 (RRS2) under 30 TAC §335 in a letter from TCEQ dated January 5, 2005.

3.2 Texaco Landfill #3

Texaco Landfill #3 is a landfill that was operated by Texaco up until 1980. Because it was removed prior to the sale of the refinery to GATX, this unit did not receive a NOR number. The unit and all wastes were removed by Texaco in 1980. The RFI for this unit was accepted by TCEQ on December 8, 2000. This unit was granted No Further Action (NFA) status at that time.

3.3 Impoundment #3

Impoundment #3 is a surface impoundment that was discovered on historical aerial photographs of the former Texaco Refinery during the RFA process. Impoundment #3 was identified in the draft RFA Report only from its appearance on aerial photographs from 1945 and 1953, although it was described as having been constructed prior to 1920 and inactivated in 1981. Its capacity and the types of waste managed in it (if any) are unknown. In response to a query from GATX, Texaco Refining and Marketing Inc. found no indication in its files of the existence of Impoundment #3. There are no obvious signs of the former impoundment visible at the surfce in the area identified in the RFA. The SWMU is not certified as closed. The TCEQ approved NFA in a letter dated April 11, 2013.

3.4 EPWMA Benzene Release

The EPWMA is an area of concern identified in the Phase II RFI because of benzene-affected groundwater. Thus, it has no NOR number. The SWMU is not certified as closed. The TCEQ approved NFA in a letter dated April 11, 2013.

4.0 WEST PLANT WASTE MANAGEMENT AREA

Five (5) of the eight (8) SWMUs in the West Plant are categorized into three (3) SWMU groups for the purpose of accomplishing delineation for the RCRA Facility Investigation (RFI). These West Plant SWMUs are discussed by SWMU Group. One other three SWMUs (Tank 5-20) is not grouped.

4.1 SWMU Group W1

There are three (3) SWMUs in SWMU Group W1. They are located in the northern part of the West Plant. SWMU Group W1 consists of the North Holding Basin (NHB), which is now the CAMU, the Equalization Basin, and the Dissolved Air Floatation (DAF) Tank.

4.1.1 CAMU (North Holding Basin)

The NHB is a surface impoundment (NOR number 004). The NHB is now the CAMU. Waste was first placed in this unit in 1975. The unit handled stormwater runoff, as well as rinsate and washwater from various loading and unloading stations, line flushes, and tank rinses. The waste codes handled by the NHB are 106110, 249000, 906110, 906330, 906870, and 913370. The functions of the NHB included flow equalization and pretreatment by aeration. Wastewater was pumped from the NHB to the Gulf Coast Waste Disposal Authority (GCWDA) wastewater treatment plant. The NHB had a capacity of 18 million gallons. Sludge built up on the bottom of the NHB during its operational lifetime. On November 7, 1988, the NHB ceased to receive wastewater. The CAMU was constructed in the NHB in 1996, after closing the unit with stabilized sludges in place, and it receives wastes from the Corrective Action process. Kinder Morgan expects to continue to use this unit in the future. The unit is currently in a Corrective Action Program.

4.1.2 Equalization (EQ) Basin

The Equalization Basin is a tank (NOR number 020). This basin functioned with the old NHB from 1975 to 1988. The basin was removed after February 1993. A response action under the TRRP has been implemented..

4.1.3 DAF Tank

The DAF Tank has a designated NOR number of 019. This tank functioned with the old NHB from 1975 to 1988. The tank was removed after February 1993. Estimated capacity of this tank is 25,000 gallons. A response action under the TRRP has been implemented.

4.2 SWMU Group W2

There are two (2) SWMUs in SWMU Group W2. They are located in the same diked area in the northern part of the West Plant. SWMU Group W2 consists of Tank 100-5 and Tank 100-6.

4.2.1 Tank 100-5

Tank 100-5 has a designated NOR number of 005. The tank initially received stormwater, but was converted later to receive wastewater. It was constructed in 1988, and together with Tank 100-6, replaced the NHB. It has a capacity of 4,200,000 gallons. It was taken out of wastewater service and placed back in product storage service in 1998. A response action under TRRP has been implemented.

4.2.2 Tank 100-6

Tank 100-6 has a designated NOR number of 006. The tank received stormwater. It was constructed in 1988, and together with Tank 100-5, it replaced the NHB. It has a capacity of 4,200,000 gallons. It was taken out of stormwater service and placed back in product storage service in 1988. A response action under TRRP has been implemented.

4.3 SWMU Group W3

There are two (2) SWMUs in SWMU Group W3. These SWMUs are Tank 10-12 and the WPWMA Groundwater Plume. Each of these SWMUs is discussed below.

4.3.1 Tank 10-12

Tank 10-12 has a designated NOR number of 003. The tank was in wastewater service and received wastes with the waste code 106110, 249000, 906110, 906330, 906870, and 913370. Its capacity is 10,000 barrels, or 420,000 gallons. No waste is present; the unit was returned to product storage service and was closed on February 19, 1993. A response action under TRRP has been implemented.

4.3.2 WPWMA Groundwater Plume

The WPWMA is an area of concern identified in the West Plan Groundwater Assessment Report. Thus, it does not have a NOR number. It is a large area with soil and groundwater impacts that are being addressed through the Corrective Action Program. A response action under TRRP has been implemented.

4.4 Others

SWMU Tank 5-20 is grouped as Other.

4.4.1 Tank 5-20

Tank 5-20 has a designated NOR number of 018. It is an active part of the wastewater treatment system as a surge tank for wastewater shipments. It receives wastes with the following waste codes: 0006205H, 0007206H, 0015119H, 106110, 906110, 906330, 906870, 906990, and 913370. Its capacity is 5,000 barrels, or 210,000 gallons. The TCEQ approved NFA in a letter dated May 11, 2005.

5.0 NORTH PLANT WASTE MANAGEMENT AREA

There are five (5) SWMUs in the North Plant. The SWMUs in the North Plant were not grouped. The SWMUs are Tract A, Tract B, Tract C, the North Spoils Area, and Texaco Landfill #4.

5.1 Tract A

Tract A is a landfill (NOR number 016). It is also referred to as the North Pit in some documents. Wastes were placed in this unit beginning from the early 1950s. Wastes of unknown types and volumes were placed in this unit until the early 1960s. Beginning from the early 1970s, this unit again received wastes. No records were kept, but evidence from terminal storage records indicates that phenolic tank bottoms and possibly creosote wastes were disposed in this landfill. Investigation data confirm this view. Aerial photographs from January 1981 show that the pit was completely filled. The capacity of this unit is approximately 6,350 cubic yards. The unit was closed and capped after 1991. The RFI was accepted by TCEQ on December 29, 1999. In 2013, a Notice of Intent to Switch to TRRP was submitted to the TCEQ for this SWMU. At that time, an addendum to the North APAR was submitted detailing additional investigaiton activities at the SWMU. The TCEQ approved the APAR in December 2013 and injection events were initiated in 2013 to

address the chlorinated COCs in groundwater. Injection events have been ongoing since 2013 and are being implemented under the Interim Corrective Action Measures of the RCRA Hazardous Waste Permit.

5.2 Tract B

Tract B is a landfill and was not assigned a NOR number. It was discovered and self-reported to TCEQ by GATX. Lead-impacted soils with concentrations in excess of RRS2 were excavated in 1998 and placed in the CAMU. The RFI has not been accepted by TCEQ. The TCEQ approved NFA in a letter dated April 1, 2005.

5.3 Tract C

Tract C is a landfill and was not assigned a NOR number. It was discovered and self-reported to TCEQ by GATX in January 1996. Lead-impacted soils with concentrations in excess of RRS2 were excavated in 1998 and placed in the CAMU. The RFI has not been accepted by TCEQ. The TCEQ approved NFA in a letter dated May 5, 2005.

6.0 TEXMARK CHEMICAL INC. (TCI) GROUP

There were two SWMUs identified in the Texmark Chemicals, Inc. (Texmark) facility. Texmark was a tenant of the former GATX Terminals Corporation prior to its purchase of the property in 1998. However, GATX (and its successor Kinder Morgan) retains responsibility for the corrective action of the SWMUs. The SWMUs were grouped in 1999. These SWMUs are Impoundment #2 and Tank 28.

6.1 Impoundment #2

Impoundment #2 was a surface impoundment. The unit was discovered on aerial photographs in the RFA. The unit may have received wastes beginning in approximately 1994. This impoundment and the features within its footprint, including the Velsicol Pit and the landfill upon which the Area 3 Pond is presently located, are no longer active. Sludges and styrene tar were placed in the pit by Velsicol, another former tenant of the land now used by Texmark. Aerial photographs suggest that waste may have been placed in the Velsicol Pit as late as 1969. Texmark presently operates its wastewater impoundment within the footprint of this SWMU. Sludges from past practices are still present. The SWMU is not certified as closed. A response action under TRRP has been implemented..

6.2 Tank 28

Tank 28 does not have NOR number. It was self-reported to TCEQ by GATX in a letter dated September 15, 1995. Estimated capacity of this tank is 1,050,000 gallons. The SWMU is not certified as closed. A response action under TRRP has been implemented.

7.0 ADDITIONAL RFI UNITS

Two (2) additonal SWMUs exist at the facility and have not been incorproated into a SWMU group. These include the Texaco Landfill #4 and North Spoils Area. Both of these SWMUs are discussed below.

7.1 Texaco Landfill #4

Texaco Landfill #4 is an impoundment. It was never operated by Kinder Morgan or its predecessor, GATX Terminals Corporation and, thus, did not receive a NOR number. It first received waste in 1952. The waste it managed was oily wastewater. It had a capacity of approximately 117,800 cubic yards. The unit was closed between 1980 and 1981. Approximately 16,000 cubic yards of waste were excavated. The unit was granted NFA status by TNRCC on June 14, 1999.

7.2 North Spoils Area

The North Spoils Area is an area where dredge spoils were piled when they were removed from the Houston Ship Channel. It was not assigned a NOR number. The activity began in late 1980 or in January 1981. It should be noted that Kinder Morgan no longer owns the land on which this unit is located. In 1990, the former GATX Terminals Corporation sold the land to ARCO Pipeline Company. The unit was approved by TNRCC for NFA on June 14, 1999.

8.0 AREAS OF CONCERN

The AOCs discussed below were incorporated into the Hazardous Waste Permit as part of the 2018 Class 3 Permit and Compliance Plan Modification. The revised Hazardous Waste Permit was issued by the TCEQ on November 18, 2019.

8.1 WEST CHEMICAL AOC

The former Vopak Terminal Galena Park, Inc. (VTGP) Terminal, which was located immediately adjacent to the Kinder Morgan Galena Park Terminal, was purchased by Kinder Morgan on February 7, 2015, and incorporated into the Galena Park Terminal. Kinder Morgan notified the TCEQ of the acquisition and submitted an application for a Class 1 permit modification to the Galena Park Hazardous Waste Permit (HW-50054) to change the legal description of the facility to include the VTGP property. The permit modification was issued by the TCEQ on May 31, 2016. The former VTGP is now referred to as the Kinder Morgan Galena Park West Chemical AOC.

A Draft 2017 RAP Addendum (TRC, 2017) for the Galena Park West Plant was submitted to the TCEQ in October 2017 to incorporate soil and groundwater impacts at the former VTGP Terminal (SWR No. 30566) into the TCEQ approved Plume Management Zone (PMZ) located in West Plant on the KM Liquids Terminals LLC (Kinder Morgan) Galena Park Terminal. The TCEQ issued conditional approval with comments of 2017 Draft RAP Addendum for the West Plant on December 29, 2017. The Final RAP Addendum for the West Plant was submitted to TCEQ in September 2018, and incorporated into the 2018 Class 3 Hazardous Waste Permit Modification Application submittal. The Class 3 Permit and Compliance Plan Modification were incorporated into Permit No. HW-50054 and a revised Hazardous Waste Permit was issued by the TCEQ on November 18, 2019.

8.2 OLD PUMP HOUSE NO. 5 AOC

Old Pump House No. 5 (OPH5) is located in the East Plant of the Galena Park Terminal. The site of the KMLT Galena Park Terminal has been used for heavy industrial purposes since prior to 1928 and was the site of a former Texaco oil refinery. Old Pump House No. 5 has been present in East Plant since at least 1944 and is currently used to transfer product from locations within the Galena Park terminal and from onsite storage to nearby barge or ship docks.

Petroleum hydrocarbon impacts were identified in 2014 and assessment and remediation have been completed at OPH5 since that time. A Response Action Completion Report (RACR) was submitted to the TCEQ in June 2024 requesting no further action for OPH5 and to update CP Table II as part of the RCRA Permit Renewal Application to designate no further action.

8.3 GATE 6 AOC

Gate 6 AOC is located in the East Plant Terminal Area of the Galena Park Terminal. While completing closure of the East Plant Turn Around Container Storage Area (RCRA Permit Unit # 3) in 2008, soil impacts unrelated to the unit was discovered. Assessment and remediation have been completed at Gate 6 since that time. A RACR was submitted to the TCEQ in October 2022 requesting no further action for Gate 6. The TCEQ conditionally approved no further action and requested that CP Table II be updated in the 2024 RCRA Permit Renewal Application to officially terminate corrective action at Gate 6 AOC.

8.4 NORTH PLANT AOC

North Plant AOC is located in the North Plant Terminal Area of the Galena Park Terminal. After demolition activities at former Tanks 118-1 (current Tank 100-11) and Tank 118-2 (current Tank 100-12), soil assessments were completed in 2022 which identified soil impacts at each former tank area. An APAR was submitted to the TCEQ in January 2004 and approved in July 2004. A Response Action Plan (RAP) was submitted in March 2005 (and subsequent RAP Addendums in 2006 and 2007) to implement and modify remedial actions at the site. A 2024 RAP Addendum was submitted in July 2024 to establish a PMZ and incorporate the North Plant AOC into the RCRA Hazardous Waste Permit as part of the 2024 Permit Renewal Application.

ATTACHMENT R

Groundwater Monitoring and Corrective Action Program Description

ATTACHMENT R

GROUNDWATER MONITORING AND CORRECTIVE ACTION PROGRAM DESCRIPTION
KM Liquids Terminals LLC – Galena Park Terminal

1.0 INTRODUCTION

This attachment describes the existing groundwater recovery and monitoring systems associated with the ongoing corrective action for the CAMU/Former North Holding Basin (NHB) (NOR 004) and Southeast Holding Basin (SEHB) (NOR 017) areas. No changes are proposed for the existing groundwater recovery systems or groundwater monitoring programs.

2.0 CAMU/FORMER NHB AREA

2.1 Groundwater Recovery System

A groundwater recovery and monitoring system was proposed and a Corrective Action Plan (see Attachment T of the 2013 Permit Renewal) was prepared for the CAMU/Former NHB area in June 1994. The system was installed in September and October 1995, and groundwater pumping began on October 11, 1995. The groundwater recovery system was designed to reduce the likelihood of impacted groundwater in Zone III and Zone IV reaching the surface water in Panther Creek. The groundwater recovery system consists of eight recovery wells. The locations of the wells are shown in Figure 1. The recovery wells and the screened zones are identified below:

- MW – 4 Zone III
- MW – 6 Zone IV
- MW – 7 Zone III
- MW – 11 Zone III
- MW – 12 Zone V
- MW – 15 Zone IV
- MW – 16 Zone III
- MW – 17 Zone IV

The contaminated groundwater is collected in a header pipe and conveyed to the aboveground storage Tank 3-10. The fluid recovered from the groundwater recovery systems is temporarily stored in Tank 3-10 before treatment and disposal. Groundwater from Tank 3-10 is then pumped to and temporarily stored in aboveground storage Tank 5-20 before being discharged to the Gulf Coast Waste Disposal Authority for treatment. The average groundwater pump rate, as combined with the SEHB groundwater recovery system, is about 5 gpm.

2.2 Groundwater Monitoring System

The groundwater monitoring system for the CAMU/Former NHB area was designed to demonstrate the effectiveness of the groundwater recovery system. The monitoring system consists of two background wells, four compliance monitoring wells, and eight Corrective Action Observation Wells. The locations of the wells are shown in Figure 1. The monitoring wells and the screened zones are identified below:

- Background Wells:
    - MW – 1 Zone III
    - MW – 8 Zone III

- Compliance Monitoring Wells:

  - MW – 6 Zone IV
  - MW – 7 Zone III
  - RW – 16 Zone III
  - RW – 17 Zone IV

- Corrective Action Observation Wells:

  - MW – 4 Zone III
  - MW – 5 Zone III
  - MW – 9 Zone III
  - MW – 13 Zone III
  - MW – 14 Zone IV
  - MW – 15 Zone IV

The groundwater monitoring program was initiated in 1996. The Sampling and Analysis Plan (SAP) is included in Attachment U of the 2013 Permit Renewal application. In July 1996, a Corrective Action Management Unit (CAMU) was constructed in the Former NHB. Since initiation of the groundwater monitoring and recovery system in 1996, groundwater samples have been collected seminannually from the monitoring wells and analyzed for 1,2-dichloroethane. Water levels in the monitoring wells have also have been measured during each sampling event.

3.0 SEHB AREA

3.1 Groundwater Recovery System

A groundwater recovery and monitoring system was installed in July 1993 and began operation in August 1993. The groundwater recovery system was designed to reduce the likelihood of impacted groundwater in SCF and UNTU zones reaching the surface water in the Houston Ship Channel and Docking Slip. The SEHB groundwater recovery system consists of twelve recovery and two interceptor trenches equipped with extraction wells. The north trench is 260 feet long and the south trench is 160 feet long. Both trenches were installed in the SCF zone with extraction wells in the middle of the trenches. The locations of the wells are shown in Figure 2. The recovery wells and the screened zones are identified below:

- MW – 5 SCF and UNTU
- MW – 7 UNTU
- MW – 10 UNTU
- MW – 13 SCF and UNTU
- MW – 24R UNTU
- MW – 25 UNTU
- MW – 26 UNTU
- MW – 30 UNTU
- MW – 33 SCF and UNTU
- MW – 34 UNTU
- RW – 1 UNTU

- RW – 2 UNTU

Like the CAMU/Former NHB groundwater recovery system, the contaminated groundwater and nonaqueous phase liquid (NAPL) are collected in a header pipe and conveyed to the aboveground storage Tank 3-10. The fluid recovered from the groundwater recovery systems is temporarily stored in Tank 3-10 before treatment and disposal. Groundwater from Tank 3-10 is then pumped to and temporarily stored in aboveground storage Tank 5-20 before being discharged to the Gulf Coast Waste Disposal Authority for treatment. The average groundwater pump rate, as combined with the CAMU/Former NHB groundwater recovery system, is about 5 gpm.

3.2 Groundwater Monitoring System

The groundwater monitoring system for the SEHB area was designed to demonstrate the effectiveness of the groundwater recovery system. The monitoring system consists of 3 compliance monitoring wells, 20 corrective action observation wells, and 3 potentiometric surface observation wells. The locations of the wells are shown in Figure 1. The wells and the screened zones are identified below:

- Compliance Monitoring Wells:
  - MW – 2R SCF and UNTU
  - MW – 3R SCF and UNTU
  - MW – 4R UNTU
- Corrective Action Observation Wells:
  - MW – 1 UNTU
  - MW – 6 UNTU
  - MW – 8 UNTU
  - MW – 9 UNTU
  - MW – 11 SCF and UNTU
  - MW – 12 UNTU
  - MW – 14 SCF and UNTU
  - MW – 15 SCF
  - MW – 16 UNTU
  - MW – 17 SCF and UNTU
  - MW – 18 SCF
  - MW – 19 UNTU
  - MW – 20 SCF
  - MW – 21 UNTU
  - MW – 22 SCF
  - MW – 23 UNTU
  - MW – 27 SCF
  - MW – 29 SCF
  - MW – 31 UNTU
  - MW – 32 SCF

- Potentiometric Surface Observation Wells:
    - P – 1 SCF

The groundwater monitoring program was initiated in 1993. The Sampling and Analysis Plan (SAP) is included in Attachment U of the 2013 Permit Renewal application. Groundwater samples are collected semiannually from the monitoring wells and analyzed for select VOCs, select SVOCs, select herbicides and total lead. Water levels and NAPL thickness in the monitoring wells are also measured during each sampling event.

EXECUTIVE SUMMARY

GATX is constructing a ground water recovery system at the request of the Texas Water Commission (TWC) to recover and treat potentially contaminated ground water at the Galena Park, Texas facility. The construction of the system is occurring in two phases, subsurface construction and above grade installation. Environmental Remediation, Inc. (ERI) was contracted by GATX to install the subsurface elements of the recovery system.

Construction of the subsurface elements of the recovery system included converting seven monitor wells to recovery wells; installation of pumping equipment in and well development of eleven recovery wells including the seven converted monitor wells; installation of two monitor wells; and excavation and backfill of two ground water recovery trenches equipped with recovery wells. Field activities were initiated on July 7, 1993 and construction was substantially completed by July 23, 1993.

During the field activities, GATX removed the upgrade of the two existing recovery wells from the scope-of-work. In addition, the design of the recovery trenches was slightly modified to facilitate the use of the specialized trenching/backfill equipment used to install the two trenches.

1 - INTRODUCTION

1.1 Project Background

GATX constructed a ground water recovery system at the request of the TWC to recover and treat potentially contaminated ground water at the Galena Park facility (Figures 1-1, 1-2 and 1-3). The design for the ground water recovery system was reviewed and approved by the TWC. Construction of the system is being performed in two phases. The first phase, which is the subject of this report, included the installation of the subsurface elements of the system. The second phase, to be completed by another contracting company, will involve the installation of the above-grade elements of the system including the water treatment equipment.

1.2 Scope and Objectives

The objective of this project was to install the subsurface elements of a ground water recovery system that would allow recovery of potentially contaminated ground water at a maximum pumping rate of two gallons per minute. The design and location of the elements of the project were specified by GATX. The scope for the ground water recovery system included the following:

- Conversion of seven monitor wells to recovery wells which included modification of the wellhead and installation of subgrade concrete well boxes;
- Installation of pumping equipment in eleven recovery wells including the seven converted monitor wells;
- Installation of two monitor wells which included obtaining soil samples taken at five foot intervals and submitted to GATX;
- Excavation and backfill of two ground water recovery trenches: a north trench (SCFI) of 260 feet long and a south trench (SCFII) of 160 feet long;
- Installation of one recovery well in each of the ground water recovery trenches; and
- Well development of all of the eleven new and/or previously installed recovery wells.

The project objective was achieved and each of the scope items was executed.

2 - FIELD ACTIVITIES

2.1 Construction Activities

The field work commenced on July 7, 1993 with the mobilization of an excavation crew for the conversion of the monitor wells to recovery wells and installation of well boxes. The trenching crew began mobilization on July 9 and initiated trenching operations on July 12, the following Monday. The drilling crew mobilized and began activities on July 15. All field activities were substantially completed by July 23, 1993. ERI provided an experienced, professional hydrogeologist to supervise the subcontractors and to install all pumping equipment at the end of construction activities. The field activities included the conversion of seven existing monitor wells to recovery wells; the installation of two new recovery wells and two new monitor wells; the excavation and backfill of two ground water recovery trenches and the installation of pneumatic pumps in the existing and new recovery wells.

2.1.1 Monitor Well Conversion

Seven existing monitor wells ranging in depths of twenty-two to twenty-seven feet below ground surface were modified and later equipped with pneumatic pumps and controls provided by GATX. A list of the monitor wells converted to recovery wells and their total depths below grade is presented in Table 2-1. Typical recovery well and recovery wellhead detail are depicted in Figures 2-1 and 2-2, respectively. Initial modifications included the installation of precast subgrade reinforced concrete well vaults also provided by GATX. ERI subcontracted an excavation crew to excavate a square hole approximately three and one-half feet wide on all sides and three and one-quarter feet deep. A one inch layer of soil was backfilled and leveled in order in insure a level surface for placement of the vault. The precast opening at the bottom the vault was centered around the wellhead as the vault was lowered. Once in place, the vault lid was replaced and the hole was backfilled. Excavated soil from each well area was field-tested by GATX, using an HNU meter and historical data, to determine if the soil could be used as backfill. Only the soils from wells 5,7, and 13 were determined by GATX to be potentially contaminated. These potentially contaminated soils were placed in a roll off bin provided by GATX. Excavated soil from vault installation of all other wells was used as backfill. Cement stabilized sand was used to backfill around the vaults of wells 5,7, and 13, which are located in a paved driveway, to prevent shifting of the vaults under traffic loads.

2.1.2 Monitor Well Installation

Two ground water monitor wells were completed, one to a depth of thirty-one feet (MW-31) and one to a depth of fourteen feet (MW-32). A typical monitor well detail is depicted in Figure 2-3. Subsurface conditions based on drill cuttings were documented and may be found in Appendix A - Soil Boring/Monitor Well Logs. At the request of GATX, soil boring samples

were taken from each well at five foot intervals, placed in four ounce pre-cleaned glass jars, labeled and hand delivered by ERI personnel to the GATX Environmental Health and Safety Manager. The samples were also reviewed by a GATX Engineer. Well locations were approved by GATX personnel for the absence of buried pipelines and conduit. Under the supervision of ERI's hydrogeologist, the two four-inch diameter stainless steel wells were installed using a hollow-stem auger. Aluminum shrouds were placed over the portion of the well extending above grade and cement pads were constructed around each shroud. A four foot long surface casing was placed around MW-32 prior to placement of the shroud, as specified. All drill cuttings were collected in drums labeled by drilling personnel. The drums were provided by GATX and the disposition of the cuttings was the responsibility of GATX. Upon completion, the wells were developed by surge block and jetting methods. Displaced well water was collected and placed in drums labeled by drilling personnel. The drums were provided and disposed of by GATX. For a summary of well development data see Table 2-2.

2.1.3 Recovery Trench Excavation and Backfill

Two ground water recovery trenches, SCFI and SCFII, were installed to provide for the collection of affected ground water. The trenches were installed using specialized trenching equipment which simultaneously excavates and backfills without exposing an open excavation. Utilization of this equipment minimized personnel exposure and the amount of potentially contaminated material generated by the excavation activities.

Trench SCFI was constructed approximately 260 feet long and twelve inches wide. The base of the trench was sloped at a two percent grade from each end (ten feet deep) to the center (12.6 feet deep). Trench SCFII was constructed approximately 160 feet long and twelve inches wide. The depth of SCFII was graded from ten feet at each end of the trench to 11.6 feet in the center. Cross-sections of both SCFI and SCFII are depicted in Figures 2-4 and 2-5.

Prior to installing Trench SCFI, the uppermost two feet of soil was removed from the work area and segregated into labeled roll-off bins. An additional two feet of overburden, eighteen inches in width was excavated along the trench path. Again, these soils were segregated and placed into labeled roll-off bins.

Upon completion of the work area preparation, and before initiation of trenching a layer of eight-mil polyethylene sheeting was placed along both sides of the trench line. During the excavation activity, spoils from the trench were deposited onto the polyethylene sheeting, thereby reducing the risk of surface soil contamination. These soils were segregated and placed in labeled roll-off bins. During the trenching operation, the trench was simultaneously backfilled with granular fill from an off-site source from the base of the trench to approximately eighteen inches below grade. Sieve analyses for the fill are provided in Appendix B. A twelve-inch clean clay cap was then placed over the backfill. The cap was compacted by tracking over the cap with a twenty-six ton track-hoe. The work area was then graded and the trench covered with native soils.

Trench SCFII was completed in essentially the same manner as SCFI. However, work area preparation of SCFII was limited to grading the upper six inches of soil to allow for a level base for the excavation equipment. Characterization and disposition of all excavated soils and trench spoils was performed by GATX.

2.2 Changes to Project Scope and Design

During projects of this magnitude, it is frequently necessary to make changes to the scope of work or project design due to site conditions. As such, some minor changes in project scope and design were made during this project. All changes in the scope of work or project design were either initiated or approved by GATX prior to implementation and are described in the following paragraphs.

2.2.1 Changes to Scope-of-Work

During the installation of the pre-cast concrete well vaults and monitor well conversions, GATX decided not to upgrade two existing recovery wells (RW-1 and RW-2). The wells were scheduled to be upgraded with the newer concrete vaults and new pumping equipment. However, GATX determined the upgrades to be unnecessary and removed them from the scope-of-work.

2.2.2 Changes to Project Design

The ground water recovery trenches were initially designed with a two percent grade from each end of the trench to the center with a one foot deep sump in the center. A recovery well was then to be installed to draw from this sump. (See Figure 2-6). The method of construction utilized for the trench installation did not facilitate the construction of an abrupt depth change such as the sump. The function of the trench was not determined to be degraded by the absence of the sump and the trench was constructed with a uniform two percent bottom slope throughout its length. The recovery well was then installed at the junction of the two slopes and the pump installed.

Report – Former NHB Corrective Action System

NHB
CORRECTIVE ACTION
PROGRAM

Site Specific Information

The North Holding Basin was constructed in 1975 and operated until 1988. The North Holding Basin is rectangular with sides of 480 feet and 276 feet. The average depth of the basin is 18.3 feet from the top of the berm. The total capacity of the basin is approximately 18 million gallons. The floor of the basin slopes slightly to the east to facilitate drainage.

The North Holding Basin received wastewater and storm water during the period of 1975 to 1988 from a collection system installed throughout the western portion of the facility. Effluent from the wastewater/storm water collection system passed through an oil/water separator before being discharged to the North Holding Basin. In 1988, the North Holding basin was retired from service. The sludge in the basin has undergone bioremediation treatment.

The subsurface in the Waste Management Area has been divided into four stratigraphic units by previous investigators. These four zones are labelled, from shallowest to deepest, Zone I through Zone IV. Lithologic descriptions of these zones are as follows:

- Zone I - Recent fill materials (ground surface to approximately 3 feet to 8 feet below ground surface.
- Zone II - Upper silty-clays and sandy-clays with silt, silty-sand and clayey-sand lenses (ranges in thickness from approximately 15 feet to 25 feet)
- Zone III - Silty-sands and clayey-sands (ranges in thickness from approximately 7 feet to 25 feet)
- Zone IV - Lower silty-sands and clayey-sands (ranges in thickness from 25 feet to 28 feet)

The lithology below Zone IV consists stiff, dense clay with very minor amounts of silt and fine sand.

Zone III is the uppermost naturally-occurring transmissive unit. The potentiometric surface of the groundwater in this unit occurs at a depth of between 3 feet and 8 feet below ground surface. Ten of the fifteen monitoring wells in the area of investigation are screened in Zone III. Three monitoring wells (MW-6, MW-14, MW-15) are screened in the deeper Zone IV. Monitoring well MW-3 is screened in Zone II and Zone III and monitoring well MW-12 is screened below Zone IV.

The approximate direction of groundwater flow in Zone III, as indicated on the June 1993 groundwater elevation contour map, was easterly to northeasterly in the area of the North Holding Basin. The potentiometric gradient in Zone III was approximately 0.009 feet/feet. The approximate direction of groundwater flow in Zone IV, as indicated on the June 1993 contour map, is to the east-northeast at the eastern end of the North Holding Basin. This flow direction is approximately coincident with the flow direction in the overlying Zone III. The gradient of the potentiometric surface in Zone IV is approximately 0.006 feet/feet.

The average hydraulic conductivity for Zone III, as determined from aquifer testing, is 1.8 feet per day. The average hydraulic conductivity for Zone IV is 0.5 feet per day. The range

of calculated hydraulic conductivities is 0.9 feet per to 3.2 feet per day for Zone III and 0.2 feet per day to 0.8 feet per day for Zone IV.

Groundwater Protection Standards

The objective of the groundwater corrective action plan for the area around the North Holding Basin is to control migration of the dissolved-phase volatile organic compound 1,2-dichloroethane in the stratigraphic Zone III and Zone IV. A series of groundwater investigations and subsequent quarterly groundwater monitoring events have identified areas in Zone III and Zone IV where the concentration of 1,2-dichloroethane in groundwater exceeds 5 micrograms per liter. Five micrograms per liter of 1,2-dichloroethane is the published TNRCC risk reduction rule Standard #2 for groundwater. This standard has been adopted as the groundwater protection standard for the North Holding Basin Waste Management Area.

Existing Groundwater Monitoring Program

Quarterly monitoring of groundwater quality is currently conducted at the North Holding Basin. Current quarterly monitoring consists of the following tasks:

- collecting water-level data from all existing monitoring wells
- inspecting each existing monitoring well
- collecting groundwater samples from each existing monitoring well
- laboratory analysis of groundwater and surface water samples for the compound 1,2-dichloroethane
- constructing potentiometric surface maps for Zone III and Zone IV.

PART V - Corrective Action Program
North Holding Basin
GATX - Galena Park, Texas

1.0 TYPE OF CORRECTIVE ACTION

Groundwater well recovery with surface treatment.

2.0 PROGRAM DESCRIPTION

The corrective action program for groundwater at the North Holding Basin has been developed to meet Texas Natural Resources Conservation Commission (TNRCC) requirements for a modification under Provision XI.D of Compliance Program CP-50054. This requirement was communicated in a letter dated December 28, 1994 from the TNRCC - Industrial and Hazardous Waste Permits Section to GATX.

The TNRCC requires that the corrective action program consider all known areas of contamination adjacent to the North Holding Basin. This area has been designated a Waste Management Area for the purposes of the corrective action. The Waste Management Area includes potential sources based on historical information on storage of product. Areas of identified groundwater contamination on the GATX property are also included in the Waste Management Area. The boundaries of the Waste Management Area are shown on Figure 2-1.

This corrective action program will focus on the identified groundwater contamination. Previous investigations have determined that the volatile organic compound 1,2-dichloroethane is the compound of concern. No soil remediation will be completed at this time as there appears to be multiple subsurface source areas in the vicinity of the North Holding Basin, as well as potential offsite sources. Identification and cleanup of these multiple source areas is not practicable because of the number of potential source areas, including possible offsite source areas, and ongoing facility operations in the North Holding Basin area. Above ground source remediation has been achieved by GATX's commitment not to store or manage this compound at this facility. Limited benefit will be gained from the additional removal of source areas because a long-term groundwater cleanup is required, in any case, to address the existing area of groundwater contamination. Planned aboveground storage tank renovations in the area of contamination will require excavation of soils in the Waste Management Area. Excavated soils will be tested, properly treated, and disposed of at that time. Some remediation of the soil is anticipated in the future.

The design of the corrective action program is based upon subsurface conditions and site constraints. Factors related to subsurface conditions include: the distribution of dissolved contaminants, subsurface geology, and the hydrodynamic characteristics of the water-bearing units. Site constraint factors include: buried utilities, roadways, property boundaries, and planned future uses of the North Holding Basin and the area around the North Holding Basin.

The findings from several groundwater investigations conducted in the area of the North Holding Basin are summarized in the document titled, "North Holding Basin Phase II Expanded Groundwater Quality Assessment Report" (Phase II - EGWQA) dated June 1993. This report provides a description of the texture, thickness, and stratigraphic relationship of Zone III and Zone IV. The report also identifies areas of groundwater contamination in Zone III and Zone IV. The distribution and concentration of 1,2-dichloroethane in groundwater has been further characterized by subsequent quarterly monitoring.

The corrective action program is designed to develop zones of capture that encompass the areas dissolved-phase contaminants in groundwater in Zone III and Zone IV. Figure 2-2 and Figure 2-3 indicate the areas where the concentration of 1,2-dichloroethane in groundwater exceeds 5 micrograms per liter. Five micrograms per liter of 1,2-dichloroethane is the published TNRCC risk reduction rule Standard #2 for groundwater. The areas of 1,2-dichloroethane concentration indicated on these figures are based data from the most recent groundwater sampling event conducted in April 1994.

Zone III and Zone IV have similar potentiometric elevations, potentiometric gradients, and groundwater flow directions. The hydraulic head difference between the two zones is small. This indicates that Zone III and Zone IV are probably hydrodynamically connected. However, there is a significant difference in the hydraulic conductivity of the two units.

Aquifer testing was conducted at 9 of the existing monitoring wells to assess the hydrodynamic characteristics of Zone III, Zone IV, and a deeper zone below Zone IV. Five tests were conducted in Zone III, three tests were conducted in Zone IV, and one test was conducted below Zone IV. Data generated during aquifer testing were used to determine the average hydraulic conductivity for Zone III and Zone IV. The aquifer test in the monitoring well screened below Zone IV yielded unsuitable data for the determination of hydraulic conductivity due to extremely impermeable clays.

The average hydraulic conductivity for Zone III, as determined from aquifer testing, is 1.8 feet per day. The average hydraulic conductivity for Zone IV is 0.5 feet per day. The range of calculated hydraulic conductivities is 0.9 feet per to 3.2 feet per day for Zone III and 0.2 feet per day to 0.8 feet per day for Zone IV. Calculated hydraulic conductivities for each of the nine aquifer tests are summarized in the following table:

Aquifer Testing - North Holding Basin

WELL ID	ZONE SCREENED	SCREEN LENGTH (feet)	Total Depth of Well (feet)	CALCULATED HYDRAULIC CONDUCTIVITY (ft/day)
MW-2	III	5	34.0	1.7
MW-4	III	20	31.7	0.9
MW-5	III	20	45.5	3.2
MW-6	IV	10	53.9	0.8
MW-7	III	10	30.4	2.1
MW-12	Below IV	10	82.0	0.0
MW-13	III	10	30.0	1.1
MW-14	IV	10	58.0	0.2
MW-15	IV	10	59.0	0.5

Average Hydraulic Conductivity (K) of Zone III	= 1.8 feet/day
Average Hydraulic Conductivity (K) of Zone IV	= 0.5 feet/day

Analytical groundwater modeling of Zone III and Zone IV in the area around the North Holding Basin was performed using the QuickFlow model. The QuickFlow analytical model simulates two-dimensional steady-state groundwater flow. The thickness of each water-bearing zone is averaged across the model.

The average hydraulic conductivities of Zone III and Zone IV were used in the QuickFlow model to simulate various groundwater pumping conditions (withdrawal rates) and recovery well system configurations. The modeled area includes the Waste Management Area and extends to Panther Creek. This area encompasses all of the 15 existing monitoring wells.

Several steady-state modeling runs were executed using varying configurations of recovery wells. Groundwater pumping of Zone III and Zone IV were modeled separately. Modeling results indicate that capture zones large enough to encompass the downgradient end of the area of contamination can be created using three recovery wells with a combined flow rate of approximately 7 gallons to 9 gallons per minute (gpm).

The proposed corrective action program will withdraw groundwater from five existing wells (MW-4, MW-15, MW-6, MW-7, and MW-12) and two new recovery wells. Two existing wells (MW-3 and MW-9) will be plugged and abandoned. The location of these wells are illustrated on Figure ~~4-1~~ 2-2.

The two new recovery wells, labeled RW-16 and RW-17, will be installed at the eastern end of the North Holding Basin near the existing monitoring wells MW-2 and MW-3. RW-16 will be screened in Zone III and RW-17 will be screened in Zone IV. The planned locations of the new recovery wells are illustrated on Figure 4-1.

The planned groundwater pumping will create a zone of capture or radius of influence for each recovery well. Projected optimum pumping rates, approximate potentiometric drawdown, and estimated radius of influence for each of the six recovery wells are summarized on the following table:

Projected Pumping Rates, Calculated Drawdown and Estimated Radius of Influence for North Holding Basin Recovery Wells

Recovery Well	Zone Screened	Projected Pumping Rate (gpm)	Calculated Potentiometric Drawdown (feet)	Estimated Radius of Influence (feet)
MW-4 (existing)	III	2.0	12.0	200
MW-15 (existing)	IV	0.5	11.0	200
MW-6 (existing)	IV	0.5	12.0	200
MW-7 (existing)	III	2.0	13.5	200
MW-12 (existing)	Below IV	< 0.1	20.0	unknown
RW-16 (proposed)	III	2.0	17.5	200
RW-17 (proposed)	IV	1.0	15.0	250

The estimated combined groundwater pumping rate for the three Zone III recovery wells (MW-4, MW-7, and RW-16) is 6 gpm. The estimated combined groundwater pumping rate for the three Zone IV recovery wells (MW-15, MW-6, and RW-17) is approximately 2 gpm. Pumping rates of Zone III wells are higher than the pumping rates of the Zone IV wells due to higher hydraulic conductivity. An accurate estimation of the pumping rate from MW-12 could not be made due to the extremely low permeability clays. However, the pumping rate from MW-12 is expected to be small (less than 100 gallons per day). The estimated total pumping rate for all 7 recovery wells is 8 gpm.

The radius of influence of the three recovery wells will merge to create a capture zone or zone of influence in Zone III after steady-state conditions are established. The modeled capture zone and potentiometric drawdown for Zone III for groundwater pumping from MW-4, MW-7, and RW-16 is represented on Figure 4-2. The modeled capture zone encompasses the entire downgradient portion of the area of contamination.

The steady-state modeled capture zone and potentiometric drawdown for Zone IV for groundwater pumping from MW-15, MW-6, and RW-17 is represented on Figure 4-3. The modeled capture zone encompasses the entire downgradient portion of the area of contamination in Zone IV.

A steady-state capture zone could not be modelled for the planned groundwater recovery at MW-12 due to the low permeability clays. The estimated radius of influence will be small, probably less than 100 feet.

System Design and Specifications

The groundwater recovery system proposed for this corrective action program will employ five existing wells, two new recovery wells, and a discharge header. The existing wells that will be used in the recovery system are MW-4, MW-15, MW-6, MW-7, and MW-12. All five of these wells are constructed of flush-threaded PVC screens and riser. Construction details of these wells are summarized below:

Recovery Well Construction Details

RECOVERY WELL	ZONE SCREENED	TOTAL DEPTH (feet)	WELL DIAMETER (inches)	SCREEN LENGTH (feet)	SCREEN SLOT SIZE (inches)
MW-4	III	31.7	4	20	0.010
MW-15	IV	59.0	4	10	0.010
MW-6	IV	53.9	4	10	0.010
MW-7	III	30.4	4	10	0.010
MW-12	Below IV	82.0	4	10	0.010

The two new recovery wells, RW-16 and RW-17, will be installed east of the North Holding Basin. RW-16 will be screened in Zone III and RW-17 will be screened in Zone IV. These wells will placed to the east of existing monitoring wells MW-2 and MW-3. Well MW-3 will be properly plugged and abandoned according to TNRCC regulations. Well MW-2 will serve as a supplemental monitoring well.

The proposed construction details of RW-16 and RW-17 are similar to the construction of the existing monitoring wells. RW-16 and RW-17 will be 4-inch diameter, flush-threaded PVC with 10 feet of 0.010-inch wire-wrapped or slotted screen. The screens in each new recovery well will be installed near the bottom of each water-bearing zone. The screen in RW-16 (Zone III) will be installed between 22 feet and 32 feet below ground surface. The screen RW-17 (Zone IV) will be installed between 47 feet and 57 feet below ground surface. Proposed construction specifications and details for the new recovery wells are illustrated on Figure 4-4. The depth of the screened intervals of the new recovery wells may be adjusted based on the geology observed in the borings.

Pneumatically operated and controlled groundwater recovery pumps will be installed in each of the seven recovery wells. The pumps can be operated using compressed air or compressed nitrogen. The plant-wide compressed nitrogen system has been used successfully for the groundwater interception system installed at the SEHB in the Central Plant. All piping and associated wellhead equipment at the North Holding Basin will be installed below grade or in below ground vaults with flush-mounted covers. This equipment arrangement will be similar to the type of groundwater recovery system operating in the Central Plant. Detail of a typical recovery wellhead is presented on Figure 4-5.

The pumps will be installed at a depth sufficient to allow for the designed drawdown in each recovery well. The estimated designed stabilized drawdowns of the potentiometric surface, as measured from ground surface, and the approximate pumping water-level elevations in the seven recovery wells are:

Estimated Drawdown and Approximate Pumping Water-Level Elevations in North Holding Basin Recovery Wells

RECOVERY WELL	Estimated Stabilized Drawdown from Ground Surface (feet)	Approximate Pumping Water-Level Elevation (feet relative to mean sea level)
MW-4	15.5	- 5.1
MW-15	15.5	- 4.1
MW-6	17.5	- 7.5
MW-7	19.3	- 8.4

RECOVERY WELL	Estimated Stabilized Drawdown from Ground Surface (feet)	Approximate Pumping Water-Level Elevation (feet relative to mean sea level)
MW-12	70.1	- 59.3
RW-16	22.5	- 13.1
RW-17	20.0	- 10.5

Groundwater withdrawn from the North Holding Basin recovery system will be collected and conveyed in a piping header. The route of the piping header from the area of the North Holding Basin to the treatment system is illustrated on Figure 4-4. The piping header will discharge to a temporary above ground storage tank prior to treatment and disposal.

The temporary above ground storage tank is labelled 3-10 and has an operating capacity of approximately 130,000 gallons. This tank is currently used for temporary storage of groundwater recovered from the interception system operating in the Central Plant. Flows from both the Central Plant groundwater interception system and the North Holding Basin groundwater recovery system will be temporarily stored in tank 3-10.

The water-level in tank 3-10 will be maintained at an approximately constant level of about 90,000 gallons. Based on an estimated combined flow rate of 10.5 gpm for both groundwater recovery systems, the approximate flow-through time or duration of storage in tank 3-10 is 6 days.

Groundwater stored in tank 3-10 will be treated by air stripping. The air stripping system was installed in 1993 in a building adjacent to tank 3-10 to treat the discharge from the Central Plant groundwater recovery system. Treated groundwater will be discharged to Gulf Coast Waste Disposal Authority under GATX's existing industrial wastewater permit.

3.0 GROUNDWATER MONITORING AND CORRECTIVE ACTION PROGRAM DESCRIPTION

Quarterly monitoring is conducted at the North Holding Basin as required in the TNRCC lettered to GATX dated December 28, 1993. Current quarterly monitoring consists of the following tasks:

- collecting water-level data from 15 existing monitoring wells
- inspecting 15 existing monitoring wells
- collecting groundwater samples from 15 existing monitoring well

- collecting 3 surface water samples from Panther Creek
- laboratory analysis of groundwater and surface water samples for the volatile organic compound 1,2-dichloroethane
- constructing potentiometric surface maps for Zone III and Zone IV.

Several changes are planned for future groundwater monitoring. The planned sampling interval will be semiannual. Monitoring will be conducted during the first month of each semiannual period (i.e., January and July). Existing and proposed wells will be grouped into the following categories:

Recovery Wells	MW-4, MW-6, MW-7 MW-12, MW-15, RW-16, RW-17
Point of Compliance Wells	MW-6, MW-7, MW-12 RW-16, RW-17
Background Wells (semiannual monitoring for 1,2-dichloroethane)	MW-1, MW-8
Corrective Action Observation Wells (semiannual monitoring for 1,2-dichloroethane)	MW-4, MW-5, MW-6, MW-7, MW-12, MW-15, RW-16, RW-17
Supplemental Wells (semiannual monitoring for water level only)	MW-2, MW-11, MW-13, MW-14
Abandoned Wells	MW-3, MW-9

Water-level data will be collected semiannually from all recovery wells, point of compliance wells, background wells, corrective action observation wells, and supplemental wells. Groundwater samples will be collected semiannually from background wells and corrective action observation wells. Groundwater samples will be analyzed for the volatile organic compound 1,2-dichloroethane. Well construction details are provided on Table V.1. Monitoring parameters and sample handling, chain-of-custody, quality control/quality assurance, and analytical procedures will be the same as conducted during prior groundwater monitoring.

Semiannual reports, as required in the permit, will be prepared to present groundwater monitoring data. The report for the period of January to June will be prepared by July 25th. The report for the period of July to December will be prepared by January 25th of the following year. Potentiometric maps of Zone III and Zone IV will be presented to illustrate the capture zones. Groundwater quality data will be presented in a table. The text will describe all activities conducted during the prior semiannual period. A determination of contaminant migration direction and migration rate will be prepared annually.

4.0 WASTE MANAGEMENT UNITS/AREAS MONITORED UNDER CORRECTIVE ACTION PROGRAMS

The waste management area at the North Holding Basin is indicated on Figure 2-1. The waste management area extends to the property line on the east side of the North Holding Basin. The proposed point of compliance are the wells MW-6, MW-7, MW-12, RW-16, and RW-17.

Wells which are included in the proposed groundwater monitoring and corrective action system are listed on Table V.1. The location of these wells are illustrated on Figures 2-3 and 4-1.

5.0 IMPLEMENTATION SCHEDULE

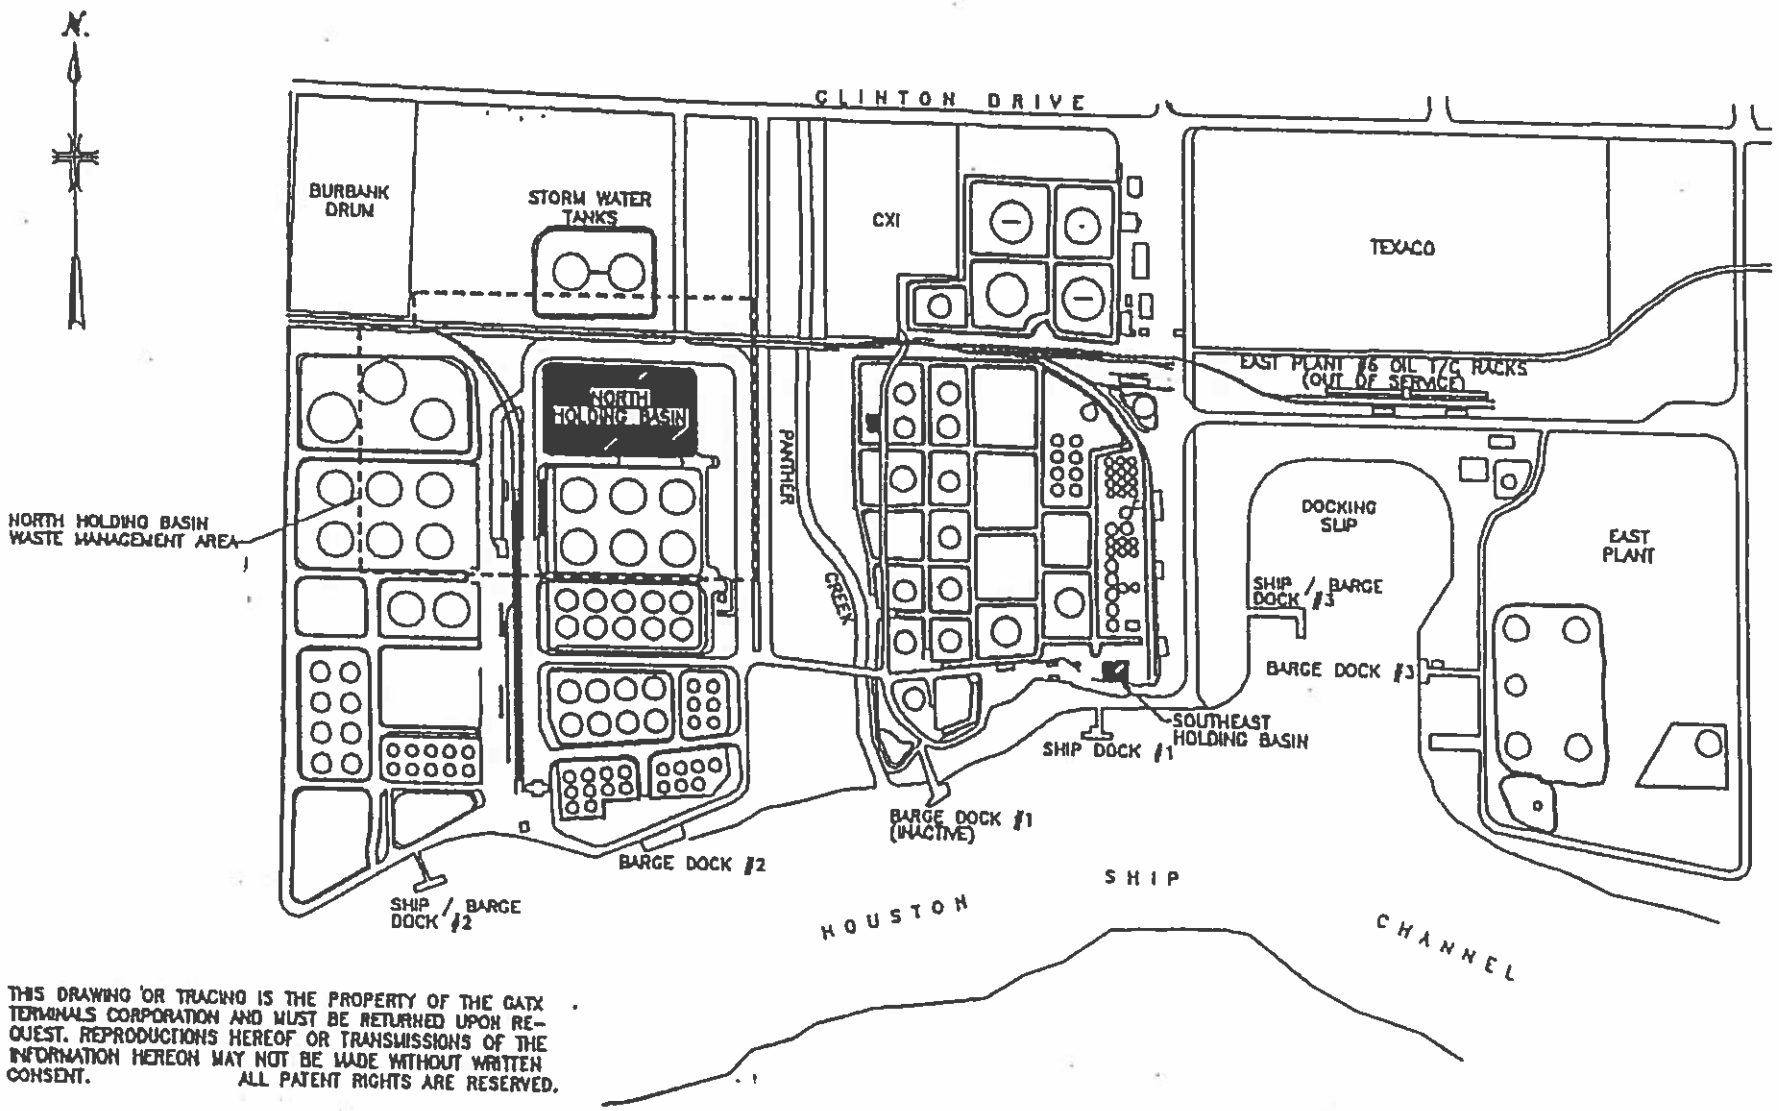
The following schedule is proposed for implementation of the corrective action program at the North Holding Basin waste management area:

Task	Time to Complete
Final Design	45 days
Contractor Procurement	90 days
Construction and Start up	180 days

The implementation schedule will begin on the date of approval of the compliance plan modification.

6.0 CONTINGENCY PROCEDURES

Groundwater monitoring will provide an evaluation of the performance of the corrective action program. Water-level monitoring will be used to assess the establishment of the proposed capture zones. Certain parameters of the corrective action program can be modified if the proposed steady-state drawdowns are not established by the designed recovery system. Built in flexibility of recovery system will allow for adjustments to pump settings and pumping rates.



THIS DRAWING OR TRACING IS THE PROPERTY OF THE GATX TERMINALS CORPORATION AND MUST BE RETURNED UPON REQUEST. REPRODUCTIONS HEREOF OR TRANSMISSIONS OF THE INFORMATION HEREON MAY NOT BE MADE WITHOUT WRITTEN CONSENT. ALL PATENT RIGHTS ARE RESERVED.

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

May 11, 2004

Mr. Neal McHugh
Environmental Health & Safety Manager
Kinder Morgan Liquids Terminals, LLC
405 Clinton Drive
Galena Park, TX 77547-0486

Re: Approval of Remedy Standard A - Residential
Tank 5-20 RFI Addendum Report and Closure Report, dated January 9, 2004
Kinder Morgan Liquids Terminals, LLC
TCEQ SWR No. 30573
TCEQ Hazardous Waste Permit/Compliance Plan No. HW- 50054
EPA ID No. TXD026481523

Dear Mr. McHugh:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above referenced submittal, dated January 9, 2004. Tank 5-20 was included in the West Plant RFI waste management area, but has subsequently been shown not to have had a release above Texas Risk Reduction Program (TRRP) Remedy Standard A, Tier 1 Residential Protective Concentration Levels (PCLs).

Based on the TCEQ review of the report, Texas Risk Reduction Program (TRRP) Remedy Standard A Tier 1 Residential Protective Concentration Levels (PCLs) have been achieved such that no institutional control or post-response action care is required. No further action is required under 30 Texas Administrative Code (TAC) §350 for the above-referenced areas.

In order to attain Remedy Standard A under TRRP, all industrial solid waste and municipal hazardous waste and waste residues must be removed or decontaminated from affected media (i.e., soil, surface water, groundwater, air, etc.) to applicable human health and ecological based standards and criteria. In order to be released from the requirement to file an institutional control in accordance with 30 TAC §350 Subchapter F, contaminants that remain in place must not exceed Remedy Standard A Tier 1 Residential PCLs.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a

nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the activities described in the report fail to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of the site to determine compliance with the report.

Questions concerning this letter should be directed to me at (512) 239-2531. When responding by mail, please submit an original and one copy of all correspondence and reports to the TCEQ Corrective Action Section at Mail Code MC-127 with an additional copy submitted to the local TCEQ Region Office. The information in the reference block should be included in all submittals.

Sincerely,

Mark E. Erwin, Project Manager
Team II, Corrective Action Section
Remediation Division

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

April 11, 2013

Mr. Johnny Kennedy
Project Manager, Environmental Remediation
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Approval of: Post Response Action Completion Report (PRACR), East Plant, dated January 16, 2013
Kinder Morgan Liquid Terminals, L.P., Galena Park
RN 100237452, CN 601545940
TCEQ SWR No. 30573
TCEQ Hazardous Waste Permit/Compliance Plan No. HW- 50054
EPA ID No. TXD026481523

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has completed the review of the above mentioned report. Post response action care activities have been evaluated annually for two years at the East Plant with the submittal of PRACRs. The Plume Management Zone (PMZ) is managed by attenuation monitoring points (AMPs) and point of exposure (POE) wells to verify that the affected groundwater plume will not migrate beyond the PMZ boundaries above the applicable protective concentration levels (PCLs).

Kinder Morgan is requesting a no further action (NFA) status for the East Plant Terminal based on four consecutive semi-annual sampling events. The PRACR has demonstrated that benzene concentrations in all the PMZ monitoring wells are stable or decreasing in concentration and continue to remain below the critical PCL. Based on the information provided, the TCEQ approves the PRACR.

Questions concerning this letter should be directed to me at (512) 239-2572.

Sincerely,

Kirk Coulter, P.G., Project Manager
Corrective Action Team, VCP/CA Section
Remediation Division

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

January 5, 2005

Mr. Lance Richards, P.E.
Project Manager, Environmental Remediation
Kinder Morgan Liquids Terminals, LLC
405 Clinton Drive
Galena Park, TX 77547-0486

Re: *Closure* - Risk Reduction Standard No. 2
Acceptance of Deed Certification and Release From Post-closure Care Responsibilities
Kinder Morgan Liquids Terminals, LLC
North Plant Tract C and East Plant Tank Car Rack - RFI Units
TCEQ SWR No. 30573
TCEQ Hazardous Waste Permit/Compliance Plan No. HW- 50054
EPA ID No. TXD026481523

Dear Mr. Richards:

The Texas Commission on Environmental Quality (TCEQ) received a letter December 8, 2004 submitted by Kinder Morgan containing proof of deed certification for the RCRA Facility Assessments/Investigations (RFI) Units Tract C and the East Plant Tank Car Rack. The certification states that contaminants remaining at the site have been remediated to meet non-residential soil criteria under Risk Reduction Standard (RRS) No. 2 pursuant to Title 30 Texas Administrative Code (TAC) Chapter 335 Subchapters A and S.

In order to attain RRS No. 2, all industrial solid waste and municipal hazardous waste and waste residues must be removed or decontaminated to health based standards and criteria. Contaminants allowed to remain in place in media of concern (i.e., soil, ground water, surface water and air) must not exceed the health based clean up levels as specified in 30 TAC §335.556. A Final Report, documenting that remediation at the facility has attained RRS No. 2 such that no post-closure care or engineering control measures are required, was previously accepted by the TCEQ in our letter dated March 11, 2004. Public Notice was published on January 4, 2004 and no comments were received.

After review of the proof of deed certification, it appears that the deed certification requirements of 30 TAC §335.560(b) and (c) have been completed. The TCEQ hereby releases the facility from post-closure care responsibilities for Tract C and the East Plant Tank Car Rack.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual closure fails to comply with these requirements, the burden remains upon Kinder Morgan to take any necessary and authorized action to correct such conditions. A TCEQ field inspector may review your Final Report and conduct a closure inspection of the site.

Questions concerning this letter should be directed to me at (512) 239-6786. When responding by mail, please submit an original and one copy of all correspondence and reports to the Corrective Action Section at Mail Code MC-127 with an additional copy submitted to the TCEQ Region 12 Office in Houston. The TCEQ Solid Waste Registration Number and North Plant Tract C and the East Plant Tank Car Rack should be referenced in all submittals.

Sincerely,

Kellie Jones, Project Manager
Team II, Corrective Action Section

EPA ID No. TXD026481523

Dear Mr. Richards:

The Texas Commission on Environmental Quality (TCEQ) received a letter March 24, 2005 submitted by Kinder Morgan containing proof of deed certification for the RCRA Facility Investigation (RFI) Unit North Plant Tract B. The certification states that contaminants remaining at the site have been remediated to meet non-residential soil criteria under Risk Reduction Standard (RRS) No. 2 pursuant to Title 30 Texas Administrative Code (TAC) Chapter 335 Subchapters A and S.

In order to attain RRS No. 2, all industrial solid waste and municipal hazardous waste and waste residues must be removed or decontaminated to health based standards and criteria. Contaminants allowed to remain in place in media of concern (i.e., soil, ground water, surface water and air) must not exceed the health based clean up levels as specified in 30 TAC §335.556. A Final Report, documenting that remediation at the facility has attained RRS No. 2 such that no post-closure care or engineering control measures are required, was previously accepted by the TCEQ in our letter dated December 9, 2004. Public Notice of proposed Corrective Measures was published on August 22, 2004, and no comments were received.

After review of the proof of deed certification, it appears that the deed certification requirements of 30 TAC §335.560(b) and (c) have been completed. The TCEQ hereby releases the facility from post-closure care responsibilities for North Plant Tract B.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual closure fails to comply with these requirements, the burden remains upon Kinder Morgan to take any necessary and authorized action to correct such conditions. A TCEQ field inspector may review your Final Report and conduct a closure inspection of the site.

Questions concerning this letter should be directed to me at (512) 239-6786. When responding by mail, please submit an original and one copy of all correspondence and reports to the Corrective Action Section at Mail Code MC-127 with an additional copy submitted to the TCEQ Region 12 Office in Houston. The TCEQ Solid Waste Registration Number and North Plant Tract B should be referenced in all submittals.

Sincerely,

Kellie Jones, Project Manager
Team II, Corrective Action Section
Remediation Division
Texas Commission on Environmental Quality

Subject: Re: TCEQ Meeting Follow-Up

Kenneth

Please provide another copy of the RACR for the East Plant. If the report is at the agency, it is probably in Central records and no longer in my office.

I concur with requested suspension on the sampling which was requested in the Semiannual Corrective Action Program Report -July 1-December 31, 2010

>>> "Kennedy, Johnny" [redacted] 5/5/2011 9:03 AM >>>
Kirk,

Thank you for meeting with Rich Steinberg and myself on Tuesday to discuss the status of the Kinder Morgan Liquids Terminals (KMLT) Galena Park projects. Per our discussion, I am following up with this email on two issues.

1) Response Action Completion Report (RACR) for the KMLT East Plant. The RACR was submitted to the TCEQ in June 2010 (copies of the cover letter and report cover attached). Could you please provide us a status on the TCEQ's review of this report. If you cannot locate the report, please let me know and I will provide you with additional copies.

2) Semiannual Corrective Action Program Report -July 1-December 31, 2010 (SWR No. 30573; HW Permit/Compliance Plan No. HW-50054). In Section 4.0, Summary and Conclusions, KMLT requested suspending sampling of CAO wells MW-5, MW-9, MW-12 and MW-14 in the NHB since reported concentrations of 1,2-dichloroethane have consistently been below GWPS. The requested suspension of sampling would only be until the POC wells listed in Table V of the Compliance Plan achieved analytical results that satisfy the GWPS for the constituents listed in Table IV of the Compliance Plan for two (2) consecutive events. At that time, the four (4) referenced wells would be sampled with all other wells associated with the NHB for the Table III constituents as outlined in the Compliance Plan.

The TCEQ approval letter for the submission, dated April 20, 201, did not address this request. Could you please provide a response.

Once again, thank you for meeting with us and if you have any questions or issues you would like to discussion, please do not hesitate to contact me.

Regards,
Johnny Kennedy

To: Kirk Coulter
Subject: Kinder Morgan Galena Park East Plant PRACR Approval Letter

Kirk,

I am in receipt of your April 11, 2013 approval letter for the Kinder Morgan Galena Park East Plant Post Response Action Completion Report (PRACR). I would just like to get one clarification before I proceed. Although not explicitly stated, I am under the assumption that your approval of the report means that you are also approving Kinder Morgan's request for a No Further Action at the site. The reason that I am asking for clarification is that I will need to plug and abandon the remaining few monitoring wells along the shoreline and I will be working with our Engineering Group once they begin shoreline stabilization for the new tank area.

I don't mean to be questioning your response, I just have to give Engineering and Management a factual answer and not my interpretation.

Thanks,

Johnny

Johnny Kennedy

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

December 19, 2022

Mr. Johnny Kennedy
Remediation Project Manager
Kinder Morgan Liquids Terminals, LL
1500 Clinton Drive
Galena Park, TX 77547

Re: Approval Conditional - TRRP Remedy Standard B- No Further Action
Response Action Completion Report (RACR) – Gate 6 Project, dated October 12, 2022
Kinder Morgan Liquids Terminals, LLC – Galena Park;
TCEQ SWR No. 30573; CN601545940; RN100237452
TCEQ Hazardous Waste Permit No. 50054; EPA ID No. TXD026481523

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above-referenced RACR. The RACR documents that the chemicals of concern remaining at the Gate 6 Area of Concern (AOC) meet the Texas Risk Reduction Program (TRRP) Remedy Standard B commercial/industrial protective concentration levels such that no post-response action care or groundwater monitoring is required pursuant to 30 Texas Administrative Code (TAC) §350.33. The RACR also documents that Kinder Morgan filed a deed notice in the Harris County records on October 16, 2018 and fulfilled the institutional control requirements of 30 TAC §350.111. The TCEQ has determined that the RACR meets the requirements of 30 TAC §350.95 and the performance standards and corrective action objectives are for Gate 6 AOC in accordance with Permit Provisions XI.D., and XI.E.

Therefore, the TCEQ approves Kinder Morgan's proposed request to terminate corrective action for Gate 6 AOC with the condition that Kinder Morgan updates CP Table II in the Permit renewal application due in 2024, to officially terminate corrective action for Gate 6 AOC in accordance with Permit Provisions XI.D., and XI.H.6.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the RAP.

Questions concerning this letter should be directed to me at (512) 239-2034. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all future documents to the TCEQ Remediation Division at Mail Code MC-127.

An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals. Note that the electronic and hard copies should be identical, complete copies. A Correspondence ID Form (TCEQ Form 20428) must accompany each document submitted to the Remediation Division and should be affixed to the front of your submittal. The Correspondence ID Form helps ensure that your documents are identified correctly and are routed to the applicable program for a timely response.

Sincerely,

Maureen M. Hatfield, P.G., Project Manager
VCP-CA Section, Remediation Division
Texas Commission on Environmental Quality

GATX Terminals Corporation - Galena Park
TNRCC SWR No. 30573
TNRCC Hazardous Waste Permit/Compliance Plan No. HW/CP-50054
EPA ID No. TXD026481523

Dear Ms. Mehra:

The Texas Natural Resource Conservation Commission (TNRCC) has reviewed the following reports: *West Plant Groundwater Assessment*, submitted November 26, 1996; *RCRA Facility Investigation Report - Phase I*, submitted April 14, 1997; *RCRA Facility Investigation Report - Phase II*, submitted July 31, 1998; and *Site Investigation Report Texmark Chemical, Inc.*, submitted September 30, 1998. A list of comments is enclosed. Please prepare a written response to each comment, referencing the assigned TNRCC comment number. The facility name, location and identification number(s) in the TNRCC reference line above should be included in your response.

An original and one copy of the written response to these comments must be submitted to the TNRCC at the letterhead address using mail code number MC-127. An additional copy should be submitted to Ms. Marsha Hill, Waste Program Manager, TNRCC Region 12 Office, 5425 Polk Ave., Suite H, Houston TX 77023-1486. Please submit your response within 90 days from the date of this letter.

Should you need additional information, or wish to discuss these comments or the due date, please call me at (512) 239-2130. Thank you for your cooperation in this matter.

Sincerely,

Lila Beckley, Project Manager

Comments to RFI Reports

1. The Phase I RFI Report proposes No Further Action (NFA) for nineteen (19) Solid Waste Management Units (SWMUs) (see Table 3). Based on information provided in this report, and for the purposes of GATX's RFI requirements, the TNRCC accepts the NFA proposal only for the following two (2) North Plant SWMUs at this time: Texaco Landfill No. 4 and the North Spoils Area.

2. There appear to be inconsistencies between the Phase I and II Reports regarding which SWMUs have released and which media have been contaminated. For example, although the Phase I Report (e.g., Table 2) does not appear to address the Central Plant Aboveground Oil/Water Separator, the Phase II Report (see pp. 3 and 43) states that the Phase I RFI showed there had been no release and recommended no further action for this unit. Additionally, there seems to be confusion on terminology and usage of data for release and extent determinations. For example, the Phase I Report proposes that Tank 10-12 be "deemed closed with no further action" (p. 6). This proposal appears to be based on findings of Total Petroleum Hydrocarbon (TPH) contamination in soil and ground water at locations which are more than 100' away from the tank. Also, as there are other tanks between Tank 10-12 and the sample locations, it is not clear how release determinations can be made for Tank 10-12.

   Please clarify GATX's interpretation of SWMU status by providing a table which lists each SWMU (ordered by SWMU groups, as appropriate), and states whether the units have released, and if so, which environmental media have been affected. Also, indicate which SWMUs are proposed for NFA, and distinguish between NFA/No Release and NFA due to previous closure activities. For the latter case, specify whether final reports were submitted to the TNRCC, and provide date(s) of TNRCC response(s) and approval, as applicable.

3. Compliance Plan Section XIII.E.5 requires a listing of SWMUs determined to be continuing sources of releases into the ground water. Please include this information in the response to this letter.

4. For each SWMU that has released contaminants into the environment, please provide maps illustrating the extent of contamination in soil and ground water, as appropriate. These maps, which should correspond to the information requested in Item No. 2 above, should be appropriately scaled and legible, and should include concentration contours of the primary, SWMU-specific constituents of concern. Please take the following into consideration when developing the requested maps:

TNRCC letter dated 6/14/99
ENCLOSURE
TNRCC SWR No. 30573

a. GATX's November 11, 1997 letter and Phase II Report (e.g., p. 27) indicate that the extent of contamination for organics would be determined by extrapolation of decreasing concentration trends below Risk Reduction Standard No. 2 levels. At the time the RFI workplan was under discussion, the TNRCC had agreed to this method of evaluation. It appears, however, that for many SWMUs discussed in the Phase II Report, direct comparisons to target concentrations were made and trend data were not incorporated. Please provide maps which clearly illustrate the pattern of decreasing concentrations. An interpretation of the total contaminated area (for all constituents of concern) should also be provided, and adequate data should be posted to justify the interpretation of the extent.

b. The Phase II Report states that the extent of contamination is defined for some SWMUs by sample results which are below quantitation limits. These quantitation limits may be elevated and may be above Standard No. 2 levels. Because the elevated quantitation limits appear to be sample-specific, the TNRCC does not concur with use of these data for extent determination without supporting documentation that lower quantitation limits were not achievable (i.e., for the suite of investigation data; see 30 TAC §335.2 - Definition of PQL). The full extent of contamination in soils and ground water should be defined to appropriate Practical Quantitation Limits, which should be equal to or less than the applicable health-based concentrations of concern.

c. Please verify that units (mg/kg vs. µg/kg) and other information are posted correctly on the maps.

3. It appears that some Phase II analytical results and laboratory flags may not have been transcribed correctly from the laboratory analytical reports to the summary tables. Examples include, but are not limited to, samples II-047 (4-8'), II-062 (12-14'), II-063 (5-7'), II-065 (17.5-20'), and II-076 (8-10'). Please verify the data and discuss the impact any errors have on determination of the extent of contamination and calculation of source terms used in the Baseline Risk Assessments.

4. Additional Comments for the West Plant, based on *West Plant Groundwater Assessment*, submitted November 26, 1996:

a. During the initial phase of this assessment, 37 soil samples were collected and analyzed for TPH and Total Organic Halogens (TOX). TOX concentrations were

TNRCC letter dated 6/14/99
ENCLOSURE
TNRCC SWR No. 30573

below detection limits in all the samples. TPH was detected in 17 of the samples, with concentrations ranging from 10 mg/kg to 25,371 mg/kg. The Report proposes no further action for soils.

According to the Risk Reduction Standards, TPH can be used as an indicator, but must be appropriately supported by compound-specific analyses [30 TAC §335.553(d); See also 30 TAC §335.553(f)]. Please complete additional sampling and analysis to determine the nature and extent of soils contamination such that requirements of the Risk Reduction Standards are met.

b. In the 1996 investigation, all ground-water samples, except for that from MW-18, were collected using direct-push methods. Additional monitor wells should be installed and ground-water samples collected for analysis to confirm the degree and extent of ground-water contamination.

Texas Risk Reduction Program
Deed Notice

STATE OF TEXAS

COUNTY OF HARRIS

This Notice is filed to provide information concerning certain environmental conditions and/or use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows:

> ***A legal property description used in the last recorded vesting deed, covering the Property that includes the entire recorded tract of land held by the owner executing this deed notice, is attached hereto and incorporated herein by reference as Exhibit A.***

Portions of the soil and groundwater of the Property contain certain identified chemicals of concern causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property for soil (Former Impoundment #3) is described as follows:

> ***METES AND BOUNDS DESCRIPTION of a 0.230 acre tract in the Ezekiel Thomas Survey, Abstract No 73, Harris County, Texas. Said 0.230 acre tract is in a 123.5686 acre tract as described in a deed to KM Liquids Terminals, L.P. as recorded in Clerk's File No. 20070176988 in the Harris County Clerk's Office and is more particularly described by metes and bounds as follows:***
>
> ***COMMENCING at a concrete monument found in the south right-of-way line of Clinton Drive, (based on a width of 100-feet), said point is the northeast corner of a 24.2862 acre tract, called "Parcel Two as described in a deed to GATX Terminals Corporation as recorded in Clerk's File No. GB67917 in the Harris County Clerk's Office, same being the northwest corner of an 88.152 acre tract, called "Tract 1" as described in a deed to Houston Cement Company, L.P. as recorded in Clerk's File No. Y243302 in the Harris County Clerk's Office;***
>
> ***THENCE, South 03°27'58" East, along the east line of said 24.2862 acre tract, same being the west line of said 88.152 acre tract, at a distance of 427.55 feet pass the northeast corner of the aforementioned 123.5686 acre tract and continue for a total distance of 2,099.25 feet to an angle point, a found 5/8-inch iron rod bears South 03"27'58" East, 493.50 feet;***
>
> ***THENCE, South 86°32'02" West, perpendicular to the east line of said 123.5686 acre tract for a distance of 220.26 feet to the POINT OF BEGINNING and northeast corner of the herein described tract, said point having a Texas State Plane surface coordinate of N 13,832,997.86', E 3,169,069.37';***
>
> ***THENCE, South 00°19'55" West, along the easterly line of the herein described tract for a distance of 100.02 feet to the southeast corner of the herein described tract;***

THENCE, West, along the southerly line of the herein described tract for a distance of 100.27 feet to the southwest corner of the herein described tract;

THENCE, North 00°19'55" East, along the westerly line of the herein described tract for a distance of 100.02 feet to the northwest corner of the herein described tract;
THENCE, East, along the northerly line of the herein described tract for a distance of 100.27 feet to the POINT OF BEGINNING; containing a computed area of 0.230 acres (10,029 square feet).

The certified meets and bounds description and corresponding plat maps of the Affected Property (Former Impoundment #3) are attached hereto and incorporated herein by reference as Exhibit B.

The constituents of concern in soil at the Affected Property (the Former Impoundment #3), defined here as exceeding TRRP Protective Concentration Levels (PCLs) for residential land use, is benzo(a)pyrene.

This notice for soil in the Former Impoundment #3 is required for the following reasons:

The Affected Property currently meets TRRP standards for commercial/industrial use. Based on the reports, the chemicals of concern pose no significant present or future risk to humans or the environment based on commercial/industrial land use. No further remediation of the Affected Property is required by the TCEQ as long as the Affected Property is not to be used for residential purposes as the property may not be protective for residential use. If any person desires in the future to use the Affected Property for residential purposes, the TCEQ must be notified at least 60 days in advance of such use and additional response actions may be necessary before the property may be used for residential purposes. Persons contemplating a change in land use for the Affected Property are encouraged to review the definitions of commercial/industrial and residential land use contained in TRRP as the definition of residential land use is broad.

The portion considered to be Affected Property for groundwater is described as follows:

METES AND BOUNDS DESCRIPTION of a 9.508 acre tract in the Ezekiel Thomas Survey, Abstract No. 73, Harris County, Texas. Said 9.508 acre tract is in a 123.5686 acre tract as described in a deed to KM Liquids Terminals, L P. as recorded in Clerk's File No. 20070176988 in the Harris County Clerk's Office and is more particularly described by metes and bounds as follows:

COMMENCING at a concrete monument found in the south right-of-way line of Clinton Drive (based on a width of 100-feet), said point is the northeast corner of a 24.2862 acre tract, called "Parcel Two" as described in a deed to GATX Terminals Corporation as recorded in Clerk's File No. G867917 in the Harris County Clerk's Office, same being the northwest corner of an 88.152 acre tract, called "Tract 1" as described in a deed to Houston Cement Company, L.P. as recorded in Clerk's File No. Y243302 in the Harris County Clerk's Office;

THENCE, South 03°27'58" East, along the east line of said 24.2862 acre tract, same being the west line of said 88.152 acre tract, at a distance of 427.55 feet pass the northeast corner of the aforementioned 123.5686 acre tract and continue for a total distance of 1,870.05 feet to a angle point, a found 5/8-inch iron rod bears

South 03°27'58" East, 723.00 feet;

THENCE, South 86°32'02" West, perpendicular to the east line of said 123.5686 acre tract for a distance of 1,226.58 feet to the POINT OF BEGINNING and easterly corner of the herein described tract, said point having a Texas State Plane surface coordinate of N 13,833,165.80', E 3,168,051.03';

THENCE, South 24°24'04" East, along the easterly line of the herein described tract for a distance of 185.77 feet to a point for corner;

THENCE, South 05°29'48" East, continuing along the easterly line of the herein described tract for a distance of 101.04 feet to a point for corner;

THENCE, South 05°58'17" West, continuing along the easterly line of the herein described tract for a distance of 300.42 feet to a point on the northerly high bank of the Houston Ship Channel;

THENCE, along the northerly high bank of said Houston Ship Channel with following courses and distances:

North 66°42'08" West, for a distance of 87.19 feet to a point for corner:

North 82°25'01" West, for a distance of 378.66 feet to a point for corner;

South 58°53'43" West, for a distance of 70.36 feet to a point for corner;

North 62°45'38" West, for a distance of 128.05 feet to a point for corner;

North 02°43'27" West, for a distance of 227.22 feet to a point for corner;

North 09°37'34" East, for a distance of 190.03 feet to a point for corner:

North 04°34'53" West, for a distance of 321.42 feet to the northwest corner of the herein described tract;

THENCE, South 87°54'37" East, along the northerly line of the herein described tract for a distance of 50.19 feet to a point for corner;

THENCE, South 71°14'07" East, continuing along the northerly line of the herein described tract for a distance of 152.21 feet to a point for corner;

THENCE, South 60°00'24" East, continuing along the northerly line of the herein described tract for a distance of 444.27 feet to the POINT OF BEGINNING; containing a computed area of 9.508 acres (414,173 square feet).

The certified meets and bounds description and corresponding plat maps of the Affected Property for

groundwater (referred to as area of the Plume Management Zone) are attached hereto and incorporated herein by reference as Exhibit B.

The constituents of concern in groundwater at the Affected Property (the Plume Management Zone), defined here as exceeding TRRP PCLs for residential and commercial/industrial land use, is benzene .

> ***The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone. A plume management zone is defined as an area of groundwater containing concentrations of chemicals of concern exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC 350.33(f)(4). The undersigned has established a plume management zone so that the chemicals of concern in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached Exhibit B provides the location and extent of the plume management zone and describes the maintenance and monitoring required. This maintenance and monitoring is required until TCEQ approves some modification of those requirements. Exposure to groundwater within the plume management zone for any purpose is not advised until such time when all the chemicals of concern no longer exceed their respective protective concentration levels. This deed notice must not be removed or modified without prior approval from TCEQ.***

As of the date of this Notice, the record owner of fee title to the Property is KM Liquids Terminals, L.P. with an address of 500 Dallas, Suite 1000, Houston, Texas 77002.

THAT, FOR TEN DOLLARS ($10.00) and other valuable consideration, the receipt and sufficiency of which are hereby acknowledged, **KINDER MORGAN LIQUIDS TERMINALS LLC**, a Delaware limited liability company ("Grantor"), whose address is 500 Dallas, Suite 1000, Houston, Texas 77002, does hereby grant, bargain, sell, convey, assign, set over, and deliver unto **KM LIQUIDS TERMINALS, L.P.**, a Delaware limited partnership ("Grantee"), whose address is 500 Dallas, Suite 1000, Houston, Texas 77002, all of Grantor's right, title, and interest in and to the property, rights, and interests described below (collectively, the "Property"):

A. That certain real property and real property interests described in those certain instruments and documents recorded in the real property records of Harris County, Texas which are more particularly described on Exhibit A attached hereto, together with all buildings, improvements and fixtures thereon;

B. Those certain easements, tenements, hereditaments, privileges and appurtenances in any way belonging to the property described in Item 1 above, including, without limitation, Grantor's right, title and interest, if any, in and to (a) any land to the midpoint of the bed of any highway, street, road or avenue, open or proposed, in front of, abutting or adjoining any such property, (b) any land lying in or under the bed of any creek, stream, bayou or river running through, abutting or adjacent to such property, (c) any riparian, appropriative or other water rights of Grantor appurtenant to such property and relating to surface or subsurface waters, (d) all wastewater (sewer) treatment capacity and all water capacity assigned to such property, (e) any oil, gas or other minerals or mineral rights relating to such property or to the surface or subsurface thereof owned by Grantor, (f) any strips, gores or pieces of property abutting, bounding or which are adjacent or contiguous to such property and (g) all easements, right-of-ways, rights of ingress or egress and reversionary interests benefiting such property; and

C. Without limiting the foregoing, all other rights, titles, interests (of whatever kind or character, whether legal or equitable, whether vested or contingent, and whether now owned or hereafter acquired by operation of law or otherwise) of Grantor in and to any of the property described in paragraphs A or B above and/or that otherwise relate to the properties, interests or items described in paragraphs A and B above, even though Grantor's rights, titles, and interest in

same may be incorrectly described in, or a description of such rights, titles and interests be omitted from, Exhibit A.

TO HAVE AND TO HOLD the Property unto Grantee and its successors and assigns to WARRANT AND FOREVER DEFEND all and singular title to the Property unto Grantee, it successors and assigns, against every person whomsoever lawfully claiming the same or any part thereof by, through or under Grantor, but not otherwise.

This Special Warranty Deed and Assignment is subject to the following terms and conditions:

1. Pursuant to that certain Contribution and Assumption Agreement (the "Contribution Agreement") dated September 1, 2004 by and between Grantor and Grantee, Grantor conveyed the Property to Grantor. Grantor and Grantee omitted to record this Special Warranty Deed and Assignment, but it is hereby clarified that this instrument with all of its terms and provisions, shall be effective as of the date of the Contribution Agreement at 9:00 a.m. Houston, Texas time on September 1, 2004 (the "Effective Time").

2. The terms, covenants and conditions hereof shall be binding upon and inure to the benefit of Grantor and Grantee, and their successors and assigns, and such terms, covenants and conditions shall be covenants running with the land.

3. This instrument is subject to the terms and conditions of (a) the instruments and agreements referred to in Exhibit A hereto and (b) the instruments and agreements which constitute the record chain of title into Grantor. Grantee agrees to be bound by and assume all obligations and rights created by said instruments, assignments and by recorded agreements related thereto.

4. Anything in this instrument to the contrary notwithstanding, this instrument shall not assign any of the Property or any benefits arising thereunder or resulting therefrom that (a) are not assignable, in whole or in part, or (b) require the consent or approval of the counter-party for the valid assignment thereof and such consent or approval has not been obtained on or before the Effective Time. If any such consents are not obtained before the Effective Time, Grantor and Grantee will use their reasonable best efforts to take such actions as may be possible without violation or breach of such Property or any instrument or agreement relating to such Property to effectively grant to Grantee the economic benefits of, and impose the economic burdens of, such Property.

EXHIBIT A

463.8705 acres of land out of the Ezekiel Thomas Survey, A-73, Harris County, Texas, being the sum of the areas of three separate tracts in said survey, and being the remainder of the following two adjacent tracts of land:

1. That certain tract described as 245.07 acres in deed from G. L. Noble to the Texas Company dated May 10, 1915, and recorded in Volume 351, Page 464, Harris County Deed Records, and
2. That certain tract described as 510.7 acres in deed from Galena Signal Oil Company to the Texas Company dated November 28, 1923, and recorded in Volume 778, Page 578, Harris County Deed Records,

after the conveyance of numerous tracts of land therefrom which severed said two adjacent tracts into the three parcels of land described below (with respect to the Texas Plane Coordinate System, South Central Zone):

PARCEL ONE:

316.0157 acres of land being all of said two adjacent tracts lying south of the south lines of the following four tracts of land conveyed in three deeds to the North Side Belt Railway Co. and to the Harris County Houston Ship Channel Navigation District for the right-of-way of said Belt Railway, and being contiguous to said south lines:

1. 0.995 acres described as Tract 1 and 0.532 acres described as Tract 2 in deed recorded in Volume 3334, Page 211, Harris County Deed Records,
2. 4.0 acres described in deed dated May 16, 1925, from the Texas Pipeline Company to said Belt Railway recorded in Volume 612, Page 561, Harris County Deed Records, and
3. 3.520 acres described in deed recorded in Volume 2665, Page 619, Harris County Deed Records,

and lying north of and contiguous to the north right-of-way line of Clinton Drive, 100 feet wide, as said right-of-way was described in deeds to Harris County recorded in Volume 704, Page 216, and Volume 1011, Page 47, Harris County Deed Records, said 316.0157 acres of land being described as follows:

BEGINNING at a concrete monument with a "Texaco Star" in its top at a fence corner at the intersection of the east line of said 510.7 acre tract with said north right-of-way line of Clinton Drive, having coordinates: x = 3,200,339.61 and y = 709,968.27 from which the City of Houston Survey Marker No. 5756-1211 bears South 85° 00' 41" East 95.77 feet;

THENCE in a westerly direction with said north right-of-way line and generally with a chain link fence with the following two courses and distances:

1. South 86° 31' 10" West 2625.15 feet to a 1½" iron pipe in said fence at an angle point, and
2. South 88° 04' 10" West 46.55 feet to a Railroad Spike for corner located on the south side of a fence corner at the intersection of said north right-of-way line with the west line of said 245.07 acre tract, and at the southeast corner of that certain 43.128 acre tract conveyed to General American Transportation Corporation by deed recorded in Volume 2433, Page 332, Harris County Deed Records, said corner having coordinates: x = 3,197,672.78 and y = 709,807.33;

178-86-2370

THENCE North 3° 24' 05" West with said west line in part generally with said chain link fence and in part generally with a barbed wire fence, in part with the east line of said 43.128 acre tract, in part with the east line of a 20.593 acre tract conveyed to Texas Pipe Line Company by deed dated October 17, 1951, recorded in Volume 2367, Page 237, Harris County Deed Records, and in part with the east line of a 49.301 acre tract also conveyed to General American Transportation Corporation by said deed recorded in Volume 2433, Page 332, Harris County Deed Records, 5054.92 feet to a 1½" iron pipe for corner at a fence corner post at the intersection of said west line with the south line of said Belt Railway right-of-way and being the south west corner of said 0.995 acre tract, said corner having coordinates: x = 3,197,372.87 and y = 714,853.34;

THENCE in an easterly direction with the south lines of said four tracts conveyed to the North Side Belt Railway Co. and to the Houston Ship Channel Navigation District for the right-of-way of said Belt Railway with the following five courses and distances:

1. North 86° 44' 20" East 697.82 feet to a 1½" iron pipe at the southeast corner of said 0.995 acre tract on a curve in the south line of said 4.0 acre tract,
2. with said curve to the right having a radius of 441.78 feet, a central angle of 43° 18' 15" and an arc length of 333.90 feet (the chord of said arc bears South 38° 54' 48" East 326.01 feet) to a 1½" iron pipe at the southeast corner of said 4.0 acre tract,
3. North 3° 24' 30" West 266.31 feet to a 1½" iron pipe at the southwest corner of said 0.532 acre tract on the east line of said 4.0 acre tract,
4. North 82° 29' 35" East 299.18 feet to a 1½" iron pipe at the southeast corner of said 0.532 acre tract and the southwest corner of said 3.520 acre tract, and
5. North 72° 25' 20" East 1520.95 feet to a 1½" iron pipe at a fence corner post for corner at the southeast corner of said 3.520 acre tract on the east line of said 510.7 acre tract, said corner having coordinates: x = 3,200,005.06 and y = 715,403.63;

THENCE South 3° 31' 20" East with said east line, in part generally with a barbed wire fence and in part generally with a chain link fence 5445.65 feet to the PLACE OF BEGINNING and containing 316.0157 acres of land.

PARCEL TWO:

24.2862 acres of land and being all of said two adjacent tracts, lying south of and contiguous to the south right-of-way line of Clinton Drive, 100 feet wide, as said right-of-way was described in deeds to Harris County recorded in Volume 704, Page 216, and Volume 1011, Page 47, Harris County Deed Records, lying north of and contiguous to the north lines of a 40 foot wide fee strip conveyed to the Texas and New Orleans Railroad Company by deed recorded in Volume 2501, Page 242, Harris County Deed Records, and lying east of and contiguous to the east line of that certain 74 foot wide strip, off the west side of said 245.07 acre tract described as Tract No. 1 containing 1.170 acres in deed to General American Transportation Corporation recorded in Volume 1163, Page 515, Harris County Deed Records, said 24.2862 acres of land being described as follows:

BEGINNING at a chain link fence corner at the intersection of said south right-of-way line of Clinton Drive with the east line of said 510.7 acre tract, having coordinates: x = 3,200,346.23 and y = 709,868.49 from which the City of Houston Survey Marker No. 5756-1211 bears North 44° 09' 08" East 127.46 feet;

THENCE South 3° 28' 30" East generally with said fence with the east line of said 510.7 acre tract 387.00 feet to a 1½" iron pipe for corner at the (northeast corner of said 40 foot wide railroad fee strip,) having coordinates: x = 3,200,369.69 and y = 709,482.20;

178-86-2371

THENCE in a westerly direction with the north line of said fee strip with the following four (4) courses and distances:

1. South 86° 31' 10" West 2170.68 feet to a 1½" iron pipe at a point of curve,
2. with said curve to the left having a radius of 306.48 feet, a central angle of 54° 33' 00" and an arc length of 291.79 feet, (the chord of said arc bears South 59° 14' 40" West 280.90 feet,) to a 1½" iron pipe at its point of tangency.
3. South 31° 58' 10" West 98.67 feet to a 1½" iron pipe, and
4. With a curve to the right having a radius of 266.48 feet, a central angle of 33° 39' 43" and an arc length of 156.56 feet (the chord of said arc bears South 48° 48' 02" West 154.32 feet to a 1½" iron pipe at the northwest corner of said fee strip in the east line of said 74 foot wide strip, said corner having coordinates: x = 3,197,793.27 and y = 709,021.42;

THENCE North 3° 30' 10" West with the east line of said 74 foot wide strip and generally with a chain link fence 690.51 feet to a concrete monument with a "Texaco Star" in its top for corner at a corner of said fence, at the northeast corner of said 74 foot wide strip on said south right-of-way line of Clinton Drive, said corner having coordinates: x = 3,197,751.08 and y = 709,710.64;

THENCE North 86° 31' 10" East with said south right-of-way line and generally with said chain link fence 2399.95 feet to the PLACE OF BEGINNING and containing 26.2862 acres of land.

PARCEL THREE:

123.5686 acres of land being all of said two adjacent tracts lying south of and contiguous to the south lines of said 40 foot wide fee strips conveyed to the Texas and New Orleans Railroad Company by deed recorded in Volume 2501, Page 242, Harris County Deed Records, lying north of the "Harbor Line" for the Houston Ship Channel established in grant from the Texas Company to the United States of America recorded in Volume 998, Page 529, Harris County Deed Records, and lying east of and contiguous to the east line of another 74 foot wide strip off the west side of said 245.07 acre tract described as Tract No. 2 containing 2.01 acres in said deed to General American Transportacion recorded in Volume 1163, Page 515, Harris County Deed Records, said 123.5686 acres of land being described as follows:

BEGINNING at a 1½" iron pipe at the south east corner of said 40 foot wide railroad fee strip in the east line of said 510.7 acre tract having coordinates: x = 3,200,372.11 and y = 709,442.27 from which the City of Houston Survey Marker No. 5756-1211 bears North 6° 55' 43" East 521.48 feet;

THENCE South 3° 28' 30" East with the east line of said 510.7 acre tract and generally with a chain link fence, at 2165.50 feet pass a 5/8" iron rod, at 2179.0 feet pass the end of said fence at the north bank of the Houston Ship Channel and at a total distance of 2334.00 feet to a point for corner on said Harbor Line, having coordinates: x = 3,200,313.58 and y = 707,112.56; N

13. Pipe line right-of-way from The Texas Company to The Texas Pipe Line Company dated October 10, 1950, recorded in Volume 2181, Page 369 of the Deed Records; amended by instrument filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number G416430, and recorded under Film Code Number 150-83-1481 of the Official Public Records of Real Property of Harris County, Texas.

14. Pipe line right-of-way from The Texas Company to The Texas Pipe Line Company, dated October 10, 1950, recorded in Volume 2181, Page 371, of the Deed Records of Harris County, Texas.

15. Pipe line right-of-way from The Texas Company to Texas - New Mexico Pipe Line Company dated October 10, 1950, recorded in Volume 2181, Page 617, of the Deed Records of Harris County, Texas.

16. Pipe line right-of-way from The Texas Company to Service Pipe Line Company dated June 23, 1952, as recorded in Volume 2481, Page 725, of the Deed Records of Harris County, Texas.

17. Pipe line right-of-way from The Texas Company to The Texas Pipe Line Company, dated December 22, 1953, as recorded in Volume 2715, Page 461 of the Deed Records of Harris County, Texas; amended by instrument filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number G416390, and recorded under Film Code Number 150-83-1370, of the Official Public Records of Real Property of Harris County, Texas.

18. Pipe line right-of-way from The Texas Company to Warren Petroleum Corp. dated May 28, 1951, recorded in Volume 2971, Page 103, of the Deed Records of Harris County, Texas.

19. Easement from The Texas Company to Houston Lighting and Power Company dated April 10, 1923, recorded in Volume 4119, Page 178, of the Deed Records of Harris County, Texas.

20. Pipe line right-of-way from Texaco, Inc., to Sinclair Petrochemicals, Inc., dated April 8, 1963, recorded in Volume 5078, Page 225, of the Deed Records of Harris County, Texas, amended by instrument recorded in Volume 5586, Page 5, of the Deed Records of Harris County, Texas.

21. Water line and access easement from Texaco, Inc., to the City of Houston dated December 12, 1963, recorded in Volume 5366, Page 395, of the Deed Records of Harris County, Texas.

22. Easement for construction and maintenance of Ship Channel dated January 16, 1964, recorded in Volume 5398, Page 516, of the Deed Records of Harris County, Texas.

178-86-2375

23. *Easement from* Texaco, Inc., to Houston, Lighting and Power Company, dated March 18, 1966, as set out and described on sketch attached to instrument recorded in Volume 6302, Page 22, of the Deed Records of Harris County, Texas.

24. Easement from Texaco, Inc., to City of Houston dated February 7, 1966, recorded in Volume 6439, Page 419, of the Deed Records of Harris County, Texas.

25. Pipe line right-of-way from Texaco, Inc., to Houston Pipe Line Company dated July 22, 1969, recorded in Volume 7696, Page 254, of the Deed Records of Harris County, Texas.

26. Easement from Texaco, Inc., to Houston Lighting and Power Company dated July 14, 1972, the location of which is shown by sketch attached to instrument filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number D661090, and recorded under Film Code Number [redacted]-1397 of the Official Public Records of Real Property of Harris County, Texas.

27. Easement from Texaco, Inc., to Houston Lighting and Power Company dated September 12, 1975, the location of which is shown by sketch attached to instrument filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number E564232, and recorded under Film Code Number 128-13-0747 of the Official Public Records of Real Property of Harris County, Texas; as amended by instrument as follows: Filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number E758870, and recorded under Film Code Number [redacted]-1310 of the Official Public Records of Real Property of Harris County, Texas.

28. Pipe line right-of-way from Texaco, Inc., to Amerada Hess Corp., dated September 15, 1977, filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number F330573, and recorded under Film Code Number [redacted]-9651 of the Official Public Records of Real Property of Harris County, Texas.

29. Pipe line right-of-way from Texaco, Inc., to Amerada Hess Corp., dated April 14, 1978, as filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number F490040, and recorded under Film Code Number [redacted]-0219 of the Official Public Records of Real Property of Harris County, Texas.

30. Pipe line right-of-way from Texaco, Inc., to Houston Pipe Line Company dated June 30, 1978, filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number F683531, and recorded under Film Code Number [redacted]-1478 of the Official Public Records of Real Property of Harris County, Texas.

31. Easement rights and right-of-way dated March 15, 1956, from The Texas Company to Harris County Houston Ship Channel Navigation District and the U. S. A. as follows: Recorded in Volume 3124, Page 425, of the Deed Records of Harris County, Texas.

32. Pipe line easement between The Texas Company and Texas - New Mexico Pipe Line Company dated June 9, 1938, (unrecorded) and amended by agreement dated December 7, 1972, (unrecorded), both agreements amended by instrument filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number G416663, and recorded under Film Code Number 150-83-2204 of the Official Public Records of Real Property of Harris County, Texas.

178-86-2376

33. Designation of disposal sites for solid waste or set out in instrument filed for record in the office of the County Clerk of Harris County, Texas, under County Clerk's File Number G502833, and recorded under Film Code Number [redacted]-1347 of the Official Public Records of Real Property of Harris County, Texas.

34. Heater site easement from The Texas Co., to Humble Oil and Refining Co., dated August 31, 1945, as follows: Recorded in Volume 1400, Page 344, of the Deed Records of Harris County, Texas.

35. Gravesite and access thereto as shown on survey of Paul Ledbetter, dated February 4, 1981.

36. Easement from Texaco, Inc., to Houston Lighting and Power Company, dated August 8, 1963, and shown on sketch attached to instrument as follows: Recorded in Volume 5240, Page 37, of the Deed Records of Harris County, Texas.

37. The following matters are excepted to though apparently not of record:

(A) Easement from The Texas Company to Sinclair Refining Company dated October 26, 1938.

(B) Easement from The Texas Company to Houston Lighting and Power Company dated February 20, 1930.

(C) Downguy easement from The Texas Company to Houston Lighting and Power Company dated May 25, 1938.

(D) Easement from The Texas Company to the General American Transporation Corporation dated June 20, 1955.

(E) Easement from Texas Pipe Line Company to American Petroleum Company dated August 4, 1920.

(F) Easement from The Texas Company to Southwestern Bell Telephone Company dated November 30, 1938.

38. An undivided 5/6 interest in and to all oil, gas and other minerals reserved by grantor in deed from Texaco, Inc., (grantor) to South States Terminals Company, dated February 18, 1981.

Exhibit B

KM Liquids Terminals, L.P.
0.230 Acre

Ezekiel Thomas Survey
Abstract No. 73

KMLT East Plant Impoundment # 3

STATE OF TEXAS §

COUNTY OF HARRIS §

METES AND BOUNDS DESCRIPTION of a 0.230 acre tract in the Ezekiel Thomas Survey, Abstract No. 73, Harris County, Texas. Said 0.230 acre tract is in a 123.5686 acre tract as described in a deed to KM Liquids Terminals, L.P. as recorded in Clerk's File No. 20070176988 in the Harris County Clerk's Office and is more particularly described by metes and bounds as follows:

COMMENCING at a concrete monument found in the south right-of-way line of Clinton Drive, (based on a width of 100-feet), said point is the northeast corner of a 24.2862 acre tract, called "Parcel Two" as described in a deed to GATX Terminals Corporation as recorded in Clerk's File No. G867917 in the Harris County Clerk's Office, same being the northwest corner of an 88.152 acre tract, called "Tract 1" as described in a deed to Houston Cement Company, L.P. as recorded in Clerk's File No. Y243302 in the Harris County Clerk's Office;

THENCE, South 03°27'58" East, along the east line of said 24.2862 acre tract, same being the west line of said 88.152 acre tract, at a distance of 427.55 feet pass the northeast corner of the aforementioned 123.5686 acre tract and continue for a total distance of 2,099.25 feet to an angle point, a found 5/8-inch iron rod bears South 03°27'58" East, 493.80 feet;

THENCE, South 86°32'02" West, perpendicular to the east line of said 123.5686 acre tract for a distance of 220.26 feet to the POINT OF BEGINNING and northeast corner of the herein described tract, said point having a Texas State Plane surface coordinate of N 13,832,997.86', E 3,169,069.37';

THENCE, South 00°19'55" West, along the easterly line of the herein described tract for a distance of 100.02 feet to the southeast corner of the herein described tract;

THENCE, West, along the southerly line of the herein described tract for a distance of 100.27 feet to the southwest corner of the herein described tract;

THENCE, North 00°19'55" East, along the westerly line of the herein described tract for a distance of 100.02 feet to the northwest corner of the herein described tract;

THENCE, East, along the northerly line of the herein described tract for a distance of 100.27 feet to the POINT OF BEGINNING; containing a computed area of 0.230 acres (10,029 square feet).

NOTES:

1. The bearings and coordinate shown hereon are based on the Texas Coordinate System of 1983, South Central Zone (scale factor 0.99987).

2. The corners of this tract have not been monumented at the request of the client.

3. A separate exhibit map has been prepared in connection with this description.

Exhibit B
Plume Management Zone Maintenance and Monitoring Requirements

Facility monitoring will consist of semi-annual groundwater monitoring of the approved plume management zone well network with annual reporting to the TCEQ. More detail regarding the facility monitoring and maintenance can be found in the TCEQ-approved Response Action Plan for the East Plant of the Galena Park Terminal (August 2007).

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

June 24, 2014

RECEIVED

Mr. John Kennedy
Project Manager, Environmental Remediation
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Conditional Approval - *Response Action Plan Addendum – Central Plant*, dated January 20, 2014
Kinder Morgan Liquids Terminals, LLC – Galena Park
TCEQ SWR No. 30573; TCEQ Hazardous Waste Permit/Compliance Plan 50054
EPA ID No. TXD026481523; RN 100237452, CN 601545940

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has completed the review of the above referenced report received by the Remediation Division on March 11, 2014. Based on the TCEQ review, the RAP fulfills the requirements of 30 Texas Administrative Code (TAC) §350.94. The approved RAP proposes continued monitoring and active groundwater recovery at Plume Management Zone (PMZ) designated wells until the concentrations of constituents of concern meet residential protective concentration levels. Please implement the RAP, and if applicable, submit a Response Action Effectiveness Report (RAER) in accordance with the schedule proposed in the approved RAP. Upon attainment of the response objectives, a Response Action Completion Report (RACR) must be submitted, in accordance with 30 TAC §350.95. The approved RAP also contains documentation fulfilling the requirements of 30 TAC §350.94(k), which includes a proposed monitoring and reporting schedule for post-response action care activities required under Remedy Standard B.

The RAP contains proposed institutional control language sufficient to fulfill the requirements of 30 TAC §350.111. Proof of filing the institutional control must be submitted to the TCEQ within one-hundred-twenty (120) days of the date of this letter in accordance with 30 TAC §350.33(f)(4)(C)(i).

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the report.

Questions concerning this letter should be directed to me at (512) 239- 2034 or maureen.hatfield@tceq.texas.gov. When responding by mail, please submit an original and one copy on CD of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted to the local TCEQ Region Office. The information in the reference block should be included in all submittals.

Sincerely,

Maureen Hatfield, P.G., Project Manager

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

April 10, 2018

Mr. Johnny Kennedy
Remediation Project Manager
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Conditional Approval of

- *Draft Revised Response Action Plan for TCI Plant,* dated January 15, 2018.
- *Draft Revised Response Action Plan, East Plant Gate 6 Area to the 2014 RAP,* dated March 5, 2018
- *Draft Response Action Plan, Old Pump House (OPH) No. 5 Area of Concern, (East Plant),* dated March 28, 2018;

Kinder Morgan Liquids Terminals, LLC - Galena Park;
TCEQ SWR No. 30573; TCEQ Hazardous Waste Permit/Compliance Plan 50054;
EPA ID No. TXD026481523;
Customer No. CN601545940; Regulated Entity No. RN100237452

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above referenced Response Action Plans (RAPs) received by the Remediation Division on January 24, March 6, and April 2, 2018, respectively. Based on the TCEQ review, the Draft RAPs fulfill the requirements of 30 Texas Administrative Code (TAC) §350.94. The TCEQ hereby approves Draft RAP with the following conditions:

- Within one-hundred-twenty (120) days from the date of this letter please submit the above referenced Response Action Plans (RAPs) as part of a Class 3 Permit Modification application. The Modification to the Permit shall incorporate proposed response actions for the OPH No. 5 Area of Concern, East Plant Gate 6 Area, and the TCI Plant, and any other areas at the Galena Park site in which the response action will take more than 3 years to complete. Please submit an original and three copies of the Class 3 Permit Modification application to the IHW Permits Section at mail code MC130.
- The TCEQ recommends that the Implementation Schedule for the submittal of proof of institutional controls (ICs) in the form of deed notice be consistent between RAPs. For example, proof of filing be submitted within 120 days of RAP approval in accordance with 30 TAC §350.33.
- Since the CP Attachment A maps for the final draft permit will be in black and white the TCEQ recommends that the designated monitoring well location for point-of-exposure well, attenuation monitoring, etc., have a different symbol so the different well can be easily distinguished from one another.
- Revise the deed Notice language in Appendix 4 of the RAPs to include the following information as required by 30 TAC §350.111 and per TCEQ Guidance RG-366/TRRP 16 *Institutional Controls under TRRP*:

- A metes and bounds description of the portion(s) of the affected property to which the IC applies;
- A plat map clearly demarcating the portion(s) of the affected property to which the IC applies. The map must contain a north arrow, a correlating map scale, and a legend identifying any used symbols or abbreviations;
- Both the metes and bounds and plat map need to be certified by a registered professional land surveyor or registered by the Texas Bard of Professional Surveying attesting to the accuracy of the descriptions.
- A list of constituents of concern for each environmental media that contain concentrations above their respective protective concentration levels (PCLs).
- A description of any monitoring and maintenance requirements of the physical controls and/or ICs, or compliance with health and safety plans.
- The TCEQ Program and identifier number which should be SWR No. 30573.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the plan.

Questions concerning this letter should be directed to me at (512) 239-2034 or maureen.hatfield@tceq.texas.gov. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals.

Sincerely,

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

December 29, 2017

Mr. Johnny Kennedy
Remediation Project Manager
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Conditional Approval of Response Action Plan
Draft Addendum Response Action Plan, West Plant, dated October 27, 2017
Kinder Morgan Liquids Terminals, LLC - Galena Park;
TCEQ SWR No. 30573; TCEQ Hazardous Waste Permit/Compliance Plan 50054;
EPA ID No. TXD026481523;
Customer No. CN601545940; Regulated Entity No. RN100237452

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above referenced Response Action Plan (RAP) received by the Remediation Division on October 30, 2017. The Draft Addendum Response Action Plan was prepared to incorporate soil and groundwater impacts at the former Vopak Terminal Galena Park, Inc. (VTGP) into the TCEQ approved plume management zone (PMZ) for the West Plant on the Kinder Morgan Liquids Terminals, LLC (Kinder Morgan) Galena Park Terminal. Kinder Morgan purchased the VTGP property on February 7, 2015. Since the impacted soil and groundwater from the VTGP shall be incorporated into the existing West Plant PMZ, the existing deed notice shall be modified to incorporate the affected soils and groundwater from the VTGP, and expand the West Plant PMZ boundary. The response action shall include continued semiannual groundwater monitoring within the expanded PMZ, continued groundwater recovery in the southeast corner of the West Plant PMZ, and annual reporting.

Based on the TCEQ review, the Draft Addendum RAP fulfills the requirements of 30 Texas Administrative Code (TAC) §350.94. The TCEQ hereby approves Draft Addendum RAP with the following conditions:

1. If the proposed response action for the revised West Plant PMZ is determined to be longer than 3 years to achieve cleanup goals, then the West Plant PMZ shall need to be incorporated into the Permit/Compliance Plan corrective action program as part of the Class 3 Modification application. As specified in the TCEQ November 9, 2016 letter the due date for submittal of the above reference Class 3 Permit Modification application is deferred until assessment at Gate 6 is completed. At that time, a new deadline will be re-established for submittal of the application to include changes to the corrective action program.
2. Please proceed with implementation of the Draft Addendum RAP, and submittal of required reports in accordance with the schedule proposed in the approved Addendum RAP. Upon attainment of the response objectives, a Response Action Completion Report (RACR) must be submitted, in accordance with 30 TAC §350.95.
3. The approved Draft Addendum RAP contains proposed institutional control language sufficient to fulfill the requirements of 30 TAC §350.111. Proof of filing of the

institutional controls must be submitted within 120 days of the date of this letter in accordance with §350.33(f)(4)(C)(i) regarding Remedy Standard B groundwater response action PMZ.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the plan.

Questions concerning this letter should be directed to me at (512) 239-2034 or maureen.hatfield@tceq.texas.gov. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals.

Sincerely,

Re: Report Transmittal – Response Action Plan Addendum, Central Plant
KM Liquids Terminals LLC - Galena Park Terminal
Galena Park, Texas
ISWR No. 30573
Hazardous Waste Permit No. HW-50054
EPA I.D. No. TXD026481523

Dear Ms. Sifuentes-Chavez:

Please find enclosed one hard copy and one electronic copy of the Response Action Plan (RAP) Addendum for the Central Plant Waste Management Area (WMA) located in the Central Plant on the KM Liquids Terminals LLC (KMLT) Galena Park Terminal.

The RAP Addendum is being submitted to make a minor adjustment to monitoring well network and upgradient plume management boundary. Based on these minor revisions, the RAP Addendum only includes documentation related to the changes and does not include the entire RAP Addendum document in this submittal. This 2024 RAP Addendum was prepared to update the 2014 RAP Addendum, with the following information:

- Removal of upgradient well MW-41 (which was destroyed) from the sampling plan. MW-38 will remain as the upgradient well. Groundwater analytical data for MW-38 presented in the Annual Corrective Action Program Reports for the last four years demonstrates MW-38 remains the appropriate background well.
- Adjusted/updated the Plume Management Zone (PMZ) northern boundary based on MW-38 as the upgradient well. Figures 2D (PMZ Map), 3A (Monitoring and Sampling Points) and 5A (Post-Response Action Care Sampling Points) have been updated to reflect the slight PMZ boundary change.
- Included the filed institutional control for Central Plant for reference.

KMLT is proposing to include the RAP Addendum for Central Plant as part of the renewal of the Hazardous Waste Permit and Compliance Plan.

If you have any questions regarding this submittal or require additional information, please feel free to contact me at (713) 654-6035, or if you wish you can e-mail me at [redacted]

Sincerely,
KM Liquids Terminals LLC

Re: *Executed Copy of the Deed Notice – Response Action Plan Addendum – Central Plant*
Galena Park Terminal
KM Liquids Terminals LLC
Galena Park, Texas
TCEQ SWR No. 30573

Dear Ms. Hatfield:

Attached please find the certified copy of the deed notice providing institutional control for the KM Liquids Terminals LLC (KMLT) Galena Park Terminal Central Plant Area in Galena Park, Texas.as required by the Response Action Plan (RAP) Addendum dated March 20, 2014. The RAP Addendum was approved by the Texas Commission on Environmental Quality (TCEQ) by letter dated June 24, 2014.

The deed notice was filed with the Harris County Courthouse Clerk's Office on July 30, 2014, within 120 days as per the RAP Addendum. The deed notice provides institutional control for the Plume Management Zone (PMZ) established at the Central Plant Area of the Terminal, and includes Exhibit A (legal property description) and Exhibit B (meets and bounds descriptions and plat maps of the PMZ).

If you have any questions regarding the information presented in this submittal, please do not hesitate to contact me at (713) 920-8423.

Sincerely,
KM Liquids Terminals LLC

Deed Notice

STATE OF TEXAS

COUNTY OF HARRIS

This Notice is filed to provide information concerning certain environmental conditions and/or use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows:

P
Lee

Lee
To the
Public

A legal property description used in the last recorded vesting deed, covering the Property that includes the entire recorded tract of land held by the owner executing this deed notice, is attached hereto and incorporated herein by reference as Exhibit A.

Portions of the groundwater of the Property contain certain identified chemicals of concern causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property is described as follows:

RP 092-29-0278

METES AND BOUNDS DESCRIPTION for a 28.4814 acre tract of land extending over, through, along and across a called 31.96 acre tract of land (Tract B), and a called 2.01 acre tract (Tract No. 2), as recorded in Volume 1163, Page 515 , Deed Records of Harris County, Texas, and the residue of a 123.5686 acre tract of land, as recorded in File No. 20070176988, Film Code 041-65-1336, Official Public Records of Real Property, Harris County, Texas, said tract being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows:

D

Bearings and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83 in feet.

BEGINNING in the East property line of said 2.01 acre tract (Tract No. 2), said "POINT OF BEGINNING" being South 03°25'40" East, along said East property line, a distance of 146.58 feet from the calculated Northeast corner of said 2.01 acre tract (Tract No. 2), said Northeast corner being at the intersection of the South right-of-way line of Union Pacific Railroad and the West property line of said 123.5686 acre tract, said "POINT OF BEGINNING" having coordinates N=13,832,233.24, E=3,166,211.22;

THENCE, South 39°37'03" East, a distance of 140.35 feet to a point;

THENCE, a distance of 293.98 feet, along the arc of a curve to the right, having a radius of 475.00 feet, a delta angle of 35°27'38", and a chord bearing of South 21°53'13" East, a distance of 289.31 feet to a point;

THENCE, South 04°09'24" East, a distance of 287.20 feet to a point; THENCE, South 02°34'21" East, a distance of 132.48 feet to a point; THENCE, South 00°39'05" West, a distance of 140.48 feet to a point;

defined here as exceeding TRRP Protective Concentration Levels (PCLs) for residential and commercial/industrial land use, are summarized on the attached Table 1.

This notice is required for the following reasons:

> ***The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone. A plume management zone is defined as an area of groundwater containing concentrations of chemicals of concern exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC 350.33(f)(4). The undersigned has established a plume management zone so that the chemicals of concern in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached Exhibit B provides the location and extent of the plume management zone and describes the maintenance and monitoring required. This maintenance and monitoring is required until TCEQ approves some modification of those requirements. Exposure to groundwater within the plume management zone for any purpose is not advised until such time when all the chemicals of concern no longer exceed their respective protective concentration levels. This deed notice must not be removed or modified without prior approval from TCEQ.***

As of the date of this Notice, the record owner of fee title to the Property is KM Liquids Terminals, L.P. with an address of 1001 Louisiana St., Suite 1000, Houston, Texas 77002.

SPECIAL WARRANTY DEED AND ASSIGNMENT

STATE OF TEXAS §
§ KNOW ALL PERSONS BY THESE PRESENTS:
COUNTY OF HARRIS §

THAT, FOR TEN DOLLARS ($10.00) and other valuable consideration, the receipt and sufficiency of which are hereby acknowledged, **KINDER MORGAN LIQUIDS TERMINALS LLC**, a Delaware limited liability company ("Grantor"), whose address is 500 Dallas, Suite 1000, Houston, Texas 77002, does hereby grant, bargain, sell, convey, assign, set over, and deliver unto **KM LIQUIDS TERMINALS, L.P.**, a Delaware limited partnership ("Grantee"), whose address is 500 Dallas, Suite 1000, Houston, Texas 77002, all of Grantor's right, title, and interest in and to the property, rights, and interests described below (collectively, the "Property"):

A. That certain real property and real property interests described in those certain instruments and documents recorded in the real property records of Harris County, Texas which are more particularly described on Exhibit A attached hereto, together with all buildings, improvements and fixtures thereon;

B. Those certain easements, tenements, hereditaments, privileges and appurtenances in any way belonging to the property described in Item 1 above, including, without limitation, Grantor's right, title and interest, if any, in and to (a) any land to the midpoint of the bed of any highway, street, road or avenue, open or proposed, in front of, abutting or adjoining any such property, (b) any land lying in or under the bed of any creek, stream, bayou or river running through, abutting or adjacent to such property, (c) any riparian, appropriative or other water rights of Grantor appurtenant to such property and relating to surface or subsurface waters, (d) all wastewater (sewer) treatment capacity and all water capacity assigned to such property, (e) any oil, gas or other minerals or mineral rights relating to such property or to the surface or subsurface thereof owned by Grantor, (f) any strips, gores or pieces of property abutting, bounding or which are adjacent or contiguous to such property and (g) all easements, right-of-ways, rights of ingress or egress and reversionary interests benefiting such property; and

C. Without limiting the foregoing, all other rights, titles, interests (of whatever kind or character, whether legal or equitable, whether vested or contingent, and whether now owned or hereafter acquired by operation of law or otherwise) of Grantor in and to any of the property described in paragraphs A or B above and/or that otherwise relate to the properties, interests or items described in paragraphs A and B above, even though Grantor's rights, titles, and interest in

RP-2007-0176988

same may be incorrectly described in, or a description of such rights, titles and interests be omitted from, Exhibit A.

TO HAVE AND TO HOLD the Property unto Grantee and its successors and assigns to WARRANT AND FOREVER DEFEND all and singular title to the Property unto Grantee, it successors and assigns, against every person whomsoever lawfully claiming the same or any part thereof by, through or under Grantor, but not otherwise.

This Special Warranty Deed and Assignment is subject to the following terms and conditions:

1. Pursuant to that certain Contribution and Assumption Agreement (the "Contribution Agreement") dated September 1, 2004 by and between Grantor and Grantee, Grantor conveyed the Property to Grantor. Grantor and Grantee omitted to record this Special Warranty Deed and Assignment, but it is hereby clarified that this instrument with all of its terms and provisions, shall be effective as of the date of the Contribution Agreement at 9:00 a.m. Houston, Texas time on September 1, 2004 (the "Effective Time").

2. The terms, covenants and conditions hereof shall be binding upon and inure to the benefit of Grantor and Grantee, and their successors and assigns, and such terms, covenants and conditions shall be covenants running with the land.

3. This instrument is subject to the terms and conditions of (a) the instruments and agreements referred to in Exhibit A hereto and (b) the instruments and agreements which constitute the record chain of title into Grantor. Grantee agrees to be bound by and assume all obligations and rights created by said instruments, assignments and by recorded agreements related thereto.

4. Anything in this instrument to the contrary notwithstanding, this instrument shall not assign any of the Property or any benefits arising thereunder or resulting therefrom that (a) are not assignable, in whole or in part, or (b) require the consent or approval of the counter-party for the valid assignment thereof and such consent or approval has not been obtained on or before the Effective Time. If any such consents are not obtained before the Effective Time, Grantor and Grantee will use their reasonable best efforts to take such actions as may be possible without violation or breach of such Property or any instrument or agreement relating to such Property to effectively grant to Grantee the economic benefits of, and impose the economic burdens of, such Property.

W. D. MILLER, Clerk County Court, Harris County, Texas. By Olga Newberry Deputy.

No. 219548

The Texas Company To General American Transportation Corp.

Deed & Map.

State of Texas, County of Harris. Know all men by these presents:

That The Texas Company, a Delaware corporation, with a permit to do business in Texas, is the owner of certain land in Harris County, Texas, described as follows:

About two hundred seventy-three and sixty-three one hundredths (273.63) acres out of a league of land originally granted to Ezekiel Thomas on the North side of Buffalo Bayou, Harris County, Texas, described by meetes and bounds as follows: Beginning at the intersection of the west line of a tract of land conveyed by G. L. Noble to The Texas Company, by a deed dated May 10, 1915, and recorded in Volume 351 at page 464, of the Deed Records in the office of the Clerk of the County of Harris Texas, , , with the north bank of Buffalo Bayou; thence North along the said west line thirty-nine hundred and seventy-four varas, or eleven thousand and thirty-nine (11039) feet, to a concrete monument on the west line; thence west one thousand sixty-six (1066) feet to a concrete monument for corner; thence south eleven thousand four hundred and fifty-nine (11459) feet to a concrete monument in the north bank of Buffalo Bayou; thence down said Bayou with its meanders to the place of beginning; except a right-of-way eighty (80) feet in width conveyed by P. S. Griffith to the T. & N. O. Railway Company by deed dated September 29, 1916, recorded in Volume 371, Page 268, of the Deed Records of the said Clerk; and except a right-of-way for a public road sixty (60) feet in width conveyed by said P. S. Griffith to the County of Harris across said tract of land, said right-of-way deed being recorded in Volume 375, page 188, of the Deed Records of said Clerk as extended by a subsequent right-of-way by The Texas Company to said County of Harris; That The Texas Company, hereinafter called "Grantor", for an in consideration of the sum of Ten Dollars ($10.00) and other good and valuable considerations to it paid by General American Transportation Corporation, a New York corporation, hereinafter called "Grantee", has granted, sold and conveyed, and by these presents, does grant, sell, and convey unto said General American Transportation Corporation, subject to the reservations and exceptions hereinafter set out, two tracts out of the land described above and two additional tracts, all four of which tracts are described as follows: Tract (A) All that part of the said described land lying south of the hundred (100) foot right-of-way of the road known as Clinton Public Road, and North of the north line of the right-of-way of the Texas and New Orleans Railroad Company (S.P.RR.Co.) containing sixteen and ninety-one hundredths (16.91) acres, more or less; Tract (B) All that part of said land first above described lying south of the said right-of-way of the Texas and New Orleans Railroad Company (S.P.R.R. Co) containing thirty-one and ninety-six hundredths (31.96) acres, more or less; and the two tracts of land adjacent to and east of the above described tracts (A) and (B), which are more accurately described as follows:

Tract No. (1) Beginning at the northeast corner aforedescribed tract (A); thence in an easterly direction along the South line of the hundred (100) foot right-of-way of the road known as Clinton Public Road to a point where a line parallel to, and seventy-four (74) feet east of, the east line of said aforedescribed tract (A) would intersect the said south line; thence in a southerly direction parallel to, and seventy-four (74) feet east of, the east line of the sadd land of aforedescribed tract (A) to the north line of the right-of-way of the Texas and New Orleans Railroad Company (S.P.R.R.Co.); thence in a westerly direction along the said north line of the said right-of-way seventy-four (74) feet to the southeast corner of aforedescribed

Clerk's Notes—Art. 4606.

tract (A); thence in a northerly direction along east line of aforedescribed tract (A) to the point of beginning. Containing one and seventeen hundredths (1.170) acres, more or less; Tract No. (2) beginning at the northeast corner of aforedescribed tract (B); thence in an easterly direction along the south line of the right-of-way of the Texas and New Orleans Railroad Company (S.P. R. R.Co) to a point where a line parallel to, and seventy-four (74) feet east of, the east line of aforedescribed tract (B) would intersect the said south line; thence in a southerly direction parallel to and seventy-four (74) feet east of, the east line of aforedescribed tract (B) to the north bank of Buffalo Bayou; thence in a westerly direction along the said north bank to the southeast corner of aforedescribed tract (B); thence in a northerly direction along the said east line of the aforedescribed tract (B) to the point of beginning. Containing two and one hundredth (2.01) acres, more or less; all as shown on the print of grantor's drawing 15-1060 attached hereto, together with all and singular the rights (including riparian rights) and appurtenances thereto in anywise belonging. The above described four tracts comprising a tract eleven hundred forty (1140) feet wide measured along the south line of Clinton Road by nineteen hundred forty (1940) feet more or less on the east side and twenty-three hundred and seventy-four (2374) feet, more or less, on the west side running from the said south line of Clinton Road to the north bank of Buffalo Bayou (Houston Ship Channel) excepting an eighty (80) foot right-of-way owned and occupied by the Texas and New Orleans Railroad Company, consisting of fifty-two and five hundredths (52.05) acres, more or less, said four tracts being also the same tracts covered by agreements dated January 2, 1935 and March 27, 1936 between The Texas Company and General American Tank Storage and Terminal Company, Inc., and General American Tank Car Corporation.

Grantor reserves and excepts from this conveyance, for itself, its successors and assigns, all rights to oil, gas and other minerals in and under said above described tracts of land, together with the right to drill, mine and operate on the said above described property for such oil, gas or other minerals, provided, however, that in the exercise of such rights, grantors its successors and assigns, shall not damage or interfere with any buildings, pipes, structures, or equipment of any kind or character of Grantee, its successors and assigns, on said above described property, or with the business conducted or to be conducted thereon by grantee, its successors and assigns, and shall reimburse grantee, its successors and assigns, for any and all damages or expenses incurred by or resulting from the exercise of said rights by grantor, its successors and assigns. Grantor also reserves to itself, its successors and assigns forever a right-of-way to lay, maintain, repair and replace two pipe lines across the above described tracts of land, and/or along the western boundary of said tracts of land to connect with grantor's land adjoining the above described property on the east, the location of said right-of-way being shown on the print of grantor's drawing 15-1060, attached hereto and made a part hereof.

This conveyance is subject to: (a) General taxes, special assessments and all other taxes, assessments and licenses whatsoever applicable to the above described tracts of land, and all buildings and improvements thereon (except those owned by other parties) and to the business conducted or to be conducted thereon covering the calendar year 1935 and subsequent years. (b) The rights of all persons claiming by, through or under the grantee herein; also the rights of all persons claiming by, through or under General American Tank Storage & Terminal Co., Inc. a Louisiana corporation, which heretofore assigned to the grantee all of its right, title and interest, in, to and under those certain agreements dated January 2, 1935, and March 27, 1936, hereinafter more particularly described. (c) The rights, grants, privileges, and easements insofar as they cover and affect the above described tracts of land, granted or conveyed by the following described instruments, viz: (1) Pipe line right-of-way grant, dated February 6, 1920, from The Texas Company to Sinclair Cudahy Pipe Line Co., recorded in Book 442, Page 511, in the Clerk's Office of Harris County, Texas, with a supplement thereto dated May 29, 1920;

Clerk's Notes—Art. 4606.

METES AND BOUNDS DESCRIPTION FOR
KMLT CENTRAL PLANT PLUME MANAGEMENT ZONE
ACROSS KINDER MORGAN LIQUIDS TERMINALS LLC
AND KM LIQUIDS TERMINALS, L.P.

Metes and bounds description for a 28.4814 acre tract of land extending over, through, along and across a called 31.96 acre tract of land (Tract B), and a called 2.01 acre tract (Tract No. 2), as recorded in Volume 1163, Page 515 , Deed Records of Harris County, Texas, and the residue of a 123.5686 acre tract of land, as recorded in File No. 20070176988, Film Code 041-65-1336, Official Public Records of Real Property, Harris County, Texas, said tract being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows:

Bearings and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83 in feet.

BEGINNING in the East property line of said 2.01 acre tract (Tract No. 2), said "POINT OF BEGINNING" being South 03°25'40" East, along said East property line, a distance of 146.58 feet from the calculated Northeast corner of said 2.01 acre tract (Tract No. 2), said Northeast corner being at the intersection of the South right-of-way line of Union Pacific Railroad and the West property line of said 123.5686 acre tract, said "POINT OF BEGINNING" having coordinates N=13,832,233.24, E=3,166,211.22;

THENCE, South 39°37'03" East, a distance of 140.35 feet to a point;

THENCE, a distance of 293.98 feet, along the arc of a curve to the right, having a radius of 475.00 feet, a delta angle of 35°27'38", and a chord bearing of South 21°53'13" East, a distance of 289.31 feet to a point;

THENCE, South 04°09'24" East, a distance of 287.20 feet to a point;

THENCE, South 02°34'21" East, a distance of 132.48 feet to a point;

THENCE, South 00°39'05" West, a distance of 140.48 feet to a point;

THENCE, a distance of 144.61 feet, along the arc of a curve to the right, having a radius of 70.00 feet, a delta angle of 93°48'37", and a chord bearing of South 47°33'24" West, a distance of 102.23 feet to a point;

THENCE, North 85°32'18" West, a distance of 223.05 feet to a point;

THENCE, South 89°47'15" West, a distance of 113.35 feet to a point;

THENCE, North 84°13'50" West, a distance of 153.90 feet to a point;

THENCE, a distance of 182.43 feet, along the arc of a curve to the right, having a radius of 750.00 feet, a delta angle of 13°56'12", and a chord bearing of North 77°15'44" West, a distance of 181.98 feet to a point;

THENCE, North 70°17'39" West, a distance of 59.38 feet to a point;

THENCE, a distance of 279.53 feet, along the arc of a curve to the right, having a radius of 1,500.00 feet, a delta angle of 10°40'38", and a chord bearing of North 64°57'19" West, a distance of 279.13 feet to a point;

THENCE, North 59°37'00" West, a distance of 35.46 feet to a point;

THENCE, a distance of 345.62 feet, along the arc of a curve to the right, having a radius of 375.00 feet, a delta angle of 52°48'25", and a chord bearing of North 33°12'48" West, a distance of 333.52 feet to a point;

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

June 24, 2014

RECEIVED

Mr. John Kennedy
Project Manager, Environmental Remediation
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Conditional Approval - *Response Action Plan Addendum – Central Plant*, dated January 20, 2014
Kinder Morgan Liquids Terminals, LLC – Galena Park
TCEQ SWR No. 30573; TCEQ Hazardous Waste Permit/Compliance Plan 50054
EPA ID No. TXD026481523; RN 100237452, CN 601545940

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has completed the review of the above referenced report received by the Remediation Division on March 11, 2014. Based on the TCEQ review, the RAP fulfills the requirements of 30 Texas Administrative Code (TAC) §350.94. The approved RAP proposes continued monitoring and active groundwater recovery at Plume Management Zone (PMZ) designated wells until the concentrations of constituents of concern meet residential protective concentration levels. Please implement the RAP, and if applicable, submit a Response Action Effectiveness Report (RAER) in accordance with the schedule proposed in the approved RAP. Upon attainment of the response objectives, a Response Action Completion Report (RACR) must be submitted, in accordance with 30 TAC §350.95. The approved RAP also contains documentation fulfilling the requirements of 30 TAC §350.94(k), which includes a proposed monitoring and reporting schedule for post-response action care activities required under Remedy Standard B.

The RAP contains proposed institutional control language sufficient to fulfill the requirements of 30 TAC §350.111. Proof of filing the institutional control must be submitted to the TCEQ within one-hundred-twenty (120) days of the date of this letter in accordance with 30 TAC §350.33(f)(4)(C)(i).

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the report.

Questions concerning this letter should be directed to me at (512) 239- 2034 or maureen.hatfield@tceq.texas.gov. When responding by mail, please submit an original and one copy on CD of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted to the local TCEQ Region Office. The information in the reference block should be included in all submittals.

Sincerely,

Maureen Hatfield, P.G., Project Manager

Re: *Executed Copy of the Deed Notice – Response Action Plan Addendum – Central Plant*
Galena Park Terminal
KM Liquids Terminals LLC
Galena Park, Texas
TCEQ SWR No. 30573

Dear Ms. Hatfield:

Attached please find the certified copy of the deed notice providing institutional control for the KM Liquids Terminals LLC (KMLT) Galena Park Terminal Central Plant Area in Galena Park, Texas.as required by the Response Action Plan (RAP) Addendum dated March 20, 2014. The RAP Addendum was approved by the Texas Commission on Environmental Quality (TCEQ) by letter dated June 24, 2014.

The deed notice was filed with the Harris County Courthouse Clerk's Office on July 30, 2014, within 120 days as per the RAP Addendum. The deed notice provides institutional control for the Plume Management Zone (PMZ) established at the Central Plant Area of the Terminal, and includes Exhibit A (legal property description) and Exhibit B (meets and bounds descriptions and plat maps of the PMZ).

If you have any questions regarding the information presented in this submittal, please do not hesitate to contact me at (713) 920-8423.

Sincerely,
KM Liquids Terminals LLC

Texas Risk Reduction Program
Deed Notice

STATE OF TEXAS

COUNTY OF HARRIS

This Notice is filed to provide information concerning certain environmental conditions and/or use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows:

P
Lee

Lee
To the
Public

A legal property description used in the last recorded vesting deed, covering the Property that includes the entire recorded tract of land held by the owner executing this deed notice, is attached hereto and incorporated herein by reference as Exhibit A.

Portions of the groundwater of the Property contain certain identified chemicals of concern causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property is described as follows:

RP 092-29-0278

METES AND BOUNDS DESCRIPTION for a 28.4814 acre tract of land extending over, through, along and across a called 31.96 acre tract of land (Tract B), and a called 2.01 acre tract (Tract No. 2), as recorded in Volume 1163, Page 515 , Deed Records of Harris County, Texas, and the residue of a 123.5686 acre tract of land, as recorded in File No. 20070176988, Film Code 041-65-1336, Official Public Records of Real Property, Harris County, Texas, said tract being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows:

D

Bearings and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83 in feet.

BEGINNING in the East property line of said 2.01 acre tract (Tract No. 2), said "POINT OF BEGINNING" being South 03°25'40" East, along said East property line, a distance of 146.58 feet from the calculated Northeast corner of said 2.01 acre tract (Tract No. 2), said Northeast corner being at the intersection of the South right-of-way line of Union Pacific Railroad and the West property line of said 123.5686 acre tract, said "POINT OF BEGINNING" having coordinates N=13,832,233.24, E=3,166,211.22;

THENCE, South 39°37'03" East, a distance of 140.35 feet to a point;

THENCE, a distance of 293.98 feet, along the arc of a curve to the right, having a radius of 475.00 feet, a delta angle of 35°27'38", and a chord bearing of South 21°53'13" East, a distance of 289.31 feet to a point;

THENCE, South 04°09'24" East, a distance of 287.20 feet to a point; THENCE, South 02°34'21" East, a distance of 132.48 feet to a point; THENCE, South 00°39'05" West, a distance of 140.48 feet to a point;

Any provision herein which restrict the sale, rental or use of the described Real Property because of color or race is invalid and unenforceable under the Federal Law. Confidential information may have been redacted from the document in compliance with the Public Information Act.

defined here as exceeding TRRP Protective Concentration Levels (PCLs) for residential and commercial/industrial land use, are summarized on the attached Table 1.

This notice is required for the following reasons:

> ***The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone. A plume management zone is defined as an area of groundwater containing concentrations of chemicals of concern exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC 350.33(f)(4). The undersigned has established a plume management zone so that the chemicals of concern in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached Exhibit B provides the location and extent of the plume management zone and describes the maintenance and monitoring required. This maintenance and monitoring is required until TCEQ approves some modification of those requirements. Exposure to groundwater within the plume management zone for any purpose is not advised until such time when all the chemicals of concern no longer exceed their respective protective concentration levels. This deed notice must not be removed or modified without prior approval from TCEQ.***

As of the date of this Notice, the record owner of fee title to the Property is KM Liquids Terminals, L.P. with an address of 1001 Louisiana St., Suite 1000, Houston, Texas 77002.

same may be incorrectly described in, or a description of such rights, titles and interests be omitted from, Exhibit A.

TO HAVE AND TO HOLD the Property unto Grantee and its successors and assigns to WARRANT AND FOREVER DEFEND all and singular title to the Property unto Grantee, it successors and assigns, against every person whomsoever lawfully claiming the same or any part thereof by, through or under Grantor, but not otherwise.

This Special Warranty Deed and Assignment is subject to the following terms and conditions:

1. Pursuant to that certain Contribution and Assumption Agreement (the "Contribution Agreement") dated September 1, 2004 by and between Grantor and Grantee, Grantor conveyed the Property to Grantor. Grantor and Grantee omitted to record this Special Warranty Deed and Assignment, but it is hereby clarified that this instrument with all of its terms and provisions, shall be effective as of the date of the Contribution Agreement at 9:00 a.m. Houston, Texas time on September 1, 2004 (the "Effective Time").

2. The terms, covenants and conditions hereof shall be binding upon and inure to the benefit of Grantor and Grantee, and their successors and assigns, and such terms, covenants and conditions shall be covenants running with the land.

3. This instrument is subject to the terms and conditions of (a) the instruments and agreements referred to in Exhibit A hereto and (b) the instruments and agreements which constitute the record chain of title into Grantor. Grantee agrees to be bound by and assume all obligations and rights created by said instruments, assignments and by recorded agreements related thereto.

4. Anything in this instrument to the contrary notwithstanding, this instrument shall not assign any of the Property or any benefits arising thereunder or resulting therefrom that (a) are not assignable, in whole or in part, or (b) require the consent or approval of the counter-party for the valid assignment thereof and such consent or approval has not been obtained on or before the Effective Time. If any such consents are not obtained before the Effective Time, Grantor and Grantee will use their reasonable best efforts to take such actions as may be possible without violation or breach of such Property or any instrument or agreement relating to such Property to effectively grant to Grantee the economic benefits of, and impose the economic burdens of, such Property.

W. D. MILLER, Clerk County Court, Harris County, Texas. By Olga Neuhaus Deputy.

No. 219548

The Texas Company To General American Transportation Corp.

Deed & Map.

State of Texas, County of Harris. Know all men by these presents:

That The Texas Company, a Delaware corporation, with a permit to do business in Texas, is the owner of certain land in Harris County, Texas, described as follows:

About two hundred seventy-three and sixty-three one hundredths (273.63) acres out of a league of land originally granted to Ezekiel Thomas on the North side of Buffalo Bayou, Harris County, Texas, described by meetes and bounds as follows: Beginning at the intersection of the west line of a tract of land conveyed by G. L. Noble to The Texas Company, by a deed dated May 10, 1915, and recorded in Volume 351 at page 464, of the Deed Records in the office of the Clerk of the County of Harris Texas, , with the north bank of Buffalo Bayou; thence North along the said west line thirty-nine hundred and seventy-four varas, or eleven thousand and thirty-nine (11039) feet, to a concrete monument on the west line; thence west one thousand sixty-six (1066) feet to a concrete monument for corner; thence south eleven thousand four hundred and fifty-nine (11459) feet to a concrete monument in the north bank of Buffalo Bayou; thence down said Bayou with its meanders to the place of beginning; except a right-of-way eighty (80) feet in width conveyed by P. S. Griffith to the T. & N. O. Railway Company by deed dated September 29, 1916, recorded in Volume 371, Page 268, of the Deed Records of the said Clerk; and except a right-of-way for a public road sixty (60) feet in width conveyed by said P. S. Griffith to the County of Harris across said tract of land, said right-of-way deed being recorded in Volume 375, page 188, of the Deed Records of said Clerk as extended by a subsequent right-of-way by The Texas Company to said County of Harris; That The Texas Company, hereinafter called "Grantor", for an in consideration of the sum of Ten Dollars ($10.00) and other good and valuable considerations to it paid by General American Transportation Corporation, a New York corporation, hereinafter called "Grantee", has granted, sold and conveyed, and by these presents, does grant, sell, and convey unto said General American Transportation Corporation, subject to the reservations and exceptions hereinafter set out, two tracts out of the land described above and two additional tracts, all four of which tracts are described as follows:

Tract (A) All that part of the said described land lying south of the hundred (100) foot right-of-way of the road known as Clinton Public Road, and North of the north line of the right-of-way of the Texas and New Orleans Railroad Company (S.P.RR.Co.) containing sixteen and ninety-one hundredths (16.91) acres, more or less; Tract (B) All that part of said land first above described lying south of the said right-of-way of the Texas and New Orleans Railroad Company (S.P.R.R. Co) containing thirty-one and ninety-six hundredths (31.96) acres, more or less; and the two tracts of land adjacent to and east of the above described tracts (A) and (B), which are more accurately described as follows:

Tract No. (1) Beginning at the northeast corner aforedescribed tract (A); thence in an easterly direction along the South line of the hundred (100) foot right-of-way of the road known as Clinton Public Road to a point where a line parallel to, and seventy-four (74) feet east of, the east line of said aforedescribed tract (A) would intersect the said south line; thence in a southerly direction parallel to, and seventy-four (74) feet east of, the east line of the sadd land of aforedescribed tract (A) to the north line of the right-of-way of the Texas and New Orleans Railroad Company (S.P.R.R.Co.); thence in a westerly direction along the said north line of the said right-of-way seventy-four (74) feet to the southeast corner of aforedescribed

Clerk's Notes—Art. 4606.

COUNTY COURT OF HARRIS COUNTY, TEXAS

tract (A); thence in a northerly direction along east line of aforedescribed tract (A) to the point of beginning. Containing one and seventeen hundredths (1.170) acres, more or less; Tract No. (2) beginning at the northeast corner of aforedescribed tract (B); thence in an easterly direction along the south line of the right-of-way of the Texas and New Orleans Railroad Company (S.P. R. R.Co) to a point where a line parallel to, and seventy-four (74) feet east of, the east line of aforedescribed tract (B) would intersect the said south line; thence in a southerly direction parallel to and seventy-four (74) feet east of, the east line of aforedescribed tract (B) to the north bank of Buffalo Bayou; thence in a westerly direction along the said north bank to the southeast corner of aforedescribed tract (B); thence in a northerly direction along the said east line of the aforedescribed tract (B) to the point of beginning. Containing two and one hundredth (2.01) acres, more or less; all as shown on the print of grantor's drawing 15-1060 attached hereto, together with all and singular the rights (including riparian rights) and appurtenances thereto in anywise belonging. The above described four tracts comprising a tract eleven hundred forty (1140) feet wide measured along the south line of Clinton Road by nineteen hundred forty (1940) feet more or less on the east side and twenty-three hundred and seventy-four (2374) feet, more or less, on the west side running from the said south line of Clinton Road to the north bank of Buffalo Bayou (Houston Ship Channel) excepting an eighty (80) foot right-of-way owned and occupied by the Texas and New Orleans Railroad Company, consisting of fifty-two and five hundredths (52.05) acres, more or less, said four tracts being also the same tracts covered by agreements dated January 2, 1935 and March 27, 1936 between The Texas Company and General American Tank Storage and Terminal Company, Inc., and General American Tank Car Corporation.

Grantor reserves and excepts from this conveyance, for itself, its successors and assigns, all rights to oil, gas and other minerals in and under said above described tracts of land, together with the right to drill, mine and operate on the said above described property for such oil, gas or other minerals, provided, however, that in the exercise of such rights, grantor, its successors and assigns, shall not damage or interfere with any buildings, pipes, structures, or equipment of any kind or character of Grantee, its successors and assigns, on said above described property, or with the business conducted or to be conducted thereon by grantee, its successors and assigns, and shall reimburse grantee, its successors and assigns, for any and all damages or expenses incurred by or resulting from the exercise of said rights by grantor, its successors and assigns. Grantor also reserves to itself, its successors and assigns forever a right-of-way to lay, maintain, repair and replace two pipe lines across the above described tracts of land, and/or along the western boundary of said tracts of land to connect with grantor's land adjoining the above described property on the east, the location of said right-of-way being shown on the print of grantor's drawing 15-1060, attached hereto and made a part hereof.

This conveyance is subject to: (a) General taxes, special assessments and all other taxes, assessments and licenses whatsoever applicable to the above described tracts of land, and all buildings and improvements thereon (except those owned by other parties) and to the business conducted or to be conducted thereon covering the calendar year 1935 and subsequent years. (b) The rights of all persons claiming by, through or under the grantee herein; also the rights of all persons claiming by, through or under General American Tank Storage & Terminal Co., Inc. a Louisiana corporation, which heretofore assigned to the grantee all of its right, title and interest, in, to and under those certain agreements dated January 2, 1935, and March 27, 1936, hereinafter more particularly described. (c) The rights, grants, privileges, and easements insofar as they cover and affect the above described tracts of land, granted or conveyed by the following described instruments, viz: (1) Pipe line right-of-way grant, dated February 6, 1920, from The Texas Company to Sinclair Cudahy Pipe Line Co., recorded in Book 442, Page 511, in the Clerk's Office of Harris County, Texas, with a supplement thereto dated May 29, 1920;

Clerk's Notes—Art. 4606.

RP 092-29-0794

Any provision herein which restrict the sale, rental or use of the described Real Property because of color or race is invalid and unenforceable under the Federal Law. Confidential information may have been redacted from the document in compliance with the Public Information Act.

METES AND BOUNDS DESCRIPTION FOR
KMLT CENTRAL PLANT PLUME MANAGEMENT ZONE
ACROSS KINDER MORGAN LIQUIDS TERMINALS LLC
AND KM LIQUIDS TERMINALS, L.P.

Metes and bounds description for a 28.4814 acre tract of land extending over, through, along and across a called 31.96 acre tract of land (Tract B), and a called 2.01 acre tract (Tract No. 2), as recorded in Volume 1163, Page 515 , Deed Records of Harris County, Texas, and the residue of a 123.5686 acre tract of land, as recorded in File No. 20070176988, Film Code 041-65-1336, Official Public Records of Real Property, Harris County, Texas, said tract being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows:

Bearings and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83 in feet.

BEGINNING in the East property line of said 2.01 acre tract (Tract No. 2), said "POINT OF BEGINNING" being South 03°25'40" East, along said East property line, a distance of 146.58 feet from the calculated Northeast corner of said 2.01 acre tract (Tract No. 2), said Northeast corner being at the intersection of the South right-of-way line of Union Pacific Railroad and the West property line of said 123.5686 acre tract, said "POINT OF BEGINNING" having coordinates N=13,832,233.24, E=3,166,211.22;

THENCE, South 39°37'03" East, a distance of 140.35 feet to a point;

THENCE, a distance of 293.98 feet, along the arc of a curve to the right, having a radius of 475.00 feet, a delta angle of 35°27'38", and a chord bearing of South 21°53'13" East, a distance of 289.31 feet to a point;

THENCE, South 04°09'24" East, a distance of 287.20 feet to a point;

THENCE, South 02°34'21" East, a distance of 132.48 feet to a point;

THENCE, South 00°39'05" West, a distance of 140.48 feet to a point;

THENCE, a distance of 144.61 feet, along the arc of a curve to the right, having a radius of 70.00 feet, a delta angle of 93°48'37", and a chord bearing of South 47°33'24" West, a distance of 102.23 feet to a point;

THENCE, North 85°32'18" West, a distance of 223.05 feet to a point;

THENCE, South 89°47'15" West, a distance of 113.35 feet to a point;

THENCE, North 84°13'50" West, a distance of 153.90 feet to a point;

THENCE, a distance of 182.43 feet, along the arc of a curve to the right, having a radius of 750.00 feet, a delta angle of 13°56'12", and a chord bearing of North 77°15'44" West, a distance of 181.98 feet to a point;

THENCE, North 70°17'39" West, a distance of 59.38 feet to a point;

THENCE, a distance of 279.53 feet, along the arc of a curve to the right, having a radius of 1,500.00 feet, a delta angle of 10°40'38", and a chord bearing of North 64°57'19" West, a distance of 279.13 feet to a point;

THENCE, North 59°37'00" West, a distance of 35.46 feet to a point;

THENCE, a distance of 345.62 feet, along the arc of a curve to the right, having a radius of 375.00 feet, a delta angle of 52°48'25", and a chord bearing of North 33°12'48" West, a distance of 333.52 feet to a point;

Re: *Response Action Plan Addendum – Central Plant Galena Park Terminal*
KM Liquids Terminals LLC
Galena Park, Texas
TCEQ SWR No. 30573

Dear Mr. Coulter:

Attached please find the Response Action Plan (RAP) Addendum for the KM Liquids Terminals LLC (KMLT) Galena Park Terminal Central Plant area in Galena Park, Texas. The RAP Addendum prepared by URS Corporation (URS) presents additional data and a revised ground water remedial strategy developed subsequent to the original RAP approved by the Texas Commission on Environmental Quality (TCEQ) on November 1, 2007.

The RAP Addendum summarizes PMZ well installation and additional surface soil and groundwater data collected based on the response actions proposed in the 2007 RAP. In addition, the RAP Addendum presents a revised remedial strategy of on-site containment and recovery of affected ground water in the northwest corner of Central Plant. The revised strategy was developed in response to the off-site landowner's denial of KMLT's request for a downgradient point of exposure well in the adjacent right-of-way and deed recordation of the area as commercial/industrial land use. The RAP Addendum details the groundwater recovery system installed and currently operating at the KMLT Galena Park Central Plant.

If you have any questions regarding the information presented in this submittal, please do not hesitate to contact me at (713) 920-8423.

Sincerely,
KM Liquids Terminals LLC

RAP Executive Summary	ID No.: SWR #30573
	Report Date: March 20, 2014

Use this worksheet to summarize the report. Be sure to complete and submit the Checklist for Report Completeness. **Attach a chronology of activities associated with the affected property.**

Briefly describe the affected property and PCLE zones, the conclusions from the assessment activities, identify any affected or threatened receptors, and describe any other major considerations taken into account when developing this response action plan. If any portion of the response action is necessitated due to an aesthetic or nuisance condition, identify the nature of that condition and identify that portion of the response action proposed to address it. If any media that contains a PCLE zone is not addressed in this RAP, provide justification.

Background

This Response Action Plan (RAP) Addendum has been prepared for Solid Waste Management Unit (SWMU) groups C1, C2, and C3 at the Central Plant area of the KM Liquids Terminals LLC (KMLT) Galena Park Terminal to present additional data collected following approval of the 2007 RAP (URS, 2007). The 2007 RAP discussed response actions for four Central Plant SWMU Groups: C1, C2, C3, and C4, that were identified and investigated in the 2004 site-wide Affected Property Assessment Report (APAR; Arcadis, 2004) as depicted on **Attachment 1A-1**.

The purpose of this RAP Addendum, as discussed in more detail below, is to provide additional surface and subsurface soil data that impact response actions discussed for soil and revise the remedial strategy of a Plume Management Zone (PMZ) for affected groundwater containment and recovery in the northwest corner of the Central Plant. Analytical data collected following submittal of the 2007 RAP are provided in **Appendix 2**.

Proposed Response Actions for Soil

Multiple response actions were proposed for the surface soil Protective Concentration Level Exceedance (PCLE) zones identified in the Central Plant – SWMU Group C1, C2, and C3 in the 2007 RAP (URS, 2007). Due to varied chemical and physical properties of the COCs, the spatial distribution of PCL exceedances, and physical site conditions, specific response actions were proposed to protect human health and the environment, including excavation, resampling to assess attenuation, and establishment of a PMZ where excavation is impracticable (URS, 2007). Where impractical for removal due to existing Terminal infrastructure, or where soil constituents of concern (COCs) were also pervasive in groundwater without exceeding the total soil combined ($^{Tot}Soil_{Comb}$) PCL in soil, surface soils were proposed to be included as part of the Central Plant PMZ. This remains the proposed path forward for these PCLE zones. However, prior to conducting the response actions for the remainder of the surface soil PCLE zones, resampling was conducted to confirm current concentration levels. **Attachment 2A-1** depicts the previously identified surface soil impacted locations, and **Table 2-1** in **Appendix 2** provides a summary of the surface soil resampling data. The results of the resampling analytical data indicated the concentrations of COCs had attenuated below the critical PCL. Based on these resampling data, the response actions for the soils in Central Plant SWMU C1, most of SWMU C2, and three locations in SWMU C3 soil meet a Remedy Standard A closure approach and **No Further Action (NFA) is proposed in these PCLE zones**.

Three surface soil locations with prior PCL exceedances on the eastern side of SWMU Group C2 (Attachment 2A-1) were not resampled due to existing infrastructure. However, soils are located under concrete, and therefore, the pathway for direct contact is incomplete. These locations, in addition to the southeast portion of SWMU C3 where excavation is impractical due to existing infrastructure, will be included as part of the Central Plant PMZ under Remedy Standard B.

Two locations in the southeast corner of SWMU C2 exceeded soil to air inhalation exposure pathway, $^{Air}Soil_{Inh\text{-}V}$ PCL for benzene when evaluated during the 2004 APAR. A Tier 2 $^{Air}Soil_{Inh\text{-}V}$ PCL was calculated for benzene for the soil to air exposure pathway to demonstrate compliance with worker safety air exposure levels by using the Occupational Safety and Health Administration (OSHA) permissible exposure level (PEL) for benzene for the TRRP Risk Based Exposure Level (RBEL) in the Tier 2

calculation in accordance with Texas Administrative Code (TAC) §350.74(b). The Tier 2 PCL was not exceeded. No further action is proposed for these two locations. The Tier 2 PCL calculation spreadsheet for the soil to air inhalation pathway is provided as **Table 3-1** in **Appendix 3**.

Proposed Response Actions for Groundwater

The 2007 RAP (URS, 2007) provides a more detailed discussion of the response actions related to the groundwater PCLE zones. Groundwater PCLE zones were identified for the groundwater ingestion pathway, the groundwater to air inhalation pathway, and the groundwater to surface water exposure pathway. Approved response actions for the identified groundwater PCLE zones include a SWMU-wide PMZ addressing the groundwater ingestion exposure pathway, and compliance with worker safety air exposure levels TAC§350.74 to address the groundwater to air inhalation pathway for site workers. Potential human exposure to COCs migrating from groundwater will be monitored through scheduled ground water monitoring events and controlled and managed through the Terminal's permitting process and the KMLT Operations and Maintenance (T-O&Ms) procedures (e.g., employee's and contractor's responsibilities, respiratory protection, portable vapor detectors, soil disturbance), which are equivalent to the TRRP referenced health and safety plan, as necessary, in general accordance with TAC§350.74(b)(1). The PMZ will also incorporate the existing Compliance Plan (CP 50054) recovery well and trench network along the surface water frontage of the ship berthing area and the Houston Ship Channel (HSC). A map showing the PMZ and associated monitoring wells is included as **Attachment 2D**.

The potentiometric surface for Central Plant shows a south-southeast trending hydraulic mound, with groundwater flow to the east, southeast, south and west. The potentiometric surface maps from the February 2008 and latest gauging event in April 2013 are included as **Attachment 1A-2** and **Attachment 1A-3**, respectively. Groundwater flow to the east, southeast, and south is toward the Compliance Plan recovery well and trench network along the surface water frontage of the ship berthing area and the HSC. Groundwater flow to the west is toward the CenterPoint Energy Right-Of-Way (CPROW). As a result of the outward flow from the hydraulic mound in the Central Plant, the proposed PMZ will monitor for potential COC migration to the surface water to the east, southeast and south, and to the CPROW to the west. Therefore, the PMZ will utilize different PCLs depending on the off-site migration route and the potential receptors.

Approved ecological and human health groundwater to surface water (^{SW}GW) PCLs were calculated in the 2007 RAP. The ^{SW}GW PCLs will also serve as Attenuation Action Levels (AALs) for the PMZ to the east, southeast, and south of the hydraulic high and along the surface water frontage. For groundwater flow to the west of the hydraulic mound toward the CPROW, the applicable groundwater PCLs are the $^{GW}GW_{Ing}$ PCLs. Attenuation Monitoring Point (AMP) wells AMP-1, AMP-2, AMP-3, and Point of Exposure (POE) monitoring wells, POE-1, and POE-2 were installed in January 2008 on the west side of Central Plant to effectively monitor this component of groundwater flow. Groundwater sampling of the PMZ wells for westward migration toward the CPROW, including the newly-installed AMP and POE wells, was performed in February 2008 and in April/May 2013. The analytical data are summarized in **Table 2-2 (Appendix 2)**. The analytical data obtained was used to calculate AALs for the western PMZ boundary toward the CPROW.

During the February 2008 groundwater sampling activities, bis(2-chloroethyl)ether was detected at a concentration that exceeded the critical PCL in monitoring well POE-2, located near the northwest boundary of the PMZ. Resampling was performed in April 2008, January 2010, and September 2010, which confirmed the PCL exceedance of bis(2-chloroethyl)ether in this well. Although there is no known source and this COC was not detected in any adjacent monitoring wells, a groundwater recovery system, which incorporated POE-2 as a recovery well, was installed and activated in December 2011 to provide capture at the KMLT property line. As of December 1, 2013, POE-2 was recovering groundwater at an average rate of 0.63 gallons per minute (gpm). To-date, approximately 583,000 gallons of groundwater have been recovered since activation of the recovery system. Schematics of the groundwater recovery system are shown on **Attachment 2A-2** and **Attachment 2A-3**.

RAP Executive Summary

ID No.: SWR #30573

Report Date: March 20, 2014

In conjunction with the active recovery, monthly sampling of POE-2 for bis(2-chloroethyl)ether commenced in May 2012. The concentration versus time graph for POE-2 and bis(2-chloroethyl)ether is included as **Attachment 1B**. The current bis(2-chloroethyl)ether concentration has decreased to below the critical PCL but still exceeds the residential PCL. Active groundwater recovery and monthly sampling for POE-2 will continue until sufficient data have been collected to show that the bis(2-chloroethyl)ether concentration remains below the residential PCL. Following this, KMLT will notify the TCEQ of its intent to discontinue operation of the recovery well and include semi-annual monitoring of POE-2 under the PMZ sampling program.

What is the selected remedy standard for this affected property? X A X B

List all media that contains a PCLE zone and specify the proposed response action for each media. Indicate the type of removal, decontamination, physical control and/or institutional control action that is proposed.

Media	COCs[1]	Removal	Decontamination	Control			
				Physical Control	Modified Groundwater Response Objective[2]		
					PMZ	WCU	TI
Surface soil	VOCs, SVOCs, Metals				X		
Subsurface Soil	VOCs, SVOCs, Metals				X		
Groundwater	VOCs, SVOCs, 2,4-D, and Lead	X *(see note below)*			X		

An existing groundwater recovery system, consisting of recovery wells and recovery trenches, is currently in operation at the former SEHB area per Compliance Plan CP-50054. An additional recovery system was activated at POE-2 to recover groundwater impacted by bis(2-chloroethyl)ether.

Is there a media that contains a PCLE zone that is not addressed in this RAP? ____ yes X no
If yes, provide justification for not addressing the PCLE zone in this RAP.

On-site land use: [ ] Residential [X] Commercial/Industrial
Off-site land use: [ ] Residential [X] Commercial/Industrial (check all that apply)

Is this a re-submittal or revision of a previous RAP? X Yes ___ No
If yes, explain why the RAP is being revised or resubmitted.

This addendum to the 2007 RAP is being submitted to revise the remedial strategy for affected groundwater to containment and recovery in the northwest corner of the Central Plant. This RAP Addendum also includes surface soil resampling data collected subsequent to the approval of the 2007 RAP indicating NFA for multiple surface soil PCLE zones. Groundwater sampling data were also collected subsequent to the 2007 RAP approval. The data was used to calculate AALs for the AMPs at

[1] Specify either a specific COC or, if the response action is the same for all COCs in one type, specify the type of COC (for example, VOCs, SVOCs, metals).
[2] If a modified groundwater response objective is proposed, check the type(s) of proposed modifications.

the Site.

Were all the appropriate notifications made in accordance with §350.55? ___ Yes X No
If no, explain why notifications were not made:

Not applicable as affected groundwater is being captured in the northwest corner of the KMLT Central Plant and no response action is proposed for the off-site property.

Response Action Plan Addendum
Central Plant Chronology
Kinder Morgan Liquid Terminals, LP
Galena Park, Texas

December 23, 2013 – Plugging and abandonment of MW-39 and RI-1-15 was performed for the expansion of the railroad easement at the northeast portion of the Central Plant.

April 30, 2013 – Groundwater sampling of the Point of Exposure (POE), Attenuation Monitoring Point (AMP), and monitoring wells on the western portion of Central Plant was performed.

April 6-8, 2008 – Confirmation soil sampling was performed.

February 5-6, 2008 – Groundwater sampling of the POE, AMP, and monitoring wells on the western portion of Central Plant was performed.

January 29-31, 2008 – Installation of Point of Exposure (POE) wells POE-1 through POE-2 and Attenuation Monitoring Points (AMP) AMP-1 through AMP-3.

November 1, 2007 – The Response Action Plan (RAP) was approved by the TCEQ.

August 3, 2007 – The RAP for the Central Plant Plant was submitted to TCEQ.

February 7, 2007 – The APAR was approved by the TCEQ.

October 7, 2004 – The Affected Property Assessment Report (APAR) was submitted to the TCEQ.

September 8, 2003 – The sixth of six semiannual reports was submitted conveying groundwater monitoring for SWMU Group C4.

March 2, 2001 – Kinder Morgan Liquids Terminal, LLC purchased the Galena Park facility from GATX Terminals Corporation.

October 11, 2000 – The RFI was tentatively approved for SWMU Group C4, but new monitoring wells as well as semiannual monitoring for two years was requested.

June 14, 2000 – GATX submitted the RFI Addendum Report for SWMU Group C4.

March 30, 2000 – GATX submitted the RFI Addendum Report for SWMU Groups C1, C2, and C3.

July 31, 1998 – GATX submitted its six-volume Phase II RFI.

September 16, 1997 – GATX contracted Geraghty & Miller to perform the RFI.

April 15, 1997 – GATX submitted the Phase I RFI report, summarizing the status of the SWMUs.

September 24, 1996 – The TNRCC approved the RFI Workplan.

July 19, 1996 – GATX submitted the RFI Workplan.

August 1993 – The groundwater interception system was installed in the Central Plant and began operation.

April 13, 1992 – The RCRA Facility Assessment (RFA) was issued for the SWMUs.

April to May, 1989 – A facility inspection took place and a number of SWMUs were identified.

1989 – The "Aboveground oil-water separator" (misnomer) was installed. This unit is now a part of SWMU Group C3. The Container Storage Building was placed in service. It is now part of SWMU Group C4.

1987 – The Southeast Holding Basin was closed and capped.
May 20, 1986 – An order was issued by the TWC regarding the initial discovery of possible releases from hazardous waste management units at the GATX Galena Park Facility.

1985 – Lift Station No. 4 and the Southeast Holding Basin Sump (now parts of SWMU Group C2) were brought into operation, and the Southeast Holding Basin was removed from service.

1980s – Tanks 26 and 82 were decommissioned and demolished.

1980 – The Below Ground Oil/Water Separator was installed as a part of what is now referred to as SWMU Group C1.

1975 – The Southeast Holding Basin was placed in service to receive wastewater. This unit was the main unit in what is now SWMU Group C2.

1945 – The Central Plant Stormwater Drainage System and T/TR #4, the beginning of what is now SWMU Group C2, were brought into operation.

1944 – Aerial photographs were taken that reveal that GATX has a surface impoundment in the northwestern part of the Central Plant. This impoundment was designated "Impoundment #1" in the RFA and is now part of SWMU Group C4.

1938 – Tanks 116, 117, 50m and 51 were constructed in the Central Plant. These tanks are now part of SWMU Group C1. Tank 25-1, now part of SWMU Group C4, was also constructed. Tanks 3-9 and 32, now part of SWMU Group C3 were constructed.

1930s – Tank 26 and Tank 82, now part of SWMU Group C2, were constructed for product storage use.

1933 or 1934 – GATX purchased the Central Plant tank farm from Texaco.

1928 – The Galena Signal Oil Company sold the property that now comprises the North, East and Central Plants to the Texas Company, the predecessor of Texaco.

Checklist for Report Completeness

ID No.: SWR #30573

Report Date: March 20, 2014

Use this checklist to determine the portions of the form that must be submitted for this report. Answer all questions by checking Yes or No. If the answer is Yes include that portion of the report. If the answer is No, do not complete or submit that portion of the report. All form contents that are marked "Required" must be submitted. Form contents marked with an asterisk (*) are not included in the blank form and are to be provided by the person.

Use this worksheet to describe the objectives for the response action in each media.

Response Action Objectives

List the environmental media to which this applies Soils
Repeat this section for each medium that has a different response action objective.

State the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33 as applicable. Explain how the response action is appropriate based on the hydrogeologic characteristics, COC characteristics, and potential unprotective conditions that could continue or result during the remedial period.

Multiple response actions were proposed for the surface soil PCLE zones identified in the Central Plant – SWMU C1, C2, and C3 in the 2007 RAP (URS, 2007). Based on the PCL exceedance, the nature of the COC, and site conditions encountered, specific response actions were proposed to protect human health and the environment including excavation, resampling to assess attenuation, and establishment of a PMZ where excavation is impracticable (URS, 2007). Where impractical for removal due to existing Terminal infrastructure (locations II-082, II-075, and II-059 in SWMU C2 and as stated in the approved 2007 RAP nine locations in the areas of Tank 32 and 37 in the southeast portion of SWMU C3), surface soils were proposed to be included as part of the Central Plant PMZ under Remedy Standard B. This remains the proposed path forward for these PCLE zones. However, prior to conducting the proposed response actions for the remainder of the soil PCLE zones, resampling was conducted in 2005 and 2008 to confirm current concentration levels. **Attachment 2A-1** depicts the soil PCLE zones, and **Table 2-1** in **Appendix 2** provides a summary of the surface soil resampling data. The results of the resampling analytical data indicated the concentrations of COCs had attenuated below the critical PCL. Based on these resampling data, the response actions for the soils in Central Plant SWMU C1, most of SWMU C2, and locations CB-36, CB-38, and CB-39 in SWMU C3 soil meet a Remedy Standard A closure approach and no further action is proposed in these PCLE zones.

Two locations (A2SB-5 and A2SB-13) in SWMU C2 exceeded soil to air inhalation exposure pathway, $^{Air}Soil_{Inh\text{-}V}$ PCL for benzene at concentrations of 430 mg/kg and 97 mg/kg, respectively, when evaluated during the 2004 APAR. However, when evaluated using the most updated PCL from June 29, 2012, only the benzene concentration in A2SB-5 exceeded the Tier 1 $^{Air}Soil_{Inh\text{-}v}$ PCL of 141 mg/kg. A Tier 2 $^{Air}Soil_{Inh\text{-}V}$ PCL was calculated for benzene for the soil to air exposure pathway to demonstrate compliance with worker safety air exposure levels by using the OSHA permissible exposure level (PEL) for benzene for the TRRP Risk Based Exposure Level (RBEL) in the Tier 2 calculation in accordance with TAC §350.74(b). The soil benzene concentration for A2SB-5 is lower than the calculated Tier 2 PCL of 24,300 mg/kg and is therefore protective of worker safety air exposure levels. No further action is proposed for these two locations. The Tier 2 PCL calculation spreadsheet for the soil to air inhalation pathway is provided as **Table 3-1** in **Appendix 3**.

Explain how the COCs will be handled, treated, disposed, or transferred to another media and document that the response action will not result in any additional potential exposure conditions due to response action activities.

Not applicable.

State the proposed "reasonable time frame" and provide the justification for that time frame in the context of any potential for unprotective exposures to exist or develop, COC characteristics, hydrogeologic and affected property characteristics. If the reasonable time frame is different for the different affected media or for particular tracts of land, be sure to discuss that. Provide how the proposed response action will meet the objectives in a reasonable timeframe.

The areas of the $^{Tot}Soil_{Comb}$ PCLE zones in surface soil identified in the APAR (Arcadis, 2004) have attenuated to below the critical PCL based on resampling data collected in 2005 and 2008. Two areas, impractical for removal due to existing Terminal infrastructure, will be managed in a PMZ approved for the groundwater PCLE zone as discussed in the 2007 RAP (URS, 2007). These areas include soil sample

locations Il-082, Il-075, and Il-059 in SWMU C2 and nine locations in the areas of Tank 32 and 37 in the southeast portion of SWMU C3. Two additional soil sample locations (A2SB-5 and A2SB-13) exceeded soil to air inhalation exposure pathway PCL, $^{Air}Soil_{Inh\text{-}V}$, for benzene at concentrations of 430 mg/kg and 97 mg/kg, respectively, when evaluated during the 2004 APAR but do not exceed the Tier 2 PCL of 24,300 mg/kg for worker safety. The PMZ will be implemented and the area deed recorded within 180 days of the approval of this RAP Addendum.

Soil Response Action Objectives

When using removal and/or decontamination with controls or controls only, demonstrate how that physical control or combination of measures will reliably contain COCs within and/or derived from the surface soil and subsurface soil PCLE zone materials over time.

Not Applicable – Physical controls are not proposed as a soil response action. However, certain COCs in soil will be addressed in the groundwater PMZ which will require deed recordation activities.

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical surface soil and subsurface soil PCL throughout the soil PCLE zone and prevent COC concentrations above the critical soil PCLs from migrating beyond the existing boundary of the soil PCLE zone.

Resampling of the benzene (as an indicator COC) and arsenic surface soil PCLE zones indicated the COCs are below the critical PCL (**Table 2-1**). Additionally, two locations (A2SB-5 and A2SB-13) that exceeded the Tier 1 PCL for the soil to air inhalation exposure pathway did not exceed the calculated Tier 2 PCL (**Table 3-1**). Therefore, an NFA is proposed for locations CB-9 and Il-068 in SWMU C1; A2SB-5 and A2SB-13 in SWMU C2; and CB-36, CB-38, and CB-39 in SWMU C3.

Locations Il-082, Il-075, and Il-059 in SWMU C2 and nine locations in the areas of Tank 32 and 37 in the southeast portion of SWMU C3, as stated in the approved 2007 RAP, will be managed in the PMZ. Proposed routine groundwater sampling of the Compliance Plan analytes (VOCs, SVOCs, and metals) will be used to evaluate COC concentrations in groundwater and verify stability of the plume.

Response Action Objectives

List the environmental media to which this applies Groundwater
Repeat this section for each medium that has a different response action objective.

State the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33 as applicable. Explain how the response action is appropriate based on the hydrogeologic characteristics, COC characteristics, and potential unprotective conditions that could continue or result during the remedial period.

Groundwater Response Action Remedy Standard B – PMZ and Compliance with Worker Safety Air Exposure Levels

The 2007 RAP (URS, 2007) provides a more detailed discussion of the response actions related to the groundwater PCLE zones. Groundwater PCLE zones were identified for the groundwater ingestion pathway, the groundwater to air inhalation pathway, and the groundwater to surface water exposure pathway. Approved response actions for the identified groundwater PCLE zones include a SWMU-wide PMZ addressing the groundwater ingestion exposure pathway, and compliance with worker safety air exposure levels (TAC §350.74) to address the groundwater to air inhalation pathway for site workers. Potential human exposure to COCs migrating from groundwater will be monitored through scheduled ground water monitoring events and controlled and managed through the Terminal's permitting process and the KMLT Operations and Maintenance (T-O&Ms) procedures (e.g., employee's and contractor's responsibilities, respiratory protection, portable vapor detectors, soil disturbance), which are equivalent to the TRRP referenced health and safety plan, as necessary, in general accordance with TAC§350.74(b)(1). The PMZ will also incorporate the existing Compliance Plan (CP 50054) recovery well

and trench network along the surface water frontage of the ship berthing area and the HSC by utilizing some of the strategic existing Compliance Plan monitoring wells to monitor groundwater concentrations for PMZ compliance and relying on the Compliance Plan recovery wells and trench network to effect withdrawal, treatment and/or containment of contaminated groundwater and LNAPL per the objectives of the Compliance Plan.

Groundwater sampling data collected as part of the APAR indicated that concentrations of benzene, naphthalene, and vinyl chloride exceed the Tier 1 $^{Air}GW_{Inh\text{-}V}$ PCLs at the locations as depicted on Attachment 2A-2 of the 2007 RAP (URS, 2007). Tier 2 PCLs were calculated for benzene, naphthalene, and vinyl chloride for the groundwater to air exposure pathway to demonstrate compliance with worker safety air exposure levels by using the OSHA PELs for benzene, naphthalene, and vinyl chloride for the TRRP RBELs in the Tier 2 calculation in accordance with TAC §350.74(b). Currently, monitoring wells MW-10, MW-12, MW-20, and MW-23 contain LNAPL and have not been sampled. The LNAPL is being recovered as part of the existing Compliance Plan (CP 50054) recovery well and trench network along the surface water frontage of the ship berthing area and the HSC. The current concentrations of benzene, naphthalene, and vinyl chloride in the other monitoring wells from the July 2013 Compliance Monitoring event do not exceed the Tier 2 PCLs and are protective of worker safety air exposure levels (**Table 2-3** in **Appendix 2**). The Tier 2 PCL calculation spreadsheets for the groundwater to air inhalation pathway are provided as **Table 3-2** through **Table 3-5** in **Appendix 3**. As stated in the paragraph above, potential human exposure to COCs migrating from groundwater will be monitored through scheduled ground water monitoring events and controlled and managed through the Terminal's permitting process and the KMLT Operations and Maintenance (T-O&Ms) procedures, in general accordance with TAC§350.74(b)(1).

The potentiometric surface for Central Plant shows a south-southeast trending hydraulic mound, with groundwater flow to the east, southeast, south and west. The potentiometric surface maps from the February 2008 and latest gauging event in April 2013 are included as **Attachment 1A-2**, and **Attachment 1A-3**, respectively. Groundwater flow to the east, southeast, and south is toward the Compliance Plan recovery well and trench network along the surface water frontage of the ship berthing area and the HSC. Groundwater flow to the west is toward the CPROW. As a result of the outward flow from the hydraulic mound in the Central Plant, the proposed PMZ will monitor for potential COC migration to the surface water to the east, southeast and south, and to the CPROW to the west. Therefore, the PMZ will utilize different PCLs depending on the off-site migration route and the potential receptors.

Approved ecological and human health groundwater to surface water (^{SW}GW) PCLs were calculated in the 2007 RAP. The ^{SW}GW PCLs will also serve as AALs for the PMZ to the east, southeast, and south of the hydraulic high and along the surface water frontage. For groundwater flow to the west of the hydraulic mound toward the CPROW, the applicable groundwater PCLs are the Residential $^{GW}GW_{Ing}$ PCLs. Monitoring wells AMP-1, AMP-2, AMP-3, POE-1, and POE-2 were installed in January 2008 on the west side of Central Plant to effectively monitor this component of groundwater flow. AMP-1 and AMP-2 and POE-1 shown on Attachment 2D were completed in the uppermost groundwater-bearing unit in order to effectively monitor the potential for COC leaching from soils to groundwater in the SWMU Group C3 soils area depicted on Attachment 2A-1, and to monitor downgradient COC concentrations in the groundwater migrating westward from MW-17. Additionally, existing monitoring wells RI-1-17 and RI-1-18 may also serve as POE wells due to slight variations in the groundwater flow direction in this area. AMP-3 was installed approximately midway between MW-37 and the western property boundary. POE-2 was installed west of AMP-3 outside of the soil and groundwater PCLE, approximately 15 feet or 2-years travel time from the western property boundary of Central Plant. These wells were screened in the same groundwater-bearing unit as MW-37. In addition, three additional existing monitoring wells along the western property boundary (RI-1-14, RI-3-02, and RI-3-03) will be incorporated into the PMZ as POE wells to more effectively monitor the western property boundary. Groundwater sampling of the PMZ wells for westward migration toward the CPROW, including the newly-installed AMP and POE wells, was performed in February 2008 and in April/May 2013. The analytical data are summarized in **Table 2-2** in **Appendix 2**. **Appendix 2** provides copies of the boring logs and monitoring well construction diagrams for the monitoring wells installed as part of the approved PMZ and groundwater analytical data. The

analytical data obtained were used to calculate AALs for the western PMZ boundary toward the CPROW. A review of the analytical data showed residential PCL exceedances for benzene, 1,1-dichloroethene, trans-1,2-dichloroethene, tetrachloroethylene (PCE), trichloroethene (TCE), vinyl chloride, benzo(a)pyrene, dibenzofuran, 2-methylnaphthalene, and naphthalene in the source wells MW-35, MW-36, and/or MW-37. The benzene concentration in MW-17 also currently exceeds the residential PCL, as reported in the January 2014 Semiannual Corrective Action Program Report (GES, 2014). AALs were calculated for benzene due to the PCL exceedances observed in MW-37 and MW-17. The AAL calculations are included in **Attachment 2E**.

During the February 2008 groundwater sampling activities, bis(2-chloroethyl)ether was detected at a concentration that exceeded the critical PCL in monitoring well POE-2, located near the northwest boundary of the PMZ. This PCL exceedance of bis(2-chloroethylether) has only been observed at this location and not in surrounding monitoring wells. Resampling was performed in April 2008, January 2010, and September 2010, which confirmed the PCL exceedance of bis(2-chloroethyl)ether in this well. A groundwater recovery system, which incorporated POE-2 as a recovery well, was installed and activated in December 2011 to provide capture at the KMLT property line. As of December 1, 2013, POE-2 was recovering groundwater at an average rate of 0.63 gallons per minute (gpm). To-date, approximately 583,000 gallons of groundwater has been recovered since activation of the recovery system. Schematics of the groundwater recovery system are shown on **Attachment 2A-2** and **Attachment 2A-3**.

Monthly sampling of POE-2 for bis(2-chloroethyl)ether commenced in May 2012. The concentration versus time graph for POE-2 and bis(2-chloroethyl)ether is included as **Attachment 1B** and the analytical laboratory reports are included in **Appendix 2**. The current bis(2-chloroethyl)ether concentration has decreased to below the critical PCL but still exceeds the residential PCL. Active groundwater recovery and monthly sampling for POE-2 will continue until sufficient data have been collected to show that the bis(2-chloroethyl)ether concentration remains below the residential PCL. Following this, KMLT will notify the TCEQ of its intent to discontinue operation of the recovery well and include semi-annual monitoring of POE-2 under the PMZ sampling program..

Explain how the COCs will be handled, treated, disposed, or transferred to another media and document that the response action will not result in any additional potential exposure conditions due to response action activities.

Details on the management of collected purge water produced during approved PMZ sampling activities are provided in the 2007 RAP (URS, 2007). Groundwater recovered during operation of the recovery system is currently managed through the KMLT wastewater treatment system. Precaution will be taken when performing remediation well O&M activities to measure vapors from open monitoring wells and minimize exposure to groundwater, as necessary. These activities will be managed through the KMLT permitting process using KMLT's O&M Procedures, which are equivalent to the TRRP referenced health and safety plan (HASP).

State the proposed "reasonable time frame" and provide the justification for that time frame in the context of any potential for unprotective exposures to exist or develop, COC characteristics, hydrogeologic and affected property characteristics. If the reasonable time frame is different for the different affected media or for particular tracts of land, be sure to discuss that. Provide how the proposed response action will meet the objectives in a reasonable timeframe.

The groundwater recovery system on the northwest portion of the plant at POE-2 has been operational since December 2011 and providing groundwater capture at the property line in this location. Active groundwater recovery and monthly sampling for POE-2 will continue until sufficient data have been collected to show that the bis(2-chloroethyl)ether concentration remains below the residential PCL. Following this, KMLT will notify the TCEQ of its intent to discontinue operation of the recovery well and include semi-annual monitoring of POE-2 under the PMZ sampling program. The recovery system is currently being inspected weekly to confirm the system is operating as intended and that a cone of depression is being maintained at the property line to effectively capture groundwater from migrating

offsite. Additional discussion regarding the 'reasonable time frame' for the response actions is provided in the 2007 RAP (URS, 2007).

Groundwater Response Action Objectives

Name of groundwater-bearing unit to which this information applies: Sandy Channel Fill (SCF)/Upper Naturally Transmissive Unit (UNTU)

Repeat this section for each groundwater-bearing unit for which a different response action is proposed.

Groundwater classification ____ 1 __X__ 2 ____ 3

Is a modified groundwater response action being proposed for any part of the groundwater PCLE zone (§350.33(f)(2), (3), or (4))? __X__ Yes ____ No

If yes, does the affected property meet the qualifying criteria for a modified groundwater response action using a waste control unit, plume management zone, or technical impracticability? __X__ Yes ____ No

If yes, complete the appropriate portions of this report.

If no to either question, complete the following:

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical PCL throughout the groundwater PCLE zone and prevent COC concentrations above the critical groundwater PCL from migrating beyond the existing boundary of the groundwater PCLE zone.

The groundwater response action is to establish a PMZ and perform recovery of the groundwater at POE-2 located in the northwest corner of the Central Plant. The PMZ is an exposure prevention approach that reduces the risk of exposure through the use of institutional control mechanisms (e.g., deed recordation and administrative controls) that prohibits the use of groundwater and restricts and monitors work activities in the areas of the PMZ. The PMZ will utilize a monitoring program to verify that the plume is stable or decreasing in concentration. An existing Compliance Plan recovery well and trench network operates along the surface water frontage of the ship berthing area and the HSC in the southeast part of the Central Plant in the vicinity of the former SEHB. This recovery system captures the dissolved-phase COCs and light non-aqueous phase liquids (LNAPL). The applicable PCLs in this area of the PMZ are the ^{SW}GW PCLs. Existing analytical data show COC concentrations do not exceed the lower of the human health or ecological ^{SW}GW PCLs calculated for the Central Plant. Monitoring wells located between the recovery well and trench network will serve as the most downgradient POE wells and will help ensure the recovery well and trench network continue effective capture of the groundwater plume in this area. The AMP and POE monitoring wells on the western property boundary serve as monitoring points for the potential migration of COCs offsite to the CPROW. The applicable PCLs in this area are the Residential $^{GW}GW_{Ing}$ PCLs. AALs were calculated for the AMP wells and are provided in **Attachment 2E**.

The purpose of the recovery system in the northwest corner of the Central Plant at POE-2 is to capture any COC at the property line and remove it from groundwater, thereby eliminating the potential for migrating offsite. This recovery system may also promote conditions that are conducive to monitored natural attenuation of COCs.

Explain how the response action will prevent COCs from migrating to air at concentrations above the PCLs for air if the groundwater-to-air PCLs ($^{Air}GW_{Inh\text{-}V}$) is exceeded.

The 2007 RAP provides a discussion of the response action related to the groundwater to air inhalation pathway for groundwater concentrations in excess of the $^{Air}GW_{Inh\text{-}V}$ PCL. Prior to conducting air monitoring for these COCs, Tier 2 PCLs were calculated for benzene, naphthalene, and vinyl chloride for the groundwater to air exposure pathway to demonstrate compliance with worker safety air exposure levels by using the OSHA PELs for benzene, naphthalene, and vinyl chloride for the TRRP RBELs in the Tier 2 calculation. Currently, monitoring wells MW-10, MW-12, MW-20, and MW-23 contain LNAPL and have not been sampled. The LNAPL is being recovered as part of the existing Compliance Plan (CP

50054) recovery well and trench network along the surface water frontage of the ship berthing area and the HSC. The current concentrations of benzene, naphthalene, and vinyl chloride in the other monitoring wells from the July 2013 Compliance Monitoring event do not exceed the Tier 2 PCLs and are protective of worker safety air exposure levels (**Table 2-3** in **Appendix 2**). The Tier 2 PCL calculation spreadsheet (**Table 3-2** through **Table 3-5**) for the groundwater to air inhalation pathway is provided in **Appendix 3**. Potential human exposure to COCs migrating from groundwater will be monitored through scheduled ground water monitoring events and controlled and managed through the Terminal's permitting process and the KMLT Operations and Maintenance (T-O&Ms) procedures (e.g., employee's and contractor's responsibilities, respiratory protection, portable vapor detectors, soil disturbance), which are equivalent to the TRRP referenced health and safety plan, as necessary, in general accordance with TAC§350.74(b)(1).

Explain how the response action will prevent COCs from migrating to surface water at concentrations above the PCLs for groundwater discharges to surface water if surface water is a factor.

The groundwater to surface water pathway is detailed in the 2007 RAP. Approved ecological and human health ^{SW}GW PCLs were calculated and included in Attachment 2E with supporting documentation provided in Appendix 2 in the 2007 RAP (URS, 2007). AALs have not been derived for these POE or upgradient AMP wells since there are no defined source areas associated with the Central Plant groundwater PCLE zone. Historically, COC concentrations have been well below the ^{SW}GW PCLs (lowest of the human health or ecological). Therefore, the ^{SW}GW PCLs will serve as the AALs for the PMZ in this area.

Explain how the response action will prevent human and ecological receptor exposure to the groundwater PCLE zone.

Human and ecological receptor exposure prevention through an approved PMZ is discussed in the 2007 RAP (URS, 2007).

The recovery system at the northwest corner of the Central Plant at POE-2 is intended to act as a barrier to prevent groundwater from migrating offsite to the west onto the CPROW property. By keeping the groundwater PCLE zone from migrating offsite, human and ecological receptors on the CPROW property will not be exposed to the groundwater PCLE zone.

Response Action Design

Use this worksheet to provide detailed descriptions of the response action. Attach design and layout drawings and equipment specifications in Attachment 2A.

Media: Soils

List all media to which this information applies. If the response action is different for another media, complete a separate worksheet.

Provide a detailed description of the response action. Describe the removal action, decontamination, treatment system(s), and/or physical or institutional control actions that are proposed for each media and discuss the reasons for choosing the response action(s). Identify and describe any ecological services analysis and compensatory restoration plan that will be utilized (if so, include the complete ESA and compensatory restoration plan in Attachment 2C).

Multiple response actions were proposed for the surface soil PCLE zones identified in the Central Plant – SWMU C1, C2, and C3 in the 2007 RAP (URS, 2007). Based on the PCL exceedance, the nature of the COC, and site conditions encountered, specific response actions were proposed to protect human health and the environment including excavation, resampling to assess attenuation, and establishment of a PMZ where excavation is impracticable (URS, 2007). Where impractical for removal due to existing Terminal infrastructure (locations Il-082, Il-075, and Il-059 in SWMU C2 and as stated in the approved 2007 RAP, nine locations in the areas of Tank 32 and 37 in the southeast portion of SWMU C3) surface soils were proposed to be included as part of the Central Plant PMZ under Remedy Standard B. This remains the proposed path forward for these PCLE zones. However, prior to conducting the proposed response actions for the remainder of the soil PCLE zones, resampling was conducted in 2005 and 2008 to confirm current concentration levels. **Attachment 2A-1** depicts the soil PCLE zones, and **Table 2-1** in **Appendix 2** provides a summary of the surface soil resampling data. The results of the resampling analytical data indicated the concentrations of COCs had attenuated below the critical PCLs. Based on these resampling data, the response actions for the soils in Central Plant SWMU C1, most of SWMU C2, and locations CB-36, CB-38, and CB-39 in SWMU C3 soil meet a Remedy Standard A closure approach and therefore, NFA is proposed in these PCLE zones.

Two locations (A2SB-5 and A2SB-13) in SWMU C2 exceeded soil to air inhalation exposure pathway, $^{Air}Soil_{Inh\text{-}V}$ PCL for benzene at concentrations of 430 mg/kg and 97 mg/kg, respectively, when evaluated during the 2004 APAR. However, when evaluated using the most updated PCL from June 29, 2012, only the benzene concentration in A2SB-5 exceeded the Tier 1 $^{Air}Soil_{Inh\text{-}v}$ PCL of 141 mg/kg. A Tier 2 $^{Air}Soil_{Inh\text{-}V}$ PCL was calculated for benzene for the soil to air exposure pathway to demonstrate compliance with worker safety air exposure levels by using the OSHA PEL for benzene for the TRRP RBEL in the Tier 2 calculation in accordance with TAC §350.74(b). The soil benzene concentration for A2SB-5 is lower than the calculated Tier 2 PCL of 24,300 mg/kg and is therefore protective of worker safety air exposure levels. NFA is proposed for these two locations. The Tier 2 PCL calculation spreadsheet for the soil to air inhalation pathway is provided as **Table 3-1** in **Appendix 3**.

Surface Soil Response Action Remedy Standard A - Resampling

In the APAR (Arcadis, 2004), two COCs (benzene and toluene) were identified in the surface soil in SWMU C1 exceeding the critical PCLs. Toluene was detected above the critical PCL in boring location CB-12 in the 0-2 feet below ground surface (ft bgs) depth interval. Arcadis conducted a resampling event of select soil locations on February 7, 2005. The toluene concentration at CB-12 was below the detection limit (<0.00152 mg/kg) during this resampling event. Benzene was detected above the PCL in boring locations Il-068 [0.5-2.5 feet below ground surface (ft bgs)] in 1997, CB-9 (0-2 ft bgs and 4-5 ft bgs) in 2002, and CB-12 (0-2 ft bgs) in 2002. The analytical data from the 2005 Arcadis resampling event indicated that benzene concentrations had decreased to below the detection limit at these locations, with the exception of the 4-5 ft bgs depth interval at CB-9, where the benzene concentration exceeded the critical PCL of 0.013 mg/kg. URS resampled Il-068 and CB-9 in April 2008. Benzene was below the detection limit at Il-068 (0.5-2.5 ft bgs) and CB-9 (0-2 ft bgs) at concentrations of <0.0031

mg/kg and <0.0029 mg/kg, respectively. Benzene was detected at a concentration of 0.0122 mg/kg at CB-9 (4-6 ft bgs), which is below the critical PCL. Therefore, based on these two confirmatory sampling events, a NFA is being requested for the surface soil PCLE zone identified at SWMU C1.

In the 2004 APAR, arsenic was detected in surface soil above the critical PCL in soil borings CB-36 (0-2 ft bgs), CB-38 (0-2 ft bgs and 4-5 ft bgs), and CB-39 (0-2 ft bgs) at SWMU C3. CB-38 was resampled in February 2005 by Arcadis, which confirmed the critical PCL exceedances in this location. URS resampled locations CB-36, CB-38, and CB-39 in April 2008. Analytical results from the April 2008 sampling event indicated that arsenic concentrations in these three locations have decreased to below the critical PCL of 5.9 mg/kg. Therefore, a NFA is being requested for the surface soil PCLE zone at SWMU C3.

Surface Soil Response Action Remedy Standard B - PMZ

Nine COCs were identified in the surface soil in SWMU C2 in the 2004 APAR (Arcadis, 2004). Excavation of surface soil was proposed in the 2007 RAP (URS, 2007) for soil boring locations Il-059, Il-075, and Il-082. However, excavation could not be performed at these locations due to existing infrastructure. These locations are currently covered by concrete and asphalt along the main road for access and egress to the Central Plant, which eliminates the direct contact exposure pathway ($^{Tot}Soil_{Comb}$). Benzene concentrations in surface soil boring locations A2SB-5 (0-0.5 ft bgs) and A2SB-15 (0-0.5 ft bgs) exceeded the 2007 $^{Air}Soil_{Inh\text{-}V}$ PCL at 430 mg/kg and 97 mg/kg. A Tier 2 PCL was calculated for benzene for the soil to air exposure pathway to demonstrate compliance with worker safety air exposure levels by using the OSHA PEL for benzene for the TRRP RBEL in the Tier 2 calculation in accordance with TAC §350.74(b). The soil benzene concentrations for these two locations are lower than the calculated Tier 2 PCLs; therefore, the soil concentrations are protective of worker safety air exposure levels. The surface soils for these locations are proposed to be included as part of the Central Plant PMZ to monitor the migration of the COCs to groundwater.

With the exception of soil boring locations CB-36, CB-38, and CB-39 at SWMU C3 where an NFA is being requested as discussed above, the PCL exceedances in other locations within the SWMU will be managed under the Central Plant PMZ for multiple COCs, as stated in the approved 2007 RAP.

Describe all major treatment system components and equipment of the response action. Illustrate the response action design and provide equipment specifications in Attachment 2A.

Not applicable.

List permits or registrations needed to construct or implement the response action, including permits or registrations needed to conduct studies or tests. For VCP sites, list the permits that would be required if the site was not in the VCP (required by the VCP).

Permitting/Registration Authority	Type of permit/registration	Permit or registration number if already issued	Anticipated application date
Not applicable			

Identify and discuss the results of any studies or tests, such as pilot studies, feasibility studies, technical impracticability studies, treatability studies, and/or toxicity studies conducted or proposed to be conducted at the affected property. Discuss the reason for the study or test and how it verifies the effectiveness and appropriateness of the chosen response action or documents that a particular response action is not appropriate for the affected property. Describe how the results of completed studies or tests determined the design or choice of response action. Attach any separate reports and supporting documentation in Appendix 3.

Not applicable.

Response Action Design

Use this worksheet to provide detailed descriptions of the response action. Attach design and layout drawings and equipment specifications in Attachment 2A.
