A detailed discussion of the monitoring and sampling plan related to the groundwater PCLE zones is provided in the 2007 RAP (URS, 2007). As approved in this RAP, four new monitoring wells were installed to establish the approved PMZ. Since the approval of the 2007 RAP, four proposed monitoring wells were installed (MW-35 through MW-38) in 2008 by URS, to establish the PMZ. Three groundwater monitoring events (February 2008; April 2011; February 2013) have been conducted on the approved new and existing PMZ monitoring wells indicating the PMZ remains protective of the groundwater to surface water pathway as presented in Table 2-2 and shown on Attachment 1A-3. Five monitor wells (MW-29, MW-31, MW-32, MW-33, and MW- 34), as per the TCEQ approved 2007 RAP (URS, 2007) located on the western property boundary of the West Plant were previously not included in the SWMU-wide PMZ due to suspected COCs migrating onsite from the adjacent upgradient West Chemical Plant facility. These monitor wells were included in the monitoring and sampling plan for the proposed revised PMZ with the incorporation of the WCP as part of the 2017 RAP Addendum. Monitor well MW-20, thought to have been destroyed (URS 2013) was subsequently located and is incorporated into the Revised PMZ as originally proposed (URS 2007). When compared to the $^{Air}GW_{Inh\text{-}V}$ PCL, the results indicate that vinyl chloride in MW-32 continues to exceed the Tier 1 PCL for the pathway but not the calculated Tier 2 PCL. KMLT will continue periodic monitoring of the western property line wells to evaluate the offsite and upgradient contribution to the site groundwater PCLE zone and to evaluate worker safety to address the groundwater to air inhalation pathway concurrent with TCEQ's evaluation of the westward upgradient facility.

NFA status was obtained for the CPROW alkylate release by TCEQ in correspondence dated July 11, 2008 (TCEQ, 2008). The monitoring and recovery wells associated with the release were subsequently plugged and abandoned and the Dual Phase Extraction (DPE) System was dismantled as described in the Well Abandonment and Plugging Report CenterPoint Right-of-Way Alkylate Remediation System prepared by The Loper Group, Inc. in September 2008 (Loper Group, 2008). As presented in Attachment 2D of the 2007 RAP (URS, 2007), some of the wells associated with the Alkylate Remediation System were to be incorporated in a proposed PMZ for the West Plant. However, KMLT's request to CenterPoint Energy to allow for the downgradient POE onto the CenterPoint Energy transmission tower right-of-way was denied because CenterPoint Energy does not want to deed record the property as commercial/industrial. KMLT, therefore, has revised the remedial strategy to onsite containment and recovery in the southeast corner of the West Plant. KMLT installed an array of recovery wells at the property line to provide groundwater capture in the southeast corner of the West Plant to provide onsite containment. As of August 30, 2013, RW-1, OB-1, RW-25R, MW-39, MW-23, and OB-3 are actively recovering groundwater at an average rate of 2.67 gallons per minute. Since November 2011, approximately 3.6 million gallons of groundwater have been recovered. The recovery well network is inspected weekly to confirm adequate groundwater containment.

To address the groundwater to air exposure pathway, Tier 2 PCLs have been calculated to demonstrate compliance with worker safety air exposure levels for site workers in accordance with TAC §350.74. Groundwater sampling data indicate that current concentrations of benzene and vinyl chloride exceed the Tier 1 $^{Air}GW_{Inh\text{-}V}$ PCLs at three locations as depicted on Attachment 3A. Tier 2 PCLs were calculated for benzene and vinyl chloride for the groundwater to air exposure pathway to demonstrate compliance with worker safety air exposure levels by using the OSHA PELs for benzene and vinyl chloride for the TRRP RBELs in the Tier 2 calculation in accordance with TAC §350.74(b). Groundwater concentrations onsite are lower than the calculated Tier 2 PCLs; therefore, the groundwater levels are protective of the worker safety air

exposure levels. The Tier 2 PCL calculation spreadsheet (Tables E-1 through 4) for the groundwater to air inhalation pathway is provided in Appendix 3. Potential human exposure to COCs migrating from groundwater will be monitored through scheduled ground water monitoring events and controlled and managed through the Facility's permitting process and the KMLT Operations and Maintenance (T-O&Ms) procedures (e.g., employee's and contractor's responsibilities, respiratory protection, portable vapor detectors, soil disturbance), which are equivalent to the TRRP referenced health and safety plan, as necessary, in general accordance with TAC§350.74(b)(1).

Operation and Maintenance	RAP Worksheet 3.2	Page _1_ of _2_
	ID No.: SWR# 30573	Report Date: June 28, 2024

Use this worksheet to describe the operation and maintenance (O&M) activities for each response action. In situations where the response action consists of more than one major component, for clarity one worksheet can be completed for each major component.

Response Action Name/Designation: *Plume Management Zone*
List all portions of the response action to which this information applies.

Describe the O&M and inspection activities that will be required to operate and maintain response action components.

Refer to the 2007 RAP.

List and discuss the key operating parameters for a properly functioning response action. Address how changes in these parameters will result in operating changes, providing sufficient detail to explain how the operator will know the component is functioning properly.

Not Applicable

List the routine tasks required to operate the response action.

Not Applicable

List the routine tasks required to maintain the response action, including scheduled inspections, maintenance, and component replacement.

Not Applicable

Response Action Name/Designation: *Compliance with Worker Safety Air Exposure Levels*
List all portions of the response action to which this information applies.

Describe the O&M and inspection activities that will be required to operate and maintain response action components.

Tier 2 PCLs have been calculated to demonstrate compliance with worker safety air exposure levels for site workers in accordance with TAC §350.74. Groundwater sampling data indicates that current and historical concentrations are below the calculated Tier 2 PCLs; therefore, groundwater levels are protective of the worker safety air exposure levels. Groundwater concentrations will be compared to the Tier 2 PCLs semiannually. Potential human exposure to COCs migrating from groundwater will be monitored through scheduled ground water monitoring events and controlled and managed through the Facility's permitting process and the KMLT Operations and Maintenance (T-O&Ms) procedures (e.g., employee's and contractor's responsibilities, respiratory protection, portable vapor detectors, soil disturbance), which are equivalent to the TRRP referenced health and safety plan, as necessary, in general accordance with TAC§350.74(b)(1).

List and discuss the key operating parameters for a properly functioning response action. Address how changes in these parameters will result in operating changes, providing sufficient detail to explain how the operator will know the component is functioning properly.

Semi-annual groundwater monitoring activities as described for the PMZ will be used to monitor the exposure pathway.

List the routine tasks required to operate the response action.

Semi-annual groundwater monitoring activities as described for the PMZ will be used to monitor the exposure pathway.

List the routine tasks required to maintain the response action, including scheduled inspections, maintenance, and component replacement.

Not Applicable

Response Action Name/Designation: *Recovery System*
List all portions of the response action to which this information applies.

Describe the O&M and inspection activities that will be required to operate and maintain response action components.

The groundwater recovery system in the southeast corner of the West Plant will be continuously operated to maintain affected groundwater capture upgradient of the CPROW property. Proposed weekly inspections will ensure pumps remain operational and that adequate recovery volumes are maintained by the system. Inspection activities would also include confirmation that all system components are operating in accordance with design requirements.

List and discuss the key operating parameters for a properly functioning response action. Address how changes in these parameters will result in operating changes, providing sufficient detail to explain how the operator will know the component is functioning properly.

The primary consideration is to ensure that the pneumatic pumps remain operational and the actuation levels of the pump remain set at depths to create adequate drawdown in the wells in order to promote groundwater capture. Obtaining periodic counter readings will confirm adequate groundwater volumes are being recovered by the system. Other key operating parameters include inspecting air supply connections, gauges, and lines for pneumatic pump operation and discharge lines and connections for effluent water.

List the routine tasks required to operate the response action.

Inspect air connections, gauges, and lines; inspect discharge line and connections; and obtain counter readings.

List the routine tasks required to maintain the response action, including scheduled inspections, maintenance, and component replacement.

Routinely replace lines/fittings, as needed. Troubleshoot pumps for fouling if the counter readings show decreasing trends and an increase in line pressure is observed. O&M described in the preceding sections is performed on a weekly basis when the system is operational.

Confirmation Sampling Plan	RAP Worksheet 4.0 Page _1_ of _1_	
Associated Information: Attachment 4A	ID No.: SWR# 30573	Report Date: June 28, 2024

List the COCs and other parameters that will be sampled to confirm completion of the response action. Illustrate the monitoring or sampling locations in Attachment 4A. If monitoring or observation wells will be constructed for the response action, provide well construction details in Attachment 2B if not previously provided. If needed, describe the sample collection and handling methods, if not previously provided, in Appendix 6.

Media	COC[1]	Other parameter (specify)	Sampling Method	Sampling points[2]	Depth/height (ft.)	Analytical Method	Sampling Frequency
Surface Soil	*Not Applicable*						
Subsurface Soil							
Groundwater							
Surface water							
Sediment							
Air							
Other media (specify)							

Explain the reasons for the above-listed sampling plan. Discuss statistical or geostatistical methodology(ies) which will be applied, if any, in the data collection process. Discuss any assumptions made in the statistical/geostatistical assessment, and how they will be met.

Not Applicable – Excavation not conducted as a response action. Therefore, confirmation sampling is not applicable.

[1] Specify either a specific COC or type of COC (such as VOCs, metals).
[2] Specify the sampling point to the degree it is known, (for example, MW-1, or near former boring #2).

Post-Response Action Care Associated Information: Attachments 5A-5C	RAP Worksheet 5.0 Page _1_ of _2_ ID No.: SWR# 30573	Report date: June 28, 2024

Complete this worksheet only if Remedy Standard B will be used.

What is the proposed initial post-response action care period? (default 30 yr.) *30* years

If the proposed initial post-response action care period is less than 30 years, provide a technical justification in accordance with §350.33(h).

Refer to the 2007 RAP.

What is the foreseeable land use during the post-response action care period? _____

Describe how the future use of the property will not compromise the integrity of the physical controls, will not interfere with the function of the monitoring systems, will not pose a threat to human health or the environment, and will be in accordance with any institutional controls.

The facility will continue to operate as an industrial property for the foreseeable future. A deed notice documenting the PMZ and groundwater use restrictions will be filed in the county property records. Ongoing operation of the facility is not anticipated to interfere with the monitoring program or pose a threat to human health or the environment as a result of potential exposures to COCs in the PCLE zone.

Briefly describe the proposed post-response action care activities. Describe the type of monitoring and/or inspections to be performed. Discuss the rationale for not including COC(s) analyzed during the response action, monitoring or sampling point location, frequency of monitoring and/or inspections, and the duration of the monitoring program.

Post-response action care (PRAC) activities will consist of the following:

1. *Perform groundwater monitoring of the PMZ monitoring wells for COCs specified in Worksheet 2.1.*
2. *Compare concentration results of monitoring events to AALs listed in Worksheet 2.1 and calculated Tier 2 PCLs for the groundwater to air exposure pathway.*
3. *Note any other significant observations from monitoring events that could be indicative of an increase in plume size or concentration or migration that could result in exposure to COCs.*
4. *Assess the effectiveness of the monitoring program, taking into account updated groundwater flow and concentration data obtained from semi-annual sampling events, to determine whether any revisions to the groundwater sampling program (e.g. additional/fewer COCs or wells to be monitored, or increased/decreased sampling frequency) are recommended.*
5. *Operate and maintain recovery system to ensure capture is occurring in southeast corner of the West Plant by inspecting system and measuring groundwater recovery volumes on a weekly basis.*
6. *Verify that institutional controls remain effective (e.g. groundwater use restriction).*
7. *Provide recommendations regarding any additional activities needed to address any issues observed in items 1 to 5, including considerations of additional response actions if necessary.*
8. *Submit Post Response Action Care Reports (PRACR) to TCEQ documenting these activities.*

Will PRAC sampling procedures be the same as those as previously documented for monitoring and/ or confirmation sampling? ____ Yes ____ No
If no, provide in Appendix 6 a description of the monitoring or sampling collection procedures to be conducted during the post-response action care period.

Cost Estimate

Complete this portion of the form only if a physical control is proposed (installed hydraulic control system, slurry wall, cap, etc.). Provide in Attachment 5B a detailed cost estimate for a third party to operate and maintain the physical control during the PRAC period, based on current dollar amount.

Specify the physical control to which this information applies

Not Applicable per 30 TAC §350.33(f)(4)(F)(ii)(III)

Complete this worksheet for each physical control that will be used as part of the response action.

What is the total estimated annual cost of O&M for the PRAC period? $ *Not Applicable*

What is the total estimated cost for a third party to perform PRAC activities? $

Identify the type of financial assurance mechanism to be used, and the contact person managing fiduciary responsibility, if known.

Not Applicable

Does the person meet the criteria and definition of a small business? (see §350.33(n)) ___ Yes X No
If yes and the person desires to pursue the reduced amount of financial assurance, provide a legally binding affidavit as Attachment 5C. Include in the affidavit the information requested in 30 TAC §350.33(l), (m), and (n). An example affidavit is attached in the instructions.

Implementation Schedule	RAP Worksheet 6.0 Page _1_ of _1_	
	ID No.: SWR# 30573	Report Date: June 28, 2024

Document the proposed schedule for implementing the response action. Include all major response action activities through the life of the project, including all removal, decontamination, and control actions, component installations, O&M, monitoring, and post-response action care activities.

Implementation of Response Action (specify component or action)	**Start**	**Finish**	**Duration**
File Institutional Control (Deed Notice) for PMZ	*Upon TCEQ approval of RAP Addendum*	*Within 180 Days of TCEQ approval of RAP Addendum*	*180 Days*
File Institutional Control (Deed Notice) for Industrial Land Use	*Upon TCEQ approval of RACR*	*Within 90 Days of TCEQ approval of RACR*	*90 Days*

List the proposed schedule for report submittals. Add additional lines if more reports than listed will be needed to complete the response action.

Reports	**Submittal date**
Response Action Effectiveness Report (RAER)	
RAER submittal number 1	*Not Applicable*
RAER submittal number 2	
RAER submittal number 3	
Response Action Completion Report (RACR)	*Within 180 days of Completion of Response Action*
Post-Response Action Care Report (PRACR)	
PRACR submittal number 1	*Annually starting 1st year after RACR approval*
PRACR submittal number 2	
PRACR submittal number 3

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{c\text{-}w}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{>w}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{ing}GW_{ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{-vw}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

West Chem Wells

	CAO wells
	MW-3

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{tvw}GW_{ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Notes:

Recovery wells are compaterd to the Texas Risk Reduction Program residential groundwater injestion Protective Concentration Limit ($^{-vw}GW_{Ing}$)

GWPS - Groundwater Protection Standard as listed in CP Table IIIA of HW permit 50054

(mg/L) - Milligrams per liter

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

* - Laboratory Control Sample (LCS) or LCS Duplicate exceeds the control limits

- - Not reported

NS - Not sampled

F - RPD exceeded lab control limits.

U - Indicates the analyte was analyzed for but not detected.

Bold Italic - Exceeds GWPS

NA - Not applicable

D - The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

Orange highlight - The laboratory method detection limit (MDL) is higher than the PCL

POE = Point of Exposure

AMP = Attenuation Monitoring Point

CAO = Corrective Action Observation

Dear Ms. Hatfield:

As per your Response Action Plan (RAP) conditional approval letter dated December 29th, 2017, KM Liquids Terminals LLC (KMLT) is submitting this proof of filing of the Institutional Control (IC) document for the modified plume management zone (PMZ) at the KMLT Galena Park West Plant area in Galena Park, Texas. The modified PMZ was surveyed by a Texas licensed surveyor, who provided a Metes and Bounds description and plat map of the affected area. A Deed Notice was filed with the Harris County Clerk on May 7th, 2018. The IC proof of filing is attached.

If you have any questions or require any additional information at this time, please do not hesitate to contact me at (713) 654-6035.

Sincerely,
KM Liquids Terminals LLC

Johnny Kennedy, P.G.
Remediation Manager

Texas Risk Reduction Program
Deed Notice

STATE OF TEXAS

COUNTY OF HARRIS

This Notice is filed to provide information concerning certain environmental conditions and/or use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows: EE

A legal property description used in the last recorded vesting deed, covering the Property that includes the entire recorded tract of land held by the owner executing this deed notice, is attached hereto and incorporated herein by reference as Exhibit A.

Portions of the groundwater of the Property contain certain identified chemicals of concern causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property is described as follows:

METES AND BOUNDS DESCRIPTION of a 51.726 acre tract of land, extending over, through, along and across, a called 69.31248 acre tract of land (Second Tract) as recorded in File No. C288395, Film Code 051-2411421, Official Public Records of Real Property of Harris County, Texas, and called 37 acre tract of land (Exhibit "A") as recorded in File No. 20070466722, Official Public Records of Harris County, Texas, said tracts being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows: D

Bearings and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83 U.S. survey feet.

COMMENCING at a 5/8" iron rod found for the Northeast corner of a called 17.66626 acre tract of land (First Tract) as recorded in File No. C288395, Film Code 051-24-1421, Official Public Records of Real Property of Harris County, Texas, said corner having coordinates N=13,833,097.40, E=3,164,701.32;

THENCE, South 03°27'57" East, along the East boundary line of said 17.66626 acre tract, at 693.02 feet passing the southeast corner of said, 17.66626 acre tract, crossing an eighty feet (80') wide rightof-way, as recorded in Volume 371, Page 245, of the Deed Records of Harris County, Texas, at 773.04 feet to a point on the south line of said eighty feet (80') wide right-of-way, same said point being in the northeast corner of the above mention 69.31248 acre tract, continuing along and with the east boundary line of said 69.31248 acre tract, a total distance of 1993.38 feet to a point;

THENCE, South 86°36'30" West, a distance of 23.57 feet to the POINT OF BEGINNING having coordinates N=13,831,105.66, E=3,164,798.53;

THENCE, South 13°46'21" East, a distance of 76.03 feet to a point;

THENCE, South 03°15'52" East, a distance of 121.42 feet to a point;

THENCE, South 00°42'57" West, a distance of 127.83 feet to a point;

THENCE, South 56°47'37" West, a distance of 17.86 feet to a point;

THENCE, South 63°15'20" West, a distance of 583.65 feet to a point;

THENCE, North 70°55'46" West, a distance of 124.24 feet to a point;

THENCE, South 63°58'35" West, a distance of 113.54 feet to a point;

THENCE, North 69°04'27" West, a distance of 80.58 feet to a point;

THENCE, South 64°03'36" West, a distance of 203.63 feet to a point;

THENCE, South 28°18'19" East, a distance of 148.51 feet to a point;

THENCE, South 63°19'30" West, a distance of 144.80 feet to a point;

THENCE, South 74°21 '27" East, a distance of 61.65 feet to a point;

THENCE, South 72°56'07" East, a distance of 57.79 feet to a point;

THENCE, South 71 °55'26" East, a distance of 130.00 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the right having a radius of 595.80 feet, a central angle 19°45'05", arc distance of 205.39 feet and a chord distance of South 61 °02 '22" East for a distance of 204.37 feet to a point;

THENCE, South 47°54'26" East, a distance of 94.31 feet to a point;

THENCE, South 63°17'49" East, a distance of 99.36 feet to the POINT OF BEGINNING containing 51 . 726 acres of land.

The certified meets and bounds description and corresponding plat maps of the Affected Property for groundwater (referred to as the Plume Management Zone) are attached hereto and incorporated herein by reference as Exhibit B.

The constituents of concern in groundwater at the Affected Property (the Plume Management Zone), defined here as exceeding TRRP Protective Concentration Levels (PCLs) for residential and commercial/industrial land use, are benzene, ethylbenzene, xylenes, isopropylbenzene, chlorobenzene, cis-1,2-dichloroethene, 1,2-dichloroethane, tetrachloroethene, trichloroethene, vinyl chloride, and bis(2-chloroethyl)ether.

This notice is required for the following reasons:

The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone. A plume management zone is defined as an area of groundwater containing concentrations of chemicals of concern exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC 350.33(f)(4). The undersigned has established a plume management zone so that the chemicals of concern in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached Exhibit B provides the location and extent of the plume management zone and describes the maintenance and monitoring required. This maintenance and monitoring is required until TCEQ approves some modification of those requirements. Exposure to groundwater within the plume management zone for any purpose is not advised until such time when all the chemicals of concern no longer exceed their respective protective concentration levels. This deed notice must not be removed or modified without prior approval from TCEQ.

As of the date of this Notice, the record owner of fee title to the Property is KM Liquids Terminals, LLC with an address of 1001 Louisiana St., Suite 1000, Houston, Texas 77002.

METES AND BOUNDS DESCRIPTION FOR A
51.726 ACRE AREA
PLUME MANAGEMENT ZONE

METES AND BOUNDS DESCRIPTION of a 51.726 acre tract of land, extending over, through, along and across, a called 69.31248 acre tract of land (Second Tract) as recorded in File No. C288395, Film Code 051-24-1421, Official Public Records of Real Property of Harris County, Texas, and called 37 acre tract of land (Exhibit "A") as recorded in File No. 20070466722, Official Public Records of Harris County, Texas, said tracts being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows:

Bearings and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83 U.S. survey feet.

COMMENCING at a 5/8" iron rod found for the Northeast corner of a called 17.66626 acre tract of land (First Tract) as recorded in File No. C288395, Film Code 051-24-1421, Official Public Records of Real Property of Harris County, Texas, said corner having coordinates N=13,833,097.40, E=3,164,701.32;

THENCE, South 03°27'57" East, along the East boundary line of said 17.66626 acre tract, at 693.02 feet passing the southeast corner of said, 17.66626 acre tract, crossing an eighty feet (80') wide right-of-way, as recorded in Volume 371, Page 245, of the Deed Records of Harris County, Texas, at 773.04 feet to a point on the south line of said eighty feet (80') wide right-of-way, same said point being in the northeast corner of the above mention 69.31248 acre tract, continuing along and with the east boundary line of said 69.31248 acre tract, a total distance of 1993.38 feet to a point;

THENCE, South 86°36'30" West, a distance of 23.57 feet to the **POINT OF BEGINNING** having coordinates N=13,831,105.66, E=3,164,798.53;

THENCE, South 13°46'21" East, a distance of 76.03 feet to a point;

THENCE, South 03°15'52" East, a distance of 121.42 feet to a point;

THENCE, South 00°42'57" West, a distance of 127.83 feet to a point;

THENCE, South 56°47'37" West, a distance of 17.86 feet to a point;

THENCE, South 63°15'20" West, a distance of 583.65 feet to a point;

THENCE, North 70°55'46" West, a distance of 124.24 feet to a point;

THENCE, South 63°58'35" West, a distance of 113.54 feet to a point;

THENCE, North 69°04'27" West, a distance of 80.58 feet to a point;

THENCE, South 64°03'36" West, a distance of 203.63 feet to a point;

THENCE, South 28°18'19" East, a distance of 148.51 feet to a point;

THENCE, South 63°19'30" West, a distance of 144.80 feet to a point;

THENCE, North 26°43'13" West, a distance of 155.06 feet to a point;

THENCE, South 49°47'25" West, a distance of 122.60 feet to a point;

THENCE, South 01°23'13" West, a distance of 49.15 feet to a point;

THENCE, South 62°46'36" West, a distance of 70.90 feet to a point;

THENCE, North 60°48'41" West, a distance of 35.36 feet to a point;

THENCE, South 64°54'55" West, a distance of 118.01 feet to a point;

THENCE, South 11°19'37" West, a distance of 171.28 feet to a point;

THENCE, South 57°42'08" West, a distance of 94.03 feet to a point;

THENCE, In a Southwesterly direction along the arc of a curve to the right having a radius of 137.51 feet, a central angle 33°43'04", arc distance of 80.92 feet and a chord bearing of South 77°42'53" West for a distance of 79.76 feet to a point;

THENCE, In a Northwesterly direction along the arc of a curve to the right having a radius of 399.28 feet, a central angle of 43°57'45", arc distance of 306.37 feet and a chord bearing of North 66°03'24" West for a distance of 298.91 feet to a point;

THENCE, In a Northwesterly direction along the arc of a curve to the right having a radius of 478.75 feet, a central angle of 21°27'26", arc distance of 176.29 feet and a chord bearing of North 29°48'40" West for a distance of 178.24 feet to a point;

THENCE, North 10°00'30" West, a distance of 64.65 feet a point;

THENCE, North 01°33'22" West, a distance of 1,418.86 feet to a point;

THENCE, North 01°09'54" East, a distance of 40.52 feet to a point;

THENCE, In a Northeasterly direction along the arc of a curve to the right having a radius of 72.78 feet, a central angle 18°14'43", arc distance of 23.18 feet and a chord bearing of North 10°41'28" East for a distance of 23.08 feet to a point;

THENCE, In a Northeasterly direction along the arc of a curve to the right having a radius of 50.79 feet, a central angle 77°00'56", arc distance of 68.27 feet and a chord bearing of North 59°33'57" East for a distance of 63.25 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the right having a radius of 226.75 feet, a central angle 28°36'39", arc distance of 113.23 feet and a chord bearing of South 69°12'21" East for a distance of 112.05 feet to a point;

THENCE, South 55°54'50" East, a distance of 59.24 feet to a point;

THENCE, South 54°21'05" East, a distance of 103.63 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the left having a radius of 334.54 feet, a central angle 29°08'33", arc distance of 170.16 feet and a chord bearing of South 66°39'19" East for a distance of 168.33 feet to a point;

THENCE, South 79°57'40" East, a distance of 54.81 feet to a point;

THENCE, South 77°34'39" East, a distance of 40.21 feet to a point;

THENCE, South 73°53'04" East, a distance of 43.54 feet to a point;

THENCE, South 71°05'42" East, a distance of 68.75 feet to a point;

THENCE, South 70°59'16" East, a distance of 109.67 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the left having a radius of 1,350.04 feet, a central angle 05°10'55", arc distance of 122.10 feet and a chord distance of South 75°23'02" East for a distance of 122.06 feet to a point;

THENCE, South 79°17'36" East, a distance of 132.02 feet to a point;

THENCE, South 81°15'47" East, a distance of 245.02 feet to a point;

THENCE, South 79°37'02" East, a distance of 102.48 feet to a point;

THENCE, South 76°46'01" East, a distance of 97.48 feet to a point;

THENCE, South 74°21'27" East, a distance of 61.65 feet to a point;

THENCE, South 72°56'07" East, a distance of 57.79 feet to a point;

THENCE, South 71°55'26" East, a distance of 130.00 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the right having a radius of 595.80 feet, a central angle 19°45'05", arc distance of 205.39 feet and a chord distance of South 61°02'22" East for a distance of 204.37 feet to a point;

THENCE, South 47°54'26" East, a distance of 94.31 feet to a point;

THENCE, South 63°17'49" East, a distance of 99.36 feet to the **POINT OF BEGINNING** containing 51.726 acres of land.

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

December 29, 2017

Mr. Johnny Kennedy
Remediation Project Manager
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Conditional Approval of Response Action Plan
Draft Addendum Response Action Plan, West Plant, dated October 27, 2017
Kinder Morgan Liquids Terminals, LLC - Galena Park;
TCEQ SWR No. 30573; TCEQ Hazardous Waste Permit/Compliance Plan 50054;
EPA ID No. TXD026481523;
Customer No. CN601545940; Regulated Entity No. RN100237452

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above referenced Response Action Plan (RAP) received by the Remediation Division on October 30, 2017. The Draft Addendum Response Action Plan was prepared to incorporate soil and groundwater impacts at the former Vopak Terminal Galena Park, Inc. (VTGP) into the TCEQ approved plume management zone (PMZ) for the West Plant on the Kinder Morgan Liquids Terminals, LLC (Kinder Morgan) Galena Park Terminal. Kinder Morgan purchased the VTGP property on February 7, 2015. Since the impacted soil and groundwater from the VTGP shall be incorporated into the existing West Plant PMZ, the existing deed notice shall be modified to incorporate the affected soils and groundwater from the VTGP, and expand the West Plant PMZ boundary. The response action shall include continued semiannual groundwater monitoring within the expanded PMZ, continued groundwater recovery in the southeast corner of the West Plant PMZ, and annual reporting.

Based on the TCEQ review, the Draft Addendum RAP fulfills the requirements of 30 Texas Administrative Code (TAC) §350.94. The TCEQ hereby approves Draft Addendum RAP with the following conditions:

1. If the proposed response action for the revised West Plant PMZ is determined to be longer than 3 years to achieve cleanup goals, then the West Plant PMZ shall need to be incorporated into the Permit/Compliance Plan corrective action program as part of the Class 3 Modification application. As specified in the TCEQ November 9, 2016 letter the due date for submittal of the above reference Class 3 Permit Modification application is deferred until assessment at Gate 6 is completed. At that time, a new deadline will be re-established for submittal of the application to include changes to the corrective action program.
2. Please proceed with implementation of the Draft Addendum RAP, and submittal of required reports in accordance with the schedule proposed in the approved Addendum RAP. Upon attainment of the response objectives, a Response Action Completion Report (RACR) must be submitted, in accordance with 30 TAC §350.95.
3. The approved Draft Addendum RAP contains proposed institutional control language sufficient to fulfill the requirements of 30 TAC §350.111. Proof of filing of the

institutional controls must be submitted within 120 days of the date of this letter in accordance with §350.33(f)(4)(C)(i) regarding Remedy Standard B groundwater response action PMZ.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the plan.

Questions concerning this letter should be directed to me at (512) 239-2034 or maureen.hatfield@tceq.texas.gov. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals.

Sincerely,

Maureen Hatfield, P.G., Project Manager
Team 1, VCP-CA Section
Remediation Division
Texas Commission on Environmental Quality

RAP Executive Summary	ID No.: SWR# 30573
	Report Date: 05/15/2017

Use this worksheet to summarize the report. Be sure to complete and submit the Checklist for Report Completeness. **Attach a chronology of activities associated with the affected property.**

Briefly describe the affected property and PCLE zones, the conclusions from the assessment activities, identify any affected or threatened receptors, and describe any other major considerations taken into account when developing this response action plan. If any portion of the response action is necessitated due to an aesthetic or nuisance condition, identify the nature of that condition and identify that portion of the response action proposed to address it. If any media that contains a PCLE zone is not addressed in this RAP, provide justification.

Background

This Response Action Plan (RAP) Addendum has been developed to incorporate soil and groundwater impacts at the former Vopak Terminal Galena Park, Inc. (VTGP) Terminal (SWR No. 30566) into the TCEQ approved Plume Management Zone (PMZ) located in West Plant on the KM Liquids Terminals LLC (Kinder Morgan) Galena Park Terminal' (SWR No. 30573). The former VTGP Terminal, which was located immediately adjacent to the Kinder Morgan Galena Park Terminal, was purchased by Kinder Morgan on February 7, 2015 and incorporated into of the Kinder Morgan Galena Park Terminal. Kinder Morgan notified the Texas Commission on Environmental Quality (TCEQ) of the acquisition by letter, and submitted an application for a Class I[1] permit modification to the Galena Park Hazardous Waste Permit (HW-50054) to change the legal description of the facility to include the VTGP property. The permit modification was issued by the TCEQ on May 31, 2016. The former VTGP is now referred to as the Kinder Morgan Galena Park West Chemical Plant (WCP).

As required by the Galena Park Terminal Hazardous Waste Permit (HW-50054) various Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) on the Galena Park Terminals have been assessed and the findings detailed in a site-wide Affected Property Assessment Report (APAR). The 2004 Kinder Morgan Site-Wide APAR for the Galena Park Terminal (Arcadis, 2004) identified a dissolved-phased chlorinated hydrocarbon water plume in the western part of the Kinder Morgan West Plant. Based on the chemicals of concern (COCs), concentration gradient and groundwater flow direction, the source of the impacted groundwater was attributed to an up-gradient, off-site source (the former VTGP Terminal to the west). Subsequently, Kinder Morgan and VTGP conducted groundwater sampling events at their respective terminals, coordinated joint gauging events, and participated in meetings and communications with the TCEQ that are well documented. The TCEQ eventually requested that VTGP complete an assessment and submit an APAR for their terminal. The TCEQ Central Registry database indicates that this report was received by the Agency on July 16, 2013, but subsequent communication with Agency staff suggests the report has never been reviewed. Kinder Morgan in general agrees with the data in the APAR defining the soil and groundwater protective concentration level exceedance (PCLE) zones and the conclusion that the groundwater plume is stable. Kinder Morgan disagrees with the interpretations presented in the APAR regarding groundwater flow directions and the concentration gradients, a position the TCEQ expressed in a February 7, 2007 letter to VTGP. An electronic copy of the 2013 VTGP APAR is included on a compact disk in Appendix 2 of this RAP Addendum as verbally requested.

The TCEQ approved 2007 Kinder Morgan West Plant RAP (URS, 2007) discussed response actions for three West Plant Solid Waste Management Unit (SWMU) Groups: W1, W2, and W3, that were identified and investigated in the site-wide APAR (Arcadis, 2004). The 2007 RAP proposed a PMZ to manage impacted soil and ground water in the West Plant area, and presented calculated ecological and human health ground water to surface water (^{SW}GW) protective concentration levels (PCLs) applicable to the adjacent Houston Ship Channel. The proposed PMZ did not include the upgradient portion of the groundwater PCLE Zone, which was attributed to the offsite source on the former VTGP Terminal. The TCEQ approved the 2007 West Plant RAP by letter dated November 1, 2007. A RAP Addendum (URS, 2013) for the Galena Park West Plant was submitted to the TCEQ in September 2013 to provide additional surface soil data, revise the remedial strategy of the PMZ for affected groundwater containment and recovery in the southeast corner of the West Plant, and present Tier 2 commercial/industrial PCLs for benzene and vinyl chloride for $^{Air}GW_{Inh\text{-}V}$ pathway. The 2013 West Plant RAP Addendum was approved by the TCEQ by letter dated December 10, 2013.

This RAP Addendum proposes to incorporate, into the existing TCEQ approved PMZ in West Plant, impacted soil and ground water at the WCP (former VTGP Terminal) and the remaining area of the West Plant ground water

PCLE zone identified in the 2007 RAP. The response action is appropriate since 1) COCs exceeding the critical PCL in the area to be incorporated are the same as those in the existing PMZ COCs, 2) the concentrations of COCs are well below the risk-based criteria already established for the existing PMZ, and 3) a monitoring network is already in-place, and the proposed response action only includes an expansion of the existing monitoring program and reporting, and modification of the existing institutional controls.

Proposed Response Actions for Soil

The proposed response action for soils is to incorporate the WCP impacted soils into the Kinder Morgan West Plant PMZ. Soil COCs at WCP that exceed the soil leaching to ground water ingestion ($^{GW}Soil_{Ing}$) PCLs are present in the ground water, but the soil concentrations do not exceed the direct exposure pathway ($^{Tot}Soil_{Comb}$). The expansion of the West Plant PMZ to incorporate the WCP impacted soil is an exposure prevention response. It is not intended to demonstrate reduction of COC concentrations to meet PCLs. However, it is intended to demonstrate the plume is stable, and that the soils are not contributing to increased contaminant mass. Based on the nature of the COCs present, the natural attenuation process will reduce concentrations to below the applicable PCL over time. The existing deed recordation will also be modified to incorporate and manage impacted soil at the WCP into the existing Kinder Morgan West Plant PMZ under Remedy Standard B.

Response Actions for Groundwater

The proposed response action for groundwater is to incorporate the impacted groundwater at the WCP into the Kinder Morgan West Plant PMZ. The TCEQ approved 2007 West Plant RAP (URS, 2007) and 2013 West Plant RAP Addendum (URS 2013) provides a more detailed discussion of the response actions related to the groundwater PCLE zones. Changes to the West Plant PMZ and the monitoring network resulting from the inclusion of the impacted groundwater in WCP are outlined in Worksheet 2.1

What is the selected remedy standard for this affected property? ___ A X B

List all media that contains a PCLE zone and specify the proposed response action for each media. Indicate the type of removal, decontamination, physical control and/or institutional control action that is proposed.

Media	COCs[1]	Removal	Decontamination	Control			
				Physical Control	Modified Groundwater Response Objective[2]		
					PMZ	WCU	TI
Surface and Subsurface Soil	Benzene Chlorobenzene				X		
Groundwater	Benzene Chlorobenzene cis-1,2-Dichloroethene 1,2-Dichloroethane Ethylbenzene Isopropylbenzene Xylenes Tetrachloroethene Trichloroethene Vinyl chloride Bis(2-chloroethyl)ether				X		

[1] Specify either a specific COC or, if the response action is the same for all COCs in one type, specify the type of COC (for example, VOCs, SVOCs, metals).
[2] If a modified groundwater response objective is proposed, check the type(s) of proposed modifications.

RAP Executive Summary	ID No.: SWR# 30573
	Report Date: 05/15/2017

Note: COCs listed above are those identified in the soil and ground water at the WCP in the 2013 APAR and are consistent with those currently managed in the approved West Plant PMZ.

Is there a media that contains a PCLE zone that is not addressed in this RAP? ____ yes __X__ no
If yes, provide justification for not addressing the PCLE zone in this RAP.

On-site land use: [ ] Residential [X] Commercial/Industrial
Off-site land use: [ ] Residential [X] Commercial/Industrial (check all that apply)

Is this a re-submittal or revision of a previous RAP? __X__ Yes ____ No

If yes, explain why the RAP is being revised or resubmitted.

This RAP Addendum has been developed to incorporate soil and groundwater impacts at the former VTGP Terminal (SWR No. 30566) into the TCEQ approved PMZ for the Kinder Morgan Galena Park Terminal's West Plant (SWR No. 30573). The former VTGP Terminal was purchased by Kinder Morgan on February 7, 2015 and is located immediately adjacent to and formerly shared a fence line with the Galena Park West Plant. The former VTGP is now referred to as the Kinder Morgan Galena Park WCP.

Were all the appropriate notifications made in accordance with §350.55? ___ Yes __X__ No

If no, explain why notifications were not made:

Not applicable as affected groundwater is being captured only in the southeast corner of the Kinder Morgan West Plant as detailed in the 2013 West Plant RAP and no additional response actions are proposed for the off-site property. The VTGP Terminal is now owned by Kinder Morgan and is up gradient of the existing PMZ.

CHRONOLOGY
Former Vopak Terminal, Galena Park, Texas

February 2017	Groundwater Sampling event conducted at Kinder Morgan West Chemical Plant (WCP), the former Vopak Terminal Galena Park (VTGP).
Jan 2016- May 2017:	Monthly Gauging and LNAPL removal event for monitor wells VMW-3, VMW-8, VMW-10 at WCP.
May 31, 2016:	Class 1 Permit modification for the Kinder Morgan Terminal hazardous waste permit issued by the TCEQ, incorporating the WCP
Jan - Dec 28, 2016:	Monthly gauging and LNAPL removal event for monitor wells VMW-3, VMW-8, VMW-10 at WCP.
March 13, 2016:	A Class 1[1] permit modification application for the KINDER MORGAN West Plant was submitted to the TCEQ to incorporate the former VTGP Terminal as part of KM Liquids Terminals Galena Park Terminal. The VTPG Terminal is now identified as the Kinder Morgan West Chemical Plant (WCP).
November 23, 2015:	Gauging and LNAPL removal event for monitor wells VMW-3, VMW-8, VMW-10 at WCP.
August 13, 2015:	Gauging and LNAPL removal event for monitor wells VMW-3, VMW-8, VMW-10 at WCP.
July 13, 2015:	Gauging and LNAPL removal event for monitor wells VMW-3, VMW-8, VMW-10 at WCP.
July 2, 2015:	Groundwater sampling event conducted at WCP.
June 22, 2015:	Gauging of all monitoring wells at WCP. LNAPL detected in three monitoring wells VMW-3, VMW-8, and VMW-10 and manually abated.
February 7, 2015:	Kinder Morgan purchases the VTGP. The VTGP Terminal is now identified as the Kinder Morgan West Chemical Plant (WCP).
July 2013:	APAR prepared by ERM for VTGP.
August 2011:	Groundwater sampling event conducted at VTGP.
September 2010:	Groundwater sampling event conducted at VTGP.
April, 2009:	VTGP submits a work plan to Kinder Morgan to conduct joint gauging and sampling events.

Sept 3, 2008:	Kinder Morgan provides access to VTGP to conduct joint groundwater gauging events.
July 3, 2007:	VTGP and Kinder Morgan agree in a meeting to share assessment data and groundwater level gauging data.
June 2007:	Groundwater sampling event conducted at VTGP.
May 2007:	Groundwater sampling event conducted at VTGP.
April 2007:	Groundwater sampling event conducted at VTGP.
October 2006:	Groundwater sampling event conducted at VTGP.
June 6, 2006:	TCEQ sends a letter to VTGP regarding groundwater flow direction issues and to conduct a shared sampling event with Kinder Morgan wells.
May 24, 2006:	VTGP was informed of the results of two groundwater grab samples collected within the VTGP Terminal in February 2006 by an environmental consultancy representing Kinder Morgan. Subsequently, Kinder Morgan maintained that affected ground water identified near the VTGP/Kinder Morgan joint property boundary is sourced within the VTGP property.
March 2, 2006:	Kinder Morgan Sends response letter to the TCEQ regarding the migration of COCs from VTGP to Kinder Morgan that was presented in the Kinder Morgan 2004 APAR.
July and August 1997:	Groundwater Flow Investigation was conduct at the former Paktank site prior to VTGP owning the site.

Checklist for Report Completeness	ID No.: SWR # 30573
	Report Date: 05/15/2017

Use this checklist to determine the portions of the form that must be submitted for this report. Answer all questions by checking Yes or No. If the answer is Yes include that portion of the report. If the answer is No, do not complete or submit that portion of the report. All form contents that are marked "Required" must be submitted. Form contents marked with an asterisk (*) are not included in the blank form and are to be provided by the person.

				Report Contents

Form contents marked with an asterisk (*) are not included in the blank form.

Use this worksheet to describe the objectives for the response action in each media.

Response Action Objectives

List the environmental media to which this applies Surface and Subsurface Soils
Repeat this section for each medium that has a different response action objective.

State the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33 as applicable. Explain how the response action is appropriate based on the hydrogeologic characteristics, COC characteristics, and potential unprotective conditions that could continue or result during the remedial period.

Except to expand the boundaries of the existing TCEQ approved West Plant PMZ to include surface and subsurface soils with benzene and chlorobenzene concentrations that exceed the commercial/industrial $^{GW}Soil_{Ing}$ PCLs (as determined in the 2013 VTGP Terminal APAR (ERM 2013)), the soil response will remain the same as that in the approved 2007 RAP and 2013 RAP Addendum.

Explain how the COCs will be handled, treated, disposed, or transferred to another media and document that the response action will not result in any additional potential exposure conditions due to response action activities.

Handling, treatment, and disposal of soils within the existing Kinder Morgan West Plant PMZ are discussed in the TCEQ approved Kinder Morgan 2007 RAP and 2013 RAP Addendum. Generation of COC impacted soil during the Response Action is not expected. No soil removal is proposed.

State the proposed "reasonable time frame" and provide the justification for that time frame in the context of any potential for unprotective exposures to exist or develop, COC characteristics, hydrogeologic and affected property characteristics. If the reasonable time frame is different for the different affected media or for particular tracts of land, be sure to discuss that. Provide how the proposed response action will meet the objectives in a reasonable timeframe.

The $^{GW}Soil_{Ing}$ PCLE zones for benzene and chlorobenzene for surface and subsurface soil at the WCP identified in the APAR for the former VTGP Terminal (ERM, 2013) will be managed in the proposed expanded West Plant PMZ and groundwater PCLE zone as discussed in the TCEQ approved 2007 Kinder Morgan RAP (URS, 2007) and the approved 2013 RAP Addendum (URS, 2013). The expanded PMZ will be implemented and the institutional control (deed record) will be modified and filed following approval of the RAP Addendum with the revised PMZ boundaries.

Soil Response Action Objectives

When using removal and/or decontamination with controls or controls only, demonstrate how that physical control or combination of measures will reliably contain COCs within and/or derived from the surface soil and subsurface soil PCLE zone materials over time.

Physical Controls are not proposed as a soil response action.

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical surface soil and subsurface soil PCL throughout the soil PCLE zone and prevent COC concentrations above the critical soil PCLs from migrating beyond the existing boundary of the soil PCLE zone.

The results of proposed routine groundwater sampling will be used to ensure that benzene and chlorobenzene concentrations in groundwater are not increasing due to leaching of COCs from soil and to verify containment of the plume and that groundwater is not migrating beyond the PMZ above applicable PCLs.

Response Action Objectives

List the environmental media to which this applies Groundwater
Repeat this section for each medium that has a different response action objective.

State the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33 as applicable. Explain how the response action is appropriate based on the hydrogeologic characteristics, COC characteristics, and potential unprotective conditions that could continue or result during the remedial period.

Except to expand the boundaries of the existing TCEQ approved West Plant PMZ to include the upgradient, impacted ground water on West Plant and the former VTGP Terminal and to adjust the ground water monitoring network, the ground water response will remain the same as that in the approved 2007 RAP and 2013 RAP Addendum. The impacted groundwater in the areas to be incorporated into the PMZ contains the same COCs as previously reported in the 2007 RAP and the 2013 RAP Addendum for the impacted ground water currently in the PMZ. In addition, the current concentrations of COCs at the new additional proposed POEs do not exceed the approved action levels defined in the 2007 RAP and 2013 RAP Addendum and therefore the potential for un-protective conditions is not increased by the change in the PMZ configuration.

Explain how the COCs will be handled, treated, disposed, or transferred to another media and document that the response action will not result in any additional potential exposure conditions due to response action activities.

The management of COC impacted ground water is not changed by the proposed RAP addendum. Details on the management of impacted ground water during the Response Action are provided in the TCEQ approved Kinder Morgan 2007 RAP and 2013 RAP Addendum.

State the proposed "reasonable time frame" and provide the justification for that time frame in the context of any potential for unprotective exposures to exist or develop, COC characteristics, hydrogeologic and affected property characteristics. If the reasonable time frame is different for the different affected media or for particular tracts of land, be sure to discuss that. Provide how the proposed response action will meet the objectives in a reasonable timeframe.

The proposed changes to the PMZ in this RAP Addendum do not alter the "reasonable time frame" as proposed in the approved 2007 RAP and 2013 RAP Addendum.

Groundwater Response Action Objectives

Name of groundwater-bearing unit to which this information applies: Sandy Channel Fill (SCF)/ Upper Naturally Transmissive Unit (UNTU)

Repeat this section for each groundwater-bearing unit for which a different response action is proposed.

Groundwater classification ____ 1 _X_ 2 ___ 3

Is a modified groundwater response action being proposed for any part of the groundwater PCLE zone (§350.33(f)(2), (3), or (4))? _X_ Yes ___ No

If yes, does the affected property meet the qualifying criteria for a modified groundwater response action using a waste control unit, plume management zone, or technical impracticability? _X_ Yes ___ No

If yes, complete the appropriate portions of this report.
If no to either question, complete the following:

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical groundwater PCL throughout the groundwater PCLE zone and prevent COC concentrations above the critical groundwater PCL from migrating beyond the existing boundary of the groundwater PCLE zone.

See the approved 2007 RAP and 2013 RAP Addendum for how the COCs concentration in ground water will be reduced and prevented from migrating beyond the groundwater PCLE Zone. The proposed changes to the ground water response action in this RAP Addendum are not anticipated to affect what was proposed previously.

Explain how the response action will prevent COCs from migrating to air at concentrations above the PCLs for air if the groundwater-to-air PCLs ($^{Air}GW_{Inh-V}$) is exceeded.

See the approved 2007 RAP and 2013 RAP Addendum for details related to the air inhalation pathway. The proposed changes to the ground water response action in this RAP Addendum are not anticipated to affect what was proposed previously for this pathway.

Explain how the response action will prevent COCs from migrating to surface water at concentrations above the PCLs for groundwater discharges to surface water if surface water is a factor.

See the approved 2007 RAP and 2013 RAP Addendum for details related to the ground water to surface water pathway. The proposed changes to the ground water response action in this RAP Addendum are not anticipated to affect what was proposed previously for this pathway.

Explain how the response action will prevent human and ecological receptor exposure to the groundwater PCLE zone.

See the approved 2007 RAP and 2013 RAP Addendum for details related to the prevention of human and ecological receptor exposure to ground water COCs. The proposed changes to the ground water response action in this RAP Addendum are not anticipated to affect what was proposed previously relative to human and ecological receptor exposure.

NOTES:

1. All concentrations are reported in milligrams per liter (mg/L).
2. "J" indicates reported concentration is estimated.
3. "L" indicates bias sample result likely to be low.
4. "NS" indicates not sampled.

FILE NO.: Att 1A4 - KM-WestPlant-GalenaPark - SOIL PCLE Map - Sept-2017.dwg

Response Action Design

Use this worksheet to provide detailed descriptions of the response action. Attach design and layout drawings and equipment specifications in Attachment 2A.

Media: Soils

List all media to which this information applies. If the response action is different for another media, complete a separate worksheet.

Provide a detailed description of the response action. Describe the removal action, decontamination, treatment system(s), and/or physical or institutional control actions that are proposed for each media and discuss the reasons for choosing the response action(s). Identify and describe any ecological services analysis and compensatory restoration plan that will be utilized (if so, include the complete ESA and compensatory restoration plan in Attachment 2C).

With the exception of expanding the existing West Plant PMZ boundaries and adding additional groundwater monitoring points (AMPs, POEs, and Background Wells), this RAP Addendum does not change the response action as outlined in the TCEQ approved 2007 RAP and 2013 RAP Addendum for West Plant. See the 2007 RAP and 2013 RAP Addendum for a detailed description of the response action design for soil. Changes to the PMZ as a result of this addendum are detailed in Worksheet 2.1

Describe all major treatment system components and equipment of the response action. Illustrate the response action design and provide equipment specifications in Attachment 2A.

Not applicable.

List permits or registrations needed to construct or implement the response action, including permits or registrations needed to conduct studies or tests. For VCP sites, list the permits that would be required if the site was not in the VCP (required by the VCP).

Permitting/Registration Authority	Type of permit/registration	Permit or registration number if already issued	Anticipated application date
Not Applicable			

Identify and discuss the results of any studies or tests, such as pilot studies, feasibility studies, technical impracticability studies, treatability studies, and/or toxicity studies conducted or proposed to be conducted at the affected property. Discuss the reason for the study or test and how it verifies the effectiveness and appropriateness of the chosen response action or documents that a particular response action is not appropriate for the affected property. Describe how the results of completed studies or tests determined the design or choice of response action. Attach any separate reports and supporting documentation in Appendix 3.

Not Applicable

Response Action Design

Use this worksheet to provide detailed descriptions of the response action. Attach design and layout drawings and equipment specifications in Attachment 2A.

Media: Groundwater

List all media to which this information applies. If the response action is different for another media, complete a separate worksheet.

Provide a detailed description of the response action. Describe the removal action, decontamination, treatment system(s), and/or physical or institutional control actions that are proposed for each media and discuss the reasons for choosing the response action(s). Identify and describe any ecological services analysis and compensatory restoration plan that will be utilized (if so, include the complete ESA and compensatory restoration plan in Attachment 2C).

With the exception of expanding the existing West Plant PMZ boundaries and adding additional groundwater monitoring points (AMPs, POEs, and Background Wells), this RAP Addendum does not change the response action as outlined in the TCEQ approved 2007 RAP and 2013 RAP Addendum for West Plant. See the 2007 RAP and 2013 RAP Addendum for a detailed description of the response action design for groundwater. Changes to the PMZ as a result of this addendum are detailed in Worksheet 2.1

Describe all major treatment system components and equipment of the response action. Illustrate the response action design and provide equipment specifications in Attachment 2A.

The Recovery System Layout and Piping and Details specifications for the recovery system located in the southeast corner of the Kinder Morgan West Plant are provided in Attachments 2A-2 and Attachments 2A-2a, 2A-2b, and2A-2c, respectively of the TCEQ approved 2013 Kinder Morgan RAP Addendum.

List permits or registrations needed to construct or implement the response action, including permits or registrations needed to conduct studies or tests. For VCP sites, list the permits that would be required if the site was not in the VCP (required by the VCP).

Permitting/Registration Authority	Type of permit/registration	Permit or registration number if already issued	Anticipated application date
Not Applicable			

Identify and discuss the results of any studies or tests, such as pilot studies, feasibility studies, technical impracticability studies, treatability studies, and/or toxicity studies conducted or proposed to be conducted at the affected property. Discuss the reason for the study or test and how it verifies the effectiveness and appropriateness of the chosen response action or documents that a particular response action is not appropriate for the affected property. Describe how the results of completed studies or tests determined the design or choice of response action. Attach any separate reports and supporting documentation in Appendix 3.

No pilot feasibility studies, technical impracticability studies or other studies were conducted to develop this RAP Addendum

Plume Management Zone	RAP Worksheet 2.1	Page 1 of 3
Associated Information: Attachments 2D, 2E	ID No.: SWR# 30573	Report Date: 05/15/2017

Complete this worksheet when a PMZ is proposed as part of the response action. Include in Attachment 2D a map of the proposed PMZ with alternate POE(s) and attenuation monitoring points identified and the current groundwater PCLE zone. If a PMZ is not proposed, do not submit this worksheet.

Groundwater-bearing unit SCF/UNTU
Repeat this worksheet for each groundwater-bearing unit for which a PMZ is proposed.
Groundwater classification X 2 ____ 3

Provide justification as to why the PMZ is appropriate in accordance with §350.33(f)(4)(A). Include supporting documentation in Attachment 2E.

A detailed discussion regarding the adequacy of the PMZ as a response action is detailed in the TCEQ approved 2007 RAP (URS, 2007) and will apply to incorporating groundwater impacts at the WCP into the Kinder Morgan West Plant PMZ. The list of monitor wells to be sampled during the monitoring activities has been revised to incorporate the WCP monitor wells and monitor wells at the Kinder Morgan West Plant that were previously not part of the PMZ into the PMZ and to be consistent with the containment strategy currently being employed. Five monitoring wells (MW-29, MW-31, MW-32, MW-33, and MW-34) located on the western property boundary of the Kinder Morgan West Plant were not included in the SWMU-wide PMZ due to suspected COCs migrating onsite from the former adjacent Vopak (West Chemical Plant) upgradient facility to the west (URS, 2007). The monitor wells are now proposed to be included in the proposed expanded PMZ.

Page 3 of Worksheet 2.1 provides the list of COCs, approved attenuation action levels and revised list of monitor wells to be sampled as part the PMZ. Attachment 2D depicts the revised expanded PMZ.

Is the alternate POE proposed to be beyond the current limits of the PCLE zone? ___ Yes X No
If yes, how far? _____ (§350.37(l) or (m) as applicable)
Is it to be off-site? ____ Yes ____ No

On an off-site property that currently does not contain a residential-based groundwater PCLE zone?

____Yes ___No

If yes and this is a Class 2 groundwater, provide the basis for concluding that this groundwater does not have a reasonably anticipated future beneficial use (§350.37(l)(3)).

Not Applicable. Alternate POE wells are not proposed beyond the current limits of the PCLE zone due to the PCLE zone's downgradient extent abutting the Houston Ship Channel. POE wells are along the Houston Ship Channel and groundwater analytical results will be compared to the approved ^{SW}GW PCLs.

Is NAPL present? X Yes ____ No

If so, describe how the response action will achieve the performance criteria in §350.33(f)(4)(E).

During a monitor well gauging event performed on June 3, 2015 for the West Chemical Plant, LNAPL was measured in the following wells: VMW-3 (1.40 ft.) and VMW-10 (5.03 ft.). On March 29, 2016 LNAPL was measured in the following wells: VMW-3 90 (0.02 ft.), VMW-8 (sheen), and VMW-10 (0.44 ft.). On September 22, 2107, 2017, LNAPL was measured in the following wells: VMW-3 (0.02 ft.), VMW-8 (0.09 ft.), and VMW-10 (0.16 ft.). Between June 3, 2015 and September 22, 2017, monthly gauging and product removal (if necessary) events have been conducted on these wells with the measured NAPL in VMW-3 decreasing from 1.40 ft. to a sheen, and in VMW-10 from 5.03 ft. to 0.04 ft., and 0.02 feet present in VMW-8. Since there is no known source(s), the LNAPL appears to be spatially isolated and in general, the LNAPL has been removed to the extent practicable, the response action will be to continue to monitor these wells on a periodic basis and remove any accumulated LNAPL. Gauging data can be found in Appendix 2, Table 2-2.

If this is a Class 2 groundwater, explain how the response action will ensure that leachate from the surface soil and subsurface soil PCLE zones will not increase concentration of COCs greater than the current measured concentrations (at time of RAP submittal). (§350.33(a)(2))

Benzene and chlorobenzene exceeds the soil to groundwater ingestion PCLs at four locations at the WCP. These soil PCLE zones will be incorporated into and managed in the TCEQ approved PMZ for the West Plant. Groundwater analytical data (Appendix 2, Table 2-1) shows groundwater concentrations to be stable as discussed in the VTGP APAR (ERM, 2013). Semi-annual groundwater monitoring will be performed to monitor benzene and chlorobenzene concentrations in groundwater and to verify there is no increase in contaminant mass due COCs leaching from the soil PCLE zones. A depiction of the revised Plume Management Zone Map is provided as Attachment 2D. The proposed soil response actions for the WCP are consistent with the soil response actions in the 2013 TCEQ approved RAP Addendum.

Provide the basis that the COCs will not migrate beyond the downgradient boundary of the PMZ at concentrations above the critical PCL. Include supporting documentation in Attachment 2E.

The proposed modified PMZ will monitor the COC concentrations within the plume and at the downgradient extent of the plume. Because the groundwater ingestion pathway is proposed to be eliminated with the institutional controls of the PMZ, the groundwater to surface water exposure pathway is considered to be complete and is the basis of the AALs. A more detailed discussion is provided in the TCEQ approved 2007 RAP (URS, 2007). The recovery system in the southeastern corner of the West Plant is intended to prevent COC-containing groundwater from migrating beyond the downgradient boundary of the PMZ and offsite to the southeast onto the CenterPoint Energy right-of-way (CPROW) property. COC concentrations will be monitored in AMP wells on a semi-annual basis to verify COC concentrations are not increasing so that they would exceed the PCLs at the POE.

Describe the methods used to determine that there are no artificial penetrations which can allow COCs to migrate from the groundwater PCLE zone to currently unaffected groundwater-bearing units. Include supporting documentation in Attachment 2E.

There are no known artificial penetrations which can allow COCs to migrate to unaffected groundwater bearing units.

List the attenuation action level determined for each attenuation monitoring point. Illustrate the proposed attenuation monitoring points and the groundwater PCLE zone on the map in Attachment 2D. Include all calculations and other methods of determining the attenuation action levels in Attachment 2E.

COC	Attenuation Monitoring Point (well number)	Attenuation Action Level (mg/L)	Attenuation Action Level limited by $^{Air}GW_{Inh-V}$ or existing COC concentration? Y/N
Benzene	PMZ wells*	1,470	N**
Ethylbenzene	PMZ wells*	5,180	N
Xylenes (total)	PMZ wells*	17,700	N
Bis(2-chloroethyl)ether	PMZ wells*	110	N
Isopropylbenzene	PMZ wells*	4,890	N
Chlorobenzene	PMZ wells*	2,190	N
PCE	PMZ wells*	4,470	N
TCE	PMZ wells*	8,490	N
Cis-1,2-Dichloroethene	PMZ wells*	14,200	N
Vinyl Chloride	PMZ wells*	5,760	Y**
1,2-Dichloroethane	PMZ wells*	1,030	N

* The PMZ has been revised and expanded to incorporate upgradient monitor wells MW-3, P-1, VMW-4, and VMW-9; AMP monitor wells VMW-1, VMW-3, VMW-6, VMW-7, MW-29, and MW-31. Monitor well MW-20, thought to have been destroyed (URS 2013) was subsequently located and is incorporated into the Revised PMZ as originally proposed (URS 2007). Five monitoring wells (MW-29, MW-31, MW-32, MW-33, and MW-34) located on the western property boundary of the West Plant are included in the revised PMZ. Monitor well MW-35 has been removed as an upgradient monitor well and is now designated an AMP well. Monitor wells MW-22 and MW-33 have been removed as AMP wells with the revised West Plant PMZ which incorporates the WCP into the PMZ. Calculations for Attenuation Action Levels are presented in Attachment 2E of the 2007 TCEQ approved RAP (URS 2007) and these AALs will apply to the Revised PMZ with the incorporation of the WCP into the PMZ.

** See Appendix 2, Table 2-2 of the 2013 RAP Addendum for approved Tier 2 commercial/industrial $^{Air}GW_{Inh-V}$ PCLs for benzene and vinyl chloride.

Institutional Control	RAP Worksheet 2.4 Page 1 of 1	
Associated Information: Appendices 4, 5	ID No.: SWR# 30573	Report Date: 05/15/2017

Complete this worksheet if an institutional control will be used as part of the response action. Include a draft of the proposed institutional controls in Appendix 4. Provide a list of landowners from whom landowner concurrence will be requested, as necessary, in Appendix 5.
Specify the property for which this applies. Kinder Morgan West Plant and WCP (Note: Only proposed changes related to this addendum are included)
Repeat this worksheet for each different property for which an institutional control will be used.

Institutional Control	Type of Institutional Control[1]				Property Ownership		Anticipated Filing Date[2]
	Deed Notice	Restrictive Covenant	VCP Certificate of Completion	Equivalent zoning or governmental ordinance	Check if pertinent tract of land is owned by the person	Check if the pertinent tract of land is owned by an innocent owner or operator	
Document use of commercial/industrial land use (§350.31(g))	X				X		Within 90 days of RACR approval
Document use of physical or institutional control under Remedy Standard B §350.31(g))							
Document notice of on-going long term response action (§350.31(h))							
Document use of occupational inhalation criteria as RBELs (§350.74(b)(1))							
Document variance from the default exposure factors (§350.74(j)(2)(L))							
Document the use of a non-default soil exposure area (§350.51(l)(3)&(4))							
Document WCU exclusion area (§350.33(f)(2))							
Document establishing a PMZ (§350.33(f)(4)(C)(I))	X				X		Within 120 days of RAP Addendum approval
Document the demonstration of technical impracticability (§350.33(f)(3)(F))							
Relocation of soils containing COCs for reuse (§350.36(b)(4) and (c)(4))							

[1] Check the appropriate box(es) to indicate the type of institutional control required for the proposed response action.
[2] Specify date or amount of time after RAP approval.

FILE: Att2D - KM-WestPlant-GalenaPark - Plume Management Zone - Sept-2017.dwg

List the monitoring and sampling of COC concentrations or other parameters that will be conducted during the response action. Illustrate the monitoring or sampling locations in Attachment 3A. If statistics or geostatistics will be used, provide details in Appendix 7. If monitoring or observation wells will be constructed for the response action, provide well construction details in Attachment 2B if not previously provided.

Monitored Media	COC[1]	Other parameter (specify)	Sampling Method[2]	Sampling points or locations[3]	Depth/Height[4] (ft.)	Analytical or Field Screening Method	Sampling or Monitoring Frequency[5]
Surface Soil							
Subsurface Soil							
Groundwater	Benzene, Ethylbenzene, Xylenes, Isopropylbenzene, Chlorobenzene, cis-1,2-Dichloroethane, 1,2-Dichloroethane, PCE, TCE, Vinyl chloride, and bis(2-Chloroethyl)Ether		Low flow sampling techniques	PMZ wells from Worksheet 2.1	SCF/UNTU water bearing unit	Select list by VOC 8260 and SVOC 8270	Semi-Annually
	Recovery System		Weekly Inspections	RW-1, RW-25R, OB-1,OB-3, MW-23, and MW-39	SCF/UNTU water bearing unit	Inspection and flow measurements	Weekly
Surface water							
Sediment							
Air	Not applicable unless groundwater concentrations exceed Tier 2 $^{Air}GW_{Inh-V}$.						
Other Media (specify)							

[1] Specify the COCs to be monitored in this media. List either type of COC (such as VOCs, metals) if all the COCs of that type will be monitored the same way.
[2] Describe the sampling or monitoring methods and QC procedures in Appendix 1 unless the proposed sampling or monitoring procedure is the same as the sampling or monitoring procedure described in the APAR.
[3] Specify the sampling or monitoring point, such as the specific monitor well or general sampling or monitoring location.
[4] Specify the depth or height of the sampling or monitoring points.
[5] Specify the frequency at which this monitoring or sampling will occur.

Explain the reasons for the above-listed monitoring and sampling plan.

A detailed discussion of the monitoring and sampling plan related to the groundwater PCLE zones is provided in the TCEQ approved 2007 RAP (URS, 2007) and the 2013 RAP Addendum (URS, 2013) for the Kinder Morgan West Plant and will apply to the WCP. The above listed monitoring and sampling plan incorporates the WCP into the monitor and sampling plan for the Kinder Morgan West Plant. Five monitor wells (MW-29, MW-31, MW-32, MW-33, and MW-34), as per the TCEQ approved 2007 RAP (URS, 2007) located on the western property boundary of the West Plant were previously not included in the SWMU-wide PMZ due to suspected COCs migrating onsite from the adjacent upgradient West Chemical Plant facility. These monitor wells are now included in the monitoring and sampling plan for the proposed revised PMZ with the incorporation of the WCP. Monitor well MW-20, thought to have been destroyed (URS 2013) was subsequently located and is incorporated into the Revised PMZ as originally proposed (URS 2007).

With the exception of the additional groundwater monitoring points this RAP Addendum does not change the Post-Response Actin Care activities outline in the approved 2007 RAP and 2013 RAP Addendum

Complete this worksheet only if Remedy Standard B will be used.

What is the proposed initial post-response action care period? (default 30 yr.) _____ years

If the proposed initial post-response action care period is less than 30 years, provide a technical justification in accordance with §350.33(h).

See approved 2007 RAP and 2013 RAP Addendum

What is the foreseeable land use during the post-response action care period? Industrial

Describe how the future use of the property will not compromise the integrity of the physical controls, will not interfere with the function of the monitoring systems, will not pose a threat to human health or the environment, and will be in accordance with any institutional controls.

See approved 2007 RAP and 2013 RAP Addendum.

Briefly describe the proposed post-response action care activities. Describe the type of monitoring and/or inspections to be performed. Discuss the rationale for not including COC(s) analyzed during the response action, monitoring or sampling point location, frequency of monitoring and/or inspections, and the duration of the monitoring program.

See approved 2007 RAP and 2013 RAP Addendum

Will PRAC sampling procedures be the same as those as previously documented for monitoring and/ or confirmation sampling? X _____ Yes ___ No

If no, provide in Appendix 6 a description of the monitoring or sampling collection procedures to be conducted during the post-response action care period.

Cost Estimate

Complete this portion of the form only if a physical control is proposed (installed hydraulic control system, slurry wall, cap, etc.). Provide in Attachment 5B a detailed cost estimate for a third party to operate and maintain the physical control during the PRAC period, based on current dollar amount.

Specify the physical control to which this information applies: See approved 2007 RAP and 2013 RAP Addendum

Complete this worksheet for each physical control that will be used as part of the response action.

What is the total estimated annual cost of O&M for the PRAC period? See approved 2007 RAP and 2013 RAP Addendum

What is the total estimated cost for a third party to perform PRAC activities? See approved 2007 RAP and 2013 RAP Addendum

Identify the type of financial assurance mechanism to be used, and the contact person managing fiduciary responsibility, if known.

See approved 2007 RAP and 2013 RAP Addendum

Does the person meet the criteria and definition of a small business? (see §350.33(n)) Yes X No

If yes and the person desires to pursue the reduced amount of financial assurance, provide a legally binding affidavit as Attachment 5C. Include in the affidavit the information requested in 30 TAC §350.33(l), (m), and (n). An example affidavit is attached in the instructions.

Implementation Schedule	RAP Worksheet 6.0 Page 1 of 1	
	ID No.: SWR# 30573	Report Date: 05/15/2017

Document the proposed schedule for implementing the response action. Include all major response action activities through the life of the project, including all removal, decontamination, and control actions, component installations, O&M, monitoring, and post-response action care activities.

Implementation of Response Action (specify component or action)	Start	Finish	Duration
File Institutional Control (Deed Notice) for PMZ	Upon TCEQ approval of RAP Addendum	Within 120 Days of TCEQ approval of RAP Addendum	120 Days
File Institutional Control (Deed Notice) for Industrial Land Use	Upon TCEQ approval of RACR	Within 90 Days of TCEQ approval of RACR	90 Days

List the proposed schedule for report submittals. Add additional lines if more reports than listed will be needed to complete the response action.

Reports	Submittal date
Response Action Effectiveness Report (RAER)	
RAER submittal number 1	Not Applicable
RAER submittal number 2	
RAER submittal number 3	
Response Action Completion Report (RACR)	Within 180 days of Completion of Response Action
Post-Response Action Care Report (PRACR)	
PRACR submittal number 1	Annually starting 1st year after RACR approval
PRACR submittal number 2	
PRACR submittal number 3

TRC Notes:

1. [1] - Tier II PCLs were calculated and presented in Appendix 3 of the 2012 RAP Addendum.
2. J - Estimated data: the reported quantitation limit or sample concentration is approximated due to exceedance of one or more QC requirements or the analyte was detected between the method quantitation limit and the sample quantiation limit.
3. < - The result is not detected above the sample quantitation limit.
4. NA - Not Analyzed
5. Bold - Values above the PCL
6. mg/L - milligrams per liter
7. '--' - PCL not calculated for analyte due to Tier 1 PCL not being exceeded.

VOPAK Notes:

8. VOPAK data obtained from Table 5B in Affected Property Assessment Report submitted July 8, 2013. Lab reports were not reviewed to verify results.
9. NS - Not Sampled
10. Product[1] - Results reported in mg/kg
11. '---' - Data not available

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments
No additional comments.

Receipt
The samples were received on 11/25/2015 12:32 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.2º C.

Receipt Exceptions
A trip blank was submitted for analysis with these samples; however, it was not listed on the Chain of Custody (COC).

GC/MS VOA
Method 8260B: The following samples were diluted due to the nature of the sample matrix (foamy): MW-2 (600-122269-1), MW-6 (600-122269-4), and VMW-7 (600-122269-12). Elevated reporting limits (RLs) are provided.

Method 8260B: The following samples were diluted to bring the concentration of target analytes within the calibration range: P-2 (600-122269-6), VMW-6 (600-122269-11), MW-29 (600-122269-14), and MW-31 (600-122269-15). Elevated reporting limits (RLs) are provided.

Method 8260B: Due to the high concentration of Benzene and cis1,2-Dichloroethene, the matrix spike / matrix spike duplicate (MS/MSD) for batches 122621 and 122622 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

July 16, 2018

Mr. Johnny Kennedy
Remediation Project Manager
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Approval of Filing of Institutional Controls
Institutional Control Filing - West Plant Galena Park Terminal, dated May 15, 2018
North Holding Basin and Southeast Holding Basin
Kinder Morgan Liquids Terminals, LLC - Galena Park;
TCEQ SWR No. 30573;
TCEQ Hazardous Waste Permit/Compliance Plan No. 50054
EPA ID No. TXD026481523;
Customer No. CN601545940; Regulated Entity No. RN100237452

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ), Remediation Division received your letter on May 16, 2018 submitted by Kinder Morgan containing proof of filing of institutional controls for the West Plant Galena Park Terminal which includes an approved revised plume management zone (PMZ) and commercial/industrial land use deed notice.

After reviewing the proof of filing of institutional controls the TCEQ concurs that the institutional control requirements of 30 Texas Administrative Code (TAC) §350.111 have been completed. The institutional controls were filed to inform others of ongoing long-term response actions within the revised PMZ boundary. Please continue the response actions in accordance with the approved Response Action Plan (RAP) and submit Response Action Effectiveness Reports (RAERs) in accordance with the schedule proposed in the approved RAP.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions.

Questions concerning this letter should be directed to me at (512) 239-2034. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals. Note that the electronic

and hard copies should be identical, complete copies. A Correspondence ID Form (TCEQ Form 20428) must accompany each document submitted to the Remediation Division, and should be affixed to the front of your submittal. The Correspondence ID Form helps ensure that your documents are identified correctly and are routed to the applicable program for a timely response.

Sincerely,

Maureen Hatfield, P.G., Project Manager
Team 1, VCP-CA Section
Remediation Division
Texas Commission on Environmental Quality

Texas Risk Reduction Program
Deed Notice

STATE OF TEXAS

COUNTY OF HARRIS

This Notice is filed to provide information concerning certain environmental conditions and/or use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows:

A legal property description used in the last recorded vesting deed, covering the Property that includes the entire recorded tract of land held by the owner executing this deed notice, is attached hereto and incorporated herein by reference as Exhibit A.

Portions of the groundwater of the Property contain certain identified chemicals of concern causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property is described as follows:

METES AND BOUNDS DESCRIPTION of a 51.726 acre tract of land, extending over, through, along and across, a called 69.31248 acre tract of land (Second Tract) as recorded in File No. C288395, Film Code 051-2411421, Official Public Records of Real Property of Harris County, Texas, and called 37 acre tract of land (Exhibit "A") as recorded in File No. 20070466722, Official Public Records of Harris County, Texas, said tracts being situated in the Ezekiel Thomas Survey, Abstract 73, Harris County, Texas, said metes and bounds being more fully described as follows:

Bearings and coordinates are based on the Texas Coordinate System, South Central Zone, NAD 83 U.S. survey feet.

COMMENCING at a 5/8" iron rod found for the Northeast corner of a called 17.66626 acre tract of land (First Tract) as recorded in File No. C288395, Film Code 051-24-1421, Official Public Records of Real Property of Harris County, Texas, said corner having coordinates N=13,833,097.40, E=3,164,701.32;

THENCE, South 03°27'57" East, along the East boundary line of said 17.66626 acre tract, at 693.02 feet passing the southeast corner of said, 17.66626 acre tract, crossing an eighty feet (80') wide rightof-way, as recorded in Volume 371, Page 245, of the Deed Records of Harris County, Texas, at 773.04 feet to a point on the south line of said eighty feet (80') wide right-of-way, same said point being in the northeast corner of the above mention 69.31248 acre tract, continuing along and with the east boundary line of said 69.31248 acre tract, a total distance of 1993.38 feet to a point;

THENCE, South 86°36'30" West, a distance of 23.57 feet to the POINT OF BEGINNING having coordinates N=13,831,105.66, E=3,164,798.53;

THENCE, South 13°46'21" East, a distance of 76.03 feet to a point;

THENCE, South 03°15'52" East, a distance of 121.42 feet to a point;

THENCE, South 00°42'57" West, a distance of 127.83 feet to a point;

THENCE, South 56°47'37" West, a distance of 17.86 feet to a point;

THENCE, South 63°15'20" West, a distance of 583.65 feet to a point;

THENCE, North 70°55'46" West, a distance of 124.24 feet to a point;

THENCE, South 63°58'35" West, a distance of 113.54 feet to a point;

THENCE, North 69°04'27" West, a distance of 80.58 feet to a point;

THENCE, South 64°03'36" West, a distance of 203.63 feet to a point;

THENCE, South 28°18'19" East, a distance of 148.51 feet to a point;

THENCE, South 63°19'30" West, a distance of 144.80 feet to a point;

THENCE, North 26°43'13" West, a distance of 155.06 feet to a point;

THENCE, South 49°47'25" West, a distance of 122.60 feet to a point;

THENCE, South 01°23'13" West, a distance of 49.15 feet to a point;

THENCE, South 62°46'36" West, a distance of 70.90 feet to a point;

THENCE, North 60°48'41" West, a distance of 35.36 feet to a point;

THENCE, South 64°54'55" West, a distance of 118.01 feet to a point;

THENCE, South 11°19'37" West, a distance of 171.28 feet to a point;

THENCE, South 57°42'08" West, a distance of 94.03 feet to a point;

THENCE, In a Southwesterly direction along the arc of a curve to the right having a radius of 137.51 feet, a central angle 33°43'04", arc distance of 80.92 feet and a chord bearing of South 77°42'53" West for a distance of 79. 76 feet to a point;

THENCE, In a Northwesterly direction along the arc of a curve to the right having a radius of 399.28 feet, a central angle of 43°57'45", arc distance of 306.37 feet and a chord bearing of North 66°03'24" West for a distance of 298.91 feet to a point;

THENCE, In a Northwesterly direction along the arc of a curve to the right having a radius of 478.75 feet, a central angle of 21°27'26", arc distance of 176.29 feet and a chord bearing of North 29°48'40" West for a distance of 178.24 feet to a point;

THENCE, North 10°00'30" West, a distance of 64.65 feet a point;

THENCE, North 01°33'22" West, a distance of 1,418.86 feet to a point;

THENCE, North 01°09'54" East, a distance of 40.52 feet to a point;

THENCE, In a Northeasterly direction along the arc of a curve to the right having a radius of 72.78 feet, a central angle 18°14'43", arc distance of 23.18 feet and a chord bearing of North 10°41 '28" East for a distance of 23.08 feet to a point;

THENCE, In a Northeasterly direction along the arc of a curve to the right having a radius of 50.79 feet, a central angle 77°00'56", arc distance of 68.27 feet and a chord bearing of North 59°33'57" East for a distance of 63.25 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the right having a radius of 226.75 feet, a central angle 28°36'39", arc distance of 113.23 feet and a chord bearing of South 69°12'21" East for a distance of 112.05 feet to a point;

THENCE, South 55°54'50" East, a distance of 59.24 feet to a point;

THENCE, South 54°21 '05" East, a distance of 103.63 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the left having a radius of 334.54 feet, a central angle 29°08'33", arc distance of 170.16 feet and a chord bearing of South 66°39'19" East for a distance of 168.33 feet to a point;

THENCE, South 79°57'40" East, a distance of 54.81 feet to a point;

THENCE, South 77°34'39" East, a distance of 40.21 feet to a point;

THENCE, South 70°59' 16" East, a distance of 109.67 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the left having a radius of 1,350.04 feet, a central angle 05°10'55", arc distance of 122.10 feet and a chord distance of South 75°23'02" East for a distance of 122.06 feet to a point;

THENCE, South 79°17'36" East, a distance of 132.02 feet to a point;

THENCE, South 81°15'47" East, a distance of 245.02 feet to a point;

THENCE, South 79°37'02" East, a distance of 102.48 feet to a point;

THENCE, South 76°46'01" East, a distance of 97.48 feet to a point;

THENCE, South 74°21 '27" East, a distance of 61.65 feet to a point;

THENCE, South 72°56'07" East, a distance of 57.79 feet to a point;

THENCE, South 71 °55'26" East, a distance of 130.00 feet to a point;

THENCE, In a Southeasterly direction along the arc of a curve to the right having a radius of 595.80 feet, a central angle 19°45'05", arc distance of 205.39 feet and a chord distance of South 61 °02 '22" East for a distance of 204.37 feet to a point;

THENCE, South 47°54'26" East, a distance of 94.31 feet to a point;

THENCE, South 63°17'49" East, a distance of 99.36 feet to the POINT OF BEGINNING containing 51 .726 acres of land.

The certified meets and bounds description and corresponding plat maps of the Affected Property for groundwater (referred to as the Plume Management Zone) are attached hereto and incorporated herein by reference as Exhibit B.

The constituents of concern in groundwater at the Affected Property (the Plume Management Zone), defined here as exceeding TRRP Protective Concentration Levels (PCLs) for residential and commercial/industrial land use, are benzene, ethylbenzene, xylenes, isopropylbenzene, chlorobenzene, cis-1,2-dichloroethene, 1,2-dichloroethane, tetrachloroethene, trichloroethene, vinyl chloride, and bis(2-chloroethyl)ether.

This notice is required for the following reasons:

The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone. A plume management zone is defined as an area of groundwater containing concentrations of chemicals of concern exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC 350.33(f)(4). The undersigned has established a plume management zone so that the chemicals of concern in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached Exhibit B provides the location and extent of the plume management zone and describes the maintenance and monitoring required. This maintenance and monitoring is required until TCEQ approves some modification of those requirements. Exposure to groundwater within the plume management zone for any purpose is not advised until such time when all the chemicals of concern no longer exceed their respective protective concentration levels. This deed notice must not be removed or modified without prior approval from TCEQ.

As of the date of this Notice, the record owner of fee title to the Property is KM Liquids Terminals, [redacted] with an address of 1001 Louisiana St., Suite 1000, Houston, Texas 77002.

Plume Management Zone Maintenance and Monitoring Requirements

Facility monitoring will consist of semi-annual groundwater monitoring of the approved plume management zone well network with annual reporting to the Texas Commission on Environmental Quality (TCEQ). More detail regarding monitoring and maintenance can be found in the TCEQ-approved Response Action Plan Addendum for the West Plant of the Galena Park Terminal (October 2017)

RECORDER'S MEMORANDUM:
At the time of recordation, this instrument was found to be inadequate for the best photographic reproduction because of illegibility, carbon or photo copy, discolored paper, etc. All blockouts, additions and changes were present at the time the instrument was filed and recorded.

Re: Report Transmittal – Response Action Plan Addendum for North Plant Tank 100-11 and Tank 100-12 (North Plant)
KM Liquids Terminals LLC - Galena Park Terminal
Galena Park, Texas
ISWR No. 30573
Hazardous Waste Permit No. HW-50054
EPA I.D. No. TXD026481523

Dear Ms. Sifuentes-Chavez:

Please find enclosed one hard copy and one electronic copy of the Response Action Plan (RAP) Addendum for the North Plant Tank 100-11 and Tank 100-12 (North Plant) on the KM Liquids Terminals LLC (KMLT) Galena Park Terminal. This RAP Addendum was prepared to update the current response actions being completed at North Plant.

KMLT is also proposing to include the corrective actions presented in the RAP Addendum at North Plant into the renewal application for Hazardous Waste Permit 50054. North Plant would be included into the permit as an area of concern (AOC). The permit renewal application would update Compliance Plan (CP) Tables II, III, IIIA, and V to incorporate North Plant into the Hazardous Waste Permit and Compliance Plan.

If you have any questions regarding this submittal or require additional information, please feel free to contact me at (713) 654-6035, or if you wish you can e-mail me at [redacted]

Sincerely,
KM Liquids Terminals LLC

Johnny Kennedy
Remediation Manager

RAP Executive Summary	ID No.: SWR No. 30573 Page _1_ of _3_
	Report Date: June 28, 2024

Use this worksheet to summarize the report. Be sure to complete and submit the Checklist for Report Completeness. **Attach a chronology of activities associated with the affected property.**

Briefly describe the affected property and PCLE zones, the conclusions from the assessment activities, identify any affected or threatened receptors, and describe any other major considerations taken into account when developing this response action plan. If any portion of the response action is necessitated due to an aesthetic or nuisance condition, identify the nature of that condition and identify that portion of the response action proposed to address it. If any media that contains a PCLE zone is not addressed in this RAP, provide justification.

This Response Action Plan (RAP) has been prepared to provide a compilation of the proposed response action documented in the March 2005 initial RAP, the May 2006 RAP Addendum, and subsequent January 2007 RAP Addendum submittals, as well as address current amendments based on recent data. **Attachment 1A-1** depicts the layout of the North Plant.

The original RAP was submitted on March 31, 2005 and approved by the TCEQ in a letter dated May 11, 2005. An addendum to the RAP was prepared to accommodate remedial activities planned for the alkylate release within the MTBE plume area was submitted to the TCEQ on May 5, 2006 and approved by the TCEQ on August 26, 2006. This program was implemented in accordance with the RAP Addendum (dated January 26, 2007), approved by the TCEQ on May 29, 2007. Previous RAERs documenting response action effectiveness were submitted to the TCEQ on June 15, 2011, July 17, 2014, June 12, 2017, June 19, 2020 and June 21, 2023.

MTBE Dissolved Phase Plume

The response action for the MTBE groundwater plume in the North Plant is enhanced in-situ bioremediation by delivery of oxygen into groundwater through passive oxygenation at 22 selected locations within the MTBE plume. The objective of this program is to enhance natural biodegradation of the MTBE plume by promoting a nutrient and oxygen-rich environment in site groundwater.

Nutrients are introduced into the MTBE plume at 24 selected well locations. In order to achieve the objective, and as approved in the Underground Injection Control (UIC) permit (TCEQ Authorization No. 5X2600543), KMLT currently monitors nitrate levels in groundwater in wells associated within the MTBE plume. Nutrient levels were historically measured on a weekly basis. They were then conducted on a semiannual basis during the semiannual groundwater monitoring events with the employment of the nutrient canisters. Currently, the nutrient canisters are inspected monthly and if the nutrients in the canister are spent, additional nutrients are added.

The injection authorization was amended in December 2021 and November 2022. The first amendment approved the well status conversion of 22 injection wells (OW-1, OW-2, OW-4, OW-5, OW-6, and OW-8 through OW-24), as designated within the permit, from injection well status to monitor well status. These wells were subsequently plugged and abandoned in January and February 2022. The second amendment approved the well status conversion of 4 injection wells (DG-1 through DG-3 and UG-1), as designated within the permit, from injection well status to monitor well status. These wells were also plugged and abandoned on November 29, 2022.

Treatment of dissolved phase MTBE-impacted groundwater and impacted soils originating beneath the area of Tank 100-12 is treated in-situ with a passive delivery of oxygen and nutrient enriched water beneath Tank 100-12 through a sump inlet for a gravity feed infiltration gallery beneath Tank 100-12.

KMLT initiated an Accelerated Remediation Technologies (ART) Integrated Remediation System pilot test at the Tank 100-12 containment area in October 2016. The objective of the ART System pilot test was to treat the near-source area core of the MTBE plume within the Tank 100-12 containment area through a combination of in-situ air-stripping, air-sparging, and Soil Vapor Extraction (SVE). As part of the pilot test, amendments to existing UIC Permits 5X2600543B and 5X2600543C were implemented in 2016 for the

installation of two new injection wells and the injection of atmospheric air as an injectate ahead of ART System installation. The ART System equipment consists of two, 6-inch ART System atmospheric air injection wells and a dedicated skid unit containing the vapor extraction pump and a pneumatic well pump compressor.

The combination of MTBE response actions has proven to be successful as the dissolved MTBE plume has decreased in size while the concentrations of MTBE continue to decline as shown on **Attachment 1A-4.**

MTBE-affected groundwater currently extends from Tank 100-12 approximately 450 feet to the southwest and remains contained within the KMLT property. When the MTBE plume was initially delineated in 2011, it extended from Tank 100-12 approximately 600 feet to the southwest. Since the MTBE plume has been decreasing in size (aerial extent), KMLT has selectively reduced the number of wells used to monitor the down-gradient or cross-gradient extent of the MTBE plume. With the reduction on the MTBE plume extent, KM has also modified the locations of oxygenation wells (iSOC wells) to more effectively attenuate the MTBE Plume.

Attachment 1A-1 shows the location of the current response action components employed at the KMLT NP, including the RAP monitoring wells, the oxygenation wells, nutrient delivery wells, gravity feed infiltration gallery, and the ART System.

Alkylate Plume

The original RAP for the KMLT NP MTBE remediation was submitted to the TCEQ on March 31, 2005, and approved by the TCEQ on May 11, 2005. An alkylate release near Tank 100-11 was encountered within the MTBE dissolved-phase groundwater plume area during the original RAP implementation activities and is depicted on the Affected Property Map **(Attachment 1A-2).**

As stated in the January 2007 RAP Addendum, the response action for the free-phase alkylate plume was to recover alkylate at Tank 100-11 to minimal thicknesses (< 0.10 feet). Alkylate is currently being monitored and removed as necessary on a bi-weekly basis. During the 2023 reporting period, only observation well OW-3 had measurable alkylate that could be removed. The alkylate thickness has been substantially reduced through the recovery program. Based on a review of cumulative data through Second Half 2023, the Response Action for the free-phase alkylate plume has been achieved.

The full-scale MTBE remediation system (which was operated simultaneously with the previously approved remedy for the alkylate plume), was installed in August 2006 and has been in operation for 18 years, effectively decreasing the lateral extent of the groundwater plume. A review of the 2023 groundwater sampling data indicates that plume degradation is still occurring.

Based on the reduced lateral plume extent, a KMLT is proposing a modified Remedy Standard B to reduce the MTBE Remediation System well network to wells located within the immediate vicinity of the tank battery, establish a Plume Management Zone (PMZ) to monitor continued operation of the MTBE groundwater remediation, and implementation of institutional controls (*i.e.,* deed restriction).

What is the selected remedy standard for this affected property? ___ A X B

RAP Executive Summary	ID No.: SWR No. 30573 Page _3_ of _3_
	Report Date: June 28, 2024

List all media that contains a PCLE zone and specify the proposed response action for each media. Indicate the type of removal, decontamination, physical control and/or institutional control action that is proposed.

Media	COCs[1]	Removal	Decontamination	Control			
				Physical Control	Modified Groundwater Response Objective[2]		
					PMZ	WCU	TI
Groundwater	Alkylate (TPH)	X					
Groundwater	MTBE		X		X		

Is there a media that contains a PCLE zone that is not addressed in this RAP? X yes ___ no
If yes, provide justification for not addressing the PCLE zone in this RAP.

Remediation of MTBE affected soil at the North Plant was addressed in the original RAP submitted March 31, 2005, and approved by the TCEQ in a letter dated May 11, 2005. Since the approved soil remedy has already been implemented at the site and remains the same, this RAP amendment does not address soil media.

On-site land use: [ ] Residential [X] Commercial/Industrial
Off-site land use: [ ] Residential [X] Commercial/Industrial (check all that apply)

Is this a re-submittal or revision of a previous RAP? X Yes ___ No
If yes, explain why the RAP is being revised or resubmitted.

This submittal is provided to amend the portion of the January 26, 2007 RAP Addendum to address the change from Remedy Standard A to a modified Remedy Standard B, reducing the MTBE Remediation System well network to wells located within the immediate vicinity of the tank battery, establishing a PMZ to monitor continued operation of the MTBE groundwater remediation, and implementation of institutional controls (i.e., deed restriction).

Were all the appropriate notifications made in accordance with §350.55? X Yes ___ No
If no, explain why notifications were not made:

[1] Specify either a specific COC or, if the response action is the same for all COCs in one type, specify the type of COC (for example, VOCs, SVOCs, metals).
[2] If a modified groundwater response objective is proposed, check the type(s) of proposed modifications.

Chronology

Kinder Morgan Liquids Terminal (KMLT) LLC North Plant
Galena Park Texas Terminal

November 29, 2022 – Monitor wells UG-01, DG-01, DG-02, DG-03, were plugged and abandoned.

November 14, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

October 31, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

October 17, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

October 11, 2022 – Kinder Morgan received approval from the TCEQ for the Class V Authorization 5X2600543 to be amended for the conversion of the injection wells UG-1, DG1, DG-2 and DG-3 to monitor wells.

October 3, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

September 21, 2022 - Kinder Morgan submitted a Class V Injection Well Authorization/Inventory – Injection Well Status Change Request to the TCEQ UIC Permits Section – Radioactive Materials Division requesting the TCEQ to authorize the status change of 4 selected injection wells (DG-1 through DG-3 and UG-1) from injection well status to monitor well status.

September 19, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

September 6, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

August 22, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

August 9, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

August 1, 2022 – AECOM completed sampling of North Plant wells for MTBE and TPH.

July 25, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from

OW-3.

July 15, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

July 6, 2022 – AECOM submitted Semiannual Status Report – Class V Aquifer Remediation Injection Wells Permit.

June 16, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

May 31, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

May 16, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

May 4, 2022 – AECOM added 210 milligrams (mg) nitrate to wells MW-10A, MW-12, OW-25, OW-37 through OW-48, TMW-4, and TMW-8 through TMW-12.

May 2, 2022 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW- 03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

April 18, 2022 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

April 4, 2022 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW- 03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

March 21, 2022 - AECOM completed gauging the alkylate thickness for (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

March 8, 2022 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

February 22, 2022 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

February 18, 2022 - AECOM completed sampling of North Plant wells for MTBE and TPH.

February 7, 2022 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, OW-03, OW-7 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

January and February, 2022 - Observation wells OW-1, OW-2, OW-4 through OW-6, and OW-8 through OW-24 were plugged and abandoned.

January 13, 2022 - AECOM submitted Semiannual Status Report - Class V Aquifer Remediation Injection Wells Permit.

January 11, 2022 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

December 28, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

December 16, 2021 – TCEQ approved the well status conversion of 22 injection wells (OW-1, OW-2, OW-4 – OW-6, and OW-8 – OW-24), as designated within the permit, from injection well status to monitor well status was approved by the TCEQ via letter dated December 16, 2021.

December 13, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

November 29, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

November 19, 2021 - Kinder Morgan submitted a Class V Injection Well Authorization/Inventory – Injection Well Status Change Request to the TCEQ UIC Permits Section – Radioactive Materials Division requesting the TCEQ to authorize the status change of 22 selected injection wells (OW-1, OW-2, OW-4 through OW-6, and OW-8 through OW-24) from injection well status to monitor well status.

November 15, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

November 1, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

October 18, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

October 4, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

September 20, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

September 8, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

September 2, 2021 – AECOM added 210 mg nitrate to wells MW-10A, MW-12, OW-25, OW-37 through OW-48, TMW-4, and TMW-8 through TMW-12.

August 24, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

August 12, 2021 - AECOM completed sampling of North Plant wells for MTBE and TPH.

August 8, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

July 26, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

July 12, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

July 8, 2021 - AECOM submitted Semiannual Status Report - Class V Aquifer Remediation Injection Wells Permit.

June 28, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

June 14, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

June 1, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

May 17, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

May 4, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

April 19, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.
April 6, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

March 22, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM

removed alkylate from OW-3.

March 8, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

February 22, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

February 8, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

February 2, 2021 - AECOM completed sampling of North Plant wells for MTBE and TPH.

January 25, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

January 12, 2021 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

January 7, 2021 - AECOM submitted Semiannual Status Report - Class V Aquifer Remediation Injection Wells Permit.

December 30, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

December 15, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

December 1, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

November 17, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

November 2, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

October 19, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

October 5, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

September 23, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

September 8, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG- 03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

August 24, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

August 11, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

August 5, 2020 – AECOM added 210 mg nitrate to wells OW-43 through OW-48, TMW-4, TMW-8, TMW-9, and TMW-10.

August 4, 2020 - AECOM completed sampling of North Plant wells for MTBE and TPH.

July 28, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

July 14, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

July 13, 2020 - AECOM submitted Semiannual Status Report - Class V Aquifer Remediation Injection Wells Permit.

June 29, 2020 – AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

June 15, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

June 1, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

May 19, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

May 5, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

April 21, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-

03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

April 6, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

March 9, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

February 24, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

February 10, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3. AECOM added 210 mg nitrate to MW-12 and OW-7.

February 6, 2020 - AECOM completed sampling of North Plant wells for MTBE and TPH. February 3,

2020 – AECOM added 210 mg nitrate to MW-12, OW-7, and OW-4.

January 27, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

January 15, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

January 13, 2020 - AECOM submitted Semiannual Status Report - Class V Aquifer Remediation Injection Wells Permit.

January 8, 2020 – AECOM added 210 mg of nitrate to wells MW-10A, OW-25, OW-37 through OW-48, TMW-4, TMW-8, TMW-10, TMW-11, and TMW-12.

January 3, 2020 - AECOM completed gauging the alkylate thickness for wells (UG-01, DG-01, DG-02, DG-03, and OW-01 through OW-10 and MW-12) inside the containment of Tank 100-11. AECOM removed alkylate from OW-3.

Chronology between August 2006 and January 1, 2020 is provided in the July 17, 2014 Response Action Effectiveness Report (RAER), June 12, 2017 RAER, and June 19, 2020 RAER.

August 2006 - MTBE passive oxygenation system initiated.

August 2, 2006 - TCEQ approved RAP addendum for alkylate recovery system. July 13, 2006- TCEQ approved North Plant Tank Farm APAR Addendum.

2nd Quarter 2006 - Twenty-four oxygenation wells were installed for the full-scale implementation of the passive oxygenation system.

May 4, 2006 - Completed pilot-test for remediation of MTBE in groundwater using passive oxygenation.

January 19, 2006 - Began pilot-test for remediation of MTBE in groundwater using passive oxygenation.

January 2006 - Installed pilot test for passive oxygenation to enhance bioremediation of the MTBE in groundwater.

January 14, 2006- Alkylate recovery system initiated in Tank 100-11 containment area. April 28, 2006 - Submitted RAP Addendum for alkylate recovery system to TCEQ. April 22, 2006 - North Plant Tank Farm APAR Addendum submitted to the TCEQ.

1st Quarter 2006 - Alkylate was observed in MW-12, within the containment area of Tank 100-11.

1st Quarter 2006 - Approximately 13,000 cubic yards of MTBE-affected soil was excavated from an area west of Tank 100-12.

May 11, 2005 - TCEQ approved the RAP for the North Plant Tank Farm.

March 31, 2005 - The RAP for the North Plant Tank Farm was prepared by ARCADIS and submitted to the TCEQ.

November 10-11, 2004 – Seven permanent monitoring wells, MW-11 to MW-17, were installed in the North Plant Tank Farm.

July 16, 2004 – TCEQ approved the APAR for the North Plant Tank Farm, approved the HSVIZ for No Further Action, and requested a RAP for the Tanks.

February 3, 2004 – Borings were advanced and samples were collected by Tank 100-11 and 100-12 to test biodegradation in the field pilot study.

January 29, 2004 – APAR submitted for the North Plant Tank Farm.
January 15-22, 2004 – Excavation and backfill of impacted soil in the Historic Soil VOC Impact Zone took place.

January 7, 2004 – Borings were advanced and samples were collected by Tank 100-11 and 100-12 to test biodegradation in the field pilot study.

December 17, 2003 – The eighth injection event took place for the field pilot study.

November 26, 2003 – Borings were advanced and samples were collected by Tank 100-11 and 100-12 to test biodegradation in the field pilot study.

November 5, 2003 – The seventh injection event took place for the field pilot study.

October 23, 2003 – Borings were advanced and samples were collected by Tank 100-11 and 100-12 to test biodegradation in the field pilot study.

October 7-8, 2003 – The sixth injection event took place for the field pilot study.

September 18, 2003 – There was further field investigation to complete delineation of TPH in the North Plant. Borings NT-134A to NT-136A were advanced and sampled. These borings were advanced in the same locations as their namesakes.

September 18, 2003 – Borings were advanced and samples were collected by Tank 100-11 and 100-12 to test biodegradation in the field pilot study.

September 3-4, 2003 – The fifth injection event took place for the field pilot study.

August 21, 2003 – Borings were advanced and samples were collected by Tank 100-11 and 100-12 to test biodegradation in the field pilot study.

July 25, 2003 – The fourth injection event took place for the field pilot study.

July 15-17, 2003 – A trench was installed in the berm of Tank 100-12 (former Tank 118-2) in support of the field pilot study.

July 9, 2003 – The field investigation continued in order to complete the delineation of MTBE in soil by former Tank 118-1. Step-out borings NT-174 and NT-175 were advanced.

July 1-2, 2003 – The third injection event took place for field the pilot study.

June 23, 2003 – Further field investigation took place to complete the delineation of MTBE in soil by former Tanks 118-1 and 118-2. Borings NT-170 to NT-173 were advanced.

June 20, 2003 – Sampling of soil took place in the North Plant, and four injection points were installed in support of the field pilot study.

May 20, 2003 – The second injection event took place for the field pilot study.

May 19, 2003 – Borings were advanced and were samples collected by Tank 100-11 to test biodegradation in the field pilot study.

April 23-24, 2003 – The first injection event took place for the field pilot study.

February 28, 2003 – Samples were collected by Tank 100-11 to test biodegradation in the field pilot study.

February 18, 2003 – Samples were collected by Tank 100-11 to test biodegradation in the field pilot study.

October 26, 2002 – Groundwater samples were collected from temporary monitoring wells NT-166 to NT-169 installed in Clinton Drive.

October 2, 2002 – Shallow borings were advanced in the berms of the new tanks, Tank 100-11 and 100-12, to support efforts by Kinder Morgan to landscape the bermed area to control the flow of stormwater. The borings were designated NT-148 to NT-165.

August 29, 2002 – The laboratory bench scale study was completed. Ferric chloride emerged as the best candidate as a remediation reagent.

August 28, 2002 – The geotechnical study report was released. The report showed that the stratigraphic data did not preclude the possibility of migration of MTBE in groundwater offsite to the south.

July 25, 2002 – Kinder Morgan met with Harris County officials to inform them of the potential that MTBE crossed the property line in groundwater under Clinton Drive at concentrations in excess of the PCLs. Clinton Drive belongs to Harris County. Kinder Morgan sought permission to drill into the road to investigate the groundwater. The County gave Kinder Morgan advice as to how to obtain permission to drill in a public roadway.

July 2, 2002 – Temporary monitoring wells NT-143 to NT-147 were advanced to complete the delineation of MTBE in groundwater to residential assessment levels on three sides of the affected property. It was not possible to assess the south side because we did not yet have a permit from Harris County to stop traffic and drill into Clinton Drive.

June 25, 2002 – The geotechnical borings were surveyed.

June 18, 2002 – Geotechnical borings (GT-1 to GT-5) were advanced to determine whether the stratigraphy precludes the migration of MTBE across Clinton Drive.

May 22, 2002 – Temporary monitoring wells NT-131, NT-136, NT-140 to NT-142 were advanced to delineate the MTBE in groundwater to commercial/industrial PCLs.

April 23-25, 2002 – Temporary monitoring wells were advanced to delineate the MTBE in the area west of former Tank 118-2, to delineate the groundwater plume, and to complete the investigation of the Historic Soil VOC Impact Zone. Borings NT-129, NT-130, NT-132 to NT-135, NT-137, and NT-139 were advanced.

April 22, 2002 – Impacts in temporary groundwater monitoring wells of MTBE in groundwater at concentrations greater than 1 mg/L were confirmed in the southernmost portion of the North Plant in which drilling was feasible. ARCADIS recommended a stratigraphic study to determine if the transmissive sand pinched out under Clinton Drive. This hypothesis had support in data from the Texmark RFI and the observation that there was a buried stream channel, but existing data were insufficient to confirm this hypothesis without further investigation.

April 16-18, 2002 – ARCADIS oversaw the excavation and backfilling of impacted soil east of former Tank 118-1, and the installation of the gravity feed system.
April 15, 2002 – Temporary monitoring wells were advanced to delineate the groundwater plume toward the south: NT-121, NT-122, and NT-138.

April 1, 2002 – NT-112, a temporary monitoring well, was installed to locate the southeast extent of the MTBE plume.

March 25-27, 2002 – ARCADIS oversaw the installation of the former Tank 118-2 remediation system, including a pipe gallery of infiltration and extraction lines, and sparge points for the deeper vadose zone.

March 9-21, 2002 – ARCADIS oversaw the installation of the former Tank 118-1 remediation system, including a pipe gallery of infiltration and extraction lines, and sparge points for the deeper vadose zone.

March 6, 2002 – Borings were advanced to delineate potential soil and groundwater impacts from the Historic Soil VOC Impact Zone. In this area, NT-123, and NT-125 to NT-128 were advanced.

March 4-6, 2002 – Borings were advanced to delineate the groundwater plume to the west, and to locate the edge of the LNAPL plume by former Tank 118-2. One additional boring was advanced to complete the soil delineation east of former Tank 118-1. Borings NT-60, NT-108, NT-116 to NT-120, and NT-124 were advanced, and NT-98 advanced in the southeast corner of the affected property.

March 4, 2002 – Data became available showing MTBE detections in groundwater at concentrations greater than 1 mg/L in temporary monitoring wells along the southern boundary just north of the presence of utilities and other obstructions. These were the southernmost points feasible for drilling. ARCADIS informed Kinder Morgan, and recommended that confirmation sampling take place for NT-99, NT-101, NT-105, and NT-107.

February 26-27, 2002 – Excavation and backfilling of impacted soils in the central part of the footprint of former Tank 118-2 took place.

February 22-3, 2002 – Excavation and backfilling of impacted soils in former Tank 118-2 tank ring took place.

February 19, 2002 – The bench scale biogeochemical study commenced in Durham, North Carolina to determine the feasibility of six in-situ remediation reagents for MTBE and its degradation product, TBA.

February 18-21, 2002 – Borings were advanced to delineate the southern edge of the plume (NT-99 to NT-107, NT-111), and to locate the extent of the LNAPL plume (NT-86 to NT-90, NT-113 to NT-115); NT-50 extended to a greater depth to vertically delineate MTBE in soil by former Tank 118-1.

February 11-13, 2002 – Borings were advanced to delineate the MTBE that was discovered under the footprint and to the west of former Tank 118-2 (NT-73 to NT-85), and to delineate MTBE to the east of former Tank 118-1 (NT-48, NT-50, NT-52 to NT-54, NT-58A, NT-58B, NT-59A, and NT-59B).

February 6-7, 2002 – The initial seven borings were installed in the footprint of former Tank 118-2 (NT-66 to NT-72).

February 5, 2002 – Seven borings previously installed by hand auger within the footprint of former Tank 80-28 were extended by geoprobe to a depth of 16 feet to determine the vertical extent of TPH and MTBE. No constituents were detected at depths greater than 2 feet bgs, and no MTBE was detected in groundwater.

February 2, 2002 – Temporary monitoring well in boring NT-65 was converted into a permanent well, MW-10, in order to facilitate the recovery of LNAPL.

January 30, 2002 – Boring NT-65 was installed in order to determine if the LNAPL discovered in NT-64 was widespread. LNAPL was found; borings were advanced to delineate a soil impact by MTBE east of former Tank 118-1 (NT-45-51).

January 28-29, 2002 – Borings were installed on all four sides of former Tank 118-2 to determine if MTBE and TPH were present in soil surrounding the former tank (NT-61 to NT-64). LNAPL was discovered at NT-64.

January 28, 2002 – The investigation of former Tank 80-28 commenced with seven borings installed by hand auger within the tank footprint (NT-91 to NT-97). Detections of MTBE in NT-91, and detections of TPH in three borings, prompted further study. Borings were advanced near the footprint of former Tank 118-1 (NT-42 to NT44) to delineate MTBE in groundwater; the full list of parameters used in the RFI at the Kinder Morgan facility was analyzed in soil and groundwater at NT-42.

January 21, 2002 – Borings were installed on the other three of four sides (south boring was previously installed) of former Tank 118-1 to determine if MTBE had migrated in groundwater and soil from under the footprint of the former Tank 118-1 (NT-28, NT-29, and NT-31). Samples were collected south of the former tank to delineate MTBE (NT-39 to NT-41); discolored soil was observed in NT-28, thus the Historic Soil VOC Impact Zone was identified.

January 17, 2002 – Deeper samples were collected from an existing investigation point at the ring wall (NT-33).

January 15, 2002 – The first of four borings (NT-30) that were to surround former Tank 118-1 was advanced. The investigation of soil at the former tank continued with the advancement of a boring in an impacted area in the center of the tank (NT-32) and of several borings near the former ring (NT-33 to NT-38).

January 11, 2002 – The investigation of footprint of former Tank 118-1 began with seven initial borings (NT-21 to NT-27) advanced by geoprobe. TPH was not detected, but the detections of MTBE over PCLs in soil and groundwater indicated that further investigation was necessary.

January 9, 2002 – Kinder Morgan informed ARCADIS that the demolition on Tank 118-1 was complete and the demolition of Tank 118-2 was in progress. Kinder Morgan requested that ARCADIS conduct an investigation of the soil under the floors of the tanks to determine if there were environmental issues.

November 16, 2001 – Tank 118-1 was decommissioned. Tank 118-2 was decommissioned shortly thereafter. Both tanks were demolished in January 2002.

June 2001 – Kinder Morgan removed soil in the footprint under former Tank 80-27 in which the Tier 2 PCL for MTBE was exceeded. There were two excavations, one at NT-1 and the other at NT-6. Confirmation samples were collected.

June 18, 2001 – ARCADIS issued its report on the delineation of MTBE impacts at former Tank 80-27. The report recommended that all soil that was impacted with MTBE above Tier 2 PCLs be removed.

May 31, 2001 – Borings (NT-12 to NT-17) were advanced to delineate an area at NT-6 under the footprint of former Tank 80-27 in which MTBE exceeded the Tier 2 PCLs. A composite sample called "NT-18" (not a real boring) confirmed that TPH was below the applicable PCL.

May 22-23, 2001 – ARCADIS conducted an investigation of the soil and groundwater at and around the footprint of former Tank 80-27 (NT-1 to NT-11).

May 2001 – Tank 80-26 and Tank 80-27 were demolished. Kinder Morgan determined that there were no environmental issues with Tank 80-26, but called ARCADIS to investigate the footprint of former Tank 80-27.

March 2, 2001 – Kinder Morgan Liquids Terminals, LLC purchased the Galena Park facility from GATX Terminals Corporation.

Approximately 1990 – Tanks 80-26, 80-27, 80-28, 118-1, and 118-2 were converted from crude oil storage to MTBE storage.

1950's – GATX purchased a large portion of what is now the North Plant from Texaco. The land was part of a petroleum refinery.

April 3, 1944 – The earliest known aerial photograph was taken that shows former Tanks 80-26, 80-27, 80-28, 118-1, and 118-2.

1936 – Texaco erected several petroleum storage tanks including former Tanks 80-26, 80-27, 80-28, 118-1, and 118-2.

1928 – The Galena Signal Oil Company sold the property that now comprises the North, East and Central Plants to the Texas Company, the predecessor to Texaco.

Checklist for Report Completeness

ID No.: SWR No. 30573 Page _1_ of _2_

Report Date: June 28, 2024

Use this checklist to determine the portions of the form that must be submitted for this report. Answer all questions by checking Yes or No. If the answer is Yes include that portion of the report. If the answer is No, do not complete or submit that portion of the report. All form contents that are marked "Required" must be submitted. Form contents marked with an asterisk (*) are not included in the blank form and are to be provided by the person.

Form contents marked with an asterisk (*) are not included in the blank form.

Use this worksheet to describe the objectives for the response action in each media.

Response Action Objectives

List the environmental media to which this applies Groundwater
Repeat this section for each medium that has a different response action objective.

State the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33 as applicable. Explain how the response action is appropriate based on the hydrogeologic characteristics, COC characteristics, and potential unprotective conditions that could continue or result during the remedial period.

The objectives for the response action for groundwater as addressed in the March 2005 initial RAP, the May 2006 RAP Addendum, and subsequent January 2007 RAP Addendum are as follows:

- Remove recoverable free-phase alkylate from the groundwater surface in a portion of the dissolved phase MTBE plume to minimal thickness;
- Enhance soil biological activity and subsequent bioremediation of MTBE; and
- Mitigate the potential for plume migration and expansion of free-phase alkylate and dissolved phase MTBE.

Alkylate Plume

As stated in the January 2007 RAP Addendum, the response action for the free-phase alkylate plume was to recover alkylate at Tank 100-11 to minimal thicknesses (< 0.10 feet). The alkylate skimmer system, installed within the alkylate plume, has demonstrated the capability of recovering alkylate to minimal thicknesses. Alkylate is currently being monitored, and recovered when necessary, from wells within the plume. The alkylate thickness has been substantially reduced since recovery began in January 2006. A continued decrease in alkylate thickness in 2009 and 2010 was observed in select monitoring wells which currently have measurable alkylate. From January 2020 through May 2023, alkylate was only observed in monitoring well OW-3 at a thickness greater than 0.1 feet (0.11 feet in January 2020 and February 2023 and 0.14 feet in October 2022, respectively). Based on a review of cumulative data through Second Half 2023, KMLT believes that the Response Action Objective has been met and no further action related to the alkylate plume is required.

MTBE Dissolved Phase Plume

Oxygenation
The response action for the MTBE groundwater plume in the NP is enhanced in-situ bioremediation by delivery of oxygen into groundwater through passive oxygenation at 22 selected locations within the MTBE plume. The objective of this program is to enhance natural biodegradation of the MTBE plume by promoting a nutrient and oxygen-rich environment in site groundwater. The layout of the oxygenation system is wells is shown on **Attachment 1A-1.**

Nutrients
Nutrients have also been introduced into the MTBE plume at 24 selected well locations. In order to achieve the objective, and as approved in the UIC permit, KMLT used to monitor nitrate levels in groundwater from wells associated within the MTBE plume. Nutrient levels were historically measured on a weekly basis and on a semiannual basis during the semiannual groundwater monitoring events. Currently, the wells are monitored periodically. The nutrient canisters are inspected monthly and if the nutrients in the canister are spent, additional nutrients are added. Wells receiving nitrate addition are shown in **Attachment 1A-1**.

In the past, nutrients were added to selected wells by suspending a permeable bag with approximately 30

milligrams (mg) (2 teaspoons) of Scotts Osmocote® Mini Prill in the groundwater within the well to enhance natural biodegradation of the MTBE within the groundwater at selected well locations. Once hydrated, the Osmocote® slowly dissolves, diffusing the nitrates into the groundwater.

On March 11, 2019, Kinder Morgan notified the TCEQ of its intent to test a new type of nutrient delivery system consisting of a 2-foot long by 1-inch diameter section of slotted polyvinyl chloride (PVC) well screen, replacing the permeable bags. The canister nutrient delivery systems were initiated in May 2019.

The canisters deliver nutrients over a larger cross-sectional area of the water column over a longer period between monitoring periods versus the previous delivery system. During May 2019, these nutrient delivery canisters containing approximately 210 mg of nitrate each were placed into two wells, replacing the previous smaller nutrient-permeable bag systems. The design of the larger-capacity canisters is such that they only require monthly rather than weekly monitoring/replenishment. The nutrient canisters are inspected monthly and if the nutrients in the canister are spent, additional nutrients are added. Field observations indicate that the nutrient canisters deliver nitrates into the groundwater for up to 60 days. The canisters are not replaced but the nutrients are replenished as necessary.

ART System

The objective of the Accelerated Remediation Technology (ART) System pilot test was to treat the near source area core of the MTBE plume within the Tank 100-12 containment area through a combination of in-situ air-stripping, air-sparging, and Soil Vapor Extraction (SVE). The ART System equipment consists of two, 6-inch ART System atmospheric air injection wells and a dedicated skid unit containing the SVE vacuum pump and a pneumatic well pump compressor. Two SVE off-gas activated carbon drums in series are located adjacent to the dedicated skid unit to treat the off-gas. Vapors extracted from the ART wells are monitored with a photo-ionization detector (PID) during operation at several points within the system to monitor performance and identify potential leaks or problems. The ART System components and layout are illustrated on **Attachment 2A-1.**

Layout of the full-scale MTBE remediation systems is shown on **Attachment 1A-1**.

Explain how the COCs will be handled, treated, disposed, or transferred to another media and document that the response action will not result in any additional potential exposure conditions due to response action activities.

Recovered alkylate is temporarily stored in a polyethylene tank located adjacent to the recovery wells. KMLT removes alkylate from the polyethylene tank with a vacuum truck, and the recovered alkylate is then transferred to another tank at their facility used for managing off-specification liquid products.

No MTBE is recovered from the *in situ*, passive oxygenation remediation system. The response action is degrading the concentration of MTBE in groundwater to a concentration below the 0.73 mg/L commercial industrial PCL within the containment areas and 0.24 mg/L residential PCL at downgradient property lines.

State the proposed “reasonable time frame” and provide the justification for that time frame in the context of any potential for unprotective exposures to exist or develop, COC characteristics, hydrogeologic and affected property characteristics. If the reasonable time frame is different for the different affected media or for particular tracts of land, be sure to discuss that. Provide how the proposed response action will meet the objectives in a reasonable timeframe.

KMLT will continue operation of the current passive oxygenation system in order to control plume migration and to promote MTBE degradation for 10 years. Since the MTBE plume has decreased significantly in extent, KMLT is proposing to continue MTBE remediation activities within the immediate

tank battery area and establish a PMZ to monitor MTBE plume stability and continued plume degradation over time on a semiannual basis.

Soil Response Action Objectives

When using removal and/or decontamination with controls or controls only, demonstrate how that physical control or combination of measures will reliably contain COCs within and/or derived from the surface soil and subsurface soil PCLE zone materials over time.

Not Applicable

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical surface soil and subsurface soil PCL throughout the soil PCLE zone and prevent COC concentrations above the critical soil PCLs from migrating beyond the existing boundary of the soil PCLE zone.

Not Applicable

Groundwater Response Action Objectives

Name of groundwater-bearing unit to which this information applies Sandy Channel Fill
Repeat this section for each groundwater-bearing unit for which a different response action is proposed.
Groundwater classification ____ 1 X 2 ___ 3

Is a modified groundwater response action being proposed for any part of the groundwater PCLE zone (§350.33(f)(2), (3), or (4))? X Yes ____ No

If yes, does the affected property meet the qualifying criteria for a modified groundwater response action using a waste control unit, plume management zone, or technical impracticability? X Yes ____ No

If yes, complete the appropriate portions of this report.
If no to either question, complete the following:

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical groundwater PCL throughout the groundwater PCLE zone and prevent COC concentrations above the critical groundwater PCL from migrating beyond the existing boundary of the groundwater PCLE zone.

Not Applicable

Explain how the response action will prevent COCs from migrating to air at concentrations above the PCLs for air if the groundwater-to-air PCLs ($^{Air}GW_{Inh\text{-}V}$) is exceeded.

Not Applicable

Explain how the response action will prevent COCs from migrating to surface water at concentrations above the PCLs for groundwater discharges to surface water if surface water is a factor.

Not Applicable

Explain how the response action will prevent human and ecological receptor exposure to the groundwater PCLE zone.

Not Applicable

Response Action Design

Use this worksheet to provide detailed descriptions of the response action. Attach design and layout drawings and equipment specifications in Attachment 2A.

Media: Groundwater
List all media to which this information applies. If the response action is different for another media, complete a separate worksheet.

Provide a detailed description of the response action. Describe the removal action, decontamination, treatment system(s), and/or physical or institutional control actions that are proposed for each media and discuss the reasons for choosing the response action(s). Identify and describe any ecological services analysis and compensatory restoration plan that will be utilized (if so, include the complete ESA and compensatory restoration plan in Attachment 2C).

Alkylate Plume

As stated in the January 2007 RAP Addendum, the response action for the free-phase alkylate plume was to recover alkylate at Tank 100-11 to minimal thicknesses (< 0.10 feet). The alkylate recovery system was initiated on January 14, 2006. Alkylate was initially recovered with a skimmer pump system. However, due to diminishing volumes of alkylate recovered using the skimmer pump system, the pumps were deactivated in February 2010. Hand bailing was being conducted on an as needed basis in OW-3, the only well with measurable alkylate. Alkylate gauging of monitoring wells was then conducted on a bi-weekly basis and recorded.

MTBE Dissolved Phase Plume

As presented in the January 26, 2007 RAP Addendum, MTBE is being removed by enhanced bioremediation through the passive oxygenation of affected groundwater. This response action was chosen due to the tendency for MTBE to be degraded by microbial organisms. Passive oxygenation was chosen because it allows for oxygen to be dissolved by groundwater through contact with a large static oxygen surface within the emitter, rather than by sparging or other turbulent dissolution processes, which may cause COCs to volatilize and spread.

Twenty-four wells placed throughout the plume have been fitted with oxygen emitters (iSOC® units) to passively deliver oxygen to groundwater *in situ* **(Attachment 2A-2).** As demonstrated by the pilot system, an increase in the DO of the affected groundwater will enhance the microbial activity within the affected area and will subsequently decrease the MTBE concentrations in the affected media.

Nutrients are also introduced into the MTBE plume at 24 selected well locations. In order to achieve the objective, and as approved in the UIC permit, KMLT used to monitor nitrate levels in groundwater from wells associated within the MTBE plume. Nutrient levels were historically measured on a weekly basis and on a semiannual basis during the semiannual groundwater monitoring events. Currently, the wells are monitored periodically. The nutrient canisters are inspected monthly and if the nutrients in the canister are spent, additional nutrients are added. Wells receiving nitrate addition are shown in **Attachment 1A-1**.

Nutrients are added to the monitoring wells by suspending a 2-foot long by 1-inch diameter section of slotted polyvinyl chloride (PVC) well screen filled with approximately 210 mg of Scotts Osmocote® Mini Prill in the groundwater within the well to enhance natural biodegradation of the MTBE within the groundwater at selected well locations. The nutrient canisters are inspected monthly and if the nutrients in the canister are spent, additional nutrients are added. The canisters are not replaced but the nutrients are replenished as necessary.

To allow for fluctuations in COC concentrations and flow heterogeneities, KMLT will adjust the number

and location of iSOCs as needed within the parameters of the UIC permit.

ART System

The objective of the Accelerated Remediation Technology (ART) System pilot test was to treat the near source area core of the MTBE plume within the Tank 100-12 containment area through a combination of in-situ air-stripping, air-sparging, and Soil Vapor Extraction (SVE). The ART System equipment consists of two, 6-inch ART System atmospheric air injection wells and a dedicated skid unit containing the SVE vacuum pump and a pneumatic well pump compressor. Two SVE off-gas activated carbon drums in series are located adjacent to the dedicated skid unit to treat the off-gas. Vapors extracted from the ART wells are monitored with a photo-ionization detector (PID) during operation at several points within the system to monitor performance and identify potential leaks or problems. The ART System components and layout are illustrated on **Attachment 2A-1.**

The ART System was activated on October 26, 2016, after receipt of amendment approval of Class V Injection Well Authorization 5X2600543 for two additional injection wells and addition of atmospheric air as an injectate. The ART system was initially operated only during daylight hours while a field technician was at the site. The system was later modified to maintain a lower operating temperature and as of February 24, 2020, the system now operates 24 hours per day during the work week when possible. KMLT is proposing to continue running the ART system to promote continued degradation of any residual source mass that may still be present in soil at the foot of Tank 10-112.

Plume Management Zone

Based on the continued decrease in MTBE concentrations and the current lateral plume extent, a PMZ will be implemented to contain COCs within the limits of KMLT property.

Institutional Controls

Institutional controls in the form of a deed recordation will also be implemented as an administrative COC exposure control.

Describe all major treatment system components and equipment of the response action. Illustrate the response action design and provide equipment specifications in Attachment 2A.

Attachment 1A-1 depicts the modified MTBE system layout and passive oxygenation system components proposed in this RAP. The system includes:

- Oxygenation wells fitted with iSOC® oxygen emitters and individual oxygen cylinders
- ART system connected to ART-1 and ART-2 wells
- 10 permanent monitor wells to be used as Plume Management Zone (PMZ) wells (shown in **Attachment 2-D**)

List permits or registrations needed to construct or implement the response action, including permits or registrations needed to conduct studies or tests. For VCP sites, list the permits that would be required if the site was not in the VCP (required by the VCP).

Permitting/Registration Authority	Type of permit/registration	Permit or registration number if already issued	Anticipated application date
TCEQ UIC	Class V Injection Permit	5X2600543	09/14/2009

Identify and discuss the results of any studies or tests, such as pilot studies, feasibility studies, technical impracticability studies, treatability studies, and/or toxicity studies conducted or proposed to be conducted at the affected property. Discuss the reason for the study or test and how it verifies the effectiveness and

appropriateness of the chosen response action or documents that a particular response action is not appropriate for the affected property. Describe how the results of completed studies or tests determined the design or choice of response action. Attach any separate reports and supporting documentation in Appendix 3.

Not Applicable

Plume Management Zone	RAP Worksheet 2.1	Page 1 of 2
Associated Information: Attachments 2D, 2E	ID No.: SWR No. 30573	Report Date: June 28, 2024

Complete this worksheet when a PMZ is proposed as part of the response action. Include in Attachment 2D a map of the proposed PMZ with alternate POE(s) and attenuation monitoring points identified and the current groundwater PCLE zone. If a PMZ is not proposed, do not submit this worksheet.

Groundwater-bearing unit Sandy Channel Fill
Repeat this worksheet for each groundwater-bearing unit for which a PMZ is proposed.
Groundwater classification **X** 2 ____ 3

Provide justification as to why the PMZ is appropriate in accordance with §350.33(f)(4)(A). Include supporting documentation in Attachment 2E.

The combination of MTBE response actions has proven to be successful as the dissolved MTBE plume has decreased in size while the concentrations of MTBE continue to decline as shown on **Attachment 1A-2**. MTBE-affected groundwater currently extends from Tank 100-12 approximately 450 feet to the southwest and remains contained within the KMLT property. When the MTBE plume was initially delineated in 2011, it extended from Tank 100-12 approximately 600 feet to the southwest. Since the MTBE plume has been decreasing in size (aerial extent), KMLT has selectively reduced the number of wells used to monitor the down-gradient or cross-gradient extent of the MTBE plume. With the reduction on the MTBE plume extent, KM has also modified the locations of oxygenation wells (iSOC wells) to more effectively attenuate the MTBE Plume.

The affected groundwater bearing unit is classified as Class 2 groundwater. Any groundwater that may be used in the area will be obtained from deeper (greater than 100 feet below ground surface) aquifers and utilized for industrial water supplies. Water in the area surrounding the site is provided by a public water supply system and therefore, eliminating the need for local groundwater as a drinking water supply source.

Is the alternate POE proposed to be beyond the current limits of the PCLE zone? ____ Yes X No
If yes, how far? Not Applicable (§350.37(l) or (m) as applicable)
Is it to be off-site? ____ Yes X No
On an off-site property that currently does not contain a residential-based groundwater PCLE zone?
____ Yes X No

If yes and this is a Class 2 groundwater, provide the basis for concluding that this groundwater does not have a reasonably anticipated future beneficial use (§350.37(l)(3)).

Not Applicable

Is NAPL present? ____ Yes X No
If so, describe how the response action will achieve the performance criteria in §350.33(f)(4)(E).

Not Applicable

If this is a Class 2 groundwater, explain how the response action will ensure that leachate from the surface soil and subsurface soil PCLE zones will not increase concentration of COCs greater than the current measured concentrations (at time of RAP submittal). (§350.33(a)(2))

The release occurred near the base of the tank. Affected soils were removed and backfilled with clean fill, eliminating the potential of leachate from the surface soil and subsurface soil PCLE zones to groundwater. Furthermore, the top of the uppermost groundwater bearing unit is located 7 to 10 feet below ground surface, with overlying soils comprised of low transmissivity clays, further mitigating the potential of leachate from the surface soil and subsurface soil PCLE zones to groundwater.

Plume Management Zone	RAP Worksheet 2.1	Page _2_ of _2_
Associated Information: Attachments 2D, 2E	ID No.: SWR No. 30573	Report Date: June 28, 2024

Provide the basis that the COCs will not migrate beyond the downgradient boundary of the PMZ at concentrations above the critical PCL. Include supporting documentation in Attachment 2E.

A review of the historic groundwater data for the past 10 years shows the plume to be shrinking in a direction farther away from the proposed Point of Exposure (POE) wells. Based on this long term trend, KMLT does not believe that the plume will extend beyond the downgradient boundary of the PMZ.

Describe the methods used to determine that there are no artificial penetrations which can allow COCs to migrate from the groundwater PCLE zone to currently unaffected groundwater-bearing units. Include supporting documentation in Attachment 2E.

A review of the Texas Water Development Board online water well interactive maps as well as the Railroad Commission of Texas' Oil and Gas well interactive maps did not identify any current or historic wells within the groundwater plume extent. Furthermore, the powerline right-of-way located northeast of the plume is upgradient/crossgradient of the groundwater plume, mitigating the potential for downward COC migration via powerline tower footers.

List the attenuation action level determined for each attenuation monitoring point. Illustrate the proposed attenuation monitoring points and the groundwater PCLE zone on the map in Attachment 2D. Include all calculations and other methods of determining the attenuation action levels in Attachment 2E.

COC	Attenuation Monitoring Point (well number)	Attenuation Action Level (mg/L)	Attenuation Action Level limited by $^{Air}GW_{Inh\text{-}V}$ or existing COC concentration? Y/N
Methyl-tert butyl ether	TMW-07A	0.49	N
	OW-36	1.34	N
	OW-31	1.34	N

Waste Control Unit	RAP Worksheet 2.2	Page 1 of 1
Associated Information: Attachment 2F	ID No.: SWR No. 30573	Report Date: June 28, 2024

NOT APPLICABLE

Use this worksheet to document the use of a waste control unit to modify the groundwater response actions (§350.33(f)(2)). Provide a map in Attachment 2F of the waste control unit overlying the PCLE zone. Include proposed institutional controls in Appendix 4. If this modification does not apply, do not submit this worksheet.

Is the waste control unit an existing unit? ____ Yes ____ No
If yes, provide: the permit number _____
description _____
status ____ active ____ closed

Describe how the existing or proposed WCU meets the definition set forth in §350.4(a)(91).

If the WCU is proposed, identify any applicable permitting process that must be completed prior to operation of the WCU.

Has the applicable permit been pursued yet? ____ Yes ____ No
If not, when will this be initiated?

Technical Impracticability	RAP Worksheet 2.3 Page _1_ of _1_	
Associated Information: Attachment 2G	ID No.: SWR No. 30573	Report Date: June 28, 2024

NOT APPLICABLE

Use this worksheet to justify the use of technical impracticability (TI) to modify the groundwater response objectives. Also complete Worksheet 2.2 to propose a plume management zone for the TI area. Include a map of the groundwater PCLE zone and area of technical impracticability in Attachment 2G. Include in the attachment any other documentation needed to make the justification. If technical impracticability is not proposed as part of the response action, do not submit this worksheet.

Describe the groundwater PCLE zone and demonstrate in accordance with *Guidance for Evaluating the Technical Impracticability of Ground-Water Restoration* (EPA OSWER Directive 9234.2-25), unless otherwise approved by TCEQ, why it is technically impractical to reduce the COC concentrations to the critical PCLs, taking into account all currently available remediation technologies, and hydrogeologic and chemical-specific factors. Identify the specific COCs and list the PCLs that cannot be achieved.

Are there groundwater COCs in excess of the critical PCLs beyond the TI area? ___ Yes ___ No
If yes, make sure removal/decontamination actions are documented in Worksheet 1.0.

Will actions be required or already completed to prevent COC migration outside the area of technical impracticability and/or outside the existing boundary of the groundwater PCLE zone?
____ Yes ____ No
If yes, make sure removal/decontamination actions are documented in Worksheet 1.0.

Institutional Control	RAP Worksheet 2.4 Page _1_ of _1_	
Associated Information: Appendices 4, 5	ID No.: SWR No. 30573	Report Date: June 28, 2024

Complete this worksheet if an institutional control will be used as part of the response action. Include a draft of the proposed institutional controls in Appendix 4. Provide a list of landowners from whom landowner concurrence will be requested, as necessary, in Appendix 5.
Specify the property for which this applies. *Kinder Morgan Liquids Terminals, LP. – Tank 100-11 (Formerly Tank 118-1)*
Repeat this worksheet for each different property for which an institutional control will be used.

Institutional Control	Type of Institutional Control[1]				Property Ownership		Anticipated Filing Date[2]
	Deed Notice	Restrictive Covenant	VCP Certificate of Completion	Equivalent zoning or governmental ordinance	Check if pertinent tract of land is owned by the person	Check if the pertinent tract of land is owned by an innocent owner or operator	
Document use of commercial/industrial land use (§350.31(g))	X				X		180 days following RAP Addendum Approval
Document use of physical or institutional control under Remedy Standard B §350.31(g))	X				X		180 days following RAP Addendum Approval
Document notice of on-going long term response action (§350.31(h))	X				X		180 days following RAP Addendum Approval
Document use of occupational inhalation criteria as RBELs (§350.74(b)(1))							
Document variance from the default exposure factors (§350.74(j)(2)(L))							
Document the use of a non-default soil exposure area (§350.51(l)(3)&(4))							
Document WCU exclusion area (§350.33(f)(2))							
Document establishing a PMZ (§350.33(f)(4)(C)(I))	X				X		180 days following RAP Addendum Approval
Document the demonstration of technical impracticability (§350.33(f)(3)(F))							
Relocation of soils containing COCs for reuse (§350.36(b)(4) and (c)(4))							

[1] Check the appropriate box(es) to indicate the type of institutional control required for the proposed response action.
[2] Specify date or amount of time after RAP approval.

Performance Measures and Potential Problems	RAP Worksheet 3.0 Page _1_ of _1_	
	ID No.: SWR No. 30573	Report Date: June 28, 2024

Performance Measures

List and describe the performance measures for each environmental medium containing a PCLE zone that will be used to determine if reasonable progress is being made by the response action in a timely manner. Use these measures to document effectiveness of the response action in the RAER.

Performance of the oxygenation system will be monitored by sampling observation wells for DO and MTBE. Evaluation of the oxygenation/nutrient system effectiveness will be evaluated on a semiannual basis. KMLT may propose to reduce and/or decommission the oxygenation/nutrient system based on observed decreasing trends. KMLT will request regulatory closure if AMP and POE concentrations are reported at concentrations less than AALs/PCLs for a minimum of 3 years following oxygenation/nutrient system decommissioning.

Potential Problems

Complete the table for the response action. When the response action consists of several components or multiple actions, complete one table for each major component or action.

Response Action Name/Designation: MTBE Passive Oxygenation/Nutrient System

List the potential problems that might be reasonably anticipated for the response action, describe the impact of each problem, and the response to the problem.

Description of the Potential Problem	Impact	Will this cause a response action failure?		Corrective Response
		Yes	No	
DO rates are not increasing	Leak in oxygen line	X		Periodic checking of oxygen levels in groundwater and checking pressure in oxygen line.
MTBE degradation not occurring as expected	Additional nutrients (*i.e.*, phosphorus and nitrogen) needed	X		Periodically inspect nutrient delivery canisters and add additional nutrients as needed.
Increase in MTBE concentrations in source area and/or AMP wells	Regulatory non-compliance	X		Reinstate MTBE Passive Oxygenation/Nutrient System at monitor wells TMW-04, TMW-08, TMW-09, OW-43 and OW-48

Monitoring and Sampling Associated Information: Attachment 3A	RAP Worksheet 3.1 Page _1_ of _2_	
	ID No.: SWR No. 30573	Report Date: June 28, 2024

List the monitoring and sampling of COC concentrations or other parameters that will be conducted during the response action. Illustrate the monitoring or sampling locations in Attachment 3A. If statistics or geostatistics will be used, provide details in Appendix 7. If monitoring or observation wells will be constructed for the response action, provide well construction details in Attachment 2B if not previously provided.

Monitored Media	COC[1]	Other parameter (specify)	Sampling Method[2]	Sampling points or locations[3]	Depth/ Height[4] (ft.)	Analytical or Field Screening Method	Sampling or Monitoring Frequency[5]
Surface Soil							
Subsurface Soil							
Groundwater	MTBE	Dissolved Oxygen (DO)	Low Flow Groundwater Sampling	*Background wells:* MW-11; MW-13A *Source Area Wells:* OW-42; OW-45; *Attenuation Monitoring Point (AMP) Wells:* TMW-07A; OW-36; OW-31 *Point of Exposure (POE) Wells:* MW-15; MW-16; MW-18		MTBE via SW 846 EPA Method 8260	Semi-annually
Surface water							
Sediment							
Air							
Other Media (specify)							

Explain the reasons for the above-listed monitoring and sampling plan.

Semi-annual monitoring of MW-10A, MW-11, MW-12, MW-13, MW-14, MW-15, MW-16, and MW-18 has been conducted as part of the MTBE plume remediation dating back to February 2011 The following wells have been monitored voluntarily by KMLT to demonstrate effectiveness of the response action: MW-10A, MW-11, MW-14, OW-1, OW-11, OW-14, OW-15, OW-20, OW-23 , OW-25, OW-29, OW-37, OW-42, OW-43, OW-45, TMW-01, TMW-

[1] Specify the COCs to be monitored in this media. List either type of COC (such as VOCs, metals) if all the COCs of that type will be monitored the same way.
[2] Describe the sampling or monitoring methods and QC procedures in Appendix 1 unless the proposed sampling or monitoring procedure is the same as the sampling or monitoring procedure described in the APAR.
[3] Specify the sampling or monitoring point, such as the specific monitor well or general sampling or monitoring location.
[4] Specify the depth or height of the sampling or monitoring points.
[5] Specify the frequency at which this monitoring or sampling will occur.

02, TMW-03, TMW-04, TMW-08, TMW-7, TMW-11, TMW-13, and TMW-15. Based on current plume concentrations lateral extent(s), the following wells are being proposed to be monitored as part of the PMZ: Background wells: MW-11, MW-13A; Source Area Wells: OW-42, OW-45; Attenuation Monitoring Point (AMP) Wells: TMW-07A, OW-36 OW-31; and Point of Exposure (POE) Wells: MW-15, MW-16, MW-18.

Operation and Maintenance	RAP Worksheet 3.2	Page _1_ of _1_
	ID No.: SWR No. 30573	Report Date: June 28, 2024

Response Action Name/Designation: MTBE Passive Oxygenation/Nutrient Delivery System
List all portions of the response action to which this information applies.

Describe the O&M and inspection activities that will be required to operate and maintain response action components.

System performance will be monitored on a weekly basis. The monitoring activities will include documenting the volume of oxygen in each oxygen cylinder, checking the pressure gauges, and visually inspecting the oxygenation wells, gas cylinders, hosing and connectors.

List and discuss the key operating parameters for a properly functioning response action. Address how changes in these parameters will result in operating changes, providing sufficient detail to explain how the operator will know the component is functioning properly.

The primary consideration is to ensure that the oxygen lines are not leaking and that oxygen is being delivered to the iSOCs. The system will generally be inspected weekly to determine whether sufficient oxygen is being delivered to the wells. If a leak or drop in pressure is detected, the system will be closely inspected to determine the cause of the problem and it will be repaired.

List the routine tasks required to operate the response action.

- Check oxygen pressure on the gas cylinder;
- Visually inspect oxygenation wells, gas cylinders, hosing and connectors;
- Periodically sample observation wells for DO and MTBE

List the routine tasks required to maintain the response action, including scheduled inspections, maintenance, and component replacement.

Operation and maintenance described in the preceding sections will be generally performed on a weekly basis.

Confirmation Sampling Plan	RAP Worksheet 4.0 Page _1_ of _2_	
Associated Information: Attachment 4A	ID No.: SWR No. 30573	Report Date: June 28, 2024

List the COCs and other parameters that will be sampled to confirm completion of the response action. Illustrate the monitoring or sampling locations in Attachment 4A. If monitoring or observation wells will be constructed for the response action, provide well construction details in Attachment 2B if not previously provided. If needed, describe the sample collection and handling methods, if not previously provided, in Appendix 6.

Media	COC[1]	Other parameter (specify)	Sampling Method	Sampling points[2]	Depth/ height (ft.)	Analytical Method	Sampling Frequency
Surface Soil							
Subsurface Soil							
Groundwater	MTBE	Dissolved Oxygen (DO)	Low Flow Groundwater Sampling	*Background wells:* MW-11; MW-13A *Source Area Wells:* OW-42; OW-45; *Attenuation Monitoring Point (AMP) Wells:* TMW-07A; OW-36 OW-31 *Point of Exposure (POE) Wells:* MW-15; MW-16; MW-18		MTBE via SW 846 EPA Method 8260	Three semiannual events
Surface water							
Sediment							
Air							
Other media (specify)							

[1] Specify either a specific COC or type of COC (such as VOCs, metals).
[2] Specify the sampling point to the degree it is known, (for example, MW-1, or near former boring #2).

Explain the reasons for the above-listed sampling plan. Discuss statistical or geostatistical methodology(ies) which will be applied, if any, in the data collection process. Discuss any assumptions made in the statistical/geostatistical assessment, and how they will be met.

When an MTBE concentration in the Source Area and observations wells demonstrate a continuing decreasing trend in AMP and POE wells, the TCEQ will be notified and the oxygenation system will be deactivated. The observation wells will be monitored for three semiannual events to verify that MTBE concentrations do not increase.

Post-Response Action Care Associated Information: Attachments 5A-5C	RAP Worksheet 5.0 Page _1_ of _2_ ID No.: SWR No. 30573	Report date: June 28, 2024

Complete this worksheet only if Remedy Standard B will be used.

What is the proposed initial post-response action care period? (default 30 yr.) __10__ years

If the proposed initial post-response action care period is less than 30 years, provide a technical justification in accordance with §350.33(h).

Based on historic MTBE degradation trends since the MTBE remediation system was installed, KM expects MTBE concentrations to degrade to commercial/industrial PCL concentrations within 10 years.

What is the foreseeable land use during the post-response action care period? commercial/industrial

Describe how the future use of the property will not compromise the integrity of the physical controls, will not interfere with the function of the monitoring systems, will not pose a threat to human health or the environment, and will be in accordance with any institutional controls.

No physical controls are being implemented for this response action. No change in future land use is anticipated for the upgradient portion of the plume closest to Tank 100-112. Should the portion of the site towards the downgradient end of the plume be developed, monitor wells will be converted to at grade completions; iSOC/nutrient delivery wells will be converted to below grade vaults to mitigate the potential for damage from vehicular traffic and/or construction activities.

Briefly describe the proposed post-response action care activities. Describe the type of monitoring and/or inspections to be performed. Discuss the rationale for not including COC(s) analyzed during the response action, monitoring or sampling point location, frequency of monitoring and/or inspections, and the duration of the monitoring program.

N/A

Will PRAC sampling procedures be the same as those as previously documented for monitoring and/ or confirmation sampling? __X__ Yes ___ No

If no, provide in Appendix 6 a description of the monitoring or sampling collection procedures to be conducted during the post-response action care period.

Cost Estimate

Complete this portion of the form only if a physical control is proposed (installed hydraulic control system, slurry wall, cap, etc.). Provide in Attachment 5B a detailed cost estimate for a third party to operate and maintain the physical control during the PRAC period, based on current dollar amount.

Specify the physical control to which this information applies _____
Complete this worksheet for each physical control that will be used as part of the response action.

What is the total estimated annual cost of O&M for the PRAC period? $ _____

What is the total estimated cost for a third party to perform PRAC activities? $ _____

Identify the type of financial assurance mechanism to be used, and the contact person managing fiduciary responsibility, if known.

N/A

Does the person meet the criteria and definition of a small business? (see §350.33(n)) ___Yes ___No

If yes and the person desires to pursue the reduced amount of financial assurance, provide a legally binding affidavit as Attachment 5C. Include in the affidavit the information requested in 30 TAC §350.33(l), (m), and (n). An example affidavit is attached in the instructions.

Implementation Schedule	RAP Worksheet 6.0 Page _1_ of _1_	
	ID No.: SWR No. 30573	Report Date: June 28, 2024

Document the proposed schedule for implementing the response action. Include all major response action activities through the life of the project, including all removal, decontamination, and control actions, component installations, O&M, monitoring, and post-response action care activities.

Implementation of Response Action (specify component or action)	**Start**	**Finish**	**Duration**
Install and operate alkylate removal skimmer system	January 2006	December 2007	2 year (estimated maximum)
Post-removal interface probe measurements	January 2008	June 2008	2 quarters
Install and operate MTBE oxygenation system	January 2007	January 2034	37 years
Post –response MTBE monitoring	January 2034	June 2034	2 quarters

List the proposed schedule for report submittals. Add additional lines if more reports than listed will be needed to complete the response action.

Reports	**Submittal date**
Response Action Effectiveness Report (RAER)	
RAER submittal number 1	RAERs to be discontinued and incorporated into annual Corrective Action Report
RAER submittal number 2	N/A
RAER submittal number 3	N/A
Response Action Completion Report (RACR)	
Post-Response Action Care Report (PRACR)	
PRACR submittal number 1	
PRACR submittal number 2	
PRACR submittal number 3

iSOC® Product Information

iSOC® info

iSOC® YOUR ULTIMATE MANAGED ATTENUATION TOOL

iSOC® UPDATES

iSOC® has become a very popular bioremediation tool for remediating a wide range of contaminants, including recalcitrant compounds in groundwater and saturated porous media. iSOC® has already been used at hundreds of sites for effective hydrocarbon remediation, but we are continuing to improve and extend the technology.

A New Application of iSOC® Technology: Chlorinated Sites

Recently, iSOC® technology has been applied to sites contaminated with chlorinated hydrocarbons using oxygen and other gases to treat chlorinated sites under both anaerobic and aerobic conditions. Our website has been updated to reflect these bioremediation alternatives and various processes and soon our microcosm studies will provide more information to optimize delivery of combinations of gases to best stimulate the biological degradation of harmful substances.

A Micro-sized Control Panel

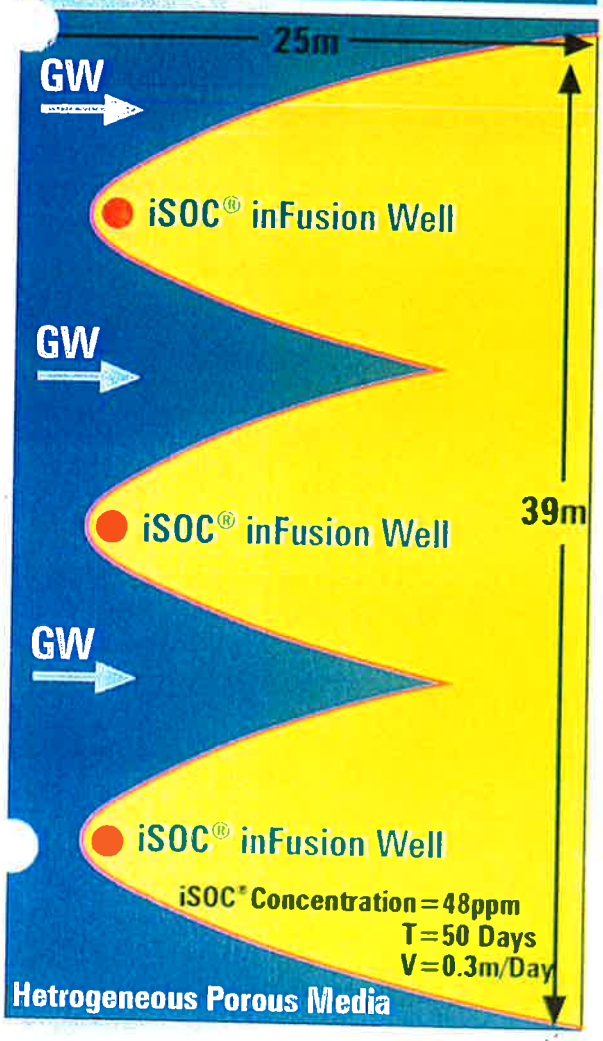
iSOC® is often used in individual wells with a small access box covering the well. While this set-up is cost-efficient and convenient, requiring no major site disruption or costly installation, the size of the access box is very limiting. Using innovative technology originally developed by NASA and successfully proven on our other Gas inFusion devices, we developed a small gas flow control device to sit in the top of the iSOC® unit. The result is a much simpler and easier installation that benefits the consultant and site owner both.

iSOC® AND BIOREMEDIATION ENHANCEMENT

iSOC® is an ingenious gas delivery system based on inVenture's patented Gas inFusion technology - a unique method of infusing supersaturated levels of dissolved gas into liquids. At the heart of iSOC®, the proprietary structured polymer mass transfer device is filled with micro-porous hollow fiber that provides an enormous surface area for mass transfer - in excess of 7000 m^2/m^3. It is hydrophobic and therefore excludes water. Maintaining gas pressure less than the surrounding liquid pressure ensures that ultra efficient mass transfer takes place without sparging.

In an aerobic bioremediation application, the iSOC® supersaturates the monitoring well with low decay dissolved oxygen (DO), typically 40-200 PPM depending on depth in groundwater. A natural convection current and a designed release bubble from the top of the iSOC® fills the well with a uniform DO curtain. The supersaturated DO curtain of water disperses around the well into the adjacent groundwater and enhanced bioremediation removes organics through natural attenuation. Placement of injection wells depends on site-specific conditions. The system is installed in a few hours and easily moved from well to well to optimize performance and remediation strategies.

iSOC® CONES OF INFLUENCE BASED ON FEMLAB MODEL



iSOC® REMEDIATION APPROACH

- Create an oxygen barrier at the leading edge of the contaminant plume to avoid boundary litigation and to protect off-site receptors.
- Reduce contamination levels by source treatment with supersaturated oxygen at the heart of the plume.
- Achieve rapid, localized remediation of low-level contamination and hot spots in existing monitoring wells.
- Accelerate site closure through natural attenuation as a primary remediation strategy or as a polisher.
- Lowest annual O&M cost of any passive enhancement technology.

HYDROCARBONS AND iSOC®

The use of dissolved oxygen in hydrocarbon contaminated groundwater to enhance natural attenuation of hydrocarbons such as MTBE and BTEX has been growing as a remediation technology since the mid-1990s. Conventional sparging technologies typically waste most of their delivered oxygen. Sparging bubbles make preferential flow paths and rise to the top of the groundwater table, escaping before they have a chance to dissolve and be utilized by naturally occurring hydrocarbon-degrading micro-organisms. Other in-situ technologies generate oxygen for a short period of time but are inadequate in aquifers with high ferrous iron, moderate BOD, and/or high concentrations of hydrocarbon constituents. iSOC® is a proven bioremediation technology that delivers high concentrations of dissolved oxygen into the aquifer. Very low O&M costs allow the iSOC® technology to be deployed in all types of remediation projects and site conditions.

iSOC® RADIUS OF INFLUENCE

Case studies and field measurements have shown the typical iSOC® radius of influence to be 10 feet (3 m) to 20 feet (6 m) laterally from the infusion well and many more feet in the direction of groundwater flow. Flowing groundwater and molecular diffusion transport the dissolved gas (e.g. oxygen, alkane, hydrogen) to the saturated porous media. The higher the concentration in the infusion well, the further the transport of the gas and the greater the influence. The influence is best measured by biological parameters, as the measure of dissolved gases at a distance from the infusion well is often inconclusive.

TYPICAL GAS CONCENTRATIONS (ppm)

GAS TYPE	WATER COLUMN DEPTH (ft/m)				
	5'/1.5	10'/3	15'/4.6	20'/6.1	50'/15.2
Oxygen	42	55	62	69	111
Methane	22	30	33	37	59
Propane	66	88	99	110	175
Hydrogen	2	2	3	3	5
Ethane	57	75	85	95	150

USING OTHER GASES WITH iSOC®

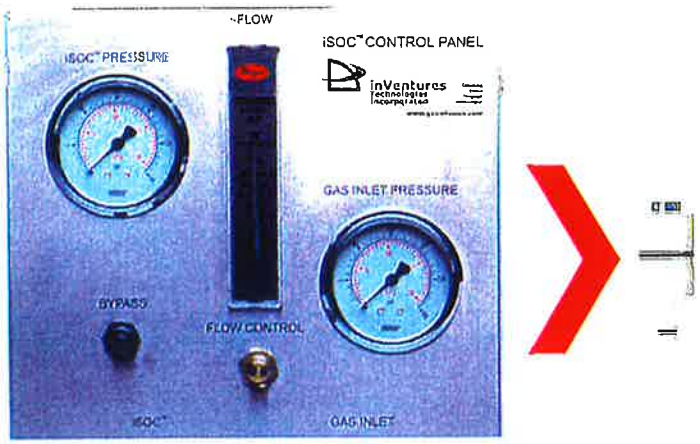
Consultants may need to use gases other than oxygen in their remediation approach. For example, hydrogen, methane, or propane may be used for remediation of chlorinated solvents and perchlorate. iSOC® will transfer these gases into the groundwater as effectively as it transfers oxygen, as shown above.

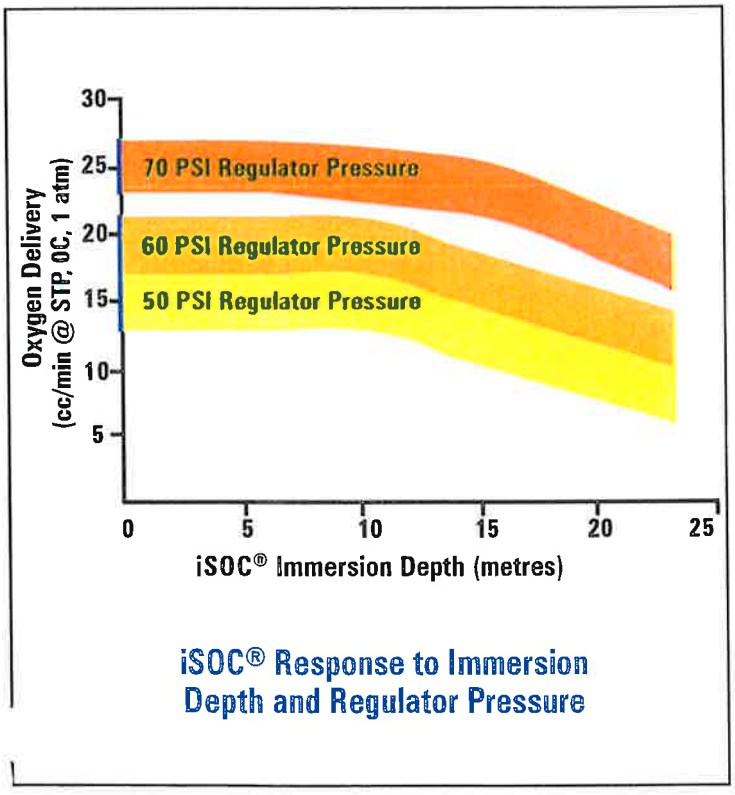
iSOC® ADVANTAGES

- Infuses 4 to 10 times more DO than any competitive technology.
- Delivers 40 to 200 PPM DO depending on iSOC® depth.
- Installs in existing 2-inch (50mm) monitoring wells.
- Application not limited by iron fouling under most conditions.
- Connects to standard gas cylinder.
- No power requirements, off-gases, pumps, or hazardous by-products.
- Small, simple, efficient, predictable, easy to use, & very low O&M.

MICRO-SIZING THE iSOC® CONTROL PANEL

In an effort to make the iSOC® System as easy to deploy as possible, the iSOC® Control Panel which determined the gas flow to the iSOC® and its structured polymer mass transfer device has been micro-sized. It now sits within the top of the iSOC® device and automatically controls the gas flow depending on groundwater depth and pressure regulator setting. All the installer has to do is set the pressure on the two-stage regulator. The iSOC® is simply attached to the tubing from the iSOC® Distribution Header and lowered into the well. There is no longer any need to house and mount a bulky control panel. The micro-sized flow controller is based upon valve control technology initially developed in the NASA Space program and currently used on other Gas inFusion Technology applications.





iSOC® Response to Immersion Depth and Regulator Pressure

MICRO-FLOW CONTROLLER

The built-in flow controller delivers a range of oxygen flow to the mass transfer device within the iSOC® depending on the immersion depth in groundwater and the pressure regulator setting. For immersion depths of less than 60 feet (18.3 m) of water, it is recommended that the oxygen regulator be set at 50 psi (3.4 bar). This will result in an average of 15 standard cc/min of oxygen delivered to the groundwater by the iSOC®. For greater depths, the regulator setting should be adjusted such that it is a minimum of 25 psi (1.7 bar) above the head pressure of the water.

WHERE HAS iSOC® BEEN USED?

The iSOC® technology has been used at hundreds of sites in the US, Canada, UK, Europe and Africa. It is currently being piloted on sites in Australasia and Japan. The technology has been deployed to bioremediate a range of hydrocarbons and other chemicals using direct aerobic, cometabolic, and anaerobic degradation methods.

iSOC® YOUR ULTIMATE MANAGED ATTENUATION TOOL

iSOC® DISTRIBUTION HEADER

Each order is supplied with a distribution header. Multiple port distribution headers are available. The size ordered is determined by the number of iSOC® units being run from each regulator. The distribution header can be directly mounted onto the gas regulator. The header is supplied with an on/off valve for each iSOC® unit such that the gas bottles can be changed without pulling the iSOC® from the well. For further detail go to www.isocinfo.com - Installation and Design - Installation Procedures.

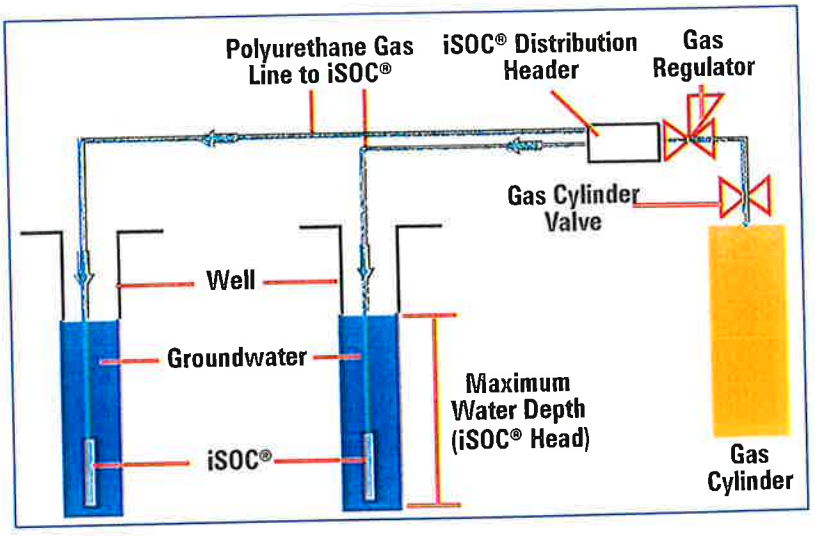
iSOC® QUALITY CONSTRUCTION

iSOC® is constructed of high quality SS316 stainless steel using the latest manufacturing equipment and a proprietary structured polymer mass transfer device. iSOC® is 1.62" (41 mm) in diameter and 12.65" (321 mm) long with a barb connector for 0.17" (4 mm) ID polyurethane tubing. The housings for the pressure and flow control unit and the drain plug are made from nylon. iSOC® has a lifting ring for connecting to a suspension line for insertion in 2" (50 mm) or larger monitoring wells.

CHLORINATED SOLVENTS AND iSOC®

The iSOC® Gas inFusion system is used to effectively remediate chlorinated solvent contaminated groundwater. Where tetrachloroethene (PCE) is the main contaminant of concern, a two-stage sequential bioremediation approach is used to first degrade PCE to trichloroethene (TCE) by reductive dechlorination, followed by aerobic cometabolic oxidation of TCE and other daughter products such as DCE and vinyl chloride. Alkane gas delivered by iSOC® stimulates the anaerobic process. iSOC®s are used to deliver oxygen and additional alkane gas to achieve aerobic cometabolic treatment of the daughter products. The aerobic process can be applied independently to TCE, DCE and VC sites and is not subject to stall due to competing electron acceptors or limited availability of necessary anaerobic microorganisms. Several alternative bioremediation approaches can also be implemented with iSOC®s including direct aerobic treatment of vinyl chloride and reductive dechlorination of chlorinated solvents by direct hydrogen delivery.

SYSTEM SET-UP



iSOC® COSTS

The iSOC® groundwater remediation technology is the leading and most cost effective solution in the marketplace today. Speak with your local iSOC® Sales Representative for system pricing. Your nearest Sales Representative can be found at www.isocinfo.com

Texas Risk Reduction Program
Deed Notice

STATE OF TEXAS §

§

COUNTY OF HARRIS §

This Notice is filed to provide information concerning certain environmental conditions and/or use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows and attached hereto and incorporated herein by reference as **Exhibit A**.

Portions of the groundwater of the Property contain certain identified chemicals of concern causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property is attached hereto and incorporated herein by reference as **Exhibit B**. The following chemicals of concern exceed their critical Protective Concentration Levels:

Chemical of Concern	*Environmental Media*
Methyl-tert butyl ether	Groundwater

This Notice is required for the following reasons:

Commercial/Industrial Land Use

The Affected Property currently meets TRRP standards for commercial/industrial use. Based on the reports, the chemicals of concern pose no significant present or future risk to humans or the environment based on commercial/industrial land use. No further remediation of the Affected Property is required by the TCEQ as long as the Affected Property is not to be used for residential purposes as the property may not be protective for residential use. If any person desires in the future to use the Affected Property for residential purposes, the TCEQ must be notified at least 60 days in advance of such use and additional response actions may be necessary before the property may be used for residential purposes. Persons contemplating a change in land use for the Affected Property are encouraged to review the definitions for commercial/industrial and residential land use contained in TRRP as the definition of residential land use is broad.

Plume Management Zone

The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone. A plume management zone is defined as an area of groundwater containing concentrations of chemicals of concern exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC

§350.33(f)(4). The undersigned has established a plume management zone so that the chemicals of concern in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached **Exhibit C** provides the location and extent of the plume management zone and describes the maintenance and monitoring required. This maintenance and monitoring is required until TCEQ approves some modification of those requirements. Exposure to groundwater within the plume management zone for any purpose is not advised until such time when all of the chemicals of concern no longer exceed their respective protective concentration levels. This deed notice [and the physical control] must not be removed or modified without prior approval from TCEQ.

Long Term (>15 years) Response Action

Remediation of the Affected Property is in progress to achieve protective conditions for the use of the Affected Property for commercial/industrial use. This notice is required to inform others of the ongoing long-term response action.

As of the date of this Notice, the record owner of fee title to the Property is _____with an address of _____.

For additional information, contact:

PLUME MANAGEMENT ZONE EXTENT/
MAINTENANCE & MONITORING REQUIREMMENTS

Kinder Morgan Liquids Terminals, LP.

Tank 100-11 (Formerly Tank 118-1)

Plume Management Zone Location/Extent; Maintenance and Monitoring Requirements

LOCATION AND EXTENT

The Site is located within The Kinder Morgan Liquids Terminal – North Plant located at 405 Clinton Drive, Galena Park, Harris County, Texas. The extent of the ground water monitoring plume is depicted in **Attachment 1.**

MAINTENANCE AND MONITORING REQUIREMENTS

The Plume Management Zone (PMZ) monitoring well network will be monitored and sampled on a semiannual basis. Monitoring wells will be analyzed for methyl-tert butyl ether (MTBE) only to assess plume mobility and extent.

Monitoring well inspections will be completed concurrently during monitoring and sampling activities. Inspection activities will include a visual inspection of well integrity as well as components related to the in situ, passive oxygenation remediation and enhanced bioremediation systems. System components will be maintained on an as needed basis. Significant maintenance and/or replacement activities (well replacement, for example) will be completed before the subsequent monitoring and sampling event following discovery of the issue/condition.

Re: Response Action Plan Addendum for the North Plant Tank 100-11 and Tank 100-12
KM Liquids Terminals, L.P. (KMLT)
Galena Park, Texas
TCEQ SWR No. 30573 / EPA ID No. TXD026481523
TCEQ Hazardous Waste Permit/Compliance Plan No. HW/CP-50054

Dear Ms. Green:

Enclosed please find the Response Action Plan (RAP) Addendum, prepared by URS Corporation (URS) and submitted on behalf of KM Liquids Terminals, L.P. (KMLT) for the above referenced North Plant Tank 100-11 and Tank 100-12 in Galena Park, Texas. The RAP Addendum is submitted to update the schedule of the Alkylate RAP Addendum submitted to the TCEQ on May 5, 2006 and approved in a letter dated August 26, 2006, as well as to amend portions of the original MTBE Remediation RAP submitted to the TCEQ on March 31, 2005 and approved on May 11, 2005.

After receiving approval of the RAP for MTBE Remediation at North Plant, KMLT evaluated several alternate remedial technologies. After the consideration of factors including implementability, effectiveness, and cost, KMLT selected the response action addressed in the enclosed RAP Addendum. KMLT further investigated the chosen response action with the implementation of a pilot system, the results of which are also presented in this RAP Addendum.

As you know, I have taken on Lance Richard's previous responsibilities for remediation efforts at this facility. If have any questions or need additional information, please do not hesitate to contact me at (713) 920-8491 or Raaj Patel (URS) at (713) 914-6422.

Sincerely,
KM Liquids Terminals L.P.

Richard B. Steinberg

RAP Executive Summary	ID No.: 30573
	Report Date: January 26, 2007

Use this worksheet to summarize the report. Be sure to complete and submit the Checklist for Report Completeness. **Attach a chronology of activities associated with the affected property.**

Briefly describe the affected property and PCLE zones, the conclusions from the assessment activities, identify any affected or threatened receptors, and describe any other major considerations taken into account when developing this response action plan. If any portion of the response action is necessitated due to an aesthetic or nuisance condition, identify the nature of that condition and identify that portion of the response action proposed to address it. If any media that contains a PCLE zone is not addressed in this RAP, provide justification.

The enclosed Response Action Plan (RAP) has been prepared to amend portions of the original RAP for KMLT's Galena Park North Plant MTBE remediation, which was submitted to the Texas Commission on Environmental Quality (TCEQ) on 03/31/05, and approved by the TCEQ in a letter dated May 11, 2005. Figure 1-1 depicts the layout of the North Plant.

An addendum to the 3/31/05 RAP was prepared to accommodate remedial activities planned for the alkylate release within the MTBE plume area (Figure 1-2), and submitted to the TCEQ on 05/05/06. This RAP addendum was approved by the TCEQ on August 26, 2006.

In the first quarter of 2006, KMLT began a series of activities related to the remediation of MTBE. These included excavation of approximately 13,000 cubic yards of affected soils, and solicitation of recommendations and cost estimates for groundwater remediation. A pilot study was conducted to evaluate an alternate remedial technology for the remediation of MTBE in groundwater.

For the pilot study, KMLT installed several wells within the MTBE plume, located in the containment of Tank 100-11, to evaluate the effectiveness of the pilot system. Figure 1-3 depicts the layout of the pilot study. The pilot test utilized an *in situ*, passive oxygenation system that delivers diffused oxygen to the groundwater to create aerobic conditions, therefore enhancing biological activities for MTBE degradation.

Based on the pilot test results, KMLT has decided to implement a full-scale MTBE groundwater remediation program at the North Plant. Layout of the full-scale system is shown together with the MTBE groundwater plume in Figure 1-4. Selection of this remedy does not affect the current TCEQ approved remedy for alkylate, which is being recovered by skimmer pumps placed within the alkylate plume.

What is the selected remedy standard for this affected property? X A ___ B

List all media that contains a PCLE zone and specify the proposed response action for each media. Indicate the type of removal, decontamination, physical control and/or institutional control action that is proposed.

Media	COCs[1]	Removal	Decontamination	Control			
				Physical Control	Modified Groundwater Response Objective[2]		
					PMZ	WCU	TI
Groundwater	Alkylate (TPH)	X					
	MTBE		X				

[1] Specify either a specific COC or, if the response action is the same for all COCs in one type, specify the type of COC (for example, VOCs, SVOCs, metals).
[2] If a modified groundwater response objective is proposed, check the type(s) of proposed modifications.

RAP Executive Summary	ID No.: 30573
	Report Date: January 26, 2007

Is there a media that contains a PCLE zone that is not addressed in this RAP? X Yes ___ no
If yes, provide justification for not addressing the PCLE zone in this RAP.

Remediation of MTBE impacted soil at the North Plant was addressed in the original RAP submitted March 31, 2005, and approved by the TCEQ in a letter dated May 11, 2005. Since the approved soil remedy has already been implemented at the site and remains the same, this RAP amendment does not address soil media.

On-site land use: [ ] Residential [X] Commercial/Industrial
Off-site land use: [ ] Residential [X] Commercial/Industrial (check all that apply)

Is this a re-submittal or revision of a previous RAP? X Yes ___ No
If yes, explain why the RAP is being revised or resubmitted.

This submittal is provided to amend the portion of the 3/31/05 RAP to address the change in remedial technology for groundwater treatment at the site.

Were all the appropriate notifications made in accordance with §350.55? X Yes ___ No
If no, explain why notifications were not made:

Chronology
Kinder Morgan North Plant

August 2006 – MTBE passive oxygenation system initiated.

August 2, 2006 – TCEQ approved RAP addendum for alkylate recovery system.

July 13, 2006 – TCEQ approved North Plant Tank Farm APAR Addendum.

2nd Quarter 2006 – Twenty-four oxygenation wells were installed for the full-scale implementation of the passive oxygenation system.

May 4, 2006 – Completed pilot-test for remediation of MTBE in groundwater using passive oxygenation.

January 19, 2006 – Began pilot-test for remediation of MTBE in groundwater using passive oxygenation.

January 2006 – Installed pilot test for passive oxygenation to enhance bioremediation of the MTBE in groundwater.

January 14, 2006 – Alkylate recovery system initiated in Tank 100-11 containment area.

April 28, 2006 – Submitted RAP Addendum for alkylate recovery system to TCEQ.

April 22, 2006 – North Plant Tank Farm APAR Addendum submitted to the TCEQ.

1st Quarter 2006 – Alkylate was observed in MW-12, within the containment area of Tank 100-11.

1st Quarter 2006 – Approximately 13,000 cubic yards of MTBE-affected soil was excavated from an area west of Tank 100-12.

May 11, 2005 – TCEQ approved the RAP for the North Plant Tank Farm.

March 31, 2005 – The RAP for the North Plant Tank Farm was prepared by ARCADIS and submitted to the TCEQ.

Chronology prior to March 31, 2005 is provided in the 3/31/05 RAP.

Checklist for Report Completeness

ID No.: 30573
Report Date: January 26, 2007

Use this checklist to determine the portions of the form that must be submitted for this report. Answer all questions by checking Yes or No. If the answer is Yes include that portion of the report. If the answer is No, do not complete or submit that portion of the report. All form contents that are marked "Required" must be submitted. Form contents marked with an asterisk (*) are not included in the blank form and are to be provided by the person.

Form contents marked with an asterisk (*) are not included in the blank form.

Use this worksheet to describe the objectives for the response action in each media.

Response Action Objectives

List the environmental media to which this applies Groundwater
Repeat this section for each medium that has a different response action objective.

State the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33 as applicable. Explain how the response action is appropriate based on the hydrogeologic characteristics, COC characteristics, and potential unprotective conditions that could continue or result during the remedial period.

The objectives are as follows:

- Remove recoverable alkylate from the groundwater surface;
- Enhance soil biological activity and subsequent bioremediation of MTBE;
- Mitigate the potential for plume migration; and
- Mitigate the potential for plume expansion.

The alkylate skimmer system, installed within the alkylate plume, has demonstrated the capability of recovering alkylate to minimal thicknesses. Alkylate is currently being recovered from selected wells within the plume based on the periodic gauging results. The alkylate thickness has been substantially reduced since recovery began in January 2006 (see Attachment 1B)

The response action for the MTBE groundwater plume for the North Plant is enhanced bioremediation by delivery of oxygen to groundwater through passive oxygenation. The initial response action submitted in the 2005 RAP was injection of ferric chloride to treat MTBE-affected groundwater. Subsequently, several additional remedial alternatives were evaluated. Considering implementability, effectiveness, and cost, KMLT selected oxygen as the reagent for MTBE remediation. In addition to being less expensive than traditional chemical oxidants, the chosen delivery system passively introduces oxygen into the groundwater, thereby mitigating potential plume migration and other issues associated with the chemical injection process.

A pilot test of the oxygenation system was conducted over a four-month period from February through May 2006. The pilot test included an injection well with an oxygen emitter and five observation wells (one upgradient and four downgradient wells). Figure 1-3 depicts the pilot-test layout. Results of the pilot test indicated increased dissolved oxygen (DO) levels in all wells and decreased MTBE levels in all but two wells, thus indicating that increased oxygenation in the MTBE plume promotes the removal of MTBE (see Attachment 1B).

The stratigraphy in the area of the pilot test is consistent with the stratigraphy of the overall area of the MTBE groundwater plume. Figures 1A-1 through 1A-4 depict generalized cross-sections of subsurface soils in the vicinity of the plumes.

Explain how the COCs will be handled, treated, disposed, or transferred to another media and document that the response action will not result in any additional potential exposure conditions due to response action activities.

Recovered alkylate is temporarily stored in a polyethylene tank located adjacent to the recovery wells. KMLT will remove alkylate from the polyethylene tank with a vacuum truck, and the recovered alkylate will be transferred to another tank at their facility used for managing off-specification liquid products.

No MTBE will be recovered from the *in situ*, passive oxygenation remediation system. The response action will degrade the concentration of MTBE in groundwater to a concentration below the 0.73 mg/L commercial industrial PCL within the containment areas and 0.24 mg/L residential PCL at downgradient property lines.

State the proposed "reasonable time frame" and provide the justification for that time frame in the context of any potential for unprotective exposures to exist or develop, COC characteristics, hydrogeologic and affected property characteristics. If the reasonable time frame is different for the different affected media or for particular tracts of land, be sure to discuss that. Provide how the proposed response action will meet the objectives in a reasonable timeframe.

KMLT plans to operate the alkylate recovery system as long as recoverable alkylate is present. It is anticipated that the system will be in operation for less than two years or until no product is detected in selected site wells for two consecutive quarters. Continuous removal of alkylate will ensure that the plume does not migrate or expand. Periodic thickness measurements in the recovery wells and monitoring wells will be used to verify that the alkylate plume is being controlled.

When the alkylate recovery system was initiated during the week ending January 14, 2006, alkylate thickness measured in RW-1 was approximately 5 ft. Alkylate thickness was reduced to less than 0.1 ft; however, the system was not operated during the 4th quarter of 2007 due to heavy rains causing flooding of the containment area. As of 12/29/06, alkylate thickness measured in RW-1 (with the system in operation) was approximately 0.6 ft. Attachment 1B-3 depicts alkylate thickness vs. time. The alkylate recovery system was reinitiated on January 2, 2007.

The MTBE passive oxygenation system will be operated as long as MTBE is detected above the applicable PCLs in site groundwater. Continuous oxygen will be delivered throughout the plume to ensure that the MTBE within the plume is degraded to concentrations below the applicable PCLs. The MTBE oxygenation system is currently projected to operate for three years, but may be discontinued if the desired results are achieved and confirmed before that time.

Soil Response Action Objectives

When using removal and/or decontamination with controls or controls only, demonstrate how that physical control or combination of measures will reliably contain COCs within and/or derived from the surface soil and subsurface soil PCLE zone materials over time.

Not Applicable

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical surface soil and subsurface soil PCL throughout the soil PCLE zone and prevent COC concentrations above the critical soil PCLs from migrating beyond the existing boundary of the soil PCLE zone.

Not Applicable

Groundwater Response Action Objectives

Name of groundwater-bearing unit to which this information applies: Sandy Channel Fill

Repeat this section for each groundwater-bearing unit for which a different response action is proposed.

Groundwater classification ____ 1 _X_ 2 ___ 3

Is a modified groundwater response action being proposed for any part of the groundwater PCLE zone (§350.33(f)(2), (3), or (4))? ___ Yes _X_ No

If yes, does the affected property meet the qualifying criteria for a modified groundwater response action using a waste control unit, plume management zone, or technical impracticability? __ Yes __ No

If yes, complete the appropriate portions of this report.

If no to either question, complete the following:

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical groundwater PCL throughout the groundwater PCLE zone and prevent COC concentrations above the critical groundwater PCL from migrating beyond the existing boundary of the groundwater PCLE zone.

The response action for alkylate involves removal of alkylate from the groundwater surface. Because the solubility of alkylate is very low, treatment for dissolved-phase alkylate will not be required.

The presence of alkylate can be identified by analysis for total petroleum hydrocarbons (TPH). The predominant component of alkylate is octane isomers, which would show up as C8 in a TPH analysis. During the 1/20/06 groundwater sampling event for the monitoring well MW-12 (where alkylate was initially observed and is currently being recovered) petroleum hydrocarbons in the C6 - C12 range were detected at an estimated concentration of 1.83 mg/L, which is below the commercial/industrial PCL. TPH has not been detected in the nearest downgradient well, MW-15, or in the nearest cross-gradient well, MW-14.

The response action for MTBE is enhanced bioremediation through the passive oxygenation of affected groundwater. During the preliminary testing of remediation techniques, DO was tested as a variable against the previously suggested technique of ferric chloride injection. The test results indicated that increasing only the DO in the affected area would have a comparable effect to chemical oxidation without the possibility of technical issues (i.e. fouling and O&M efforts). As a result, a passive oxygenation pilot test was conducted within the containment area of Tank 100-11. The oxygenation pilot system effectively demonstrated that an increase in dissolved oxygen in the affected groundwater subsequently caused a decrease in MTBE in observation wells.

KMLT is implementing a full-scale passive oxygenation system that consists of a series of oxygenation wells and monitor wells placed within the plume boundary and monitor wells located within and outside of the plume to monitor remediation progress. The wells are concentrated along the downgradient boundary to ensure no offsite migration will occur.

Explain how the response action will prevent COCs from migrating to air at concentrations above the PCLs for air if the groundwater-to-air PCLs ($^{Air}GW_{Inh\text{-}V}$) is exceeded.

Not Applicable

Explain how the response action will prevent COCs from migrating to surface water at concentrations above the PCLs for groundwater discharges to surface water if surface water is a factor.

Delineation demonstrated that alkylate is confined to a small area within the southwestern portion of the tank berm surrounding Tank 100-11 (Figure 1-2). The alkylate thickness has been substantially reduced since recovery began in January 2006. Continued alkylate recovery and subsequent plume reduction will ensure that alkylate does not migrate beyond the berm for Tank 100-11.

The MTBE plume is located primarily within the containments of Tank 100-12 and Tank 100-11, but extends approximately 600 feet to the southwest of Tank 100-11 (Figure 1-2). The oxygenation wells are situated throughout the downgradient length of the plume to treat the entire affected area. A permanent monitoring well at the downgradient edge of the plume will be used to ensure that the plume does not migrate beyond its current location. No discharge of affected groundwater to surface water is anticipated.

Explain how the response action will prevent human and ecological receptor exposure to the groundwater PCLE zone.

The extent of alkylate in groundwater is contained within the berm for Tank 100-11. There is no human or ecological receptor exposure for groundwater in this area.

MTBE affected groundwater extends from the containment areas of Tank 100-12, and Tank 100-11 to MW-16 located approximately 400 feet to the southwest of the Tank 100-11 berm. Delineation of the extent of the plume was provided in the initial RAP submittal. There is no human or ecological receptor or exposure for groundwater in this area.

Response Action Design

Use this worksheet to provide detailed descriptions of the response action. Attach design and layout drawings and equipment specifications in Attachment 2A.

Media: Groundwater
List all media to which this information applies. If the response action is different for another media, complete a separate worksheet.

Provide a detailed description of the response action. Describe the removal action, decontamination, treatment system(s), and/or physical or institutional control actions that are proposed for each media and discuss the reasons for choosing the response action(s). Identify and describe any ecological services analysis and compensatory restoration plan that will be utilized (if so, include the complete ESA and compensatory restoration plan in Attachment 2C).

Alkylate removal is being accomplished by a product-only skimmer collection system. Removal was chosen as an appropriate response action because it is a fast and thorough way to eliminate alkylate from the subsurface. Skimming was chosen because of the low solubility of alkylate and the relatively flat groundwater gradient in the impact area. Skimming also has the advantage of minimizing the volume of groundwater produced during alkylate removal.

Alkylate is skimmed from the surface of the groundwater and pumped to an aboveground temporary collection tank. Through March 13, 2006, approximately 356 gallons of alkylate had been recovered. Measured thickness in RW-1 (the 4-inch diameter recovery well) had been reduced from approximately 5 ft to less than 0.1 ft. Because of inability to access and adjust skimmer pump depths due to bad weather (heavy rain) causing the containment to be flooded most of the time, the system was not operational during the fourth quarter of 2006. Measured thicknesses were approximately 0.6 ft. in RW-1 on December 29, 2006. The vendor schematic for a typical alkylate recovery well is included with the boring log in Attachment 2B-1 and Appendix 2.

MTBE will be removed by enhanced bioremediation through the passive oxygenation of affected groundwater. This response action was chosen due to the tendency for MTBE to be degraded by microbial organisms. Passive oxygenation was chosen because it allows for oxygen to be dissolved by groundwater through contact with a large static oxygen surface within the emitter, rather than by sparging or other turbulent dissolution processes, which may cause COCs to volatilize and spread.

Twenty-four wells placed throughout the plume have been fitted with oxygen emitters (iSOC® units) to passively deliver oxygen to groundwater *in situ* (Attachment 2A-7). The typical MTBE oxygenation well completion and oxygen supply are diagram is depicted on Attachment 2B-2. As demonstrated by the pilot system, an increase in the DO of the affected groundwater will enhance the microbial activity within the affected area and will subsequently decrease the MTBE concentrations in the affected media.

Describe all major treatment system components and equipment of the response action. Illustrate the response action design and provide equipment specifications in Attachment 2A.

Figures 2A-2 and 2A-6 illustrate the layout and system components of the alkylate recovery system. Generally, these include the following:

- Recovery wells (2-inch and 4-inch)
- Skimmers
- Pumps
- Piping and Hoses
- Control Panel

- Pressure Regulators
- Temporary Alkylate Storage Tank
- Air Compressor
- Compressor Building

A sketch depicting the pump assembly is also included in Figure 2A-6.

Figures 2A-2 through 2A-5 depict the MTBE pilot system layout, full-scale system layout and passive oxygenation system components. Generally, the system includes:

- 24 Oxygenation wells fitted with iSOC® oxygen emitters
- 8 permanent monitor wells to be used as observation wells
- Oxygen cylinders
- Treatment building with fenced enclosure to house oxygen cylinders
- ¼-inch polyurethane tubing housed in 2-inch schedule 80 PVC pipe to connect cylinders to wells

List permits or registrations needed to construct or implement the response action, including permits or registrations needed to conduct studies or tests. For VCP sites, list the permits that would be required if the site was not in the VCP (required by the VCP).

Permitting/Registration Authority	Type of permit/registration	Permit or registration number if already issued	Anticipated application date
Not Applicable			

Identify and discuss the results of any studies or tests, such as pilot studies, feasibility studies, technical impracticability studies, treatability studies, and/or toxicity studies conducted or proposed to be conducted at the affected property. Discuss the reason for the study or test and how it verifies the effectiveness and appropriateness of the chosen response action or documents that a particular response action is not appropriate for the affected property. Describe how the results of completed studies or tests determined the design or choice of response action. Attach any separate reports and supporting documentation in Appendix 3.

iSOC®info

iSOC® YOUR ULTIMATE MANAGED ATTENUATION TOOL

iSOC® DISTRIBUTION HEADER

Each order is supplied with a distribution header. Multiple port distribution headers are available. The size ordered is determined by the number of iSOC® units being run from each regulator. The distribution header can be directly mounted onto the gas regulator. The header is supplied with an on/off valve for each iSOC® unit such that the gas bottles can be changed without pulling the iSOC® from the well. For further detail go to www.isocinfo.com - Installation and Design - Installation Procedures.

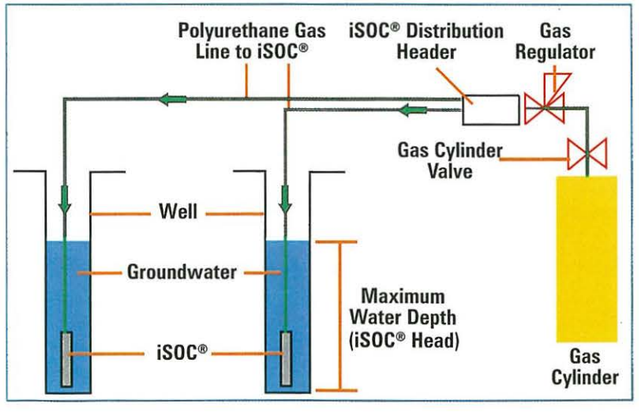
iSOC® QUALITY CONSTRUCTION

iSOC® is constructed of high quality SS316 stainless steel using the latest manufacturing equipment and a proprietary structured polymer mass transfer device. iSOC® is 1.62" (41 mm) in diameter and 12.65" (321 mm) long with a barb connector for 0.17" (4 mm) ID polyurethane tubing. The housings for the pressure and flow control unit and the drain plug are made from nylon. iSOC® has a lifting ring for connecting to a suspension line for insertion in 2" (50 mm) or larger monitoring wells.

CHLORINATED SOLVENTS AND iSOC®

The iSOC® Gas inFusion system is used to effectively remediate chlorinated solvent contaminated groundwater. Where tetrachloroethene (PCE) is the main contaminant of concern, a two-stage sequential bioremediation approach is used to first degrade PCE to trichloroethene (TCE) by reductive dechlorination, followed by aerobic cometabolic oxidation of TCE and other daughter products such as DCE and vinyl chloride. Alkane gas delivered by iSOC® stimulates the anaerobic process. iSOC®s are used to deliver oxygen and additional alkane gas to achieve aerobic cometabolic treatment of the daughter products. The aerobic process can be applied independently to TCE, DCE and VC sites and is not subject to stall due to competing electron acceptors or limited availability of necessary anaerobic microorganisms. Several alternative bioremediation approaches can also be implemented with iSOC®s including direct aerobic treatment of vinyl chloride and reductive dechlorination of chlorinated solvents by direct hydrogen delivery.

SYSTEM SET-UP



iSOC® COSTS

The iSOC® groundwater remediation technology is the leading and most cost effective solution in the marketplace today. Speak with your local iSOC® Sales Representative for system pricing. Your nearest Sales Representative can be found at www.isocinfo.com

iSOC®info

iSOC® YOUR ULTIMATE MANAGED ATTENUATION TOOL

iSOC® UPDATES

iSOC® has become a very popular bioremediation tool for remediating a wide range of contaminants, including recalcitrant compounds in groundwater and saturated porous media. iSOC® has already been used at hundreds of sites for effective hydrocarbon remediation, but we are continuing to improve and extend the technology.

A New Application of iSOC® Technology: Chlorinated Sites
Recently, iSOC® technology has been applied to sites contaminated with chlorinated hydrocarbons using oxygen and other gases to treat chlorinated sites under both anaerobic and aerobic conditions. Our website has been updated to reflect these bioremediation alternatives and various processes and soon our microcosm studies will provide more information to optimize delivery of combinations of gases to best stimulate the biological degradation of harmful substances.

A Micro-sized Control Panel
iSOC® is often used in individual wells with a small access box covering the well. While this set-up is cost-efficient and convenient, requiring no major site disruption or costly installation, the size of the access box is very limiting. Using innovative technology originally developed by NASA and successfully proven on our other Gas inFusion devices, we developed a small gas flow control device to sit in the top of the iSOC® unit. The result is a much simpler and easier installation that benefits the consultant and site owner both.

iSOC® AND BIOREMEDIATION ENHANCEMENT

iSOC® is an ingenious gas delivery system based on inVenture's patented Gas inFusion technology - a unique method of infusing supersaturated levels of dissolved gas into liquids. At the heart of iSOC®, the proprietary structured polymer mass transfer device is filled with micro-porous hollow fiber that provides an enormous surface area for mass transfer - in excess of 7000 m^2/m^3. It is hydrophobic and therefore excludes water. Maintaining gas pressure less than the surrounding liquid pressure ensures that ultra efficient mass transfer takes place without sparging.

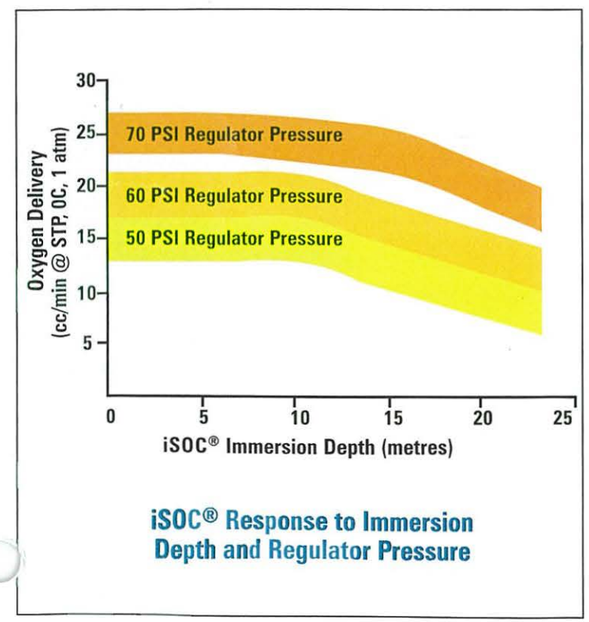
In an aerobic bioremediation application, the iSOC® supersaturates the monitoring well with low decay dissolved oxygen (DO), typically 40-200 PPM depending on depth in groundwater. A natural convection current and a designed release bubble from the top of the iSOC® fills the well with a uniform DO curtain. The supersaturated DO curtain of water disperses around the well into the adjacent groundwater and enhanced bioremediation removes organics through natural attenuation. Placement of injection wells depends on site-specific conditions. The system is installed in a few hours and easily moved from well to well to optimize performance and remediation strategies.

iSOC® ADVANTAGES

- Infuses 4 to 10 times more DO than any competitive technology.
- Delivers 40 to 200 PPM DO depending on iSOC® depth.
- Installs in existing 2-inch (50mm) monitoring wells.
- Application not limited by iron fouling under most conditions.
- Connects to standard gas cylinder.
- No power requirements, off-gases, pumps, or hazardous by-products.
- Small, simple, efficient, predictable, easy to use, & very low O&M.

MICRO-SIZING THE iSOC® CONTROL PANEL

In an effort to make the iSOC® System as easy to deploy as possible, the iSOC® Control Panel which determined the gas flow to the iSOC® and its structured polymer mass transfer device has been micro-sized. It now sits within the top of the iSOC® device and automatically controls the gas flow depending on groundwater depth and pressure regulator setting. All the installer has to do is set the pressure on the two-stage regulator. The iSOC® is simply attached to the tubing from the iSOC® Distribution Header and lowered into the well. There is no longer any need to house and mount a bulky control panel. The micro-sized flow controller is based upon valve control technology initially used in the NASA Space program and currently used on other Gas inFusion Technology applications.



iSOC® Response to Immersion Depth and Regulator Pressure

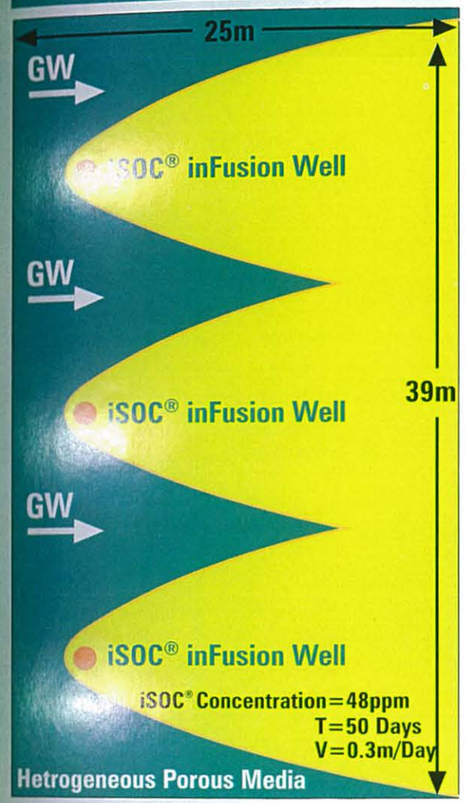
MICRO-FLOW CONTROLLER

The built-in flow controller delivers a range of oxygen flow to the mass transfer device within the iSOC® depending on the immersion depth in groundwater and the pressure regulator setting. For immersion depths of less than 60 feet (18.3 m) of water, it is recommended that the oxygen regulator be set at 50 psi (3.4 bar). This will result in an average of 15 standard cc/min of oxygen delivered to the groundwater by the iSOC®. For greater depths, the regulator setting should be adjusted such that it is a minimum of 25 psi (1.7 bar) above the head pressure of the water.

WHERE HAS iSOC® BEEN USED?

The iSOC® technology has been used at hundreds of sites in the US, Canada, UK, Europe and Africa. It is currently being piloted on sites in Australasia and Japan. The technology has been deployed to bioremediate a range of hydrocarbons and other chemicals using direct aerobic, cometabolic, and anaerobic degradation methods.

iSOC® CONES OF INFLUENCE BASED ON FEMLAB MODEL



iSOC® RADIUS OF INFLUENCE

Case studies and field measurements have shown the typical iSOC® radius of influence to be 10 feet (3 m) to 20 feet (6 m) laterally from the infusion well and many more feet in the direction of groundwater flow. Flowing groundwater and molecular diffusion transport the dissolved gas (e.g. oxygen, alkane, hydrogen) to the saturated porous media. The higher the concentration in the infusion well, the further the transport of the gas and the greater the influence. The influence is best measured by biological parameters, as the measure of dissolved gases at a distance from the infusion well is often inconclusive.

iSOC® REMEDIATION APPROACH

- Create an oxygen barrier at the leading edge of the contaminant plume to avoid boundary litigation and to protect off-site receptors.
- Reduce contamination levels by source treatment with supersaturated oxygen at the heart of the plume.
- Achieve rapid, localized remediation of low-level contamination and hot spots in existing monitoring wells.
- Accelerate site closure through natural attenuation as a primary remediation strategy or as a polisher.
- Lowest annual O&M cost of any passive enhancement technology.

HYDROCARBONS AND iSOC®

The use of dissolved oxygen in hydrocarbon-contaminated groundwater to enhance natural attenuation of hydrocarbons such as MTBE and BTEX has been growing as a remediation technology since the mid-1990s. Conventional sparging technologies typically waste most of their delivered oxygen. Sparging bubbles make preferential flow paths and rise to the top of the groundwater table, escaping before they have a chance to dissolve and be utilized by naturally occurring hydrocarbon-degrading micro-organisms. Other in-situ technologies generate oxygen for a short period of time but are inadequate in aquifers with high ferrous iron, moderate BOD, and/or high concentrations of hydrocarbon constituents. iSOC® is a proven bioremediation technology that delivers high concentrations of dissolved oxygen into the aquifer. Very low O&M costs allow the iSOC® technology to be deployed in all types of remediation projects and site conditions.

TYPICAL GAS CONCENTRATIONS (ppm)

GAS TYPE	WATER COLUMN DEPTH (ft/m)				
	5'/1.5	10'/3	15'/4.6	20'/6.1	50'/15.2
Oxygen	42	55	62	69	111
Methane	22	30	33	37	59
Propane	66	88	99	110	175
Hydrogen	2	2	3	3	5
Ethane	57	75	85	95	150

USING OTHER GASES WITH iSOC®

Consultants may need to use gases other than oxygen in their remediation approach. For example, hydrogen, methane, or propane may be used for remediation of chlorinated solvents and perchlorate. iSOC® will transfer these gases into the groundwater as effectively as it transfers oxygen, as shown above.

iSOC® Product Information

iSOC® YOUR ULTIMATE MANAGED ATTENUATION TOOL

iSOC® UPDATES

iSOC® has become a very popular bioremediation tool for remediating a wide range of contaminants, including recalcitrant compounds in groundwater and saturated porous media. iSOC® has already been used at hundreds of sites for effective hydrocarbon remediation, but we are continuing to improve and extend the technology.

A New Application of iSOC® Technology: Chlorinated Sites

Recently, iSOC® technology has been applied to sites contaminated with chlorinated hydrocarbons using oxygen and other gases to treat chlorinated sites under both anaerobic and aerobic conditions. Our website has been updated to reflect these bioremediation alternatives and various processes and soon our microcosm studies will provide more information to optimize delivery of combinations of gases to best stimulate the biological degradation of harmful substances.

A Micro-sized Control Panel

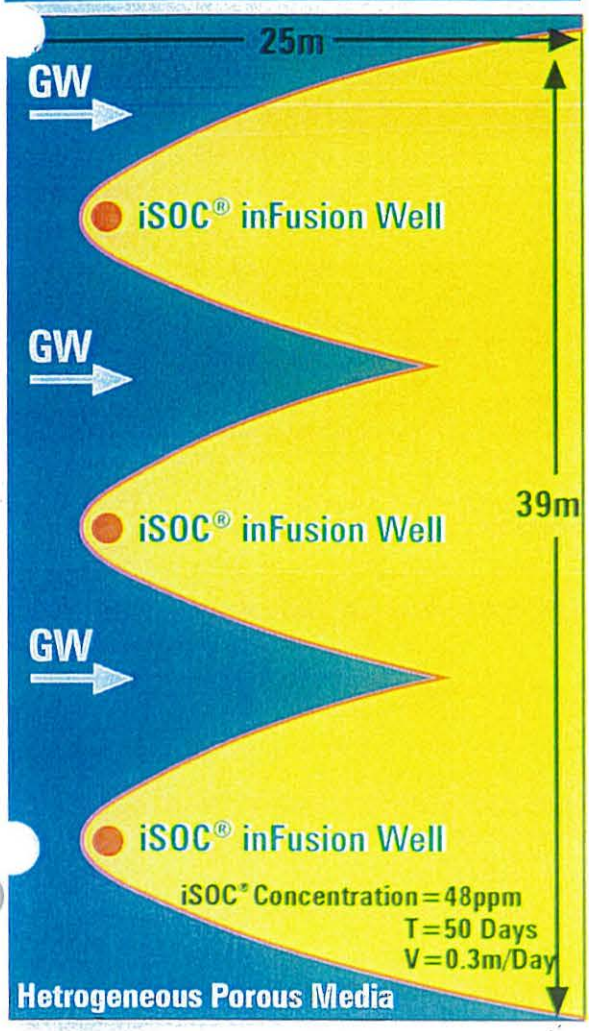
iSOC® is often used in individual wells with a small access box covering the well. While this set-up is cost-efficient and convenient, requiring no major site disruption or costly installation, the size of the access box is very limiting. Using innovative technology originally developed by NASA and successfully proven on our other Gas inFusion devices, we developed a small gas flow control device to sit in the top of the iSOC® unit. The result is a much simpler and easier installation that benefits the consultant and site owner both.

iSOC® AND BIOREMEDIATION ENHANCEMENT

iSOC® is an ingenious gas delivery system based on inVenture's patented Gas inFusion technology - a unique method of infusing supersaturated levels of dissolved gas into liquids. At the heart of iSOC®, the proprietary structured polymer mass transfer device is filled with micro-porous hollow fiber that provides an enormous surface area for mass transfer - in excess of 7000 m^2/m^3. It is hydrophobic and therefore excludes water. Maintaining gas pressure less than the surrounding liquid pressure ensures that ultra efficient mass transfer takes place without sparging.

In an aerobic bioremediation application, the iSOC® supersaturates the monitoring well with low decay dissolved oxygen (DO), typically 40-200 PPM depending on depth in groundwater. A natural convection current and a designed release bubble from the top of the iSOC® fills the well with a uniform DO curtain. The supersaturated DO curtain of water disperses around the well into the adjacent groundwater and enhanced bioremediation removes organics through natural attenuation. Placement of injection wells depends on site-specific conditions. The system is installed in a few hours and easily moved from well to well to optimize performance and remediation strategies.

iSOC® CONES OF INFLUENCE BASED ON FEMLAB MODEL



iSOC® REMEDIATION APPROACH

- Create an oxygen barrier at the leading edge of the contaminant plume to avoid boundary litigation and to protect off-site receptors.
- Reduce contamination levels by source treatment with supersaturated oxygen at the heart of the plume.
- Achieve rapid, localized remediation of low-level contamination and hot spots in existing monitoring wells.
- Accelerate site closure through natural attenuation as a primary remediation strategy or as a polisher.
- Lowest annual O&M cost of any passive enhancement technology.

HYDROCARBONS AND iSOC®

The use of dissolved oxygen in hydrocarbon contaminated groundwater to enhance natural attenuation of hydrocarbons such as MTBE and BTEX has been growing as a remediation technology since the mid-1990s. Conventional sparging technologies typically waste most of their delivered oxygen. Sparging bubbles make preferential flow paths and rise to the top of the groundwater table, escaping before they have a chance to dissolve and be utilized by naturally occurring hydrocarbon-degrading micro-organisms. Other in-situ technologies generate oxygen for a short period of time but are inadequate in aquifers with high ferrous iron, moderate BOD, and/or high concentrations of hydrocarbon constituents. iSOC® is a proven bioremediation technology that delivers high concentrations of dissolved oxygen into the aquifer. Very low O&M costs allow the iSOC® technology to be deployed in all types of remediation projects and site conditions.

iSOC® RADIUS OF INFLUENCE

Case studies and field measurements have shown the typical iSOC® radius of influence to be 10 feet (3 m) to 20 feet (6 m) laterally from the infusion well and many more feet in the direction of groundwater flow. Flowing groundwater and molecular diffusion transport the dissolved gas (e.g. oxygen, alkane, hydrogen) to the saturated porous media. The higher the concentration in the infusion well, the further the transport of the gas and the greater the influence. The influence is best measured by biological parameters, as the measure of dissolved gases at a distance from the infusion well is often inconclusive.

TYPICAL GAS CONCENTRATIONS (ppm)

GAS TYPE	WATER COLUMN DEPTH (ft/m)				
	5'/1.5	10'/3	15'/4.6	20'/6.1	50'/15.2
Oxygen	42	55	62	69	111
Methane	22	30	33	37	59
Propane	66	88	99	110	175
Hydrogen	2	2	3	3	5
Ethane	57	75	85	95	150

USING OTHER GASES WITH iSOC®

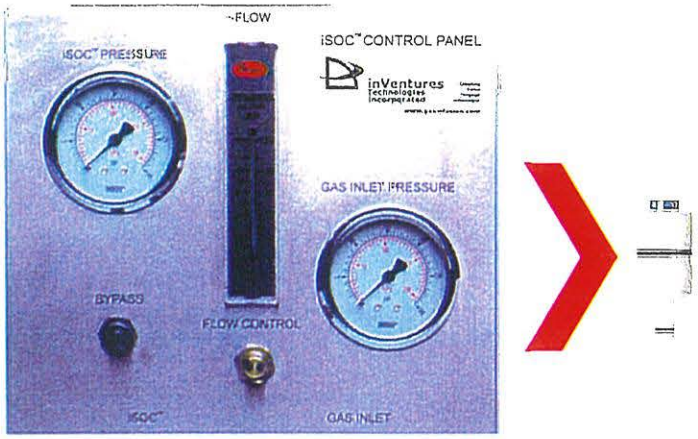
Consultants may need to use gases other than oxygen in their remediation approach. For example, hydrogen, methane, or propane may be used for remediation of chlorinated solvents and perchlorate. iSOC® will transfer these gases into the groundwater as effectively as it transfers oxygen, as shown above.

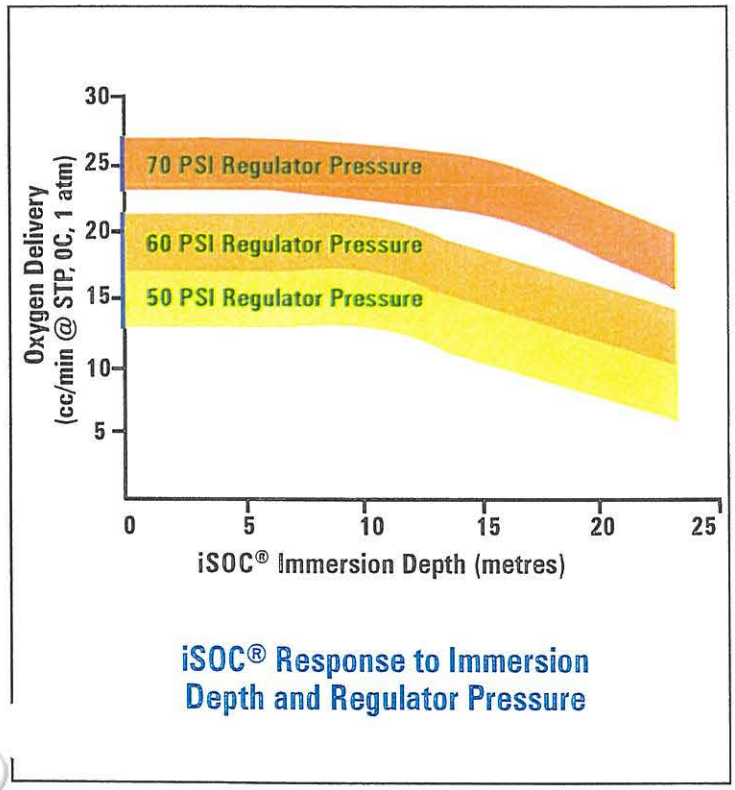
iSOC® ADVANTAGES

- Infuses 4 to 10 times more DO than any competitive technology.
- Delivers 40 to 200 PPM DO depending on iSOC® depth.
- Installs in existing 2-inch (50mm) monitoring wells.
- Application not limited by iron fouling under most conditions.
- Connects to standard gas cylinder.
- No power requirements, off-gases, pumps, or hazardous by-products.
- Small, simple, efficient, predictable, easy to use, & very low O&M.

MICRO-SIZING THE iSOC® CONTROL PANEL

In an effort to make the iSOC® System as easy to deploy as possible, the iSOC® Control Panel which determined the gas flow to the iSOC® and its structured polymer mass transfer device has been micro-sized. It now sits within the top of the iSOC® device and automatically controls the gas flow depending on groundwater depth and pressure regulator setting. All the installer has to do is set the pressure on the two-stage regulator. The iSOC® is simply attached to the tubing from the iSOC® Distribution Header and lowered into the well. There is no longer any need to house and mount a bulky control panel. The micro-sized flow controller is based upon valve control technology initially developed in the NASA Space program and currently used on other Gas inFusion Technology applications.





iSOC® Response to Immersion Depth and Regulator Pressure

MICRO-FLOW CONTROLLER

The built-in flow controller delivers a range of oxygen flow to the mass transfer device within the iSOC® depending on the immersion depth in groundwater and the pressure regulator setting. For immersion depths of less than 60 feet (18.3 m) of water, it is recommended that the oxygen regulator be set at 50 psi (3.4 bar). This will result in an average of 15 standard cc/min of oxygen delivered to the groundwater by the iSOC®. For greater depths, the regulator setting should be adjusted such that it is a minimum of 25 psi (1.7 bar) above the head pressure of the water.

WHERE HAS iSOC® BEEN USED?

The iSOC® technology has been used at hundreds of sites in the US, Canada, UK, Europe and Africa. It is currently being piloted on sites in Australasia and Japan. The technology has been deployed to bioremediate a range of hydrocarbons and other chemicals using direct aerobic, cometabolic, and anaerobic degradation methods.

iSOC® YOUR ULTIMATE MANAGED ATTENUATION TOOL

iSOC® DISTRIBUTION HEADER

Each order is supplied with a distribution header. Multiple port distribution headers are available. The size ordered is determined by the number of iSOC® units being run from each regulator. The distribution header can be directly mounted onto the gas regulator. The header is supplied with an on/off valve for each iSOC® unit such that the gas bottles can be changed without pulling the iSOC® from the well. For further detail go to www.isocinfo.com - Installation and Design - Installation Procedures.

iSOC® QUALITY CONSTRUCTION

iSOC® is constructed of high quality SS316 stainless steel using the latest manufacturing equipment and a proprietary structured polymer mass transfer device. iSOC® is 1.62" (41 mm) in diameter and 12.65" (321 mm) long with a barb connector for 0.17" (4 mm) ID polyurethane tubing. The housings for the pressure and flow control unit and the drain plug are made from nylon. iSOC® has a lifting ring for connecting to a suspension line for insertion in 2" (50 mm) or larger monitoring wells.

CHLORINATED SOLVENTS AND iSOC®

The iSOC® Gas inFusion system is used to effectively remediate chlorinated solvent contaminated groundwater. Where tetrachloroethene (PCE) is the main contaminant of concern, a two-stage sequential bioremediation approach is used to first degrade PCE to trichloroethene (TCE) by reductive dechlorination, followed by aerobic cometabolic oxidation of TCE and other daughter products such as DCE and vinyl chloride. Alkane gas delivered by iSOC® stimulates the anaerobic process. iSOC®s are used to deliver oxygen and additional alkane gas to achieve aerobic cometabolic treatment of the daughter products. The aerobic process can be applied independently to TCE, DCE and VC sites and is not subject to stall due to competing electron acceptors or limited availability of necessary anaerobic microorganisms. Several alternative bioremediation approaches can also be implemented with iSOC®s including direct aerobic treatment of vinyl chloride and reductive dechlorination of chlorinated solvents by direct hydrogen delivery.

Performance Measures

List and describe the performance measures for each environmental medium containing a PCLE zone that will be used to determine if reasonable progress is being made by the response action in a timely manner. Use these measures to document effectiveness of the response action in the RAER.

Performance of the alkylate removal system will be monitored by measuring the alkylate thickness in the recovery wells and adjacent wells, and by measuring the rate of alkylate recovery (Attachment 3A-1).

Performance of the oxygenation system will be monitored by sampling observation wells for DO and MTBE (Attachment 3A-2).

Potential Problems

Complete the table for the response action. When the response action consists of several components or multiple actions, complete one table for each major component or action.

Response Action Name/Designation: Alkylate Recovery System

List the potential problems that might be reasonably anticipated for the response action, describe the impact of each problem, and the response to the problem.

Description of the Potential Problem	Impact	Will this cause a response action failure?		Corrective Response
		Yes	No	
Skimmer set too low in the well	Groundwater/alkylate interface above the skimmer	X		Periodic gauging groundwater/alkylate levels in recovery wells and repositioning the skimmer when necessary.
Inadequate air pressure at pumps	Pumps not operational	X		Periodic checking pressure gauges to assure proper air pressure is delivered to the pumps, and that the air compressor is operational.

Potential Problems

Complete the table for the response action. When the response action consists of several components or multiple actions, complete one table for each major component or action.

Response Action Name/Designation: MTBE Passive Oxygenation System

List the potential problems that might be reasonably anticipated for the response action, describe the impact of each problem, and the response to the problem.

Description of the Potential Problem	Impact	Will this cause a response action failure?		Corrective Response
		Yes	No	
DO rates are not increasing	Leak in oxygen line	X		Periodic checking of oxygen levels in groundwater and checking pressure in oxygen line.
MTBE degradation not occurring as expected	Additional nutrients (i.e. phosphorus and nitrogen) needed			Periodically analyze groundwater for nutrients and add to wells when needed

Monitoring and Sampling	RAP Worksheet 3.1	Page 1 of 2
Associated Information: Attachment 3A	ID No.: 30573	Report Date: January 26, 2007

List the monitoring and sampling of COC concentrations or other parameters that will be conducted during the response action. Illustrate the monitoring or sampling locations in Attachment 3A. If statistics or geostatistics will be used, provide details in Appendix 7. If monitoring or observation wells will be constructed for the response action, provide well construction details in Attachment 2B if not previously provided.

Monitored Media	COC[1]	Other parameter (specify)	Sampling Method[2]	Sampling points or locations[3]	Depth/Height[4] (ft.)	Analytical or Field Screening Method	Sampling or Monitoring Frequency[5]
Surface Soil							
Subsurface Soil							
Groundwater	Alkylate		Interface Probe	MW-12, RW-1, and DG-3.		Gauging with interface probe	Monthly
	TPH C6-C12		Low Flow Groundwater Sampling	MW-12, MW-14, and MW-15.		TPH via Texas Method TX 1005	Semi-annually
	MTBE		Low Flow Groundwater Sampling	MW-10A MW-11, MW-12, MW-13, MW-14, MW-15, MW-16, and MW-18.		MTBE via SW 846 EPA Method 8260	Semi-annually
Surface water							

[1] Specify the COCs to be monitored in this media. List either type of COC (such as VOCs, metals) if all the COCs of that type will be monitored the same way.
[2] Describe the sampling or monitoring methods and QC procedures in Appendix 1 unless the proposed sampling or monitoring procedure is the same as the sampling or monitoring procedure described in the APAR.
[3] Specify the sampling or monitoring point, such as the specific monitor well or general sampling or monitoring location.
[4] Specify the depth or height of the sampling or monitoring points.
[5] Specify the frequency at which this monitoring or sampling will occur.

Sediment							
Air							
Other Media (specify)							

Explain the reasons for the above-listed monitoring and sampling plan.

Alkylate has a very low solubility. Once recovery has been accomplished as indicated by minimal measurable thickness, the response action will be complete. Alkylate levels in the recovery wells (RW-1, MW-12, and DG-3) will monitored to determine the completion of the response action (Figure 4A-1). TPH will be monitored in wells MW-12, MW-14, and MW-15 to demonstrate that dissolved phase component remains below commercial industrial PCLs.

Semi-annual monitoring of MW-10A, MW-11, MW-12, MW-13, MW-14, MW-15, MW-16, and MW-18 will be conducted as part of the MTBE plume remediation, which is expected to continue for longer than the alkylate removal (Figure 4A-2). MTBE will be monitored to assure that the concentrations in the selected wells remain below appropriate PCLs (0.73 mg/l – commercial/industrial PCLs for containment areas, and 0.24 mg/l – residential PCLs for downgradient property lines).

Operation and Maintenance	RAP Worksheet 3.2 Page 1 of 2	
	ID No.: 30573	Report Date: January 26, 2007

Use this worksheet to describe the operation and maintenance (O&M) activities for each response action. In situations where the response action consists of more than one major component, for clarity one worksheet can be completed for each major component.

Response Action Name/Designation: Alkylate Recovery System
List all portions of the response action to which this information applies.

Describe the O&M and inspection activities that will be required to operate and maintain response action components.

System performance will be monitored on a monthly basis. The monitoring activities include documenting the volume of alkylate recovered, confirming that the air pressure for the pumps is at the designed level, and confirming that the air compressor is operational. Periodically alkylate thickness will be measured in MW-12, RW-1 and DG-3. Groundwater/alkylate levels will also be checked to ensure that the skimmer is situated at the appropriate depth.

List and discuss the key operating parameters for a properly functioning response action. Address how changes in these parameters will result in operating changes, providing sufficient detail to explain how the operator will know the component is functioning properly.

The primary consideration is to ensure that the skimmer is set at the appropriate level within the well. Periodic measurement of the alkylate/water interface will confirm that the skimmer is set at the correct depth.

The air pressure for operating the removal pump needs to be at the proper setting to evacuate the skimmed alkylate. The pressure will be checked at the pressure regulator and gauge adjacent to the control panel.

List the routine tasks required to operate the response action.

- Measure alkylate and groundwater elevations
- Check pressure gauges
- Measure accumulated alkylate volume

List the routine tasks required to maintain the response action, including scheduled inspections, maintenance, and component replacement.

Operation and maintenance described in the preceding sections will be generally performed on a monthly basis.

Response Action Name/Designation: MTBE Passive Oxygenation System
List all portions of the response action to which this information applies.

Describe the O&M and inspection activities that will be required to operate and maintain response action components.

System performance will be monitored on a weekly basis. The monitoring activities will include documenting the volume of oxygen in each oxygen cylinder, checking the pressure gauges, and visually inspecting the iSOC manifold, oxygenation wells, changeover panel, and oxygen gas six-packs.

List and discuss the key operating parameters for a properly functioning response action. Address how changes in these parameters will result in operating changes, providing sufficient detail to explain how the operator will know the component is functioning properly.

The primary consideration is to ensure that the oxygen lines are not leaking and that oxygen is being delivered to the 24 iSOCs. The system will be inspected weekly to determine whether sufficient oxygen is being delivered to the wells. If a leak or drop in pressure is detected, the system will be closely inspected to determine the cause of the problem and it will be repaired.

List the routine tasks required to operate the response action.

- Check oxygen pressure at the changeover panel
- Visually inspect oxygenation wells, cylinders, manifold, and changeover panel
- Periodically sample observation wells for DO and MTBE

List the routine tasks required to maintain the response action, including scheduled inspections, maintenance, and component replacement.

Operation and maintenance described in the preceding sections will be generally performed on a weekly basis.

Note: Well locations were surveyed by Gulette and Associates, Houston, Texas, March 1, 2006.

Confirmation Sampling Plan	RAP Worksheet 4.0	Page 1 of 2
Associated Information: Attachment 4A	ID No.: 30573	Report Date: January 26, 2007

List the COCs and other parameters that will be sampled to confirm completion of the response action. Illustrate the monitoring or sampling locations in Attachment 4A. If monitoring or observation wells will be constructed for the response action, provide well construction details in Attachment 2B if not previously provided. If needed, describe the sample collection and handling methods, if not previously provided, in Appendix 6.

Media	COC[1]	Other parameter (specify)	Sampling Method	Sampling points[2]	Depth/height (ft.)	Analytical Method	Sampling Frequency
Surface Soil							
Subsurface Soil							
Groundwater	Alkylate		Interface Probe	MW-12, RW-1, and DG-3.	Gauging with interface probe	Gauging with interface probe	Monthly
	Alkylate		Low Flow Groundwater Sampling	MW-12, MW-14, and MW-15.	TPH via Texas Method TX 1005	TPH via Texas Method TX 1005	Semi-annually
Groundwater	MTBE		Low Flow Groundwater Sampling	MW-10A MW-11, MW-12, MW-13, MW-14, MW-15, MW-16, and MW-18.	MTBE via SW 846 EPA Method 8260	MTBE via SW 846 EPA Method 8260	Semi-annually
Sediment							
Air							
Other media (specify)							

[1] Specify either a specific COC or type of COC (such as VOCs, metals).
[2] Specify the sampling point to the degree it is known, (for example, MW-1, or near former boring #2).

Explain the reasons for the above-listed sampling plan. Discuss statistical or geostatistical methodology(ies) which will be applied, if any, in the data collection process. Discuss any assumptions made in the statistical/geostatistical assessment, and how they will be met.

When both the rate of alkylate recovery and the measurable thickness in recovery wells become minimal (less than 1/10th inch) for two consecutive quarters, the TCEQ will be notified and the system will be deactived. The recovery wells will be monitored quarterly for two quarters to verify that alkylate does not reappear (see Attachment 4A). Please note that the alkylate occurs in a very small portion of a larger MTBE plume. The MTBE plume remediation is expected to continue for longer than the alkylate recovery is needed.

When an MTBE concentration in the eight observation wells meets the applicable groundwater PCLS, The TCEQ will be notified and the oxygenation system will be deactivated. The observation wells will be monitored for two consecutive quarters to verify that MTBE does not reappear.

Note: Well locations were surveyed by Gulette and Associates, Houston, Texas, March 1, 2006.

Post-Response Action Care	RAP Worksheet 5.0 Page 1 of 1	
Associated Information: Attachments 5A-5C	ID No.: 30573	Report date: January 26, 2007

Complete this worksheet only if Remedy Standard B will be used.

What is the proposed initial post-response action care period? (default 30 yr.) _____ years

If the proposed initial post-response action care period is less than 30 years, provide a technical justification in accordance with §350.33(h).

N/A

What is the foreseeable land use during the post-response action care period? _____

Describe how the future use of the property will not compromise the integrity of the physical controls, will not interfere with the function of the monitoring systems, will not pose a threat to human health or the environment, and will be in accordance with any institutional controls.

N/A

Briefly describe the proposed post-response action care activities. Describe the type of monitoring and/or inspections to be performed. Discuss the rationale for not including COC(s) analyzed during the response action, monitoring or sampling point location, frequency of monitoring and/or inspections, and the duration of the monitoring program.

N/A

Will PRAC sampling procedures be the same as those as previously documented for monitoring and/ or confirmation sampling? ____ Yes ___ No
If no, provide in Appendix 6 a description of the monitoring or sampling collection procedures to be conducted during the post-response action care period.

Cost Estimate

Complete this portion of the form only if a physical control is proposed (installed hydraulic control system, slurry wall, cap, etc.). Provide in Attachment 5B a detailed cost estimate for a third party to operate and maintain the physical control during the PRAC period, based on current dollar amount.

Specify the physical control to which this information applies _____
Complete this worksheet for each physical control that will be used as part of the response action.

What is the total estimated annual cost of O&M for the PRAC period? $ _____

What is the total estimated cost for a third party to perform PRAC activities? $ _____

Identify the type of financial assurance mechanism to be used, and the contact person managing fiduciary responsibility, if known.

N/A

Does the person meet the criteria and definition of a small business? (see §350.33(n)) ___ Yes ___ No
If yes and the person desires to pursue the reduced amount of financial assurance, provide a legally binding affidavit as Attachment 5C. Include in the affidavit the information requested in 30 TAC §350.33(l), (m), and (n). An example affidavit is attached in the instructions.

Implementation Schedule	RAP Worksheet 6.0	Page 1 of 1
	ID No.: 30573	Report Date: January 26, 2007

Document the proposed schedule for implementing the response action. Include all major response action activities through the life of the project, including all removal, decontamination, and control actions, component installations, O&M, monitoring, and post-response action care activities.

Implementation of Response Action (specify component or action)	**Start**	**Finish**	**Duration**
Install and operate alkylate removal skimmer system	January 2006	December 2007	2 year (estimated maximum)
Post-removal interface probe measurements	January 2008	June 2008	2 quarters
Install and operate MTBE oxygenation system	January 2007	January 2010	3 years
Post –response MTBE monitoring	January 2010	June 2010	2 quarters

List the proposed schedule for report submittals. Add additional lines if more reports than listed will be needed to complete the response action.

Reports	**Submittal date**
Response Action Effectiveness Report (RAER)	
RAER submittal number 1	180 days after completion of response action (alkylate and MTBE response actions will be combined)
RAER submittal number 2	N/A
RAER submittal number 3	N/A
Response Action Completion Report (RACR)	
Post-Response Action Care Report (PRACR)	
PRACR submittal number 1	
PRACR submittal number 2	
PRACR submittal number 3

APPENDIX 3 Studies and Tests Documentation

MTBE Pilot Test

URS proposed the use of high-efficiency, *in situ*, passive oxygenation to stimulate biodegradation of an MTBE groundwater plume at the KM Liquids Terminals (KMLT) facility in Galena Park, Texas. URS planned and designed the pilot test with five test wells, one existing well for oxygenation and four new observation wells (Figure 1-3). An additional existing well was also used for periodic cross-gradient evaluations. The pilot test was done within the MTBE plume, and inside the containment of Tank 100-11 at the North Plant facility.

The four test wells were installed in January 2006. After well installation, the *in situ* groundwater remediation system was installed. The system consisted of an oxygen "emitter", oxygen supply cylinders, an oxygen regulator, and associated tubing and tubing housing. The oxygen emitter, installed in RW2, was an iSOC® unit, a passive, high-dissolution efficiency, oxygenation system developed by Inventure, Inc. that passively delivers *in situ* oxygen to groundwater. Passive oxygenation in this case means that oxygen is dissolved by groundwater's contact with a large static oxygen surface within the emitter, rather than by any sparging or other turbulent dissolution process. A temporary building, outside the containment of Tank 100-11, housed oxygen cylinders to supply the iSOC®. Oxygen was supplied to well RW-2, via ¼-inch polyurethane tubing contained in a protective 2-inch schedule 80 PVC pipe installed from the building to the well within Tank 100-11 containment.

The pilot test started on January 19, 2006, and was periodically monitored and inspected every week. All wells were periodically gauged, field analyzed for groundwater dissolved oxygen (DO), and samples collected and analyzed for MTBE. The pilot test results are discussed below along with the data and graphs demonstrating the successful outcome of this pilot test. The pilot test was originally planned for only two months, January to March 2006. Good initial test results led to a decision by Kinder Morgan and URS to continue the test to gather additional data to confirm the results and aid full-scale design. After four months, the last samples were collected on May 4, 2006, and the pilot test was terminated.

Pilot Test Results

During groundwater sampling events, field parameters (pH, specific conductance, temperature, DO, and oxidation reduction potential [ORP]) were measured prior to collection of groundwater samples from the pilot study wells using low-flow sampling techniques. Groundwater samples were then collected and submitted to the project analytical laboratories for analysis of MTBE. The field and analytical results are summarized in Figure A3-1 (DO Results) and Figure A3-2 (MTBE results).

Figure A3-1 includes a table and graph of the DO results obtained during the pilot test in the oxygenation well (RW2), upgradient well (UG1), downgradient wells (DG1 and DG2), and the cross-gradient wells (DG3 and MW-12). As shown in Figure A3-1, the DO concentration in RW2 (well with the iSOC®) increased significantly within the first week, and was sustained throughout the test, as would be expected. The downgradient and cross-gradient wells showed significant increases in the

DO concentrations (about six to ten fold) after the first month of the test, except at the February 2006 sampling event. During the February 27, 2006 sampling event, free-phase alkylate was detected in well RW2. When the low-flow sampling pump was activated, alkylate coated the probe of the flow-through cell, resulting in erroneously low readings for DO during the sampling event. Precautions were taken in subsequent sampling events to eliminate this interference.

Note the very high DO that the system creates over time. This supersaturation of oxygen in groundwater is possible because:

- the system is passive, in that flow is not turbulent past the emitter,
- the emitter has an enormous relative surface area,
- no turbulent sparging of air or oxygen occurs,
- the oxygenation occurs at depth under pressure in the groundwater, and
- the oxygen is a pure technical-grade oxygen rather than air.

The system stays supersaturated because of the passive, essentially non-turbulent nature of the groundwater flow in the surrounding soils. This is evidenced by the very high measured DO in downgradient wells, derived solely from the oxygen dissolved at RW2. This high saturation means that the system is more efficient than sparging for oxygen delivery and the passive nature eliminates volatilization via sparging off-gas. Oxygen initially was low in the wells, in the range of 1 ppm or less, but with the introduction of oxygen in well RW2, highly oxic conditions were created in the groundwater in RW2, and over time, in the downgradient and upgradient wells (Figure A3-1).

Figure A3-2 shows the MTBE analytical results for the pilot study. The RW2 MTBE concentration at the beginning of the test was 3,000 ug/l. Initial MTBE concentrations were highly variable from well to well, ranging from 5,470 to 1,340 ppb. Over time, the MTBE concentrations decline in RW2 and most of the other wells. The greater variability with the MTBE concentrations is probably due to the influx of extant MTBE concentrations from upgradient of the pilot area and each well. Only DG2 does not show a clear decline in MTBE concentrations over the Pilot study period. DG1, DG3, and, of course, RW2 shows a steady decrease in MTBE. These responses generally correspond to timing of these wells oxygenation and the DO concentrations achieved, taking in to account that new MTBE concentrations are moving downgradient to these wells from areas upgradient of the wells and Pilot test area. DG2 and UG1, the putative most downgradient well and upgradient well show different patterns. DG2 initially declines in MTBE as the oxygen increases. MTBE then spikes up at the last reading, probably due to an influx of higher concentrations of MTBE in groundwater from upgradient. UG1 DO concentrations are slow to increase and MTBE concentrations increase for the first several months of the study. Then, MTBE concentrations UG1 begin to decline, probably from an increasing DO but possibly from continued flow of MTBE concentrations down towards RW2. RW2 MTBE concentrations decline, but based on its DO status, not as much as downgradient wells DG1 and DG3. This smaller decline is possibly explained by the movement of higher MTBE concentration groundwater down from UG1 (Figure A3-2).

An evaluation of the groundwater surface data suggests that DG2 is not directly downgradient of RW2; but that DG3 is more likely the more direct distant downgradient well, possibly explaining why DG3 results are better than DG2 results. DG1 is so near RW2, that it is impacted early and consistently by oxygen from RW2, explaining its excellent results.

RW2 Oxygenation Well – The oxygen emitter well DO increased rapidly as would be expected and was greater than 34 ppm DO within 1 week of start up. From that point, DO in RW2 continued to increase at every measurement and at the last measurement was at its highest during the study and, as expected since it was the emitter well, was consistently the highest of all the wells in the pilot system at each measuring time and at the end of the study. As noted above, MTBE declined steadily but less than the downgradient wells, DG1 and DG3.

Downgradient Wells - The levels of DO in all the downgradient wells increased over time and at the termination of the study were at their highest DO during the study. DG1 ended up with a higher DO than the DG2, DG3 and UG1, and had a higher DO for the last two measurements than the other DG wells, which makes sense since it is closest to RW2. DG2 had similar readings as DG1 except that the last two measurements were lower than the corresponding DG1 measurements. DG1 was at least partially upgradient from DG2. Initially both wells were expected to have low DO, and they did. As DO moves down to DG1 from RG2, it travels with MTBE, and interacts with the reduced soils as well supporting MTBE degradation, consuming most of the DO (and some MTBE). This initially limits the oxygen available to show up in other wells. As more oxygen is added and advects downgradient or diffuses upgradient, MTBE decreases more near the emitter, and more oxygen makes it further downgradient, showing up at increasing concentrations in the downgradient wells. In general the data fit this well. Both DG2 and DG3 appear to be downgradient of RW2 and to some extent DG1, based on field groundwater surface measurements in the pilot system. DG2 and DG3 generally trail DG1 in DO concentrations at any time, corresponding to their relative distances from RW2, and generally track DG1's decrease in MTBE but at a delayed pace (Figure A3-2).

Upgradient Well – UG1's elevated DO toward the end of the pilot study seems anomalous but could be expected. Due to the high DO created with this system and the slow movement of groundwater in general in this setting, diffusion could cause DO to reach the upgradient well. UG1 trails most other wells in achieving a marked increase in DO and behaves similarly to the most distant putative downgradient well, DG3. Clearly DO is getting slowly upgradient to UG1, because there is no other source of supersaturated DO such as is seen at the end of the pilot study. This actually bodes well for the full-scale system because it indicates that DO will increase throughout the plume not just near the emitter wells.

MTBE Degradation

The oxic conditions created in the pilot study were intended to enhance MTBE biodegradation activities. As depicted in Figure A3-2, the MTBE concentrations were reduced to 1420 ug/l after two weeks of test operations, and continued dropping to 935 ug/l, after four months at the end of the test (over 65% reduction in MTBE concentrations). It should be noted that "new" MTBE is flowing downgradient into the pilot system so that MTBE concentrations would not be expected to reach non-detect in this 4-month pilot test. MTBE concentrations also declined in test wells, UG1 (from highest 9200 to 2570 ug/l), DG1 (from 1340 ug/l to 104 ug/l), DG2 (5,470 to 2530), and DG3 (2890 to 440 ug/l). This indicates that as oxic conditions extend down and marginally upgradient from the emitter well, MTBE concentrations go down. Because this is a passive oxygenation system, simple sparging volatilization is eliminated as a removal mechanism. A decline of MTBE in each well correlates with an increase in DO in that well. In addition, the pattern of DO concentrations appearing in downgradient wells and the decreases in MTBE concentrations over time, fit a pattern of DO extending gradually downgradient from the emitter and successively initiating biodegradation of MTBE.

Attached are photographs showing array of wells for the Pilot Test and introduction of oxygen in the remediation well RW2. Some additional lessons learned or indicated by this pilot study are:

1. The groundwater flow direction in the area of the pilot study and probably the remainder of the larger plume was somewhat different than had been suggested by the evaluation of the prior consultant on this project.
2. Groundwater flow is now believed to be much faster in the plume than the prior consultants estimate, but still slow enough to allow DO concentrations to move upgradient.

Conclusions:

The pilot test indicates that passive oxygenation in the MTBE plume promoted the removal of MTBE. This indicates that the plume can be bioremediated if adequate oxygen and coverage in the plume are achieved. The pilot test did not include additions of nutrient such as phosphorus and fixed nutrient-nitrogen. In the full-scale process, if the natural soils and groundwater do not contain these nutrients small amounts may need to be added to the oxygenation wells or other wells in the plume to sustain the biodegradation. This can be determined by the progress of the full-scale system. Nutrients can be readily and inexpensively analyzed for and then added to the wells, again in a passive manner, as needed, if needed.

Based on the premise that passive oxygenation would promote MTBE removal by bioremediation, the pilot study appears very successful. The additions of oxygen had the anticipated effect over the 4 months of the pilot study. The study indicates that a large-scale system should be effective, over a reasonable time, at promoting biodegradation of the MTBE plume. An added benefit of such as system is that it will promote the degradation of almost any non-MTBE organic (i.e. hydrocarbon) co-contaminant in the groundwater in that area. The downside is that, if there are other organic contaminants, their degradation will consume oxygen as well and possibly lengthen the time needed to treat the MTBE. The largest costs of a full-scale system are primarily in the equipment purchase and system installation, with no blowers or pumps to consume electricity or mechanically fail. Another added benefit of this system is that the oxygen emitters should last for years, typically have had little fouling, can be readily cleaned, and can be used at other locations when their initial deployment at this location is completed.

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

April 10, 2018

Mr. Johnny Kennedy
Remediation Project Manager
Kinder Morgan Liquids Terminals, LLC
906 Clinton Drive
Galena Park, TX 77547-0486

Re: Conditional Approval of

- *Draft Revised Response Action Plan for TCI Plant,* dated January 15, 2018.
- *Draft Revised Response Action Plan, East Plant Gate 6 Area to the 2014 RAP,* dated March 5, 2018
- *Draft Response Action Plan, Old Pump House (OPH) No. 5 Area of Concern, (East Plant),* dated March 28, 2018;

Kinder Morgan Liquids Terminals, LLC - Galena Park;
TCEQ SWR No. 30573; TCEQ Hazardous Waste Permit/Compliance Plan 50054;
EPA ID No. TXD026481523;
Customer No. CN601545940; Regulated Entity No. RN100237452

Dear Mr. Kennedy:

The Texas Commission on Environmental Quality (TCEQ) has reviewed the above referenced Response Action Plans (RAPs) received by the Remediation Division on January 24, March 6, and April 2, 2018, respectively. Based on the TCEQ review, the Draft RAPs fulfill the requirements of 30 Texas Administrative Code (TAC) §350.94. The TCEQ hereby approves Draft RAP with the following conditions:

- Within one-hundred-twenty (120) days from the date of this letter please submit the above referenced Response Action Plans (RAPs) as part of a Class 3 Permit Modification application. The Modification to the Permit shall incorporate proposed response actions for the OPH No. 5 Area of Concern, East Plant Gate 6 Area, and the TCI Plant, and any other areas at the Galena Park site in which the response action will take more than 3 years to complete. Please submit an original and three copies of the Class 3 Permit Modification application to the IHW Permits Section at mail code MC130.
- The TCEQ recommends that the Implementation Schedule for the submittal of proof of institutional controls (ICs) in the form of deed notice be consistent between RAPs. For example, proof of filing be submitted within 120 days of RAP approval in accordance with 30 TAC §350.33.
- Since the CP Attachment A maps for the final draft permit will be in black and white the TCEQ recommends that the designated monitoring well location for point-of-exposure well, attenuation monitoring, etc., have a different symbol so the different well can be easily distinguished from one another.
- Revise the deed Notice language in Appendix 4 of the RAPs to include the following information as required by 30 TAC §350.111 and per TCEQ Guidance RG-366/TRRP 16 *Institutional Controls under TRRP*:

- A metes and bounds description of the portion(s) of the affected property to which the IC applies;
- A plat map clearly demarcating the portion(s) of the affected property to which the IC applies. The map must contain a north arrow, a correlating map scale, and a legend identifying any used symbols or abbreviations;
- Both the metes and bounds and plat map need to be certified by a registered professional land surveyor or registered by the Texas Bard of Professional Surveying attesting to the accuracy of the descriptions.
- A list of constituents of concern for each environmental media that contain concentrations above their respective protective concentration levels (PCLs).
- A description of any monitoring and maintenance requirements of the physical controls and/or ICs, or compliance with health and safety plans.
- The TCEQ Program and identifier number which should be SWR No. 30573.

Please be aware that it is the continuing obligation of persons associated with a site to ensure that municipal hazardous waste and industrial solid waste are managed in a manner which does not cause the discharge or imminent threat of discharge of waste into or adjacent to waters in the state, a nuisance, or the endangerment of the public health and welfare as required by 30 TAC §335.4. If the actual response action fails to comply with these requirements, please take any necessary and authorized action to correct such conditions. A TCEQ field inspector may conduct an inspection of your site to determine compliance with the plan.

Questions concerning this letter should be directed to me at (512) 239-2034 or maureen.hatfield@tceq.texas.gov. When responding by mail, please submit one paper copy and one electronic copy (on USB or disc) of all correspondence and reports to the TCEQ Remediation Division at Mail Code MC-127. An additional copy should be submitted in electronic format to the local TCEQ Region Office. The information in the reference block should be included in all submittals.

Sincerely,

Maureen Hatfield, P.G., Project Manager
Team 1, VCP-CA Section
Remediation Division
Texas Commission on Environmental Quality

Revised RAP Executive Summary	ID No.: 30573
	Report Date: September 2018

Use this worksheet to summarize the report. Be sure to complete and submit the Checklist for Report Completeness. **Attach a chronology of activities associated with the affected property.**

Briefly describe the affected property and Protective Concentration Level Exceedance (PCLE) zones, the conclusions from the assessment activities, identify any affected or threatened receptors, and describe any other major considerations taken into account when developing this response action plan. If any portion of the response action is necessitated due to an aesthetic or nuisance condition, identify the nature of that condition and identify that portion of the response action proposed to address it. If any media that contains a PCLE zone is not addressed in this RAP, provide justification.

Background

The Texmark Chemicals, Inc. (TCI) facility is located at 900 Clinton Drive in Galena Park, Texas (Site), approximately one-quarter mile north of the Houston Ship Channel. TCI specializes in contract manufacturing commercial grade and high purity cyclopentadiene (CPD), dicyclopentadiene (DCDP), and derivatives of these compounds. The property is bounded by the CenterPoint Energy (CNP) right-of-way (ROW) to the west, Clinton Drive to the north, and KM Liquids Terminals (Kinder Morgan) properties to the east and south. Although TCI owns and operates the facility, Kinder Morgan will implement the response action activities at the Site.

This Revised Response Action Plan (RAP) was developed by AECOM for the TCI facility to present additional data collected and response actions following the Texas Commission on Environmental Quality (TCEQ) approval of the Revised RAP dated January 28, 2008 (2008 Revised RAP) and to revise the remedial strategies proposed therein based on these new data. A summary of significant reports submitted to the TCEQ for the TCI facility is presented below.

Report – TCEQ Submittal Date		Approved by TCEQ
April 2001	RCRA Facility Investigation (RFI)	NA
January 2006	Affected Property Assessment Report (APAR)	July 2006
December 2006	Response Action Plan (RAP)	February 2007
January 2008	Revised RAP	June 2008
February 2011	Class V Injection Permit Request	March 2011
January 2018	Draft Revised RAP	April 2018

Some of the information presented in the 2008 Revised RAP is summarized here to provide context for the new data. References for this Revised RAP are included in **Appendix 1.**

Kinder Morgan is currently preparing a Class 3 Permit Modification Application to modify the existing Kinder Morgan Galena Park Hazardous Waste Permit/Compliance Plan 50054 (Permit), ISWR No. 30573 to include on-going corrective action including that being conducted at the TCI facility. As such, the TCI facility will be subject to the reporting requirements of the Hazardous Waste/Compliance Plan CP-50054.

TCEQ-Approved 2008 Revised RAP Summary

The 2008 Revised RAP summarized the soil excavation and verification sampling conducted for the areas identified in the 2006 RAP, and proposed a plume management zone (PMZ) for the site; however, after further assessment and changing site conditions, a PMZ is no longer a viable response action. A Site Location Map is included as **Attachment 1A-1**. Listed below are the TCEQ-approved response actions for soil and groundwater at the TCI facility.

PT-8 Area Soil – No Further Action (NFA) was proposed in the 2008 Revised RAP and approved by the TCEQ in their June 26, 2008 RAP approval letter for the PT-8 Area.

Revised RAP Executive Summary	ID No.: 30573
	Report Date: September 2018

Former Tank 28 Area Soil – The arsenic impacted soil protective concentration level exceedance (PCLE) zones and groundwater impacted with benzene, toluene, ethylbenzene and xylenes (BTEX), arsenic, and styrene beneath the former Tank 28 Area was proposed to be managed under a PMZ.

Other Plant Operational Areas Soil – As summarized in the 2008 Revised RAP, approximately 22,260 cubic yards of soil and debris were removed from the northwestern portion of the Site in 2003 to 2004. The excavation was backfilled with clean imported material. The soil response actions for these areas focused on addressing the $^{GW}Soil_{Ing}$ pathway and $^{Air}Soil_{Inh\text{-}V}$ pathway. Air monitoring was proposed for two locations with exceedance of the $^{Air}Soil_{Inh\text{-}V}$ Protective Concentration Level (PCL) and the remaining $^{GW}Soil_{Ing}$ PCLE zones were to be managed under a Remedy Standard B using a ground water PMZ. The $^{Tot}Soil_{Comb}$ PCLs were not exceeded for surface soil.

Groundwater – The proposed response action for the ground water PCLE zone was a PMZ under Remedy Standard B. The PMZ was to utilize a monitoring program consisting of a network of monitoring wells considered to be attenuation monitoring points (AMPs) and point of exposure (POE) wells. Ground water concentrations from AMP wells would be compared to site-specific attenuation action levels (AALs) to confirm the plume concentration levels remained protective of downgradient receptors at the POE. Ground water concentrations would also be monitored to verify plume stability and that COC leaching from soils covered by the PMZ were contributing to increased contaminant mass in the ground water. At two locations with $^{Air}GW_{Inh\text{-}V}$ exceedances of benzene, the response action would include a demonstration to evaluate worker safety.

Activities Since Revised RAP

Following approval of the 2008 Revised RAP, monitoring wells POE-1, POE-3, AMP-1, and AMP-2 were installed in September 2008 and sampled in October 2008. The analytical results indicated that POE-1 and POE-2 exceeded the applicable PCLs. As a result, an access agreement was obtained with CenterPoint Energy (CNP) and several monitoring wells were installed hydraulically downgradient in the ROW property and hydraulically downgradient of POE-1 and POE-3. However, CNP denied Kinder Morgan's request to include the down gradient wells in the proposed PMZ, as CNP does not allow land use restrictions to be placed on their property and the ROW wells are no longer utilized. Since the proposed PMZ was not an option, Kinder Morgan conducted additional assessment activities, conducted a source area reduction pilot test, and conducted additional aquifer testing at the facility.

In February 2011, Kinder Morgan requested and received a Class V Injection Permit through the TCEQ Underground Injection Control (UIC) Permits Team to inject RegenOx at three direct probe injection points and evaluate the ability of the amendment to oxidize the dissolved phase benzene in the ground water as measured in downgradient observation points. The results indicated that although there was some initial decrease in benzene concentrations, there was no decreasing trend over the monitoring period and a full-scale implementation of the technology was not pursued further. A request to close the Class V injection permit and a memorandum documenting the injection pilot test is included in **Appendix 3**.

Subsequent site conceptual model studies showed that three predominant groundwater migration pathways exist beneath the TCI property in the affected uppermost groundwater bearing unit (SCF/UNTU); the northern groundwater migration pathway, central migration pathway and southern migration pathway **(Attachment 1A-6**). The migration pathways are defined by variations in lithology, aquifer characteristics, hydraulic properties, and groundwater flow direction. Each of the migration pathways generally flows in a westerly or southwesterly direction toward Panther Creek.

Since the PMZ was now not a viable option, Kinder Morgan revised the remedial strategy for the TCI facility to that of on-site capture and containment. Previously installed POE-1 and POE-3 were converted to recovery wells and the system was expanded in 2011 with the installation of recovery wells RW-1 through RW-5. In 2012 recovery wells RW-7 through RW-9 and monitoring well MW-18 were installed, and in 2013 recovery well RW-6 and monitoring wells MW-19, MW-20, and MW-21 wells were installed. The current

recovery system consisting of 13 recovery wells has been operational since 2011. Copies of the boring logs are included in **Appendix 2**.

The recovery system consists of thirteen recovery wells, effluent piping, a 650-gallon holding tank and transfer pump along the western TCI property boundary. Ten recovery wells, RW-1 thru RW-3, RW-6 thru RW-9, POE-1, MW-09TCI, and MW-21 are utilized to capture the affected ground water along the northern groundwater migration pathway. Three recovery wells, RW-4, RW-5, and POE-3 are utilized to capture affected ground water of the southern and central groundwater migration pathways (**Attachment 1A-6**). The 13 recovery wells are collectively providing adequate and effective containment and recovery of affected groundwater along the western TCI property boundary and preventing off-site migration, as demonstrated by a cone of depression around the downgradient recovery wells near the western property boundary. Since activation of the system, over 3.2 million gallons of groundwater have been recovered as of June 30, 2017 at an average rate of 0.77 gallons per minute (gpm) or 1,109 gallons per day (gpd).

The groundwater recovery system components are inspected at least weekly to ensure the system is operating as designed, and TCI plant personnel report any identified or potential problems to Kinder Morgan between scheduled inspections. Problems that affect the system's performance include recovery line and component clogging and fouling. An analysis of general water chemistry parameters indicated elevated levels of sodium, sulfate, and bicarbonate may be promoting the precipitation of calcium, manganese carbonates, and silica into the system, and thermal expansion and sagging of the high-density polyethylene (HDPE) effluent line appears to promote blockage and variable recovery rates. Kinder Morgan intends to replace the HDPE effluent line and ancillary discharge lines from each recovery well with fiberglass re-enforced epoxy piping in 2018.

Shallow groundwater generally flows toward the west and southwest across the Site toward Panther Creek. A cone of depression is maintained around the recovery wells. **Attachment 1A-2** shows the groundwater flow across the Site in December 2010 prior to implementing the hydraulic control by groundwater containment and recovery system. **Attachments 1A-3** (February 2013) **and 1A-4** (May 2017) show the groundwater flow after implementing the hydraulic control by groundwater containment and recovery system.

2018 Revised RAP

The response actions proposed in this Revised RAP are 1) continue the on-site containment and capture of impacted ground water utilizing the constructed recovery system, 2) implement a monitoring program of select site monitoring wells to verify plume stability and no increasing concentration trends due to leaching of soil COCs to the ground water, and 3) utilize institutional controls to restrict shallow ground water usage and document the use of occupational inhalation criteria as Risk Based Exposure Levels (RBELs)

Former Tank 28 Area Soil – An arsenic-impacted soil PCLE zone exists beneath the former Tank 28 Area. Shallow groundwater beneath the former Tank 28 area that has historically, or could potentially, be impacted by leaching of arsenic at concentrations exceeding groundwater ingestion ($^{GW}GW_{ing}$) PCLs, will be managed using the groundwater monitoring program, on-site containment and capture of impacted ground water, and an institutional control restricting groundwater usage.

Plant Operational Areas Soil – The proposed soil response actions for these areas focuses on addressing the $^{GW}Soil_{Ing}$ pathway and $^{Air}Soil_{Inh\text{-}V}$ pathway. The $^{Tot}Soil_{Comb}$ PCLs were not exceeded for surface soil. The $^{GW}Soil_{Ing}$ pathway will be addressed by managing groundwater that may potentially come in contact with COCs from soil in the form of leachate. This objective will be achieved using the groundwater monitoring program, on-site containment and capture of impacted ground water, and an institutional control restricting groundwater usage. This addresses and manages the contaminant pathways to minimize on-site exposure and off-site migration. Ground water monitoring will be utilized to verify there are no increasing COC concentration trends.

Revised RAP Executive Summary	ID No.: 30573
	Report Date: September 2018

The $^{Air}Soil_{Inh-V}$ pathway will be addressed through a site-specific risk evaluation. In accordance with Texas Administrative Code (TAC) §350.74(b), a Tier 2 $^{Air}Soil_{Inh-V}$ PCL was calculated for the benzene soil to air exposure pathway to demonstrate compliance with worker safety air exposure levels. The PCL was calculated using the Occupational Safety and Health Administration (OSHA) Permissible Exposure Level (PEL) for benzene in place of the Texas Risk Reduction Program (TRRP) RBEL. The soil benzene concentrations in borings 2-2 and 2-4a are well below the calculated Tier 2 PCL of 24,300 milligrams per kilogram (mg/kg) and are therefore protective of worker safety air exposure levels. As a result, Kinder Morgan requests NFA for this pathway once the proposed institutional control has been filed. The Tier 2 PCL calculation spreadsheet (30 TAC 350.71-350.79) for the soil to air inhalation pathway is provided as **Table 3-1** in **Appendix 3.**

Groundwater – Based on the evaluation of historical sampling results, groundwater has exceeded the TCEQ TRRP Tier 1 groundwater to air $^{Air}GW_{Inh-V}$ PCL for benzene as presented in 2008 Revised RAP. In accordance with TAC §350.74(b), a TCEQ TRRP Tier 2 groundwater to air ($^{Air}GW_{Inh-V}$) PCL) was calculated for benzene to ensure worker safety air exposure levels using the OSHA PEL for benzene in lieu of the TRRP RBEL in the Tier 2 calculations. The reported groundwater benzene concentrations for MW-10TCI and MW-12TCI were well below the calculated Tier 2 PCL of 6,700 milligrams per liter (mg/L), and are therefore protective of worker safety air exposure levels. The calculated Tier 2 $^{Air}GW_{Inh-V}$ PCL is also greater than the benzene water solubility of 1,770 mg/L, indicating the worker safety air exposure level is unlikely to be exceeded under the current site conditions. Since no ground water concentrations are even close to the calculated Tier 2 $^{Air}GW_{Inh-V}$ PCL, Kinder Morgan requests NFA for this pathway once the proposed institutional control has been filed. The Tier 2 PCL calculation spreadsheet for the Tier 2 groundwater to air inhalation pathway is provided as **Tables 3-1 through 3-5** in **Appendix 3.**

The hydraulic control (recovery) implemented at the site, in conjunction with the proposed institutional control (deed recordation), and groundwater monitoring program can effectively prevent human and ecologic exposure to affected groundwater beneath the site and prevent the PCLE zone from off-site migration.

What is the selected remedy standard for this affected property? ___ A ___X___ B

List all media that contains a PCLE zone and specify the proposed response action for each media. Indicate the type of removal, decontamination, physical control and/or institutional control action that is proposed.

Media	COCs[1]	Removal	Decontamination	Control			
				Physical Control	Modified Groundwater Response Objective[2]		
					PMZ	WCU	TI
Surface soil	Arsenic			X			
Subsurface	Benzene, toluene, and ethylbenzene			X			
Groundwater	Selectively benzene, toluene, ethylbenzene, and xylenes (BTEX),			X			

Revised RAP Executive Summary	ID No.: 30573
	Report Date: September 2018

This Revised RAP is being submitted to revise the remedial strategy proposed in the TCEQ-approved 2008 Revised RAP for affected groundwater. Since the 2008 Revised RAP approval in June 2008, additional data have been collected and evaluated, and changes in site conditions identified. These changes in site conditions warrant revision of remedial strategy from previous PMZ approach to a more vigorous hydraulic control by groundwater containment and recovery to prevent potential exposure or migration to affected groundwater beyond the property boundaries.

	arsenic, and styrene						
Air	benzene						

a) *Surface soil – arsenic-affected soil at the former Tank 28 area will be managed using a ground water monitoring program, institutional control restricting ground water usage, and ground water containment and capture to prevent off-site migration.*
b) *Subsurface soil – benzene, toluene, and ethylbenzene in the Plant Operational Area will be managed using a regular ground water monitoring program, institutional control restricting ground water usage, and ground water containment and capture to prevent off-site migration.*
c) *Ground water – BTEX, arsenic, and styrene will be managed by containment and capture to prevent off-site migration. Regular monitoring will demonstrate plume stability and an institutional control will restrict ground water usage.*
d) *Air – Tier 2 PCLs using OSHA PELs for TRRP RBELs show site COC concentrations are protective of worker safety. An institutional control documenting the occupational inhalation criteria to be filed.*

Is there a media that contains a PCLE zone that is not addressed in this RAP? Yes ____ X No ____
If yes, provide justification for not addressing the PCLE zone in this RAP.

Not Applicable

On-site land use: [ ] Residential [X] Commercial/Industrial
Off-site land use: [ ] Residential [X] Commercial/Industrial (check all that apply)

Is this a re-submittal or revision of a previous RAP? X Yes ___ No
If yes, explain why the RAP is being revised or resubmitted.

Were all the appropriate notifications made in accordance with §350.55? ___ Yes X No
If no, explain why notifications were not made:

Not Applicable, as affected groundwater is being captured and contained along the western property line of the TCI facility and no response action is necessary for the off-site property.

Checklist for Report Completeness	ID No.: 30573
	Report Date: September 2018

Use this checklist to determine the portions of the form that must be submitted for this report. Answer all questions by checking Yes or No. If the answer is Yes include that portion of the report. If the answer is No, do not complete or submit that portion of the report. All form contents that are marked "Required" must be submitted. Form contents marked with an asterisk (*) are not included in the blank form and are to be provided by the person.

Response Action Objectives

List the environmental media to which this applies Surface soil and subsurface soil
Repeat this section for each medium that has a different response action objective.

State the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33 as applicable. Explain how the response action is appropriate based on the hydrogeologic characteristics, COC characteristics, and potential unprotective conditions that could continue or result during the remedial period.

Previous site assessments identified several areas at the TCI facility where soil PCLE zones were present. These areas include the former PT-8 Area, former Tank 28 Area, and other Plant Operational Areas.

PT-8 Area Soil – A NFA was proposed and granted by the TCEQ for the PT-8 Area.

Former Tank 28 Area Soil – The arsenic impacted soil PCLE zones and groundwater beneath the former Tank 28 Area was proposed to be managed under a PMZ; however, based on additional assessment information, successful on-site groundwater hydraulic control by containment and recovery has been implemented. Therefore, a PMZ is no longer proposed for the Site. Chemicals of Concern (COCs) leached from impacted soils, if any, are proposed to be managed by on-site hydraulic control by groundwater containment and recovery. The groundwater recovery system is further described in subsequent sections.

Other Plant Operational Areas Soil – Benzene concentrations in soil exceeding the $^{GW}Soil_{Ing}$ PCL at a number of locations within the operational areas of the facility. The response actions for the plant operational areas soils were to be managed under the previously proposed PMZ; however, based on additional assessment information, successful on-site hydraulic control by groundwater containment and recovery has been implemented. The groundwater recovery system is further described in subsequent sections.

Two soil locations (boring 2-2 at 12 to 14 ft bgs and boring 2-4a at 9 to 10 ft bgs) exceeded soil to air inhalation, $^{Air}Soil_{Inh\text{-}V}$, PCL for benzene at concentrations of 157 mg/kg and 261 mg/kg, respectively, when evaluated during the 2004 APAR. In accordance with TAC §350.74(b), a Tier 2 $^{Air}Soil_{Inh\text{-}V}$ PCL was calculated for benzene for the soil to air exposure pathway ($^{Air}Soil_{Inh\text{-}V}$) to demonstrate compliance with worker safety air exposure levels by using the OSHA PEL for benzene in place of the TRRP RBEL. The soil benzene concentrations for borings 2-2 and 2-4a are below the calculated Tier 2 PCL of 24,300 mg/kg and therefore protective of worker safety air exposure levels. A NFA is currently proposed for these two locations. The Tier 2 PCL calculation spreadsheet for the $^{Air}Soil_{Inh\text{-}V}$ pathway is provided as **Tables 3-1 through 3-5** in **Appendix 3.** References are included as **Appendix 1.**

Groundwater – Following the TCEQ approval of the 2008 Revised RAP in June 2008, groundwater monitoring wells POE-1, POE-2, AMP-1, and AMP-2 were installed in September 2008 and sampled in October 2008. The analytical results indicated that POE-1 and POE-2 exceeded the applicable PCLs. As a result, the wells located in the CNP ROW property and hydraulically downgradient of POE-1 and POE-2, were installed and sampled. However, CNP denied Kinder Morgan's request to include the down gradient wells in the proposed PMZ CNP does not allow land use restrictions to be placed on their property and the ROW wells are no longer utilized. Since the request was denied, the wells were no longer sampled. Since the proposed PMZ was not an option, Kinder Morgan revised the remedial strategy and implemented on-site hydraulic control by a groundwater containment and recovery system.

The system is located in the downgradient direction along the western TCI property boundary to contain and recover affected groundwater and to prevent off-site migration. This response action was implemented in 2011 and remains active. Logistical problems slowed the progress of the recovery wells and recovery system installation such as the active property being owned by TCI, the large excavation in the northwest

portion of the TCI facility, construction of a new main building on the excavation backfill material, railroad crossing right-or-way permits, and hand-digging of many of the wells. The recovery system was initiated as a pilot test in 2008 with the installation of recovery wells POE-1 and POE-3 and monitoring wells AMP-1, and AMP-2. The system was expanded in 2011 with the installation of recovery wells RW-1 through RW-5, in 2012 with the installation of recovery wells RW-7 through RW-9 and monitoring well MW-18, in 2013 with the installation of recovery well RW-6 and monitoring wells MW-19, and MW-20, and finally, completing the system in 2013 with the installation of recovery well MW-21. The 13 recovery well system has been fully operational since. Several of the recovery wells located in the northern array were hand-installed into the backfill material.

Site Conceptual Model studies indicate that three predominant groundwater migration pathways exist beneath the TCI property in the affected uppermost groundwater bearing unit (SCF/UNTU); the northern groundwater migration pathway, central migration pathway and southern migration pathway **(Attachment 1A-6**). The migration pathways are defined by variations in lithology, aquifer characteristics, hydraulic properties, and groundwater flow direction. Each of the migration pathways generally flows in a westerly or southwesterly direction toward Panther Creek.

The groundwater recovery system is installed in the downgradient direction along the western TCI property boundary to contain and recover affected groundwater and to prevent off-site migration. This response action was implemented in 2011 and remains active. Logistical problems slowed the progress of the recovery wells and recovery system installation such as the active property being owned by TCI, the large excavation in the northwest portion of the TCI facility, construction of a new main building on the excavation backfill material, railroad crossing right-or-way permits, and hand-digging of many of the wells. The present-day recovery system was initiated as a pilot test in 2008 with the installation of monitoring wells POE-1, POE-3, AMP-1, and AMP-2. POE-1 and POE-3 were later converted to recovery wells. The system was expanded in 2011 with the installation of recovery wells RW-1 through RW-5, in 2012 with the installation of recovery wells RW-7 through RW-9 and monitoring well MW-18, and in 2013 with the installation of recovery well RW-6 and monitoring wells MW-19 and MW-20, and recovery well MW-21. The 13 recovery well system has been fully operational since 2011. Several of the recovery wells located in the northern array were hand-installed into the backfill material. Copies of the boring logs are included in **Appendix 2**.

The recovery system consists of thirteen recovery wells, effluent piping, a 650-gallon holding tank and transfer pump along the western TCI property boundary. Ten recovery wells, RW-1 thru RW-3, RW-6 thru RW-9, POE-1, MW-09TCI, and MW-21 are utilized to capture the affected ground water along the northern groundwater migration pathway. Three recovery wells, RW-4, RW-5, and POE-3 are utilized to capture affected ground water of the southern and central groundwater migration pathways (**Attachment 1A-6**). The 13 recovery wells are collectively providing adequate and effective containment and recovery of affected groundwater along the western TCI property boundary and preventing off-site migration, as demonstrated by cone of depression around the downgradient recovery wells near the western property boundary. Since activation of the system, over 3.2 million gallons of groundwater have been recovered as of June 30, 2017 at an average rate of 0.77 gpm or 1,109 gpd.

The groundwater recovery system components are inspected at least weekly to ensure the system is operating as designed, and TCI plant personnel report any identified or potential problems to Kinder Morgan between scheduled inspections. Problems that affect the system's performance include recovery line and component clogging and fouling. An analysis of general water chemistry parameters indicated elevated levels of sodium, sulfate, and bicarbonate may be promoting the precipitation of calcium, manganese carbonates, and silica into the system, and thermal expansion and sagging of the high-density polyethylene (HDPE) effluent line appears to promote blockage and variable recovery rates. Kinder Morgan intends to replace the HDPE effluent line and ancillary discharge lines from each recovery well with fiberglass re-enforced epoxy piping in 2018.

Shallow groundwater generally flows toward the west and southwest across the Site toward Panther Creek.

A cone of depression is maintained around the recovery wells. **Attachment 1A-2** shows the groundwater flow across the Site in December 2010 prior to implementing the hydraulic control by groundwater containment and recovery system. **Attachments 1A-3** (February 2013) and **1A-4** (May 2017) show the groundwater flow after implementing the hydraulic control by groundwater containment and recovery system.

Based on the evaluation of historical sampling results, groundwater from certain monitoring wells has exceeded the TCEQ TRRP Tier 1 groundwater to air $^{Air}GW_{Inh\text{-}V}$ PCL for benzene as presented in the 2008 Revised RAP. In accordance with TAC §350.74(b), a TCEQ TRRP Tier 2 groundwater to air PCL ($^{Air}GW_{Inh\text{-}V}$ PCL) was calculated for benzene for the groundwater to air pathway to ensure worker safety air exposure levels using the OSHA PEL for benzene in lieu of the TRRP RBEL in the Tier 2 calculations. The reported groundwater benzene concentrations for MW-10TCI and MW-12TCI were lower than the calculated Tier 2 PCL of 6,700 mg/L, and are protective of worker safety air exposure levels. The calculated Tier 2 $^{Air}GW_{Inh\text{-}V}$ PCL is also greater than the benzene water solubility of 1,770 mg/L, indicating the worker safety air exposure level is unlikely to be exceeded under the current site conditions. Based on these conditions, a NFA is proposed for the groundwater to air pathway in the vicinity of MW-10TCI and MW-12 TCI. The Tier 2 PCL calculation spreadsheet for the Tier 2 groundwater to air inhalation pathway is provided as **Tables 3-1 through 3-5** in **Appendix 3.**

The hydraulic control (recovery) implemented at the site, in conjunction with the proposed institutional control (deed recordation) can effectively prevent human and ecologic exposure to affected groundwater beneath the site and prevent the PCLE zone from off-site migration.

The COCs within the central and southern groundwater migration pathways are captured and recovered from the three wells along the southern recovery well array.

Explain how the COCs will be handled, treated, disposed, or transferred to another media and document that the response action will not result in any additional potential exposure conditions due to response action activities.

No active remediation will be performed for soil. Therefore, no COCs will be handled, treated, or disposed.

State the proposed "reasonable time frame" and provide the justification for that time frame in the context of any potential for unprotective exposures to exist or develop, COC characteristics, hydrogeologic and affected property characteristics. If the reasonable time frame is different for the different affected media or for particular tracts of land, be sure to discuss that. Provide how the proposed response action will meet the objectives in a reasonable timeframe.

N/A

Soil Response Action Objectives

When using removal and/or decontamination with controls or controls only, demonstrate how that physical control or combination of measures will reliably contain COCs within and/or derived from the surface soil and subsurface soil PCLE zone materials over time.

N/A – Physical controls are not proposed as a soil response action. However, certain COCs in soil will be addressed in the groundwater response action which is an -on-site groundwater capture and recovery system.

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical surface soil and subsurface soil PCL throughout the soil PCLE zone and prevent COC concentrations above the critical soil PCLs from migrating beyond the existing boundary of the soil PCLE zone.

The soil PCLE zone within the plant operational areas has been identified based on concentrations of COCs exceeding $^{GW}Soil_{Ing}$ PCLs.

Therefore, Kinder Morgan has revised the remedial strategy and implemented an on-site groundwater containment and recovery system in the downgradient direction at the western property boundary of the TCI facility to contain and recover affected groundwater and to prevent off-site migration.

Response Action Objectives

List the environmental media to which this applies Groundwater
Repeat this section for each medium that has a different response action objective.

State the property-specific response objectives for the PCLE zone in each media in the context of the response objectives set forth in §350.32 or §350.33 as applicable. Explain how the response action is appropriate based on the hydrogeologic characteristics, COC characteristics, and potential unprotective conditions that could continue or result during the remedial period.

Following the TCEQ approval of the 2008 Revised RAP in June 2008, groundwater monitoring wells POE-1, POE-2, AMP-1, and AMP-2 were installed in September 2008 and sampled in October 2008. The analytical results indicated that POE-1 and POE-2 exceeded the applicable PCLs. As a result, the wells located in the CNP ROW property and hydraulically downgradient of POE-1 and POE-2, were installed and sampled. However, CNP denied Kinder Morgan's request to include the down gradient wells in the proposed PMZ as CNP does not allow land use restrictions to be placed on their property and the ROW wells are no longer utilized. Since the proposed PMZ was not an option, Kinder Morgan revised the remedial strategy and implemented on-site hydraulic control by a groundwater containment and recovery system.

Studies indicate that three predominant groundwater migration pathways exist on the TCI property in the SCF/UNTU; the northern groundwater migration pathway, central migration pathway and southern migration pathway. The migration pathways are defined by variations in lithology, aquifer characteristics, hydraulic properties, groundwater flow direction, and the influence of the hydraulic control system of the SCF/UNTU. Groundwater in the three migration pathways generally flows in a westerly or southwesterly direction toward Panther Creek, located within the CP property. Each pathway is managed by the active hydraulic groundwater control and recovery system, comprised of 13 recovery wells located along the western TCI property boundary. COCs within the northern groundwater migration pathway are captured and recovered from the ten recovery wells (RW-1 through RW-3, RW-6 through RW-9, POE-1, MW-09TCI, and MW-21) along the northern recovery well array. COCs within the central and southern groundwater migration pathways are captured and recovered from the three recovery wells (RW-4, RW-5, and POE-3) along the southern recovery well array (**Attachment 1A-6**).

Recovery wells RW-1 through RW-5 were installed in March and April 2011 and RW-6 through RW-9 were installed in November 2012. MW-21 was installed in December 2013 and converted to a new recovery well in June 2014. Schematics of the groundwater recovery system are shown on **Attachment 2A-1, 2A-2, and 2A-3. Appendix 2** provides the boring logs and monitoring well construction diagrams for these wells.

Since activation of the groundwater containment and recovery system, over 3.2 million gallons of groundwater have been recovered as of June 30, 2017 at an average rate of 0.77 gpm or 1,109 gpd. The 13 recovery wells are collectively providing adequate and effective containment and recovery of affected groundwater. This is demonstrated by groundwater gauging measurements that indicate a cone of depression around the northern and southern recovery well arrays.

The effectiveness of recovery system can be demonstrated in comparing a groundwater potentiometric map prior to system activation to a groundwater potentiometric map after system activation. Note the westerly and southwesterly groundwater gradient of the December 2010 gradient map of **Attachment 1A-2** to the February 2013 gradient map of **Attachment 1A-3** and May 2017 gradient map of **Attachment 1A-4.** With the system, a distinct cone of depression around both the northern well array and southern well array is evident. This indicates effectiveness of the system in capturing the groundwater. The recovery system is containing and capturing groundwater and COCs at the property line as designed.

The groundwater recovery and the monitoring wells at the Site were sampled periodically from late 2008 until late 2013. The analytical data are summarized in **Table 2-1** in **Appendix 2** and historical benzene concentrations are summarized on the benzene concentration map of **Attachment 1A-5**. Benzene exceedances are present in the groundwater recovery wells but the groundwater is being contained and recovered. Although the shallow groundwater beneath the TCI property has no beneficial use, groundwater analytical data indicates benzene exceedances of the groundwater ingestion ($^{GW}GW_{ing}$) pathway.

Based on the evaluation of historical sampling results, groundwater from certain monitoring wells have exceeded the TCEQ TRRP Tier 1 groundwater to air $^{Air}GW_{Inh-V}$ PCL for benzene as presented in 2008 Revised RAP. In accordance with TAC §350.74(b), a TCEQ TRRP Tier 2 groundwater to air PCL ($^{Air}GW_{Inh-V}$ PCL) was calculated for benzene for the groundwater to air pathway to ensure worker safety air exposure levels using the OSHA PEL for benzene in lieu of the TRRP RBEL in the Tier 2 calculations. The reported groundwater benzene concentrations for MW-10TCI and MW-12TCI were lower than the calculated Tier 2 PCL of 6,700 mg/L, and are protective of worker safety air exposure levels. The calculated Tier 2 $^{Air}GW_{Inh-V}$ PCL is also greater than the benzene water solubility of 1,770 mg/L, indicating the worker safety air exposure level is unlikely to be exceeded under the current site conditions. Based on these conditions, a NFA is proposed for the groundwater to air pathway in the vicinity of MW-10TCI and MW-12 TCI. The Tier 2 PCL calculation spreadsheet for the Tier 2 groundwater to air inhalation pathway is provided as **Tables 3-1 through 3-5** in **Appendix 3.**

In addition to hydraulic control (recovery) in operation at the site, an institutional control (deed Notification) is also proposed to restrict the use of groundwater beneath the Site. These controls can effectively prevent human and ecologic exposure to affected groundwater and prevent the PCLE zone from off-site migration.

Explain how the COCs will be handled, treated, disposed, or transferred to another media and document that the response action will not result in any additional potential exposure conditions due to response action activities.

Groundwater, along with the COCs, recovered during operation of the groundwater recovery system is managed by transferring the recovered groundwater via a discharge pipeline to the Kinder Morgan wastewater collection system. The discharge pipeline is located in the Kinder Morgan Galena Park Central Plant area where it is temporarily stored and then transferred via pipeline to an off-site third-party permitted commercial wastewater treatment facility **(Attachment 2A-1 and 2A-2)**. Groundwater recovery system components are inspected at least weekly to ensure the system is operating correctly and there are no leaks. On-site TCI plant personnel report potential problems to Kinder Morgan between scheduled inspections. The recovery line within the Kinder Morgan Galena Park Central Plant was upgraded from carbon steel with high performance low maintenance reinforced fiberglass plastic (FRP) pipe in 2015 to improve performance and minimize leaks. Scheduled for 2018, Kinder Morgan also plans to replace the existing high-density polyethylene (HDPE) and carbon steel groundwater recovery piping from the TCI facility to the FRP recovery piping in the Central Plant.

State the proposed "reasonable time frame" and provide the justification for that time frame in the context of any potential for unprotective exposures to exist or develop, COC characteristics, hydrogeologic and affected property characteristics. If the reasonable time frame is different for the different affected media or for particular tracts of land, be sure to discuss that. Provide how the proposed response action will meet the objectives in a reasonable timeframe.

The groundwater response action objective is to contain and prevent off-site migration of affected groundwater using a hydraulic control system along the western property boundary of the TCI facility. To achieve that objective, Kinder Morgan installed a groundwater recovery system in 2011 and expanded the system in 2012.

As summarized in the 2008 Revised RAP, approximately 22,260 cubic yards of soil and debris were removed from the northwestern portion of the Site in 2003 to 2004. The excavation was backfilled with clean imported material. Groundwater containment and recovery wells RW-1 through RW- 3 and RW-6 through RW-9 were installed in 2011 and 2012 into the backfill material along the northwestern TCI property boundary to control westerly off-site groundwater migration. Because of the heterogeneous characteristics of the backfill materials, the recoveries, although effective, can be erratic and recovery equipment fouling requires continued maintenance. Although not installed into the backfill materials, groundwater containment and recovery wells MW-09TCI (2012) and MW-21 (2013) were installed and connected to the recovery system. Copies of the soil boring logs are provided in **Appendix 2.**

The groundwater recovery system has been operational since December 2011 and provides groundwater capture at the property boundary. Groundwater monitoring and gauging at the site have demonstrated effectiveness of the recovery system in containing and recovering the groundwater COCs. Kinder Morgan intends to maintain the hydraulic control system in place until the COC concentrations are below their appropriate PCLs along the western property boundary. Following this, Kinder Morgan will notify the TCEQ of its intent to discontinue operation of the recovery wells. The recovery system is currently being inspected weekly to confirm the system is operating as intended. Semiannual gauging is being conducted to confirm that a cone of depression is being maintained at the property boundary, and the system is effectively containing and recovering groundwater from off-site migration.

Groundwater Response Action Objectives

Name of groundwater-bearing unit to which this information applies: Sandy Channel Fill (SCF)/Upper Naturally Transmissive Unit (UNTU)

Repeat this section for each groundwater-bearing unit for which a different response action is proposed.

Groundwater classification ____ 1 __X__ 2 ___ 3

Is a modified groundwater response action being proposed for any part of the groundwater PCLE zone (§350.33(f)(2), (3), or (4))? ___ Yes __X__ No

If yes, does the affected property meet the qualifying criteria for a modified groundwater response action using a waste control unit, plume management zone, or technical impracticability? ___Yes ___No

If yes, complete the appropriate portions of this report.
If no to either question, complete the following:

Explain how the removal or decontamination action will reduce the concentration of COCs to the critical PCL throughout the groundwater PCLE zone and prevent COC concentrations above the critical groundwater PCL from migrating beyond the existing boundary of the groundwater PCLE zone.

The groundwater containment and recovery system along the western property boundary is constructed to create a groundwater cone of depression and capture COC-containing groundwater prior to off-site migration. This recovery system is sufficient and effective in preventing COC from migrating beyond the existing boundary of the groundwater PCLE zone.

Explain how the response action will prevent COCs from migrating to air at concentrations above the PCLs for air if the groundwater-to-air PCLs ($^{Air}GW_{Inh-V}$) is exceeded.

Based on the evaluation of historical groundwater and ambient air monitoring results, certain groundwater monitoring wells had exceeded the TCEQ TRRP Tier 1 groundwater to air $^{Air}GW_{Inh-V}$ PCL for benzene as presented in 2008 Revised RAP. In accordance with TAC §350.74(b), a Tier 2 groundwater to air PCL ($^{Air}GW_{Inh-V}$ PCL was calculated for benzene for the groundwater to air pathway to ensure worker safety air exposure levels by using the OSHA PEL for benzene in lieu of the TRRP RBEL in the Tier 2 calculations. The reported groundwater benzene concentrations for MW-10TCI and MW-12TCI were lower than the calculated Tier 2 PCL of 6,700 mg/L, and are protective of worker safety air exposure levels. The calculated Tier 2 $^{Air}GW_{Inh-V}$ PCL is also greater than the benzene water solubility of 1,770 mg/L, indicating the worker safety air exposure level is unlikely to be exceeded under the current site conditions. Based on these conditions, a NFA is proposed for the groundwater to air pathway in the vicinity of MW-10TCI and MW-12TCI. The Tier 2 PCL calculation spreadsheet for the Tier 2 groundwater to air inhalation pathway is provided as **Tables 3-1 through 3-5** in **Appendix 3**.

Explain how the response action will prevent COCs from migrating to surface water at concentrations above the PCLs for groundwater discharges to surface water if surface water is a factor.

There are no on-site surface water bodies. The nearest surface water body is Panther Creek located approximately 200 feet west of the Site. Since the installation and activation of the recovery system in December 2011, the affected groundwater has been effectively contained within the TCI property boundary as demonstrated by the cone of depression around the recovery system recovery containment wells. As a result, there is little likelihood that the COC-containing groundwater will migrate off-site and discharge to the surface water body of Panther Creek.

Explain how the response action will prevent human and ecological receptor exposure to the groundwater PCLE zone.

Deed recordation to be implemented at the site will prohibit the use of groundwater, which will not only limit any potential human exposure to the groundwater, but also limit ecological receptor exposures to groundwater PCLE zone. The active groundwater containment and recovery system along the western property boundary effectively intercepts and contains affected groundwater at the property line, preventing it from off-site migration. Furthermore, TCI is an industrial facility and would not have a reason to recover shallow groundwater for human consumption or industrial purposes and the TCI facility is connected to the public water supply system.

Response Action Design

Use this worksheet to provide detailed descriptions of the response action. Attach design and layout drawings and equipment specifications in Attachment 2A.

Media: Surface and subsurface soil
List all media to which this information applies. If the response action is different for another media, complete a separate worksheet.

Provide a detailed description of the response action. Describe the removal action, decontamination, treatment system(s), and/or physical or institutional control actions that are proposed for each media and discuss the reasons for choosing the response action(s). Identify and describe any ecological services analysis and compensatory restoration plan that will be utilized (if so, include the complete ESA and compensatory restoration plan in Attachment 2C).

The soil at PT-8 Area (Surface and Subsurface Soil) and Tank 28 Area were addressed following the response actions proposed in the previously submitted RAPs and the results were submitted in the 2008 Revised RAP (URS, 2008). As a result, NFA was approved by the TCEQ for the PT-8 Area. The arsenic impacted soil PCLE zones and groundwater beneath the former Tank 28 was proposed to be managed under a PMZ; however, based on additional assessment information, successful on-site groundwater hydraulic control by containment and recovery has been implemented. Therefore, a PMZ is no longer proposed for the Site. COCs leached from impacted soils, if any, will be managed by on-site hydraulic control by groundwater containment and recovery.

The soil within the operational areas of the facility exceeding the $^{GW}Soil_{Ing}$ PCL for benzene will be addressed collectively through the hydraulic control (recovery system) and institutional control (deed recordation).

In addition, soil locations boring 2-2 and boring 2-4a exceeded the soil to air inhalation, $^{Air}Soil_{Inh\text{-}V}$, PCL for benzene at concentrations of 157 mg/kg and 261 mg/kg, respectively, when evaluated during the 2004 APAR. In accordance with TAC §350.74(b), a Tier 2 $^{Air}Soil_{Inh\text{-}V}$ PCL was calculated for benzene for the soil to air exposure pathway to demonstrate compliance with worker safety air exposure levels by using the OSHA PEL for benzene in lieu of the TRRP RBEL. The soil benzene concentrations for these borings are below the calculated Tier 2 PCL of 24,300 mg/kg and are protective of worker safety air exposure levels. NFA is proposed for this scenario. The Tier 2 PCL calculation spreadsheet for the soil to air inhalation pathway is provided as **Tables 3-1 through 3-5** in **Appendix 3.**

Describe all major treatment system components and equipment of the response action. Illustrate the response action design and provide equipment specifications in Attachment 2A.

The Tank 28 soil PCLE zones were addressed in September 2007 through the permanent removal, by excavation, of lead, BTEX, and TPH-affected soils. Arsenic detections in the Tank 28 area exceeded only the $^{GW}Soil_{Ing}$ PCL, and the exceedance areas not removed during excavation will be managed collectively through the hydraulic control containment and recovery system and institutional control (deed notification). BTEX concentrations in soil beneath the former Tank 28 footprint exceeding the $^{GW}Soil_{Ing}$ PCL were excavated to 15-feet bgs, or to the groundwater interface.

Results of the verification sample at the PT-8 area indicated the PCLE zone is no longer present and NFA was approved for this area. Therefore, no other treatment system will be utilized for soils at the site.

List permits or registrations needed to construct or implement the response action, including permits or registrations needed to conduct studies or tests. For VCP sites, list the permits that would be required if the site was not in the VCP (required by the VCP).

Permitting/Registration Authority	Type of permit/registration	Permit or registration number if already	Anticipated application date
N/A			

Identify and discuss the results of any studies or tests, such as pilot studies, feasibility studies, technical impracticability studies, treatability studies, and/or toxicity studies conducted or proposed to be conducted at the affected property. Discuss the reason for the study or test and how it verifies the effectiveness and appropriateness of the chosen response action or documents that a particular response action is not appropriate for the affected property. Describe how the results of completed studies or tests determined the design or choice of response action. Attach any separate reports and supporting documentation in Appendix 3.

A Tier 2 $^{Air}Soil_{Inh\text{-}V}$ PCL was calculated for benzene for the soil-to-air exposure pathway to demonstrate compliance with worker safety air exposure level at two soil locations (boring 2-2 and boring 2-4a) exceeding the $^{Air}Soil_{Inh\text{-}V}$ PCL. The Tier 2 $^{Air}Soil_{Inh\text{-}V}$ PCL was calculated by using the OSHA PEL for benzene in place of the TRRP RBEL. The soil benzene concentrations for boring 2-2 and 2-4a are below the calculated Tier 2 PCL of 24,300 mg/kg and are protective of worker safety air exposure levels. NFA is proposed for these two locations. The Tier 2 PCL calculation spreadsheet for the soil-to-air inhalation pathway is provided as **Tables 3-1 through 3-5** in **Appendix 3.**

Response Action Design

Use this worksheet to provide detailed descriptions of the response action. Attach design and layout drawings and equipment specifications in Attachment 2A.

Media: Groundwater

List all media to which this information applies. If the response action is different for another media, complete a separate worksheet.

Provide a detailed description of the response action. Describe the removal action, decontamination, treatment system(s), and/or physical or institutional control actions that are proposed for each media and discuss the reasons for choosing the response action(s). Identify and describe any ecological services analysis and compensatory restoration plan that will be utilized (if so, include the complete ESA and compensatory restoration plan in Attachment 2C).

The response actions for groundwater consist of hydraulic control by groundwater containment and recovery, and institutional control (deed notification). These response actions were selected in response to changes in groundwater PCLE zone identified during implementation of TCEQ-approved 2008 Revised RAP. Following the TCEQ approval of the 2008 Revised RAP in June 2008, groundwater monitoring wells POE-1, POE-2, AMP-1, and AMP-2 were installed in September 2008 and sampled in October 2008. The analytical results indicated that POE-1 and POE-2 exceeded the applicable PCLs. As a result, the wells located in the CNP ROW property and hydraulically downgradient of POE-1scf and POE-2, were installed and sampled. However, CNP denied Kinder Morgan's request to include the down gradient wells in the proposed PMZ as CNP does not allow land use restrictions to be placed on their property and the ROW wells are no longer utilized. Since the proposed PMZ was not an option, Kinder Morgan revised the remedial strategy and implemented on-site hydraulic control by a groundwater containment and recovery system.

To provide immediate on-site containment and recovery of affected groundwater, Kinder Morgan elected to revise the 2008 remedial strategy from a PMZ to hydraulic control along the western property boundary of the TCI facility. The revised response action objective is to prevent the groundwater PCLE zone from expanding beyond the downgradient property boundary.

Prior to installation of the groundwater recovery system in December 2011, Kinder Morgan evaluated multiple locations for the recovery wells. An aquifer test was conducted to determine the hydraulic conductivity across the Site and a Site Conceptual Model (SCM) was developed. The aquifer test data is presented in **Appendix 3**. The results of these data indicate that three distinct groundwater flow patterns exist across the Site and are controlled by hydraulic conductivity based on the occurrence of groundwater transmissive zones (SCF and UNTU) as illustrated in **Attachment 1A-6**. Three distinct groundwater migration pathways were observed (northern, central, and southern areas). These studies provided information to design an optimal groundwater recovery system that provides complete containment of the affected groundwater. Based on the studies, a recovery system was constructed along the western property line of the TCI facility and began operation in December 2011. Studies indicated that groundwater could migrate off-site in the northern and southern areas of the Site, but not the central area of the Site due to lateral lithological permeability limitations.

The hydraulic control/recovery system currently consists of 13 recovery wells. Ten of the recovery wells (RW-1 thru RW-3, RW-6 thru RW-9, POE-1, MW-09TCI, and MW-21) capture and recover groundwater from the northern groundwater migration pathway. The remaining three recovery wells (RW-4, RW-5, and POE-3) capture and recover groundwater in the central and southern migration pathways. The current groundwater recovery system operates continuously to ensure groundwater containment and recovery. Downhole pumps, energized by site-provided pressurized atmospheric air, cycle (discharge water) when a sufficient volume of water enters the well. Groundwater from each well is pumped to an on-site 650-gallon above ground polyurethane tank for temporary storage. When the polyurethane tank approaches capacity, the recovered groundwater is then pumped via a booster pump to an above ground steel tank located on the KMLT Central Plant Area prior to off site management. Since activation of the groundwater containment and recovery system in December 2011, over 33.3 million gallons of groundwater have been recovered as of July 2017 at an average rate of 0.77 gpm or 1,109 gpd. Schematics of the groundwater recovery system are shown on **Attachment 2A-1** through **Attachment 2A-3**. The 13 recovery wells are collectively providing effective containment of affected groundwater at the western property line.

The effectiveness of the recovery system can be demonstrated in comparing a groundwater potentiometric map prior to system activation to the groundwater potentiometric maps after system activation. Note the westerly and southwesterly groundwater gradient of the December 2010 gradient map of **Attachment 1A-2** to the February 2013 gradient map of **Attachment 1A-3** and May 2017 gradient map of **Attachment 1A-4. Attachments 1A-2 and 1A-3** present the groundwater gradient following system activation and depict a distinct cone of depression around both the northern well array and southern well array. This indicates the effectiveness of the system in capturing the groundwater. The recovery system is containing and capturing groundwater at the property line as designed.

Based on historical results, two wells MW-10TCI and MW-12TCI had exceeded the groundwater to air $^{Air}GW_{Inh\text{-}V}$ PCL for benzene as presented in 2008 Revised RAP. In accordance with TAC §350.74(b), a Tier 2 $^{Air}GW_{Inh\text{-}V}$ PCL was calculated for benzene for the groundwater to air exposure pathway to demonstrate compliance with worker safety air exposure levels. The OSHA PEL for benzene was used in place of the TRRP RBEL in the Tier 2 calculations. The Tier 2 PCL calculation spreadsheet for the groundwater to air inhalation pathway is provided as **Tables 3-1 through 5** in **Appendix 3**. As shown in the table, the groundwater benzene concentrations for MW-10TCI and MW-12TCI are below the calculated Tier 2 PCL of 6,700 mg/L and are therefore protective of worker safety air exposure levels. It should be noted that the calculated Tier 2 $^{Air}GW_{Inh\text{-}V}$ PCL is greater than the benzene water solubility of 1,770 mg/L, indicating the worker safety air exposure level is unlikely to be exceeded at any conceivable

benzene groundwater concentration under the current site conditions. Oxygenation units are operating in MW-10TCI and MW-12TCI to enhance the natural degradation of the groundwater benzene. Therefore, NFA is proposed for this exposure pathway for groundwater in the vicinity of MW-10TCI and MW-12TCI.

Describe all major treatment system components and equipment of the response action. Illustrate the response action design and provide equipment specifications in Attachment 2A.

The current groundwater recovery system operates continuously with the exception of temporary shutdowns for equipment repair or replacement. Downhole pumps, energized by site-provided pressurized atmospheric air, cycle (discharge water) when a sufficient volume of water enters the well. Groundwater from each well is pumped to a 650-gallon on site above ground polyurethane tank for temporary storage. When the polyurethane tank is near capacity, the recovered groundwater is then pumped via a booster pump to an above ground steel tank (Tank 3-10) located on the Kinder Morgan Central Plant Area prior to off site management at a permitted facility. Schematics of the groundwater recovery system are shown on **Attachment 2A-1** through **Attachment 2A-3**.

List permits or registrations needed to construct or implement the response action, including permits or registrations needed to conduct studies or tests. For VCP sites, list the permits that would be required if the site was not in the VCP (required by the VCP).

Permitting/Registration Authority	Type of permit/registration	Permit or registration number if already issued	Anticipated application date
N/A			

Identify and discuss the results of any studies or tests, such as pilot studies, feasibility studies, technical impracticability studies, treatability studies, and/or toxicity studies conducted or proposed to be conducted at the affected property. Discuss the reason for the study or test and how it verifies the effectiveness and appropriateness of the chosen response action or documents that a particular response action is not appropriate for the affected property. Describe how the results of completed studies or tests determined the design or choice of response action. Attach any separate reports and supporting documentation in Appendix 3.

The following studies were performed to support the development of the Revised RAP:

- Calculations of Tier 2 PCL for benzene groundwater-to-air inhalation pathway.
- Aquifer tests.
- Site Conceptual Model development.

Based on historical results, two wells MW-10TCI and MW-12TCI had exceeded the groundwater to air $^{Air}GW_{Inh\text{-}V}$ PCL for benzene as presented in 2008 Revised RAP. In accordance with TAC §350.74(b), a Tier 2 $^{Air}GW_{Inh\text{-}V}$ PCL was calculated for benzene for the groundwater to air exposure pathway to demonstrate compliance with worker safety air exposure levels. The OSHA PEL for benzene was used in place of the TRRP RBEL in the Tier 2 calculations. The Tier 2 PCL calculation spreadsheet for the groundwater to air inhalation pathway is provided as **Table 3-1 through 3-5** in **Appendix 3**. As shown in the table, the groundwater benzene concentrations for MW-10TCI and MW-12TCI are below the calculated Tier 2 PCL of 6,700 mg/L and are therefore protective of worker safety air exposure levels. It should be noted that the calculated Tier 2 $^{Air}GW_{Inh\text{-}V}$ PCL is greater than the benzene water solubility of 1,770 mg/L, indicating the worker safety air exposure level is unlikely to be exceeded at any conceivable benzene groundwater concentration under the current site conditions. iSOC® systems (monitored

oxygen injection) have been installed in MW-10TCI, and MW-14TCI to facilitate biodegradation in the source and downgradient areas and to further minimize the potential of off-site COC migration.

On-site aquifer tests were performed on selected wells in March 2010 and were comprised of both single- and multiple-well yield pumping tests, and slug tests to obtain the hydrogeologic characteristics of the SCF/UNTU. The aquifer tests provided a design basis for the groundwater recovery system. Based on the tests, the site-wide hydraulic conductivity ranges from $1.6x10^{-5}$ centimeters per second (cm/sec) to $4.3x10^{-3}$ cm/sec. The storage coefficient in the northern and southern recovery areas is $1.05x10^{-3}$ and $4.04x10^{-4}$, respectively. The linear velocity for the Site, assuming and effective porosity of 15% ranges from 12 to 193 feet per year (ft/yr). Based on these test results, a class 2 groundwater resource was determined for the Site. The aquifer test results are summarized on **Table 2-2** in **Appendix 2**.

Studies indicate that three predominant groundwater migration pathways exist on the TCI property in the affected uppermost groundwater bearing unit (SCF/UNTU); the northern groundwater migration pathway, central migration pathway and southern migration pathway **(Attachment 1A-6**). The migration pathways are defined by variations in lithology, aquifer characteristics, hydraulic properties, groundwater flow direction, and the influence of the hydraulic control system of the SCF/UNTU. The groundwater in the migration pathways generally flows in a westerly or southwesterly direction toward Panther Creek and each is managed by the active hydraulic groundwater control and recovery system. COCs within the northern groundwater migration pathway are captured and recovered from the ten recovery wells along the northern recovery well array while COCs within the central and southern groundwater migration pathways are captured and recovered from the three wells along the southern recovery well array.

The hydraulic control by groundwater recovery system currently consists of 13 recovery wells located in the downgradient location along the western TCI property boundary. Ten recovery wells, RW-1 thru RW-3, RW-6 thru RW-9, POE-1, MW-09TCI, and MW-21 are located along the northern groundwater migration pathway. Recovery wells, RW-4, RW-5, and POE-3 are located along the southern and central groundwater migration pathways. The 13 recovery wells are collectively providing adequate and effective containment and recovery of affected groundwater along the western TCI property boundary and preventing off-site migration, as demonstrated by cone of depression around the downgradient recovery wells near the western property boundary. Since activation of the system, over 3.2 million gallons of groundwater have been recovered as of June 30, 2017 at an average rate of 0.77 gpm or 1,109 gpd.

Institutional Control Associated Information: Appendices 4	RAP Worksheet 2.4 ID No.: 30573	Page 1 of 1 Report Date: September 2018

Complete this worksheet if an institutional control will be used as part of the response action. Include a draft of the proposed institutional controls in **Appendix 4**. Provide a list of landowners from whom landowner concurrence will be requested, as necessary, in Appendix 5.
Specify the property for which this applies. Texmark Chemicals, Inc.
Repeat this worksheet for each different property for which an institutional control will be used.

Institutional Control	Type of Institutional Control[1]				Property Ownership		Anticipated Filing Date[2]
	Deed Notice	Restrictive Covenant	VCP Certificate of Completion	Equivalent zoning or governmental ordinance	Check if pertinent tract of land is owned by the person	Check if the pertinent tract of land is owned by an innocent owner or operator	
Document use of commercial/industrial land use (§350.31(g))	X						Within 180 days of Revised RAP approval.
Document use of physical or institutional control under Remedy Standard B §350.31(g))	X						Within 180 days of Revised RAP approval.
Document notice of on-going long term response action (§350.31(h))	X						Within 180 days of revised RAP approval.
Document use of occupational inhalation criteria as RBELs (§350.74(b)(1))	X						Within 180 days of Revised RAP approval.

Document the use of a non-default soil exposure area (§350.51(l)(3)&(4))							
Document WCU exclusion area (§350.33(f)(2))							
Document establishing a PMZ (§350.33(f)(4)(C)(l))							
Document the demonstration of technical impracticability (§350.33(f)(3)(F))							
Relocation of soils containing COCs for reuse (§350.36(b)(4) and (c)(4))							

[1] Check the required for the proposed response action.
[2] Specify date or amount of time after RAP approval.

Performance Measures

List and describe the performance measures for each environmental medium containing a PCLE zone that will be used to determine if reasonable progress is being made by the response action in a timely manner. Use these measures to document effectiveness of the response action in the RAER.

Groundwater

Former Tank 28 Area
The arsenic-impacted soils and groundwater were identified beneath the former Tank 28 Area. COCs leached from impacted soils, if any, will be managed by the groundwater containment and recovery system. As specified in the 2008 Revised RAP, groundwater samples from selected wells in the former Tank 28 area will be sampled. Kinder Morgan will sample monitoring well MW-10TCI and downgradient wells AMP-2 and RW-5 for BTEX, arsenic, and styrene analysis as shown on **Attachment 3A-1** and summarized in **Worksheet 3.1**.

Other Plant Operational Areas Soil – Benzene concentrations in soil exceeded the $^{GW}Soil_{Ing}$ PCL at a number of locations within the operational areas of the facility. The response actions for the plant operational areas soils were to be managed under the proposed PMZ; however, based on additional assessment information, successful on-site hydraulic control by groundwater containment and recovery has been implemented.

The response action is on-site groundwater containment and recovery along the downgradient western TCI property boundary. A recovery system consisting of 13 recovery wells was installed along the western property line and activated beginning in December 2011. Since then, groundwater containment and capture has been established and maintained at the property line as demonstrated by a groundwater cone of depression around the recovery wells. Kinder Morgan intends to maintain the hydraulic control system in place until a point when the COC concentrations are below their appropriate PCLs along the property boundary.

To ensure that groundwater capture in the area is occurring as planned, the recovery wells and recovery system are inspected weekly by Kinder Morgan personnel and observed daily by TCI plant operators to ensure proper system operation. Pump discharge cycle rates are measured quarterly and discharge rates and discharge rate performances are monitored weekly. Repairs and maintenance are performed when required. Monitor wells presented on **Attachment 3A-1** will be gauged semiannually to ensure adequate hydraulic gradient and that a cone of depression is maintained. Strategic well locations, RW-3, RW-5, MW-04TCI, MW-10TCI, MW-12TCI, MW-18TCI, MW-19TCI, and AMP-2 as shown on **Attachment 3A-1,** will be sampled and analyzed for select COCs on an annual basis to confirm the effectiveness of the recovery system. The COCs to be analyzed at the sampling strategic locations are summarized on **Worksheet 3-1** and the well locations are shown on **Attachment 3A-1**.

Active groundwater recovery, semiannual well gauging, inspections and maintenance, and annual sampling for recovery wells will continue until sufficient data have been collected to demonstrate that the recovery wells are controlling and systematically removing the groundwater benzene concentrations at the property boundary until the concentrations remain below the benzene PCL. Following this, Kinder Morgan will notify the TCEQ of its intent to discontinue operation of the recovery wells and include annual monitoring of selected wells.

Potential Problems

Complete the table for the response action. When the response action consists of several components, or multiple actions, complete one table for each major component or action.

Response Action Name/Designation: Groundwater Recovery System

List the potential problems that might be reasonably anticipated for the response action, describe the impact of each problem, and the response to the problem.

Description of the Potential Problem	Impact	Will this cause a response action failure?		Corrective Response
		Yes	No	
Pneumatic pump failure.	Temporary loss of containment of potentially affected groundwater.		X	Weekly inspection of pumps and counter readings to calculate weekly discharge rates would mitigate the potential problem from having a long-term impact to the CNP ROW. 24-hour/day on site TCI workers report any system malfunctions to Kinder Morgan. Deactivate system and immediately repair and restore system operation.
Recovery System piping or connection failure.	Release of potentially affected groundwater to the environment.		X	Weekly inspection, maintenance, and upgrade/repair/replacement of equipment components related to the recovery system will help insure proper operation and performance and mitigate a release to the environment. 24-hour/day on site TCI workers report any system malfunctions to Kinder Morgan. Deactivate system and immediately repair and restore system operation.
Temporary system shut down during hurricane evacuation.	Potential temporary loss of groundwater containment		X	Restore system operation as conditions permit.
Short term system shutdown.	Potential temporary loss of groundwater containment		X	Impact would be minimal/non-existent due to low groundwater flow rates.

Monitoring and Sampling Associated Information: Attachment 3A	RAP Worksheet 3.1	Page 1 of 2
	ID No.: 30573	Report Date: September 2018

List the monitoring and sampling of COC concentrations or other parameters that will be conducted during the response action. Illustrate the monitoring or sampling locations in Attachment 3A. If statistics or geostatistics will be used, provide details in Appendix 7. If monitoring or observation wells will be constructed for the response action, provide well construction details in Attachment 2B if not previously provided.

Monitored Media	COC[1]	Other parameter (specify)	Sampling Method[2]	Sampling points or locations[3]	Depth/Height[4] (ft.)	Analytical or Field Screening Method	Sampling or Monitoring Frequency[5]
Groundwater	Arsenic BTEX Styrene		Low-flow (Monitoring wells) Grab (Recovery well)	MW-10TCI MW-12TCI MW-18TCI MW-19TCI RW-5 AMP-2	SCF/UNTU groundwater-bearing unit	SW-846 8260 and 6010	Annual monitoring
	Benzene		Low-flow (Monitoring well) Grab (Recovery well)	MW-04TCI RW-3	SCF/UNTU groundwater-bearing unit	SW-846 8260	Annual monitoring

		Flow rate and system integrity	Weekly Inspections and daily observance.	13 recovery wells	SCF/UNTU groundwater-bearing unit	Inspection, maintenance, and flow measurements	Weekly
Surface Soil							
Subsurface Soil							
Air	Not applicable unless annual the groundwater sampling indicates that COCs exceed the site-specific Tier 2 $^{Air}GW_{ing\text{-}V}$ PCLs						
Other Media (specify)							

Explain the reasons for the above-listed monitoring and sampling plan.

[1] Specify the COCs to be monitored in this media. List either type of COC (such as VOCs, metals) if all the COCs of that type will be monitored the same way.
[2] Describe the sampling or monitoring methods and QC procedures in Appendix 1 unless the proposed sampling or monitoring procedure is the same as the sampling or monitoring procedure described in the APAR.
[3] Specify the sampling or monitoring point, such as the specific monitor well or general sampling or monitoring location.
[4] Specify the depth or height of the sampling or monitoring points.
[5] Specify the frequency at which this monitoring or sampling will occur.

Groundwater:

The response action is on-site groundwater containment and recovery along the downgradient western TCI property boundary. A recovery system consisting of 13 recovery wells was installed along the western property line and activated beginning in December 2011. Since then, groundwater containment and capture has been established at the western property boundary as demonstrated by groundwater gauging. KMLT intends to maintain the hydraulic control system in place until a point when the COC concentrations are below their appropriate PCLs along the property boundary.

To ensure that groundwater capture in the area is occurring as planned, the recovery wells and recovery system are inspected weekly by Kinder Morgan personnel and observed daily by TCI plant operators to ensure proper system operation. Pump discharge cycle rates are measured quarterly and discharge rates and discharge rate performances are monitored weekly. Repairs and maintenance are performed when required. Monitor wells presented on **Attachment 3A-1** will be gauged semiannually to ensure adequate hydraulic gradient and that a cone of depression is maintained around the recovery wells. Strategic well locations, RW-3, RW-5, MW-04TCI, MW-10TCI, MW-12TCI, MW-18TCI, MW-19TCI, and AMP-2 as shown on **Attachment 3A-1,** will be sampled and analyzed for select COCs on an annual basis to confirm the effectiveness of the recovery system. The COCs to be analyzed at the strategic sampling locations are summarized on **Worksheet 3-1** and the well locations are shown on **Attachment 3A-1**. The COC sampling list is consistent with the Revised 2008 RAP.

As specified in the 2008 Revised RAP, groundwater samples from selected wells in the former Tank 28 area and downgradient wells will be analyzed for BTEX, arsenic, and styrene and include wells RW-5, MW-10TCI, MW-12TCI, MW-18TCI, MW-19TCI, and AMP-2. Wells in the northern portion of the TCI facility, RW-3 and MW-04TCI, will be analyzed for benzene, as specified in the Revised 2008 RAP. The sampling points are shown on **Attachment 3A-1** and summarized in **Worksheet 3.1.**

Active groundwater recovery, weekly inspections and maintenance, semiannual well gauging, and annual sampling of the recovery wells will continue until sufficient data have been collected to demonstrate that the recovery wells are controlling and systematically removing the groundwater benzene concentrations until the concentrations remain below the benzene PCL. Following this, Kinder Morgan will notify the TCEQ of its intent to discontinue operation of the recovery wells and include annual monitoring of selected wells. The list of wells selected for semiannual sampling may be modified based on the performance of the groundwater containment and recovery system, and the semiannual analytical results. The TCEQ will be notified of any such changes.

Sampling Strategy

A summary of the groundwater sampling plan is presented in **Worksheet 3.1** and the locations of the sampling wells are shown on **Attachment 3A-1**.

As specified in the 2008 Revised RAP, benzene was the only COC identified in the northern portion of the site. Since the submittal of the 2008 Revised RAP, additional wells were installed and confirmed those findings. The highest benzene concentrations were detected in monitoring wells AMP 2-2 (now plugged and abandoned) and MW-04TCI. To monitor benzene concentrations in the northern portion of the site, monitoring wells MW-04TCI and downgradient recovery well RW-3, will be sampled for benzene on an annual basis as noted in **Worksheet 3.1**.

Located in the former Tank 28 Area, monitoring wells MW-10TCI and MW-12 TCI exhibit the highest groundwater concentrations of arsenic, benzene, and styrene; exceeding their respective PCLs. BTEX, arsenic, and styrene will be sampled annually in those wells and downgradient wells AMP-2, MW-18TCI, MW-19TCI, and RW-5 to monitor the stability of the plume and constituents near and downgradient of the source area.

Monitor wells MW-18TCI and MW-19TCI are located within the low transmissivity central groundwater migration pathway along the downgradient western property boundary of the TCI facility **(Attachment 1A-6)**. Although groundwater exceedances have not been observed here, annual sampling for BTEX, arsenic, and styrene will be conducted to monitor the westerly groundwater flow in the central portion of the TCI facility (**Attachment 1A-5**).

Operation and Maintenance	RAP Worksheet 3.2	Page 1 of 1
	ID No.: 30573	Report Date: September 2018

Use this worksheet to describe the operation and maintenance (O&M) activities for each response action. In situations where the response action consists of more than one major component, for clarity one worksheet can be completed for each major component.

Response Action Name/Designation: Recovery System
List all portions of the response action to which this information applies.

Describe the O&M and inspection activities that will be required to operate and maintain response action components.

To ensure proper system operation, the recovery wells and recovery system are inspected weekly by Kinder Morgan personnel and observed daily by TCI plant operators. Pump discharge cycle rates are measured quarterly and discharge rates and discharge rate performances are monitored weekly. System upgrades such as component replacement and line flushing/cleaning are performed on an as needed basis to maintain or improve system performance. Kinder Morgan is planning to replace the existing high-density polyethylene (HDPE) groundwater recovery piping with high performance low maintenance fiberglass reinforced plastic groundwater recovery piping in 2018.

List and discuss the key operating parameters for a properly functioning response action. Address how changes in these parameters will result in operating changes, providing sufficient detail to explain how the operator will know the component is functioning properly.

The primary consideration is to ensure that the pneumatic pumps remain operational and the actuation levels of the pump remain set at a depth to create adequate drawdown in the wells to promote groundwater capture. Obtaining weekly counter readings will confirm adequate groundwater volumes are being recovered by the system to maintain COC capture and a cone of depression around the recovery wells. Other key operating parameters include inspecting air supply connections, gauges, and lines for pneumatic pump operation and discharge lines and connections for recovered water.

List the routine tasks required to operate the response action.

A Weekly Inspection Form has been developed to document proper system functionality. The weekly inspections include:

- Note and record counter (cycles) readings;
- Check for leaks and malfunctions in recovery well vaults, groundwater recovery lines, and 650-gallon polyurethane tank components, including overflow alarm and float, pump, and repair; and,
- Check atmospheric air supply pressure at regulator and adjust if necessary.

Additionally, the iSOC units in monitoring wells MW-10TCI and MW-14TCI are inspected weekly to ensure an adequate oxygen supply is available and components are functioning properly.

List the routine tasks required to maintain the response action, including scheduled inspections, maintenance, and component replacement.

The routine tasks required to maintain the response action include:

- Routinely replace lines/fittings/piping, as needed;
- Troubleshoot pumps for fouling and/flush groundwater recovery piping if the counter readings show decreasing recovery trends;
- Pump removal and maintenance and cleaning as needed; and,
- System recovery line flushing/cleaning to ensure adequate flow of recovered water.

Confirmation Sampling Plan	RAP Worksheet 4.0	Page 1 of 1
Associated Information: Attachment 4A	ID No.: 30573	Report Date: September 2018

List the COCs and other parameters that will be sampled to confirm completion of the response action. Illustrate the monitoring or sampling locations in Attachment 4A. If monitoring or observation wells will be constructed for the response action, provide well construction details in Attachment 2B if not previously provided. If needed, describe the sample collection and handling methods, if not previously provided, in Appendix 6.

Monitored Media	COC[1]	Other parameter (specify)	Sampling Method[2]	Sampling points or locations[3]	Depth/Height[4] (ft.)	Analytical or Field Screening Method	Sampling Frequency[5]
Groundwater	Arsenic BTEX Styrene		Low-flow (Monitoring wells) Grab (Recovery well)	MW-10TCI MW-12TCI MW-18TCI MW-19TCI RW-5 AMP-2	SCF/UNTU groundwater-bearing unit	SW-846 8260 and 6010	Annual monitoring
	Benzene		Low-flow (Monitoring well) Grab (Recovery well)	MW-04TCI RW-3	SCF/UNTU groundwater-bearing unit	SW-846 8260	Annual monitoring
					SCF/UNTU groundwater-bearing unit	SW-846 8260	Annual monitoring
Surface Soil							
Subsurface Soil							

Explain the reasons for the above-listed sampling plan. Discuss statistical or geostatistical methodology(ies) which will be applied, if any, in the data collection process. Discuss any assumptions made in the statistical/geostatistical assessment, and how they will be met.

N/A – NFA has been approved by the TCEQ per 2008 Revised RAP (URS, 2008) for the soil PCLE zones. The remaining subsurface soil below 15 ft bgs at Tank 28 and other plant area concerning soil to groundwater pathway is addressed by the hydraulic control and institutional control.

[1] Specify the COCs to be monitored in this media. List either type of COC (such as VOCs, metals) if all the COCs of that type will be monitored the same way.
[2] Describe the sampling or monitoring methods and QC procedures in Appendix 1 unless the proposed sampling or monitoring procedure is the same as the sampling or monitoring procedure described in the APAR.
[3] Specify the sampling or monitoring point, such as the specific monitor well or general sampling or monitoring location.
[4] Specify the depth or height of the sampling or monitoring points.
[5] Specify the frequency at which this monitoring or sampling will occur.

Complete this worksheet only if Remedy Standard B will be used.

What is the proposed initial post-response action care period? (default 30 yr.) 30 Years

If the proposed initial post-response action care period is less than 30 years, provide a technical justification in accordance with §350.33(h).

What is the foreseeable land use during the post-response action care period? Industrial

Describe how the future use of the property will not compromise the integrity of the physical controls, will not interfere with the function of the monitoring systems, will not pose a threat to human health or the environment, and will be in accordance with any institutional controls.

The Site facility will continue to operate as a chemical manufacturing plant in the foreseeable future. The site is surrounded by petrochemical plants along the Houston ship Channel, undesirable for future residential development. A deed notice restricting the land use to industrial will be filed in the county property records. The deed notice will also document that groundwater within the PCLE zone should not be produced for potable use. Weekly inspection and maintenance will ensure and maintain the integrity of the hydraulic control system. Ongoing operation of the facility is not anticipated to interfere with the monitoring program or pose a threat to human health or the environment since the COC concentrations in soils and groundwater are protective of human health and the environment through the soil-to air and groundwater-to-air exposure pathways. Proposed deed notice language is included in **Appendix 4**.

Briefly describe the proposed post-response action care activities. Describe the type of monitoring and/or inspections to be performed. Discuss the rationale for not including COC(s) analyzed during the response action, monitoring or sampling point location, frequency of monitoring and/or inspections, and the duration of the monitoring program.

Post-response action care (PRAC) activities will consist of the following:

1. Perform weekly inspection and maintenance of the recovery system to ensure proper system functioning and collect groundwater recovery volume data.
2. Perform semiannual groundwater gauging activities to verify capture.
3. Perform annual groundwater monitoring at select sampling points (**Attachment 3A-1**) for COCs specified in **Worksheet 3.1**.
4. Assess the effectiveness of the hydraulic control, taking into account updated well recoveries, groundwater flow, gradient, and concentration data obtained from the weekly measurements, semiannual gauging, and annual sampling events, to determine whether any revisions to the groundwater recovery system and monitoring program (e.g., addition/removal of COCs or wells to be monitored, or increased/decreased sampling frequency) are recommended.
5. Verify that institutional controls remain effective (e.g., groundwater and property land use restriction).
6. Provide recommendations regarding any issues observed in items 1 to 5 and need to be addressed, including considerations of additional response actions, if necessary.
7. Kinder Morgan anticipates that the TCI facility will be included as a modification to the existing Galena Park Hazardous Waste Permit No. HW-50054 ISWR No. 30573 (Permit) during 2019. As such, the TCI facility will be subject to the reporting requirements of the Hazardous Waste/Compliance Plan CP-50054.

If, in the future, data supports the concept of increasing or decreasing the frequency of any of these activities, a revised schedule will be proposed to TCEQ for approval at that time.

Will PRAC sampling procedures be the same as those as previously documented for monitoring and/ or confirmation sampling? X Yes ____ No

If no, provide in Appendix 6 a description of the monitoring or sampling collection procedures to be conducted during the post-response action care period.

Cost Estimate

Complete this portion of the form only if a physical control is proposed (installed hydraulic control system, slurry wall, cap, etc.). Provide in Attachment 5B a detailed cost estimate for a third party to operate and maintain the physical control during the PRAC period, based on current dollar amount.

Specify the physical control to which this information applies N/A (financial assurance is not required per 30 TAC §350.33 (f)(4)(F)(ii)(III))

Complete this worksheet for each physical control that will be used as part of the response action.

What is the total estimated annual cost of O&M for the PRAC period? $ N/A

What is the total estimated cost for a third party to perform PRAC activities? $ N/A

Identify the type of financial assurance mechanism to be used, and the contact person managing fiduciary responsibility, if known.

N/A

Does the person meet the criteria and definition of a small business? (see §350.33(n)) ___ Yes X No
If yes and the person desires to pursue the reduced amount of financial assurance, provide a legally binding affidavit as Attachment 5C. Include in the affidavit the information requested in 30 TAC §350.33(l), (m), and (n). An example affidavit is attached in the instructions.

Document the proposed schedule for implementing the response action. Include all major response action activities through the life of the project, including all removal, decontamination, and control actions, component installations, O&M, monitoring, and post-response action care activities.

Implementation of Response Action (specify component or action)	**Start**	**Finish**	**Duration**
File Institutional Control (Deed Notice for groundwater and Land Use restrictions)	Upon TCEQ approval of Revised RAP	Within 180 days of TCEQ approval of Revised RAP	180 days

List the proposed schedule for report submittals. Add additional lines if more reports than listed will be needed to complete the response action.

Reports	**Submittal date**
Kinder Morgan anticipates that reporting will be included in the requirements specified in the Modified Hazardous Waste Permit for the Galena Park Terminal, Permit No. 50054	Corrective Action reporting is currently on a semiannual basis, in January and July. It is anticipated that annual reporting will be conducted following the approval of the Class 3 Permit of the Galena Park Hazardous Waste Permit Modification.

Project Address: Galena Park, TX

Raaj Patel:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 313944. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 313944 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Carlos Castro
Managing Director, Texas

F = These samples were analyzed outside the recommended holding time.
P = Samples analyzed within the recommended holding time.

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL(PQL) and above the SQL(MDL).

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

* Outside XENCO'S scope of NELAC Accreditation

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

TRRP Data Package Cover Page

Job Number: 600-61802-1

Project Name/Number: Kinder Morgan Texmark

This Data Package consists of:

This signature page, the laboratory review checklist, and the following Reportable Data:

- ☒ R1 Field Chain-of-Custody Form
- ☒ R2 Sample Identification Cross-reference;
- ☒ R3 Test Reports (Analytical Data Sheets) for each environmental sample that includes:
  - a) Items consistent with NELAC Chapter 5
  - b) dilution factors,
  - c) preparation methods,
  - d) cleanup methods, and
  - e) if required for the project, tentatively identified compounds (TICs).
- ☒ R4 Surrogate Recovery Data including:
  - a) Calculated recovery (%R), and
  - b) The laboratory's surrogate QC limits.
- ☒ R5 Test Reports/Summary Forms for Blank Samples;
- ☒ R6 Test Reports/Summary Forms for Laboratory Control Samples (LCSs) including:
  - a) LCS spiking amounts,
  - b) Calculated %R for each analyte, and
  - d) The laboratory's LCS QC limits
- ☒ R7 Test Reports for Matrix Spike/Matrix Spike Duplicates (MS/MSDs) including:
  - a) Samples associated with the MS/MSD clearly identified,
  - b) MS/MSD spiking amounts,
  - c) Concentration of each MS/MSD analyte measured in the parent and spiked sample,
  - d) Calculated %Rs and relative percent differences (RPDs), and
  - e) The laboratory's MS/MSD QC limits
- ☒ R8 Laboratory analytical duplicates (if applicable) recovery and precision, including:
  - a) the amount of analyte measured in the duplicate,
  - b) the calculated RPD, and
  - c) the laboratory's QC limits for analytical duplicates.
- ☒ R9 List of method quantitation limit (MQL) and detectability check sample results for each analyte for each method and matrix;
- ☒ R10 Other problems or anomalies

The exception report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under Texas laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm, to the best of my knowledge, that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Appendix A (cont'd): Laboratory Review Checklist: Reportable Data

Laboratory Name: TestAmerica-Houston	LRC Date: 10/02/12
Project Name: Kinder Morgan Texmark	Laboratory Job Number: 600-61802
Reviewer Name: TWR	Prep Batch Number(s): 600-89414- ICP

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
		Chain-of-custody (C-O-C)					
R1	OI	Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?			X		
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?			X		
		Were % moisture (or solids) reported for all soil and sediment samples?			X		
		Were bulk soil/solid samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?			X		
		Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?			X		
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?	X				
		Were analytical duplicates analyzed at the appropriate frequency?	X				
		Were RPDs or relative standard deviations within the laboratory QC limits?	X				
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				

1. Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Appendix A (cont'd): Laboratory Review Checklist: Reportable Data									
Laboratory Name: TestAmerica-Houston				LRC Date: 10/02/12					
Project Name: Kinder Morgan Texmark				Laboratory Job Number: 600-61802					
Reviewer Name: TWR				Prep Batch Number(s): 600-89414- ICP					
#[1]	A[2]	Description		Yes	No	NA[3]	NR[4]	ER#[5]	
S1	OI	**Initial calibration (ICAL)**							
		Were response factors and/or relative response factors for each analyte within QC limits?				X			
		Were percent RSDs or correlation coefficient criteria met?				X			
		Was the number of standards recommended in the method used for all analytes?		X					
		Were all points generated between the lowest and highest standard used to calculate the curve?				X			
		Are ICAL data available for all instruments used?		X					
		Has the initial calibration curve been verified using an appropriate second source standard?		X					
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration**							
		Was the CCV analyzed at the method-required frequency?		X					
		Were percent differences for each analyte within the method-required QC limits?		X					
		Was the ICAL curve verified for each analyte?		X					
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?		X					
S3	O	**Mass spectral tuning:**							
		Was the appropriate compound for the method used for tuning?				X			
		Were ion abundance data within the method-required QC limits?				X			
S4	O	**Internal standards (IS):**							
		Were IS area counts and retention times within the method-required QC limits?				X			
S5	OI	**Raw data (NELAC section 5.5.10)**							
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?		X					
		Were data associated with manual integrations flagged on the raw data?				X			
S6	O	**Dual column confirmation**							
		Did dual column confirmation results meet the method-required QC?				X			
S7	O	**Tentatively identified compounds (TICs):**							
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?				X			
S8	I	**Interference Check Sample (ICS) results:**							
		Were percent recoveries within method QC limits?		X					
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**							
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?		X					
S10	OI	**Method detection limit (MDL) studies**							
		Was a MDL study performed for each reported analyte?		X					
		Is the MDL either adjusted or supported by the analysis of DCSs?		X					
S11	OI	**Proficiency test reports:**							
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?		X					
S12	OI	**Standards documentation**							
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?		X					
S13	OI	**Compound/analyte identification procedures**							
		Are the procedures for compound/analyte identification documented?		X					
S14	OI	**Demonstration of analyst competency (DOC)**							
		Was DOC conducted consistent with NELAC Chapter 5?		X					
		Is documentation of the analyst's competency up-to-date and on file?		X					
S15	OI	**Verification/validation documentation for methods (NELAC Chapter 5)**							
		Are all the methods used to generate the data documented, verified, and validated, where applicable?		X					
S16	OI	**Laboratory standard operating procedures (SOPs):**							
		Are laboratory SOPs current and on file for each method performed?		X

		Was DOC conducted consistent with NELAC Chapter 5?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods (NELAC Chapter 5)**					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).
3 NA = Not applicable.
4 NR = Not Reviewed.
5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Appendix A (cont'd): Laboratory Review Checklist: Exception Reports	
Laboratory Name: TestAmerica-Houston	LRC Date: 10/04/12
Project Name: Kinder Morgan Texmark	Laboratory Job Number: 600-61802
Reviewer Name: WS	Prep Batch Number: 600-89474, 89487, 89530, 89731, 89810, 90019, and 90047 -VOA

ER #[1]	DESCRIPTION
1	The 1,2-Dichloroethane-d4 surrogate recoveries in samples 600-61802-5, 20 and 22; the Toluene-d8 surrogate recoveries in samples 600-61802-9, 15 and 26; and the Bromofluorobenzene surrogate recoveries in samples 600-61802-5 and 22 were outside control limits due to matrix interference.
2	Benzene was detected above MDL, but below the MQL in the method blanks for batches 600-89530 and 90019. The levels of detection are below the recommended reporting limit and appropriate flags have been applied to the report.
3	The Benzene recoveries in samples 600-61802-7DL MS/MSD were below acceptance limits due to matrix interference.
4	All of the SDLs in samples 600-61802-1, 2, 3, 4, 6, 7, 11, 13, 18, 20, and 21 were elevated due to the high concentrations of target analytes. The Benzene SDLs in samples 600-61802-5, 9, 12, 15, and 22 were elevated due to the high concentrations of this analyte. The Benzene, Ethylbenzene and Styrene SDLs were elevated in sample 600-61802-19 due to the high concentration of these analytes.
5	The Chlorobenzene-d5 ISTD responses in samples 600-61802-9, 15 and 26 were above acceptance criteria due to matrix interference.

ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked on the LRC)

Comments
The report was revised via client request--see attached email, to include Xylenes in the report.

Receipt
The samples were received on 9/21/2012 4:58 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.9° C.

Except:

The following sample(s) was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): MW-13TCI (600-61802-26)

Per conversation via email with the client on 10/05/12, sample 600-61802-19 was analyzed for Arsenic and sample 26 was analyzed for Styrene even though they were not marked on the Chain of Custody.

Metals
Method(s) 200.7 Rev 4.4, 6010B: The following sample(s) required filtration to reduce matrix interferences: MW-12TCI (600-61802-20), MW-12TCI DUP (600-61802-21).

No other analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.
U	Analyte was not detected at or above the SDL.
X	Surrogate is outside control limits
b	The compound was found in the blank and sample
N	MS, MSD: Spike recovery exceeds upper or lower control limits.

Metals

Qualifier	Qualifier Description
J	Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.
U	Analyte was not detected at or above the SDL.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Subject: RE: Files from 600-61802-1 Kinder Morgan Texmark

Hi Cathy,

We just realized that we needed to run Xylenes on all the samples in this lab package. Would you mind regenerating the report with Xylenes included? We need this pretty quickly, so if you can get this to us as soon as you can, we'd really appreciate it. Sorry for mix-up.

Thanks!
Sam

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.9
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Project Name/Number: Kinder Morgan Texmark

This Data Package consists of:

This signature page, the laboratory review checklist, and the following Reportable Data:

- ☒ R1 Field Chain-of-Custody Form
- ☒ R2 Sample Identification Cross-reference;
- ☒ R3 Test Reports (Analytical Data Sheets) for each environmental sample that includes:
  - a) Items consistent with NELAC Chapter 5
  - b) dilution factors,
  - c) preparation methods,
  - d) cleanup methods, and
  - e) if required for the project, tentatively identified compounds (TICs).
- ☒ R4 Surrogate Recovery Data including:
  - a) Calculated recovery (%R), and
  - b) The laboratory's surrogate QC limits.
- ☒ R5 Test Reports/Summary Forms for Blank Samples;
- ☒ R6 Test Reports/Summary Forms for Laboratory Control Samples (LCSs) including:
  - a) LCS spiking amounts,
  - b) Calculated %R for each analyte, and
  - d) The laboratory's LCS QC limits
- ☒ R7 Test Reports for Matrix Spike/Matrix Spike Duplicates (MS/MSDs) including:
  - a) Samples associated with the MS/MSD clearly identified,
  - b) MS/MSD spiking amounts,
  - c) Concentration of each MS/MSD analyte measured in the parent and spiked sample,
  - d) Calculated %Rs and relative percent differences (RPDs), and
  - e) The laboratory's MS/MSD QC limits
- ☒ R8 Laboratory analytical duplicates (if applicable) recovery and precision, including:
  - a) the amount of analyte measured in the duplicate,
  - b) the calculated RPD, and
  - c) the laboratory's QC limits for analytical duplicates.
- ☒ R9 List of method quantitation limit (MQL) and detectability check sample results for each analyte for each method and matrix;
- ☒ R10 Other problems or anomalies

The exception report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under Texas laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm, to the best of my knowledge, that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Appendix A (cont'd): Laboratory Review Checklist: Reportable Data

Laboratory Name: TestAmerica-Houston	LRC Date: 02/22/13
Project Name: Kinder Morgan Texmark	Laboratory Job Number: 600-68603
Reviewer Name: YX	Prep Batch Number: 600-99606, 99666, 99671 and 99904-VOA

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
		Chain-of-custody (C-O-C)					
R1	OI	Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?		X			1
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?			X		
		Were % moisture (or solids) reported for all soil and sediment samples?			X		
		Were bulk soil/solid samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?			X		
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		2
		Were MS/MSD RPDs within laboratory QC limits?			X		2
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?			X		
		Were analytical duplicates analyzed at the appropriate frequency?			X		
		Were RPDs or relative standard deviations within the laboratory QC limits?			X		
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results?	X				3
		Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				

1. Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Appendix A (cont'd): Laboratory Review Checklist: Reportable Data

Laboratory Name: TestAmerica-Houston	LRC Date: 02/22/13
Project Name: Kinder Morgan Texmark	Laboratory Job Number: 600-68603
Reviewer Name: YX	Prep Batch Number: 600-99606, 99666, 99671 and 99904-VOA

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
S1	OI	**Initial calibration (ICAL)**					
		Were response factors and/or relative response factors for each analyte within QC limits?	X				
		Were percent RSDs or correlation coefficient criteria met?	X				
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration**					
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
S3	O	**Mass spectral tuning:**					
		Was the appropriate compound for the method used for tuning?	X				
		Were ion abundance data within the method-required QC limits?	X				
S4	O	**Internal standards (IS):**					
		Were IS area counts and retention times within the method-required QC limits?	X				
S5	OI	**Raw data (NELAC section 5.5.10)**					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?			X		
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods (NELAC Chapter 5)**					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).
3 NA = Not applicable.
4 NR = Not Reviewed.
5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Appendix A (cont'd): Laboratory Review Checklist: Exception Reports	
Laboratory Name: TestAmerica-Houston	LRC Date: 02/22/13
Project Name: Kinder Morgan Texmark	Laboratory Job Number: 600-68603
Reviewer Name: YX	Prep Batch Number: 600-99606, 99666, 99671 and 99904-VOA

ER #[1]	DESCRIPTION
1	See Case Narrative.
2	The laboratory selected samples from other groups to perform as the MS/MSDs.
3	All of the SDLs in samples 600-68603-2 and 4 were elevated due to the nature of the sample matrix.

ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked on the LRC)

Job ID: 600-68603-1

Laboratory: TestAmerica Houston

Narrative

Job Narrative
600-68603-1

Comments
No additional comments.

Receipt
The samples were received on 2/14/2013 9:39 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.0° C.

Except:

The following sample(s) was listed on the Chain of Custody (COC); however, no sample(s) was received: unpreserved VOAs for each sample.

Method Summary

Client: URS Corporation

Definitions/Glossary

Client: URS Corporation
Project/Site: Kinder Morgan Texmark

TestAmerica Job ID: 600-68603-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Analyte was not detected at or above the SDL.
J	Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	5.0
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True	

Data Usability Summary

To:	Celeste Wieting	**Date:**	January 22, 2014
From:	Brenda Basile	**File:**	Kinder Morgan Texmark 1213 DUS.doc
RE:	Review of Groundwater Samples Collected December 2013	**CC:**	Samantha Hon

URS reviewed one laboratory report from TestAmerica (Houston, Texas) reporting the analytical results for groundwater samples collected December 11 to December 16, 2013 at the Kinder Morgan Texmark site. The package was reviewed for conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* (SW-846) and *Review and Reporting of COC Concentration Data* (RG-366/TRRP-13). The purpose of this sample event was to provide data on concentrations of chemicals of concern (COCs) in groundwater.

The TestAmerica laboratory is accredited under Texas certificate T104704223-14-12. TestAmerica is accredited for the matrices, methods and analytes reported in this laboratory report.

Groundwater and associated quality control samples were analyzed using the following methods:

- SW-846 8260B - Volatile Organic Compounds by Gas Chromatography-Mass Spectrometry (GC/MS)

Data were reviewed as described in the RG-366/TRRP-13 Guidance Document and the results of the review are discussed in this Data Usability Summary (DUS). The reportable data, laboratory review checklists (LRCs) and exception reports (ERs) were reviewed.

Introduction

Groundwater and associated quality control (QC) samples were analyzed for benzene using the method listed above. Table 1 lists the sample identifications cross-referenced to laboratory identifications and the analyses performed for each sample. Samples were analyzed for parameters as listed on the chain-of-custody (C-O-C). No data were qualified due to exceedances of quality control criteria.

QC Results

PRESERVATION AND HOLDING TIMES

Samples were received at the laboratory at temperatures less than 6°C. Samples were prepared and analyzed within holding times specified in Chapter Two of SW-846.

CALIBRATIONS

Initial calibration data and instrument performance calibrations (GC/MS tunes) were not submitted in the data packages. Continuing calibration data were not submitted in the data packages. The TCEQ does not require calibration data as part of the data package deliverables. According to the LRCs, tunes and calibrations were acceptable.

BLANKS

No analytes were detected in field or laboratory quality control blanks.

SURROGATE RECOVERIES AND INTERNAL STANDARD AREAS

Surrogate recoveries were within the default RG-366/TRRP-13 acceptance criteria of 60-140 percent recovery (%R). TestAmerica stated on the LRCs that internal standard areas were acceptable.

LABORATORY CONTROL SAMPLES

Laboratory control sample (LCS) recoveries were within the default RG-366/TRRP-13 acceptance criteria of 60-140%R for organic analytes.

MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Batch, or non-project, matrix spike/matrix spike duplicate (MS/MSD) data were not evaluated.

FIELD PRECISION

Field duplicate precision is summarized in Table 2. Data are evaluated using 30 relative percent difference (RPD) as the criterion for groundwater. Field duplicate precision is acceptable.

SUMMARY

Analytical data are usable for determining concentrations of COCs in groundwater at the Kinder Morgan Texmark Site.

TRRP Data Package Cover Page

Job Number: 600-84195-1
Project Name/Number: Kinder Morgan Texmark GW

This Data Package- consists of:

This signature page, the laboratory review checklist, and the following Reportable Data:

- ☒ R1 Field Chain-of-Custody Form
- ☒ R2 Sample Identification Cross-reference;
- ☒ R3 Test Reports (Analytical Data Sheets) for each environmental sample that includes:
  - a) Items consistent with NELAC Chapter 5
  - b) dilution factors,
  - c) preparation methods,
  - d) cleanup methods, and
  - e) if required for the project, tentatively identified compounds (TICs).
- ☒ R4 Surrogate Recovery Data including:
  - a) Calculated recovery (%R), and
  - b) The laboratory's surrogate QC limits.
- ☒ R5 Test Reports/Summary Forms for Blank Samples;
- ☒ R6 Test Reports/Summary Forms for Laboratory Control Samples (LCSs) including:
  - a) LCS spiking amounts,
  - b) Calculated %R for each analyte, and
  - d) The laboratory's LCS QC limits
- ☒ R7 Test Reports for Matrix Spike/Matrix Spike Duplicates (MS/MSDs) including:
  - a) Samples associated with the MS/MSD clearly identified,
  - b) MS/MSD spiking amounts,
  - c) Concentration of each MS/MSD analyte measured in the parent and spiked sample,
  - d) Calculated %Rs and relative percent differences (RPDs), and
  - e) The laboratory's MS/MSD QC limits
- ☒ R8 Laboratory analytical duplicates (if applicable) recovery and precision, including:
  - a) the amount of analyte measured in the duplicate,
  - b) the calculated RPD, and
  - c) the laboratory's QC limits for analytical duplicates.
- ☒ R9 List of method quantitation limit (MQL) and detectability check sample results for each analyte for each method and matrix;
- ☒ R10 Other problems or anomalies

The exception report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under Texas laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm, to the best of my knowledge, that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
		Chain-of-custody (C-O-C)					
R1	OI	Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?			X		
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?			X		
		Were % moisture (or solids) reported for all soil and sediment samples?			X		
		Were bulk soil/solid samples for volatile analysis extracted with methanol per SW846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?			X		
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?			X		1
		Were MS/MSD RPDs within laboratory QC limits?			X		1
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?			X		
		Were analytical duplicates analyzed at the appropriate frequency?			X		
		Were RPDs or relative standard deviations within the laboratory QC limits?			X		
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results?	X				2
		Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X				

1. Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Appendix A (cont'd): Laboratory Review Checklist: Reportable Data

Laboratory Name: TestAmerica-Houston	LRC Date: 12/24/13
Project Name: Kinder Morgan Texmark GW	Laboratory Job Number: 600-84195
Reviewer Name: YX	Prep Batch Number: 600-123145, 123327, 123395 and 123399-VOA

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
S1	OI	**Initial calibration (ICAL)**					
		Were response factors and/or relative response factors for each analyte within QC limits?	X				
		Were percent RSDs or correlation coefficient criteria met?	X				
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration**					
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
S3	O	**Mass spectral tuning:**					
		Was the appropriate compound for the method used for tuning?	X				
		Were ion abundance data within the method-required QC limits?	X				
S4	O	**Internal standards (IS):**					
		Were IS area counts and retention times within the method-required QC limits?	X				
S5	OI	**Raw data (NELAC section 5.5.10)**					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?			X		
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods (NELAC Chapter 5)**					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).
3 NA = Not applicable.
4 NR = Not Reviewed.
5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Appendix A (cont'd): Laboratory Review Checklist: Exception Reports	
Laboratory Name: TestAmerica-Houston	LRC Date: 12/24/13
Project Name: Kinder Morgan Texmark GW	Laboratory Job Number: 600-84195
Reviewer Name: YX	Prep Batch Number: 600-123145, 123327, 123395 and 123399-VOA

ER #[1]	DESCRIPTION
1	The laboratory selected samples from another groups to perform as the MS/MSDs.
2	Benzene SDL was elevated in samples 600-84195-9 and 15 due to the high concentration of this analyte.

ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked on the LRC)

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Analyte was not detected at or above the SDL.
J	Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	Lab does not accept radioactive samples.
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	1.8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

Re: *Class V Injection Well Permit (5X2600596)*
Texmark Chemicals, Inc.
900 Clinton Drive
Galena Park, Texas 77547

Dear Mr. Smith:

Attached please find a memorandum documenting the results of a chemical injection pilot test performed under the Texas Commission on Environmental Quality (TCEQ) Class V Injection Permit 5X2600596 conducted by Kinder Morgan Liquids Terminals, LLC (KMLT) at the Texmark Chemicals, Inc. (TCI) facility in Galena Park, Texas. Results of the pilot test did not meet objectives of pilot test scope of work and therefore a full scale system was not implemented. KMLT is thereby requesting closure of the above-referenced permit. Please refer to the attached memorandum and supporting documentation for more detail regarding the pilot study activities.

If you have any questions regarding the information presented in this submittal, please do not hesitate to contact me at (713) 920-8423.

Sincerely,
Kinder Morgan Liquids Terminals, LLC

Johnny Kennedy, P.G.
Remediation Project Manager

MEMORANDUM

To:	Johnny Kennedy, Remediation Project Manager Kinder Morgan Liquids Terminals, LLC	**Date:**	May 4, 2012
From:	Jeremy Andrews, Hydrogeologist Raaj Patel, Principal Geologist/Program Manager	**Project:**	Tank 28 Area Texmark Chemicals Inc. Facility
RE:	Chemical Injection Pilot Test (TCEQ Class V Injection Permit – 5X2600596)		

Introduction

On February 2, 2011, Kinder Morgan Liquids Terminals, LLC. (KMLT) requested a Class V Injection Permit to conduct a pilot test and full scale program to reduce source concentrations of benzene in groundwater at the Texmark Chemicals, Inc. (TCI) facility (the Site, see attached Figure 1) in Galena Park, Texas. The request was approved on March 2, 2011 and a Class V Injection Well Permit (5X2600596) was issued by TCEQ. This memo details the injection pilot test conducted by URS at the TCI facility on June 30, 2011 and requests closure of the permit.

Background Conditions

Dissolved-phase benzene is the primary Chemical of Concern (COC) in groundwater at the Site. The highest concentrations in the southern area of the Site have been detected in groundwater sampled from MW-10. Benzene concentrations in groundwater at MW-10TCI have ranged from 138 milligrams per liter (mg/L) to 316 mg/L since 2007. The dissolved oxygen (DO) concentration in groundwater at MW-10TCI was 1.21 mg/L prior to injection activities, indicating a potential aerobic environment. However, the oxidation-reduction potential (ORP) measurement in groundwater was -104.8 milliVolts (mV), indicating that conditions may not be optimal for natural aerobic biodegradation. Injection of RegenOx™ was proposed to oxidize benzene and also increase the DO and ORP over a period of 2 to 4 weeks.

Methods

RegenOx™ was introduced into the uppermost groundwater-bearing zone (5 – 25 feet below ground surface) through direct probe injection at three locations hydraulically up-gradient of MW-10TCI and newly installed observation well MW-10OBW on June 30, 2011 (See attached Figure 2). RegenOx™ is an in-situ chemical oxidant (sodium percarbonate) and an activator complex (a composition of ferrous salt embedded in a micro-scale catalyst gel). Groundwater chemistry parameters from monitoring wells MW-10TCI and MW-10OBW were measured in the field for DO, ORP, temperature, and pH. Benzene was analyzed from groundwater collected during pre and post injection sampling events.

Injection Program & Results

During the injection at location INJ-1, located 5.5 feet hydraulically up-gradient of MW-10OBW, field parameters were monitored in groundwater at MW-10OBW. When the injection at INJ-1 reached 17 feet below ground surfaces (23 minutes after initial injection), the DO concentration in MW-10OBW increased to 22 mg/L and the groundwater in MW-10OBW reached the top of the well casing. Therefore, injection

activities stopped at location INJ-1 and a new injection location (INJ-1A) was established 10 feet hydraulically up-gradient of MW-10OBW. The DO concentrations were stable around 45 mg/L during the injection at location INJ-1A, and the water level stabilized 5 feet below the top of the casing (approximately 2 feet below ground surface).

During the injection at location INJ-2, located 11 feet hydraulically up-gradient of MW-10TCI, field parameters were monitored in groundwater at MW-10TCI. The DO concentration in MW-10TCI was stabilized at approximately 50 mg/L, and the water level in MW-10TCI did not increase near the surface (stabilized approximately 5 feet below ground surface) during the injection activities.

Groundwater samples were collected and analyzed for benzene from MW-10TCI and MW-10OBW prior to the injection on June 21, 2011. The groundwater from both wells was sampled again following the injection on July 2, 8, 14, and 22, 2011. The DO and benzene concentrations peaked in both wells on July 2, 2011, two days after injection (Figures 3 and 4). ORP peaked on July 8, 2011 in MW-10OBW, and July 14, 2011 in MW-10TCI. The increase in the benzene concentrations may be due to the detergent effect that RegenOx™ has on benzene adsorbed to soil in the subsurface. Following the increase on July 2, 2011, benzene decreased below pre-injection concentrations in both wells on July 8, 2011. However by the July 14, 2011 sampling event, the benzene concentrations had increased back to near pre-injection concentrations. DO also returned to near pre-injection values by the July 22, 2011 sampling event for both wells. The return to pre-injection conditions may be due to migration of untreated groundwater up-gradient of the injection points reaching MW-10TCI and MW-10OBW by the July 22, 2011 sampling event.

Conclusion

The injection pilot test was conducted to evaluate the ability of RegenOx™ to oxidize dissolved phase benzene in groundwater over a period of 2 to 4 weeks at the Site. However, the injection of RegenOx™ at the Site did not maintain a decreasing trend of benzene following injection over the time frame intended. Therefore, the full scale system was not implemented because the injection pilot study did not meet the objections of the pilot test scope. KMLT requests that the above referenced injection permit be closed.

Re: *Additional Information for Class V Injection Well Permit Closure Request*
(TCEQ Authorization 5X2600596)
Texmark Chemicals, Inc.
900 Clinton Drive
Galena Park, Texas

Dear Mr. Smith:

Outlined below is the well plugging information that you requested on April 26, 2013 from Mr. Raaj Patel of URS Corporation. As discussed in the closure request for the Class V Injection Permit (Permit No. 5X2600596) dated May 04, 2012, KM Liquids Terminals LLC (KMLT) conducted a chemical injection pilot test at the Texmark Chemicals, Inc. (TCI) facility in Galena Park, Texas. The plan was to implement a full scale injection program if the pilot test results were favorable. However, the results of the pilot test did not meet the objectives of pilot test scope of work, and therefore a full scale program was not implemented.

During the pilot test, RegenOx™ (a solid oxidizer mixed with an activator at a 10% solution in water) was injected through direct probe injection at three locations and injection performance was monitored downgradient of these three locations. The injections, conducted on June 30, 2011, at each location utilized a direct push technology (DPT) GeoProbe system, and after completion of injection activities, each location was backfilled with bentonite chips and a bentonite/cement plug at the surface. Since these locations were not completed as wells, well plugging reports were not generated for these locations.

Please do not hesitate to call me at (713) 920-8423 if you have any questions regarding the information presented in this letter or need additional information.

Sincerely,
KM Liquids Terminals LLC

Johnny Kennedy, P.G.

Proposed Deed Notice Language

Texas Risk Reduction Program
Deed Notice

STATE OF TEXAS

COUNTY OF HARRIS

This Notice is filed to provide information concerning certain environmental conditions and/or use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows:

> ***A legal property description used in the last recorded vesting deed, covering the Property that includes the entire recorded tract of land held by the owner executing this deed notice, is attached hereto and incorporated herein by reference as Exhibit A.***

Portions of the groundwater of the Property contain certain identified chemicals of concern, specifically benzene, ethylbenzene, toluene, and xylenes, arsenic, and styrene, causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The property considered to be the Affected Property is described as follows:

> ***METES AND BOUNDS DESCRIPTION:*** *Being a tract of land containing 8.0685 acres of land situated in the Ezekiel Thomas Survey, A-73, Harris County, Texas, described as Tract I, Tract II, and Tract III by that instrument to Texmark Properties, Inc., recorded under File Number T453277, Harris County Official Public Records of Real Property (HCOPRRP), and being out of a called 16.91 acre tract described as "Tract A" in deed from The Texas Company to General American Transportation Corporation, dated November 22, 1944 and recorded in Volume 1163, Page 515, Harris County Deed Records (H.C.D.R.); said 8.0685 acre tract being more particularly described by metes and bounds as follows (all bearings are referenced to that instrument recorded under File Number T453277, HCOPRRP):*
>
> *BEGINNING at a "V" in concrete base of chainlink fence post set in the south right-of-way of Clinton Drive (100 feet wide) as described in Volume 704, Page 216, and Volume 1011, Page 47, H.C.D.R., said point being the northeast corner of said Tract I, from which a concrete monument with "Texaco Star" in top found for the northeast corner of a called 1.17 acre tract,*
> *described as Tract Number 1, in deed from The Texas Company to General American Transportation Corporation, dated November 22, 1944 and recorded in Volume 1163, Page 515, H.C.D.R., bears North 87°56'52" East, 195.61 feet;*
>
> *THENCE South 01°56'57" East, 154.29 feet with the east line of said Tract I to a 5/8 inch iron rod found 1.5 feet north of the base of an old chain link fence corner, 6.0 feet north of an existing chain link fence corner;*
>
> *THENCE South 87°56'52" West, 383.32 feet with the most easterly south line of said Tract I, to a "X" in concrete set for an interior corner of said Tract I;*

THENCE South 02°03'08" East, 15.00 with the east line of said Tract I to a 5/8 inch iron rod with cap stamped "A.L. SIKES RPLS 2914" set for an ell corner of said Tract I;

THENCE South 87°56'52" West, 87.10 feet with a southerly line of said Tract I to a 5/8 inch iron rod with cap stamped "A.L. SIKES RPLS 2914" set for an interior corner of said Tract I;

THENCE South 02°03'08" East, 2.00 feet with the east line of said Tract I to a 5/8 inch iron rod with cap stamped "A.L. SIKES RPLS 2914" set for an ell corner of said Tract I;

THENCE South 87°56'52" West, 20.25 feet with a southerly line of said Tract I to an "X" in concrete set for an interior corner of said Tract I, from which a bent 5/8 inch iron rod found bears South 27°20' East, 0.97 feet;

THENCE South 03°04'30" East, at 183.85 feet pass an ell corner of said Tract I, the northeast corner of said Tract III, from which a 1-1/2 inch iron pipe found bears North 12°31' East, 0.31 feet, at 326.91 feet pass a 1-1/2 inch iron pipe found for the southeast corner of said Tract III, the northeast corner of said Tract II, in all 461.62 feet to a 5/8 inch iron rod with cap stamped "A.L. SIKES RPLS 2914" set for the most northerly southeast corner of said Tract II;

THENCE South 87°48'43" West, 25.87 feet with the most northerly south line of said Tract II to a 5/8 inch iron rod found for an interior corner of said Tract II;

THENCE South 04°38'01" E, 58.12 feet with the east line of said Tract II to a 5/8 inch iron rod with cap stamped "A.L. SIKES RPLS 2914" set for the most southerly southeast corner of said Tract II, from which a bent 5/8 inch iron rod found bears North 13°59' East, 1.02 feet, said point being in the south line of said 16.91 acre tract, the north line of a tract of land described in deed to Southern Pacific Rail Road recorded in Volume 2051, Page 242, H.C.D.R.;

THENCE South 87°48'43" West, with the south line of said 16.91 acre tract, the north line of said rail road tract, the south line of said Tract II, at 172.87 feet pass a 5/8 inch iron rod found for the southwest corner of said Tract II, the most southerly southeast corner of said Tract I, in all 371.62 feet to a 5/8 inch iron rod found for the southwest corner of said Tract I, the southeast corner of a 50 foot wide pipeline alley as shown on sketch in said deed to General American Transportation Corporation, from which a 1-1/2 inch iron pipe found bears North 83°51' West, 0.69 feet, and a 5/8 inch iron rod with cap found bears North 69°30' West, 0.33 feet;

THENCE North 03°26'35" West, 692.04 feet with the east line of said pipeline alley, the west line of said Tract I, to a chainlink fence post found for the northeast corner of said pipeline alley, the northwest corner of said Tract I, said point being in the south right-of-way of said Clinton Drive;

THENCE North 87°56'52" East, 894.38 feet with the south right-of-way of said Clinton Drive, the north line of said Tract I, to the POINT OF BEGINNING, and containing 8.0685 acres of land.

The certified metes and bounds description and corresponding plat map of the Affected Property for groundwater are attached hereto and incorporated herein by reference as Exhibit A. The Affect Property Maintenance and Monitoring Requirements are provided in Exhibit B.

The constituents of concern in groundwater at the Affected Property defined here as exceeding TRRP Protective concentration Levels (PCLs) for residential land use are benzene, ethylbenzene, toluene, and xylenes, arsenic, and styrene.

This notice is required for the following reasons:

> *The Affected Property currently meets TRRP standards for commercial/industrial use. Based on the reports, the chemicals of concern pose no significant present or future risk to humans or the environment based on commercial/industrial land use. No further remediation of the Affected Property is required by the TCEQ as long as the Affected Property is not to be used for residential purposes as the property may not be protective for residential use. If any person desires in the future to use the Affected Property for residential purposes, the TCEQ must be notified at least 60 days in advance of such use and additional response actions may be necessary before the property may be used for residential purposes. Persons contemplating a change in land use for the Affected Property are encouraged to review the definitions for commercial/industrial and residential land use contained in TRRP as the definition of residential land use is broad.*

As of the date of this Notice, the record owner of fee title to the Property is Texmark Properties, Inc. with an address of 900 Clinton Drive, Houston, Texas 77547.

Affected Property Maintenance and Monitoring Requirements

Affected Property maintenance and monitoring will consist of weekly inspections and maintenance and semiannual groundwater monitoring of the well network and annual reporting to the Texas Commission on Environmental Quality (TCEQ). Additional information regarding inspections and maintenance and groundwater monitoring can be found in the TCEQ-approved Revised Response Action Plan for the Texmark Chemicals, Inc. facility (September 2018).

ISWR No. 30573
Hazardous Waste Permit No. HW-50054
EPA ID No. TXD026481523

Dear Ms. Hatfield:

Attached please find two (2) original and an electronic copy (via file transfer) of the Annual Corrective Action Program (CAP) Report for the KM Liquids Terminals LLC (KM) Galena Park Terminal located in Galena Park, Texas prepared by AECOM Technical Services, Inc. (AECOM). This report is being submitted in accordance with the reporting requirements of Section XI.G and listed in CP Table VII of the November 8, 2019 KM Compliance Plan (Section XI of the Permit). As required by the Compliance Plan, one additional copy will be submitted to the Texas Commission on Environmental Quality (TCEQ) Region 12 office in Houston, Texas.

The Galena Park Terminal's hazardous waste permit and compliance plan modification was issued on November 8, 2019. The permit was modified and approved by the TCEQ executive director on November 8, 2019 and a modified Compliance Plan was issued. The Compliance Plan specifies annual reporting to replace the previous semiannual reporting. The first Annual Corrective Action Program Report was submitted on February 28, 2020. Annual Corrective Action Program Reports followed on February 26, 2021, February 28, 2022, and February 28, 2023.

In addition to the existing permitted units, the Corrective Action Management Unit (CAMU)/(North Holding Basin) (NHB) and the former Southeast Holding Basin (SEHB), Compliance Plan modifications included the addition of the above-referenced solid waste management units (SWMU) and areas of concern (AOCs) subject to groundwater corrective action and compliance monitoring (Compliance Plan Table I).

1. Introduction

This Annual Corrective Action Program Report (Report) is being submitted in accordance with the reporting requirements of Section XI.G and those listed in the Compliance Plan Table (CP Table) VII of the Kinder Morgan Liquids Terminals LLC (Kinder Morgan) Hazardous Waste Permit 50054, issued by the Texas Commission on Environmental Quality (TCEQ) on September 30, 1992 and renewed on March 8, 2004, and January 6, 2015 (Permit). The permit was modified and approved by the TCEQ executive director on November 8, 2019 and a modified Compliance Plan was issued. The Compliance Plan specifies annual reporting of the activities associated with the Corrective Action Program in place at the Kinder Morgan Galena Park Terminal (KMLT).

In addition to the existing Corrective Action Management Unit (CAMU)/North Holding Basin (NHB), and the Southeast Holding Basin (SEHB), the Compliance Plan modifications included the addition of the following Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) subject to groundwater corrective action and compliance monitoring (Compliance Plan Table I):

- Central Plant (CP) Waste Management Area (WMA) Plume Management Zone (PMZ) (CP PMZ);
- SWMU Group W3 (West Plant WMA PMZ/West Chemical Area of Concern (AOC)) (WP/WC PMZ);
- Texmark Chemical Group (TCI); and
- Old Pump House No. 5 AOC (OPH5).

As required by CP Table VII Item 2, **Table A** below shows the history of modifications to Hazardous Waste (HW) Permit 50054.

Table A: History of Modifications to HW Permit 50054

Application Date	Type	Summary	TCEQ Approval (Issuance Date)
September 17, 2013	Renewal/Major Amendment	Compliance renewal	January 6, 2015
April 26, 2016	Class 1 Modification	Revised the legal description of the facility and replacement of Compliance Plan Attachment A	May 31, 2016
September 5, 2018	Class 3 Modification	Addition of TCI, CP PMZ, WP/WC PMZ, and OPH5 to the Corrective Action Program. Addition of the Gate 6 AOC, WP/WC PMZ, and OPH5 to Compliance Plan Table II	November 8, 2019

This Report addresses the Kinder Morgan Galena Park Terminal located in Galena Park, Texas, hereafter referred to as the Galena Park Terminal or KMLT.

Section XI of the Permit sets forth the requirements for the Corrective Action Program at the NHB, located in the WP/WC PMZ Area as shown on **Figure 1**, the SEHB, located in the Central Plant Area as shown on **Figure 2**, the CP PMZ as shown on **Figure 3**, the WP/WC PMZ as shown on **Figure 4**, TCI as shown on **Figure 5,** and OPH5 shown on **Figure 6**. General facility information is listed as follows:

Company Name: KM Liquids Terminals LLC

Primary Contact: Mr. Johnny Kennedy, P.G.

Site Location: 1500 Clinton Drive, Galena Park, Texas 77547

EPA ID No.: TXD026481523

ISWR No.: 30573

Permit No.: 50054

Compliance Plan: Section XI of the Permit

This Report covers the time period from January 1, 2023 to December 31, 2023 for the NHB, SEHB, CP PMZ, WP/WC PMZ, TCI, and OPH5 plant areas as required by the Permit.

2. Evaluation of Collected Groundwater Data (Compliance Plan Table VII Item 4, 8, 14, and 15)

In accordance with Section XI.F.3.(2), semiannual groundwater level measurements are required in the Corrective Action Program areas. Areas CP PMZ, WP/WC PMZ, TCI, and OPH5 were incorporated into the Corrective Action Program on November 8, 2019 and data relevant to this section is included in this report. Groundwater level measurements were obtained at the NHB on January 31 and July 21, 2023, at the SEHB on January 30 and July 20, 2023, at the CP PMZ on January 31 and July 21, 2023, at the WP/WC PMZ on February 24 and August 15, 2023, at TCI on February 23 and August 30, 2023 during the annual sampling and semi-annual gauging events, and at OPH5 on January 30 and July 21, 2023, during the semiannual sampling events. These data are summarized in **Tables 1 through 6**. In accordance with the Permit (CP Table VII, Item 4), a tabulation of well casing elevations is included in **Appendix A**. Potentiometric maps were prepared using the groundwater elevation data. The potentiometric maps for NHB Zone III, Zone IV, and Zone V are presented as **Figures 7a-7f,** SEHB Uppermost Natural Transmissive Unit (UNTU) and Sandy Channel Fill (SCF) maps are presented as **Figures 8a-8d,** CP PMZ maps are presented as **Figures 9a and 9b**, WP/WC PMZ maps are presented as **Figures 10a and 10b**, TCI maps are presented as **Figures 11a and 11b**, and OPH5 maps are presented as **Figures12a and 12b**.

As required by the Permit, Compliance Plan Attachment-C, Item 15,

> *The Permittee shall measure and keep a record of the elevation of the top of each well casing in feet above mean sea level to the nearest 0.01 foot and permanently mark the measuring point on the well. The Permittee shall compare old and new elevations from previously surveyed wells and determine a frequency not to exceed five (5) year intervals.*

Compliant with the Permit, the Corrective Action Systems wells in the NHB and SEHB were surveyed by a Registered Professional Land Surveyor (RPLS) during May 2019. Prior to the 2019 survey, the wells were surveyed in April 2014. Due to inaccessibility during the 2014 survey, wells MW-17 (SEHB), MW-35 (SEHB), and MW-11 (NHB) were surveyed in June 2015. The next scheduled survey will occur in 2024.

The NHB MW-5 well pad was reconstructed during July 2019. To accommodate the new well pad, 6.65” (0.55’) of the top of the well casing was removed yielding a top of casing (TOC) measurement of approximately 20.25 feet (ft.) above mean sea level (MSL). In May 2019, KMLT received approval from the TCEQ to remove MW-5 from the sampling program, therefore, NHB MW-5 has not been resurveyed since the repairs during 2021. The WP/WC PMZ monitoring well MW-27 well pad was also reconstructed during July 2019. To accommodate the new well pad, 3.95” (0.33’) of the top of the well casing was removed yielding an approximate new TOC measurement of 19.35’. WP/WC PMZ MW-27 was resurveyed by an RPLS during 2021. The CP MW-6 well casing was repaired during 2021 and was resurveyed by an RPLS during 2021. Well CP RI-1-17 was also resurveyed on account of a pad repair due to damage sustained by adjacent vehicles.

Additionally, on December 9, 2020, replacement monitoring well MW-35R was installed within 15 feet of the destroyed monitoring well MW-35 location under the same construction specifications as MW-35 with the exception of the protective surface casing which was not warranted. Well CP MW-35R was resurveyed by an RPLS during 2021. **Appendix A** contains the updated survey information.

2.1 Development and Maintenance of a Cone of Depression (Compliance Plan Table VII.8a)

NHB

Groundwater elevations from the monitoring wells screened in Zone III (MW-1, MW-4, MW-5, MW-7, MW-8, MW-9, MW-10, MW-11, MW-13, and RW-16) were used to construct a potentiometric map (January 31, 2023) for Zone III at the NHB (**Table 1, Figure 7a**). Recovery wells MW-4, MW-15, and RW-16 were not operational during the January 2023 gauging event. A well-defined cone of depression is historically observed in recovery wells MW-4 and MW-7 in Zone III, as depicted on **Figure 7a**. This cone historically also included RW-16; however, this recovery well was inactive at the time of the January sampling event. Consistent with previous events, groundwater generally flows eastward across the NHB toward MW-7 and MW-11 in Zone III.

Groundwater elevations from the monitoring wells screened in Zone IV (MW-6, MW-14, MW-15, and RW-17) were used to construct a potentiometric map (January 31, 2023) for Zone IV at the NHB (**Table 1, Figure 7b**). Consistent with previous events, groundwater generally flows eastward across the NHB toward RW-17 and MW-6 in Zone IV.

Groundwater elevation from the monitoring well screened in Zone V (MW-12) is shown on **Figure 7c** (January 31, 2023). As only one well is screened in this zone, potentiometric maps were not prepared, and groundwater flow direction was not calculated.

Groundwater elevations from the monitoring wells screened in Zone III (MW-1, MW-4, MW-5, MW-7, MW-8, MW-9, MW-10, MW-11, MW-13, and RW-16) were used to construct a potentiometric map (July 21, 2023) for Zone III at the NHB (**Table 1, Figure 7d**). As shown on **Figure 7d,** a well-defined cone of depression is observed in Zone III at MW-7. This cone historically also included RW-16; however, this recovery well was inactive at the time of the July sampling event.

Groundwater elevations from the monitoring wells screened in Zone IV (MW-6, MW-14, MW-15, and RW-17) were used to construct a potentiometric map (July 21, 2023) for Zone IV at the NHB (**Table 1, Figure 7e**). A well-defined cone of depression is historically observed in Zone IV around RW-17 and MW-06. Consistent with previous events, groundwater generally flows northward and eastward across the NHB toward RW-17 and MW-6 in Zone IV.

Groundwater elevation from the monitoring well screened in Zone V (MW-12) is shown on **Figure 7f** (July 21, 2023). As only one well is screened in this zone, potentiometric maps were not prepared, and groundwater flow direction was not calculated.

TOC elevations for the NHB are presented in **Appendix A**.

SEHB

Groundwater is recovered from the Upper Natural Transmissive Unit (UNTU) and the shallower Sandy Channel fill (SCF) Zones at the SEHB. A groundwater gradient map was prepared for wells screened across the UNTU and SCF.

Groundwater elevations from the monitoring wells screened in the UNTU (MW-1, MW-4R, MW-6, MW-8, MW-9, MW-10, MW-12, MW-16, MW-19, MW-21, MW-23, MW-24R, MW-26, MW-30, MW-31, RW-1, and RW-2) were used to construct a potentiometric map (January 30, 2023) for the UNTU at the SEHB (**Table 2**, **Figure 8a**). Consistent with previous monitoring events, the groundwater in the UNTU zones generally flows across the site to the south and east toward the groundwater recovery wells, specifically RW-1 and RW-2 to the south and MW-10, MW-24R, MW-26, and MW-30 to the east. A consistent cone of groundwater depression is formed around the areas of the recovery wells in the UNTU groundwater zone.

Groundwater elevations from the monitoring wells screened in the SCF (P-1, MW-15, MW-18, MW-20, MW-22, MW-27, MW-29, MW-32, NTRW, and STRW were used to construct a potentiometric map (January 30, 2023) for the SCF at the SEHB (**Table 2**, **Figure 8b**). Consistent with previous monitoring events, the groundwater in the SCF zone generally flows across the site to the east toward the

groundwater recovery wells, specifically NTRW in the northern portion and STRW in the southern portion of the SEHB. A consistent cone of groundwater depression is formed around the areas of recovery wells NTRW and STRW in the SCF groundwater zone.

Groundwater elevations from the monitoring wells screened in the UNTU (MW-1, MW-4R, MW-6, MW-8, MW-9, MW-10, MW-12, MW-16, MW-19, MW-21, MW-23, MW-24R, MW-26, MW-30, MW-31, RW-1, and RW-2) were used to construct a potentiometric map (July 20, 2023) for the UNTU at the SEHB (**Table 2**, **Figure 8c**). Consistent with previous monitoring events, the groundwater in the UNTU zones generally flows across the site to the south and east toward the groundwater recovery wells, specifically RW-1, and RW-2 to the south and MW-10, MW-24R, MW-26, and MW-30 to the east. A consistent cone of groundwater depression is formed around the areas of the recovery wells in the UNTU groundwater zone.

Groundwater elevations from the monitoring wells screened in the SCF (P-1, MW-15, MW-18, MW-20, MW-22, MW-27, MW-29, MW-32, NTRW, and STRW were used to construct a potentiometric map (July 20, 2023) for the SCF at the SEHB (**Table 2, Figure 8d**). Consistent with previous monitoring events, the groundwater in the SCF zone generally flows across the site to the east and southeast toward the groundwater recovery wells, specifically NTRW in the northern portion and STRW in the southern portion of the SEHB. A consistent cone of groundwater depression is formed around the areas of recovery wells NTRW and STRW in the SCF groundwater zone.

Product was observed and measured in wells MW-18, MW-20, MW-23, MW-27, P-1, NTRW, and STRW. The thickness and approximate extents are presented on **Figures 21a and 21b**. CP Well P-1 has historically had product, but it has not been observed or measured since January 2020 with the exception of a minimal observance (0.01 ft.) during the January 2023 sampling event. SEHB Well MW-12 has historically had product, but it has not been observed or measured since December 2019 and was not present during the January or July 2023 sampling events. Groundwater elevations in wells with product were corrected using a product density of 0.87.

TOC elevations for the SEHB wells are presented in **Appendix A**.

CP PMZ

The Central Plant WMA, also referred to as the CP PMZ, is comprised of SWMU C-1 through C-4. Semiannual monitoring is performed for COCs for the CP PMZ wells and additional monthly sampling for bis 2-(chloroethyl) ether has been performed for POE-2. POE-2 is historically the only recovery well located within the CP PMZ. It has been deactivated since May 9, 2019 to observe the effect of the pumping on the bis 2-(chloroethyl) ether concentrations. Due to the lack of wells in the area, a cone of depression had not been observed for
POE-2 while the pump was activated.

No other groundwater recovery systems are in place for the CP PMZ.

The CP PMZ was incorporated into the Compliance Plan on November 8, 2019. Groundwater elevations from the monitoring wells screened in the SCF/UNTU (AMP-01, AMP-02, AMP-03, POE-1, MW-35, MW-36, MW-37, MW-38, RI-1-14, RI-1-18, RI-3-01, RI-3-02, RI-3-03, R1-1-17, RI-1-09, and MW-40) were used to construct a potentiometric map (January 31, 2023) for the SCF/UNTU at the CP PMZ (**Table 3**, **Figure 9a**). POE-2 groundwater elevation was not measured as the probe would not go down the casing due to the presence of recovery well equipment in the casing. Therefore, POE-2 groundwater elevations were not used to prepare the potentiometric map. Consistent with previous monitoring events, the groundwater exhibited a radial flow from a groundwater mound in the northern center of the Site. The groundwater on the western side of the CP PMZ in the SCF/UNTU zone generally flowed across the site to the west and southwest, but groundwater on the eastern side of the CP PMZ is influenced by the recovery wells in the SEHB area (NTRW and STRW), causing the groundwater to flow east and southeast towards recovery wells NTRW and STRW.

Groundwater elevations from the monitoring wells screened in the SCF/UNTU (AMP-01, AMP-02, AMP-03, POE-1, MW-35, MW-36, MW-37, MW-38, RI-1-14, RI-1-18, RI-3-01, RI-3-02, RI-3-03, R1-1-17, RI-1-09, and MW-40) were used to construct a potentiometric map (July 21, 2023) for the SCF/UNTU at the CP

PMZ (**Table 3, Figure 9b**). POE-2 groundwater elevation was not measured as the probe would not go down the casing due to the presence of recovery well equipment in the casing. Therefore, POE-2 groundwater elevations were not used to prepare the potentiometric map. Consistent with previous monitoring events, the groundwater exhibited a radial flow from a groundwater mound in the northern center of the Site. The groundwater on the western side of the CP PMZ in the SCF/UNTU zone generally flowed across the site to the west and southwest, but groundwater on the eastern side of the CP PMZ is influenced by the recovery wells in the SEHB area (NTRW and STRW), causing the groundwater to flow east and southeast towards recovery wells NTRW and STRW.

TOC elevations for the CP PMZ are presented in **Appendix A**.

WP/WC PMZ

The WP/WC PMZ is within the WP/WC WMA, which is comprised of SWMU Groups W1 through W3, Tank 50, and areas of the West Plant/West Chem AOC. Semiannual monitoring is performed for COCs for the WP/WC PMZ wells. Historically, a cone of depression has been maintained at the groundwater recovery wells.

Groundwater elevations from the WP/WCP PMZ monitoring wells (MW-10, MW-18, MW-20, MW-25, MW-26, MW-27, MW-28, MW-29, MW-30, MW-31, MW-35, MW-36, MW-37, MW-38, MW-10, MW-3, P-1, P-2, VMW-1, VMW-2, VMW-3, VMW-4, VMW-6, VMW-7, VMW-9, P-3, MW-2, VMW-8, and VMW-10) were used to construct a potentiometric map (February 24, 2023) (**Table 4**, **Figure 10a**). The recovery wells (OB-1, OB-3, RW-1, RW-25R, and RW-39) have in-well pumps and ancillary hoses that prevent probe access for groundwater elevation data. These wells were not used to construct the groundwater elevation map (**Figure 10a**). Consistent with previous monitoring events, the groundwater generally flows across the site to the southeast toward the groundwater recovery wells located in the southeast corner of the WP/WC PMZ, to the south towards the Houston Ship Channel in the western portion of the WP/WC PMZ, and to the northeast in the northern portion of the WP/WC PMZ.

Groundwater elevations from the same monitoring wells as above, except MW-23 and MW-29, were used to construct a potentiometric map (August 15, 2023) for the WP/WC PMZ (**Table 4, Figure 10b**). The recovery wells (OB-1, OB-3, MW-23, RW-1, RW-25R, and RW-39) have in-well pumps and ancillary hoses that prevent probe access for groundwater elevation data. These wells were not used to construct the groundwater elevation map (**Figure 10b)**. Consistent with previous monitoring events, the groundwater generally flows across the site to the southeast toward the groundwater recovery wells located in the southeast corner of the WP/WC PMZ, to the south towards the Houston Ship Channel in the western portion of the WP/WC PMZ, and to the northeast in the northern portion of the WP/WC PMZ.

TOC elevations for the WP/WC PMZ are presented in **Appendix A**.

TCI

The TCI groundwater recovery system manages groundwater impacts from Impoundment 2 and Tank 28. Annual monitoring during February is performed for COCs for TCI wells. Well gauging at TCI is conducted semiannually. An active 13-well groundwater recovery system recovers groundwater at the western property boundary in the northern well group and southern well group. A well-defined cone of depression has historically been maintained at the recovery wells.

Groundwater elevations from the monitoring wells (AMP-2, MW-03-TCI, MW-04-TCI, MW-05-TCI, MW-06-TCI, MW-10-TCI, MW-12-TCI, MW-13-TCI, MW-14-TCI, MW-16-TCI, MW-17-TCI, MW-18-TCI, MW-19-TCI, MW-20-TCI, RI-1-10, and RI-1-13) and recovery wells (POE-1, POE-3, RW-1, RW-2, RW-3, RW-4, RW-5, RW-6, RW-7, RW-8, RW-9) were used to construct a potentiometric map (February 23, 2023), at TCI (**Table 5, Figure 11a**). Six wells (AMP-1, MW-07-TCI, MW-08-TCI, MW-09-TCI, MW-15-TCI, RI-1-14) were not located or could not be accessed, and MW-15-TCI was plugged and abandoned in 2013; these wells were not used to construct the groundwater elevation map (**Figure 11a**). Groundwater flow was consistent with previous years in which the groundwater generally flows across the site to the west toward the groundwater recovery wells near Panther Creek; specifically, MW-09TCI, RW-6, RW-1, RW-2, POE-1, RW-3, RW-7, RW-8, RW-9, and POE-1 in the northern recovery well group and RW-4, RW-5, and POE-3 in the southern recovery well group.

Groundwater elevations from AMP-2, MW-05-TCI, MW-06-TCI, MW-16-TCI, MW-18-TCI, MW-19-TCI, MW-20-TCI, RI-1-10, and RI-1-13) and recovery wells (POE-1, POE-3, RW-1, RW-3, RW-4, RW-5, RW-6, RW-7, and RW-8) were used to construct a potentiometric map (August 30, 2023) for TCI (**Table 5, Figure 11b**). Several wells (AMP-1, MW-03-TCI, MW-04-TCI, MW-07-TCI, MW-08-TCI, MW-09-TCI, MW-10-TCI, MW-12-TCI, MW-13-TCI, MW-14-TCI, MW-15-TCI, MW-17-TCI, RW-9, RI-1-14, and MW-9) were not located or could not be accessed; these wells were not used to construct the groundwater elevation map (**Figure 11b**). Consistent with previous monitoring events, the groundwater generally flows across the site to the west and southwest toward the northern and southern recovery well groups near Panther Creek.

On April 9, 2020, pumps in recovery wells at TCI were lowered in the wells such that they are now located approximately 20 ft below ground surface (bgs). This operational change improved the consistency of the groundwater draw-down in the wells and thus maintaining a cone of depression.

TOC elevations for the TCI wells are presented in **Appendix A**.

OPH5

The OPH5 AOC was incorporated into the Corrective Action Program with the modified Kinder Morgan Galena Park Terminal Permit/Compliance Plan on November 8, 2019. **Table 6** presents 2023 groundwater elevation data for the OPH5 AOC area. Groundwater elevations were measured on January 30 and July 21, 2023.

Groundwater elevations from the monitoring wells (OPH-1, OPH-2, OPH-3, OPH-4, OPH-5, OPH-6, OPH-7, OPH-8, OPH-9, OPH-10, and OPH-11) were used to construct a potentiometric map (January 30, 2023) at OPH5 (**Table 6, Figure 12a**). Consistent with previous monitoring events, the groundwater generally flows across the site to the southwest toward a ship docking bay off of the Houston Ship Chanel Creek.

Groundwater elevations from the same monitoring wells were used to construct a potentiometric map (July 21, 2023 at OPH5 (**Table 6, Figure 12b**). Consistent with previous monitoring events, the groundwater generally flows across the site to the southwest toward a ship docking bay off of the Houston Ship Chanel Creek.

The corrective action program at the OPH5 AOC included a manual LNAPL recovery program within a PMZ, but these activities have ceased with the approval of the TCEQ in 2021. Therefore, manual LNAPL recovery did not occur in 2023 in the OPH5 AOC. Groundwater recovery pumps are not part of the corrective action program and the development and maintenance of a cone of depression is not applicable to the OPH5 AOC. On May 24, 2022, Kinder Morgan submitted *Technical Report - LNAPL Bail/Down Testing and LNAPL Transmissivity – OPH5 AOC, East Plant* concluding that (a) the small LNAPL plume within the OPH5 PMZ is stable and is not expanding and (b) the LNAPL is not readily recoverable based on its transmissivity data. The report recommended ceasing LNAPL recovery. On August 12, 2022, the TCEQ issued a conditional approval to cease manual LNAPL removal. The conditions included:

> *2a. Continue to monitor LNAPL thicknesses for changes in its condition or distribution; and,*
>
> *2b. Verify that the presence of LNAPL does not create explosive conditions.*
>
> *If the groundwater protective concentration level exceedance (PCLE) zone expands or explosive conditions are present due to LNAPL, propose a modification to the Response Action Plan (RAP) per 30 Texas Administrative Code (TAC) §350.33(f)(4)(C)(i).*

The KMLT response to the TCEQ conditional approval, dated October 11, 2022, included the following statements:

> *Response to Comment #2a – KMLT will monitor LNAPL thicknesses for changes in its condition or distribution during the semiannual groundwater monitoring required by Provision XI.F.3.d.(1).*
>
> *Response to Comment #2b – KMLT has an extensive hydrocarbon monitoring system, both above grade and below grade, in place at OPH5 (see attached diagram). The system is in place to monitor the atmosphere for explosive vapors at Old Pumphouse #5 and the piping manifold associated with the pumphouse. If explosive atmospheric conditions were to develop in the area, the various monitors would alarm, and corrective action would be taken by. KMLT proposes that this system will be adequate for meeting the conditions stated in TCEQ Comment 2b.*

The TCEQ approved the response in a letter dated December 19, 2022.

2.2 Direction and Gradient of Groundwater Flow (Compliance Plan Table VII.8.b)

NHB

Historically, the groundwater flow direction in Zone III at the NHB is toward the east and forms a distinct groundwater cone of depression around recovery wells MW-7 and RW-16 along the eastern property boundary near Panther Creek (**Figures 7a and 7d**). However, this cone did not include RW-16 since this recovery well was inactive at the time of the sampling events. The flow direction is influenced by the active groundwater pumping along the eastern side of the NHB and the natural topographic gradient toward Panther Creek. The potentiometric gradient in Zone III between monitoring well MW-1 and recovery well MW-7 is estimated at 0.0280 feet per foot (ft/ft) (January 31, 2023) and 0.0251 ft/ft (July 21, 2023) toward the east.

Historically, the groundwater flow direction in Zone IV at the NHB is also toward the east and forms a distinct cone of depression around recovery wells MW-6 and RW-17 along the eastern property boundary near Panther Creek (**Figures 7b and 7e**). The flow direction is influenced by the active groundwater pumping along the eastern side of the NHB and the natural topographic gradient toward Panther Creek. The potentiometric gradient in Zone IV between recovery well MW-15 and recovery well MW-6 is estimated at 0.0586 (January 31, 2023) ft/ft toward MW-6 and 0.0344 ft/ft (July 21, 2023) toward MW-15. MW-15 was not operational during the January gauging event. There is only one well installed in Zone V so the potentiometric gradient cannot be determined, however, it is assumed to be consistent with gradients in Zone III and IV.

SEHB

The general groundwater flow direction at the SEHB is toward the south and east in Zone UNTU (**Figures 8a and 8c**) and in Zone SCF (**Figures 8b and 8d**). This general flow direction is influenced by the active groundwater pumping from the groundwater recovery systems along the Houston Ship Channel (HSC) and the natural topographic gradient toward the HSC. The potentiometric gradient in the UNTU between MW-6 and recovery well MW-26 was estimated at 0.0122 ft/ft (January 30, 2023) and as 0.0145 ft/ft (July 20, 2023) to the southeast. The potentiometric gradient in the SCF between MW-15 and MW-32 was estimated at 0.0151 ft/ft (January 30, 2023) and 0.0168 ft/ft (July 20, 2023) toward the recovery wells to the east and southeast.

CP PMZ

The general groundwater flow direction at the CP PMZ is toward the southwest and west on the west side of the PMZ and to the east and southeast on the east side of the PMZ in Zone SCF/UNTU (**Figures 9a and 9b**). These general flow directions are influenced by the natural topographic gradient toward the HSC on the west side of the PMZ and the recovery wells (NTRW and STRW) on the east side of the PMZ. The western potentiometric gradient in the SCF/UNTU between MW-36 and RI-3-03 was estimated at 0.0083

ft/ft (January 31, 2023) and 0.0089 ft/ft (July 21, 2023) toward the west and southwest. The eastern potentiometric gradient in SCF/UNTU between MW-36 and MW-32 was estimated at 0.0110 ft/ft (January 31, 2023) and 0.0125 ft/ft (July 21, 2023).

WP/WC PMZ

The general groundwater flow direction at the WP/WC PMZ is toward the east southeast toward the groundwater recovery wells located along the HSC, downgradient to the southeast. The general groundwater flow direction at the WP/WC PMZ is toward the southeast in Zone SCF/UNTU (**Figures 10a and 10b**). This general flow direction is influenced by the active groundwater pumping from the groundwater recovery systems along the HSC and the natural topographic gradient toward the HSC. The potentiometric gradient in the SCF/UNTU between MW-38 and MW-20 was estimated at 0.0082 ft/ft (February 24, 2023) and 0.0058 ft/ft (August 15, 2023) toward the south/southeast and northwest.

TCI

The general groundwater flow direction at TCI is toward the southwest toward the west and southwest toward the groundwater recovery wells located near Panther Creek (**Figures 11a and 11b**). This general flow direction is influenced by the active groundwater pumping from the groundwater recovery systems near Panther Creek and the natural topographic gradient toward Panther Creek. The potentiometric gradient in the SCF between MW-4-TCI and RW-9 was estimated at 0.0236 ft/ft (February 23, 2023). During the August 2023 gauging event, the gradient was 0.0859 ft/ft between MW-05-TCI and RW-8, toward the west.

OPH5

The general groundwater flow direction at the OPH5 AOC is toward the west southwest towards the ship docking bay adjacent to the HSC. (**Figures 12a and 12b**). This general flow direction is influenced by the natural topographic gradient toward the HSC as there are no active recovery wells at OPH5. The potentiometric gradient in the SCF between OPH-MW-3 and OPH-MW-5 was estimated at 0.0221 ft/ft (January 30, 2023) and 0.0207 ft/ft (July 21, 2023) toward the west southwest.

2.3 Effectiveness of Hydrodynamic Control of the Contaminated Zone (Compliance Plan Table VII.8.c)

NHB

The January 31 and July 21, 2023, groundwater potentiometric maps for the NHB (**Figures 7a through 7f**) demonstrate that the groundwater interception system (recovery wells) is effective in capturing groundwater as illustrated by a cone of depression observed in the eastern portion of the NHB in both Zone III and Zone IV. Zone V was only measured in July 2023 and exhibited a depressed groundwater level (approximately 3 ft.) from the past two years, exhibiting a relatively increased cone of depression. Weekly system inspections and measurements of instantaneous and average flow rates of the recovery wells indicate that the draw-down in the recovery wells is being maintained. The impacted groundwater at the NHB is effectively captured by the onsite groundwater recovery system.

Furthermore, none of the surface water samples collected from Panther Creek report concentrations of the NHB constituents above laboratory detection limits.

SEHB

The January 30 and July 20, 2023 groundwater potentiometric maps for the SEHB (**Figures 8a through 8d**) demonstrate that the groundwater interception system (recovery wells and trenches) is effective in capturing groundwater as illustrated by a cone of depression observed to the east and southeastern portion of the SEHB in both the UNTU and SCF. Weekly system inspections and measurements of instantaneous and average flow rates of the recovery wells indicate that the draw-down in the recovery wells is being maintained. The impacted groundwater at the SEHB is effectively captured by the onsite groundwater recovery system.

CP PMZ

Recovery well POE-2 is the only recovery well in the CP PMZ and has been inactivated since May 2019 to monitor bis 2-(chloroethyl)ether concentrations, therefore hydrodynamic control is not applicable. The POE-2 well location is shown on **Figures 9a and 9b**.

WP/WC PMZ

The February 24 and August 15, 2023, groundwater potentiometric maps for the WP/WC PMZ (**Figures 10a and 10b**) demonstrate that the groundwater interception system (recovery wells) is effective in capturing groundwater. The average pump rate has been generally consistent with historical averages and the system is operating as designed. Weekly system inspections and measurements of instantaneous and average flow rates of the recovery wells indicate that the draw-down in the recovery wells is being maintained. The impacted groundwater is effectively captured by the onsite groundwater recovery system.

TCI

The February 23, 2023 and August 30, 2023 groundwater potentiometric maps for TCI (**Figures 11a and 11b**) demonstrate that the groundwater interception system (recovery wells) is effective in capturing groundwater as illustrated by a cone of depression observed at the recovery wells along the western portion of TCI. Weekly system inspections and measurements of instantaneous and average flow rates of the recovery wells indicate that the draw-down in the recovery wells is being maintained. The impacted groundwater is effectively captured by the onsite groundwater recovery system.

OPH5

Groundwater recovery is not part of the corrective action program at the OPH5 AOC. Therefore, hydrodynamic control is not applicable.

2.4 Estimation of the Rate and Direction of Contaminant Migration (Compliance Plan Table VII.8.d)

NHB

The hydraulic gradient in Zone III between monitoring well MW-1 and recovery well MW-7 is estimated at 0.0280 ft/ft (January 31, 2023) and 0.0251 ft/ft (July 21, 2023) toward the recovery wells to the east. The hydraulic gradient in Zone IV between MW-15 and MW-6 is estimated at 0.0586 (January 31, 2023) ft/ft and 0.0344 ft/ft (July 21, 2023) toward the recovery wells to the east. LNAPL was not detected in the NHB during this reporting period and COC concentrations are generally consistent with historical findings. MW-1 reported an estimated (J) 1,2-dichloroethane concentration of 0.0083 milligrams per liter (mg/L) during July 2020 where there were no previous detections but has not been detected in MW-1 since (**Table 9, Figure 15d**). MW-6 and MW-7 reported detections above their respective groundwater protection standards, which is historically consistent. Generally, it does not appear that the dissolved phase 1,2-dichloroethane plume is migrating.

SEHB

The hydraulic gradient in the UNTU between MW-6 and recovery well MW-26 is estimated at 0.0122 ft/ft (January 30, 2023) and 0.0145 ft/ft (July 20, 2023) towards the east and southeast. The hydraulic gradient in the SCF between MW-15 and MW-32 was estimated at 0.0151 ft/ft (January 30, 2023) and 0.0168 ft/ft (July 20, 2023) toward the recovery wells to the east and southeast. The groundwater gradient data for the SCF and UNTU during the reporting period are consistent with historical trends. LNAPL and dissolved organics typically migrate at slower rates. In water bearing units like the SCF and UNTU, it is not unusual for dissolved organics to migrate on the order of a few feet per year rather than a few feet per day.

LNAPL was detected in MW-18, MW-20, MW-23, MW-27, P-1, the South Trench, and the North Trench at the SEHB during this reporting period and is discussed in Section 3.6. COC concentrations are generally consistent with historical findings; therefore, it does not appear that the area affected by the dissolved phase COCs is expanding.

CP PMZ

The hydraulic gradient in the CP PMZ is toward the west and southwest on the west side of the PMZ and to the east and southeast on the east side of the PMZ in Zone SCF/UNTU. These general flow directions are influenced by the natural topographic gradient toward the HSC on the west side of the PMZ and the recovery wells (NTRW and STRW) on the east side of the PMZ. The western hydraulic gradient in the SCF/UNTU between MW-36 and RI-3-03 was estimated at 0.0083 ft/ft (January 31, 2023) and 0.0089 ft/ft (July 21, 2023) toward the west and southwest. The eastern potentiometric gradient in SCF/UNTU between MW-36 and MW-32 was estimated at 0.0110 ft/ft (January 31, 2023) and 0.0125 ft/ft (July 21, 2023) toward the east and southeast. LNAPL was not detected at CP PMZ during this reporting period. There were no COC protective groundwater standard exceedances and no increasing concentrations in AMP or POE wells.

WP/WC PMZ

The hydraulic gradient in the WP/WC PMZ between MW-38 and MW-20 was estimated at 0.0082 ft/ft (February 24, 2023) and 0.0058 ft/ft (August 15, 2023) to the south/southeast and the northwest. LNAPL was detected in monitoring wells MW-38, VMW-8, and VMW-10 in the WP/WC PMZ during this reporting period and is discussed in Section 3.6. COC concentrations are generally consistent with historical findings; therefore, it does not appear that the dissolved phase COCs are migrating.

TCI

The hydraulic gradient at TCI between MW-04-TCI and RW-09 was estimated at 0.0236 ft/ft (February 23, 2023) and 0.0859 ft/ft (August 30, 2023) towards the recovery wells to the west and southwest. LNAPL was not detected at TCI during this reporting period. Gauging of all wells is conducted on a semiannual schedule and sampling of eight (8) select wells is conducted on an annual schedule during February and COC concentrations are generally consistent with historical findings.

OPH5

The hydraulic gradient at OPH5 between OPH-MW-3 and OPH-MW-5 was estimated at 0.0221 ft/ft (January 30, 2023) and 0.0207 ft/ft (July 21, 2023) to the east. There are no recovery wells at OPH5. LNAPL was detected in monitoring wells OPH MW-1, OPH MW-7, and OPH MW-8 in the OPH5 AOC during this reporting period and is discussed in Section 3.6. LNAPL recovery systems (Spill Busters^{TM}) installed in selected wells and manual LNAPL removal on a weekly schedule ceased on April 13, 2021, following TCEQ approval for the shutdown on March 29, 2021. The TCEQ approved the cessation of manual LNAPL removal conditionally on August 12, 2022, and formally on December 19, 2022, due to plume stability and a lack of transmissivity/

3. Reporting Requirements (Compliance Plan Table VII)

This section summarizes the groundwater monitoring and record keeping requirements of the Permit.

3.1 Corrective Action System (Compliance Plan Table VII.10 and 18)

Under Provision XI.B.3 of the Permit, Kinder Morgan is currently recovering contaminated groundwater from the NHB, the SEHB, the WP/WC PMZ, and TCI by means of a network of recovery wells and at the SEHB by a pair of groundwater interceptor trenches. The Corrective Action Systems and ancillary equipment are inspected on a weekly basis to record flow measurements at each recovery well and ensure the system is operating properly and these records are maintained at the Terminal. Well inspection checklists were completed for the NHB, SEHB, WP/WC PMZ, and TCI monitoring and recovery wells during the January-February and July-August 2023 gauging and sampling events and these records are maintained in the project files. The corrective action program at the OPH5 AOC consisted of recovery of LNAPL within a PMZ prior to 2022. The LNAPL was being recovered via a subgrade wall drain system installed in the pump house containment area, using Spill Busters™ installed in select wells/sumps, and manual removal in LNAPL plume wells not equipped with Spill Busters™. The TCEQ approved ceasing these operations on March 29, 2021 and they were shut down on April 13, 2021. The TCEQ approved the cessation of manual LNAPL removal conditionally on August 12, 2022 and formally on December 19, 2022 due to plume stability and a lack of transmissivity.

KMLT submitted a notification for well replacement for MW-35 on November 16, 2020 since the well had been damaged and was subsequently unable to be located. The TCEQ responded the same day with approval to proceed with the well replacement. During December 2020, CP MW-35R was installed within 15 feet of the original CP MW-35 well location. It was surveyed by an RPLS in December 2021. Survey data was presented in the 2021 CAP report.

Weekly inspections were not conducted the week of December 24-29, 2023 on account of the lead Geologist on site and his replacement being absent from the site due to unanticipated medical issues. The TCEQ was notified with a *Notice of Uncompleted Weekly Compliance Activities* letter on January 2, 2024 (**Appendix D**).

NHB

On January 31 and July 21, 2023, groundwater samples were collected from the Point of Compliance (POC) wells, Background wells, Corrective Action Observation (CAO) wells and Corrective Action System (CAS) wells associated with the Corrective Action Program at the NHB. Kinder Morgan received concurrence from the TCEQ to suspend sampling of MW-5, MW-9, MW-14, and MW-12 due to the lack of historical detections.

Additionally, three (3) surface water samples were collected from Panther Creek located east of the NHB. A surface water sample was collected from an up gradient, cross gradient, and downgradient location east of the NHB. A list of all the Corrective Action Program wells with designations is provided in **Table 8**. Groundwater sampling was performed in accordance with the protocol outlined in the Sampling and Analysis Plan (SAP) that was prepared to comply with Section XI of the Permit. Groundwater samples collected from the NHB Corrective Action Wells were analyzed for the Compliance Plan Table IIIA parameter (i.e., 1,2-dichloroethane). Additionally, field parameters (i.e., temperature, pH, specific conductivity, dissolved oxygen, oxygen reduction potential, and turbidity) were collected from the monitoring wells and visual descriptions were recorded in the field logs for the groundwater samples. The January and July 2023 field parameters and laboratory analytical data are summarized in **Table 9** and **Figures 15a through 15f** show the contaminant isopleths for 1,2-Dichloroethane in Zones III, IV, and V. Historical groundwater analytical data for the NHB is contained in **Appendix B**.

SEHB

On January 30 and July 20, 2023, groundwater samples were collected from Point of Exposure (POE), POC, CAO, and CAS wells associated with the Corrective Action Program at the SEHB. Refer to **Table 8** for a list of the Corrective Action Program wells with their designation. Samples were not collected from

wells containing LNAPL. The groundwater samples were analyzed for Compliance Plan Table IIIA parameters. In addition, field parameters were collected from the monitoring wells and visual descriptions were recorded in the field logs for the groundwater samples.

Evaluation of groundwater analytical data was conducted in compliance with the procedures outlined in Provision XI.F.4 of the Permit. These procedures require a direct comparison of the detected concentration of each constituent to the respective Concentration Limits listed in Compliance Plan Table IIIA. Wells are considered compliant with the Groundwater Protection Standard (GWPS) when the value of each constituent is less than, or equal to, the respective Concentration Limit. When one or more constituent values exceed the respective Concentration Limits, that well is considered non-compliant for that sampling event. This evaluation was made within 60 days of collecting the groundwater samples. Those wells with COC concentrations exceeding the GWPS are shown on **Table 10** for the SEHB. **Figures 16a through 16f** show contaminant concentrations for COCs which exceeded the GWPS in Zones UNTU, SCF, and SCF/UNTU. Historical groundwater analytical data for the SEHB is contained in **Appendix B**.

In accordance with Provision XI.E.1.e, Kinder Morgan regularly abates LNAPL from a subset of monitoring wells in the SEHB area as discussed in Section 3.6. LNAPL recovery volumes are included in **Table 7**.

CP PMZ

On January 31 and July 21, 2023, groundwater samples were collected from POE, CAO, and Attenuation Monitoring Point (AMP) wells associated with the Corrective Action Program at the CP PMZ. Refer to **Table 8** for a list of the Corrective Action Program wells with their designation. The groundwater samples were analyzed for Compliance Plan Table IIIA parameters. In addition, field parameters were collected from the monitoring wells and visual descriptions were recorded in the field logs for the groundwater samples.

Evaluation of groundwater analytical data was conducted in compliance with the procedures outlined in Provision XI.F.4 of the Permit. These procedures require a direct comparison of the detected concentration of each constituent to the respective Concentration Limits listed in Compliance Plan Table IIIA. Wells are considered compliant with the GWPS when the value of each constituent is less than, or equal to, the respective Concentration Limit. When one or more constituent values exceed the respective Concentration Limits, that well is considered non-compliant for that sampling event. This evaluation was made within 60 days of collecting the groundwater samples. None of the wells exceeded the GWPS as shown on **Table 11** for the CP. **Figures 17a and 17b** show no contaminant concentrations for COCs exceeding the GWPS in the SCF/UNTU since no exceedances were reported. Historical groundwater analytical data for the CP PMZ is contained in **Appendix B**.

WP/WC PMZ

On February 24 and August 15, 2023, groundwater samples were collected from POE, AMP and CAO wells associated with the Corrective Action Program at the WP/WC PMZ. Refer to **Table 8** for a list of the Corrective Action Program wells with their designation. Samples were not collected from wells containing LNAPL. The groundwater samples were analyzed for Compliance Plan Table IIIA parameters. In addition, field parameters were collected from the monitoring wells and visual descriptions were recorded in the field logs for the groundwater samples.

Evaluation of groundwater analytical data was conducted in compliance with the procedures outlined in Provision XI.F.4 of the Permit. These procedures require a direct comparison of the detected concentration of each constituent to the respective Concentration Limits listed in Compliance Plan Table IIIA. Wells are considered compliant with the GWPS when the value of each constituent is less than, or equal to, the respective Concentration Limit. When one or more constituent values exceed the respective Concentration Limits, that well is considered non-compliant for that sampling event. This evaluation was made within 60 days of collecting the groundwater samples. None of the wells exceeded the GWPS as shown on **Table 12** for the WP/WC PMZ. **Figures 18a and 18b** show no contaminant concentrations for COCs exceeding the GWPS since no exceedances were reported. Historical groundwater analytical data for the WP/WC PMZ is contained in **Appendix B**.

In accordance with Provision XI.E.1.e, Kinder Morgan regularly abates LNAPL from 3 monitoring wells in the WP/WC PMZ area as discussed in Section 3.6. LNAPL recovery volumes are included in **Table 7**.

TCI

On February 23, 2023, groundwater samples were collected from POC, CAO, and monitoring wells associated with the Corrective Action Program at TCI. Refer to **Table 8** for a list of the Corrective Action Program wells with their designation. LNAPL has not been observed in the wells at TCI. The groundwater samples were analyzed for Compliance Plan Table IIIA parameters. In addition, field parameters were collected from the monitoring wells and visual descriptions were recorded in the field logs for the groundwater samples.

Evaluation of groundwater analytical data was conducted in compliance with the procedures outlined in Provision XI.F.4 of the Permit. These procedures require a direct comparison of the detected concentration of each constituent to the respective Concentration Limits listed in Compliance Plan Table IIIA. Wells are considered compliant with the GWPS when the value of each constituent is less than, or equal to, the respective Concentration Limit. When one or more constituent values exceed the respective Concentration Limits, that well is considered non-compliant for that sampling event. This evaluation was made within 60 days of collecting the groundwater samples. Those wells with COC concentrations exceeding the GWPS are shown on **Table 13** for TCI. **Figure 19** shows contaminant concentrations for COCs which exceeded the GWPS in the SCF/UNTU. Historical groundwater analytical data for TCI is contained in **Appendix B**.

OPH5

Prior to 2022, the corrective action program at the OPH5 AOC consisted of recovery of LNAPL within a PMZ. The LNAPL was being recovered via a subgrade wall drain system installed in the pump house containment area, using Spill Busters™ installed in select wells/sumps, and manual removal in LNAPL plume wells not equipped with Spill Busters™. The systems (i.e. subgrade wall drain, Spill Busters™) were inspected on a weekly basis. These operations ceased on April 13, 2021, following TCEQ approval for the shutdown on March 29, 2021. The TCEQ approved the cessation of manual LNAPL removal conditionally on August 12, 2022 and formally on December 19, 2022 due to plume stability and a lack of transmissivity.

The Corrective Action Program wells for OPH5 (with well designations) are included in **Table 8**. Groundwater samples collected from the corrective action wells are analyzed for CP Table IIIA parameters (i.e. benzene, ethylbenzene, toluene, xylenes, 1-methylnaphthalene, and 2-methylnaphthalene). Samples are not collected from wells containing LNAPL. Samples were collected in the OPH5 area on January 30 and July 21, 2023; **Table 14** contains a summary of COCs in these wells. No COCs exceeded the established GWPS in the OPH5 AOC. Historical groundwater analytical data for the OPH5 AOC are included in **Appendix B**. **Figures 20a and 20b** show no contaminant concentrations for COCs since no exceedances were reported.

3.2 Field Determination Requirements (Provision XI.F.3.d(4), Compliance Plan Table VII.10)

This Section describes the evaluation of potential well silting, well performance, and performance corrective actions. A summary of these items is presented in **Table 17**.

3.2.1 Well Depth Determination

For the total well depth determination, the groundwater elevation, total well depth, screened interval, and well completion depth of the NHB, SEHB, CP PMZ, WP/WC PMZ, and TCI recovery wells were obtained from the well construction logs, where available. TOC elevations were obtained from the May 2019 well survey for the NHB and SEHB wells. Where well construction logs were not available, other sources were utilized, such as information contained in Table V.1a of the 2003 Permit Application. These data were compared to the most recent well depth measurements to determine if silting has covered more than 20%

of the well screen, thus potentially negatively affecting well performance. Where silting was suspected of impacting recoveries or the screen was more than 20% silted, the well was re-developed.

3.2.1.1 Total Depth Maintenance during the January - December 2023 Period

The well maintenance activities which were conducted during the current reporting period as a result of the weekly inspections are summarized below. Any wells indicating screen blockage greater than 20 percent (%) are scheduled to be re-developed in 2024.

NHB

- Due to the malfunctioning pump in MW-6, (Zone IV), the pump was removed for servicing on June 21, 2023. When the pump was removed, the total depth (TD) was measured, and the screen was found to be 8.6% silted and would not require redevelopment. The pump was replaced on June 23, 2023. This pump was pulled from the well again on July 6, 2023 and the screen was calculated to be only 3.9% silted.
- Due to the malfunctioning pump in MW-7, (Zone III), the pump was removed for servicing on October 27, 2022. When the pump was removed, the total depth was measured, and the screen was found to be 46.2% silted and will require redevelopment.
- The total depth of RW-16 was measured on November 16, 2022 and the screen was found to be 36.8% silted. The well was redeveloped, and the TD of RW-16 was measured on December 20, 2023. The screen was found to be 9.7% silted.

SEHB

- The pump in MW-25 (zone SCF/UNTU) is stuck, preventing repair and redevelopment. The last total depth was measured on September 9, 2020, and was calculated to be 53.3% silted. Once the pump can be pulled from the well, the well will be redeveloped, and blockage can be recalculated.

CP PMZ

- There is one recovery well in the CP PMZ, POE-2. This well was deactivated in May of 2019 in order to monitor Bis(2-chloroethyl)ether concentrations. No total depth maintenance or measurements occurred during the reporting period.

WP/WC PMZ

- During the semiannual sampling event, MW-39 was found to be 20.95% silted on August 15, 2023. This well will require redevelopment. The pump was removed again on December 20, 2023 to verify the TD. The screen was found to be 34.1% blocked and this well will require redevelopment.

TCI

- There are 13 recovery wells along the western TCI property boundary that capture the westerly groundwater flow across the site. The pumps for TCI recovery wells RW-1, RW-2, RW-3, and RW-9, were removed from the wells for maintenance or cleaning during the reporting period and a TD measurement was measured and recorded. The wells were returned to service after repairs were made; the screens were not more than 20% silted.
- The pump in RW-1 was removed for servicing on April 20, 2023 with a TD measurement resulting in 18.0% silting. An additional TD measurement on June 2, 2023 resulted in 15.2% silting. This well was not redeveloped.
- The pump in RW-2 was removed for servicing on May 12, 2023 with a TD measurement resulting in 14.2% silting. An additional TD measurement on June 2, 2023 resulted in 12.4% silting. This well was not redeveloped.
- The pump in RW-3 was removed for servicing on May 19, 2023 with a TD measurement resulting in 4.4% silting. This well was not redeveloped.
- The pump in RW-8 was removed for servicing on August 30, 2023 with a TD measurement resulting in 21.4% silting. This well will require redevelopment. This well's TD was measured on December 20,

2023 to confirm the amount of silting, the measurement resulted in 8.5% silting, which will not require redevelopment.

- The pump in RW-9 was removed for servicing on October 27, 2023 with a TD measurement resulting in 13.1% silting. This well was not redeveloped.
- The pump in RW-4 was replaced on December 15, 2023 with a TD measurement resulting in 2.7% silting. This well was not redeveloped.
- The pump in POE-1 was found offline on December 15, 2023 with a TD measurement resulting in 18.5% silting. This well was not redeveloped.

OPH5

- There are no recovery wells in the OPH5 AOC, therefore, no maintenance was performed that would require a TD measurement.

3.2.1.2 Analysis of the Data from the January - December 2023 Total Depth Data

The evaluation of potential recovery well silting and mitigation during this reporting period is summarized below.

NHB

- NHB recovery wells MW-7 is known to have more than 20% of the screen blocked by silting. This well will require redevelopment and will be addressed in 2024.

SEHB

- SEHB recovery well MW-25 is known to have more than 20% of the screen blocked by silting. This well will be redeveloped once the pump can be removed.

CP PMZ

- No recovery well POE-2 total depth maintenance or measurements occurred during the reporting period.

WP/WC PMZ

- WP/WC PMZ recovery well MW-39 is known to have more than 20% of the screen blocked by silting. This well will require redevelopment and will be addressed in 2024.

TCI

- TCI recovery well RW-8 is known to have more than 20% of the screen blocked by silting. This well will require redevelopment and will be addressed in 2024.

OPH5

- There are no recovery wells in the OPH5 AOC, therefore, no maintenance was performed that would require a TD measurement.

3.2.2 Well Performance Determination

Recovery well performance data for the reporting period were compiled and evaluated on a weekly basis to assess the potential for the groundwater production rates to decrease by 25%. The baseline period of recovery performance from which the 25% decline is measured is established when a pump is installed, or maintenance performed and/or the recovery rates have stabilized. Recovery loss due to system shut down is not included in recovery performance data. When well performance decreases by more than 25% from the established baseline, pump, well or system maintenance is performed, and monitoring is resumed.

3.2.2.1 Pump Performance Maintenance and Data Analysis During the January - December 2023 Period

Production and recovery rates will continue to be obtained, recorded, and monitored weekly. The updated results for the compliance wells will be presented in future Annual Corrective Action Program Reports.

Although occasional counter malfunctions were encountered, fluid recovery volumes were estimated by measuring the time between the individual pump cycles and multiplying by the known volume pumped, resulting in an estimated weekly recovery volume for each well. These volumes were then checked against recent readings to ascertain pump functionality.

The evaluation of potential recovery well performance reduction and mitigation during this reporting period is summarized below.

NHB

The NHB system was shut down on September 15, 2023 due to an underground leak near MW-16. New infrastructure was constructed on top of the buried piping (i.e., C-5 bullet tank with the dimensions of 11-foot in diameter by 83 feet in length and a capacity of 44,310 gallons (1055 bbls), associated concrete pump pad and ancillary piping and equipment), and piping was located and to be rerouted and replaced in 2024. As such, all NHB recovery wells exhibited a performance decline over the period. Repairs are ongoing and are scheduled to be completed in the first quarter of 2024. However, the overall trend since installation appears to be positive Recovery well MW-4 has not been functional since August of 2022 and is pending repair. However, the overall trend since installation appears to be positive. Kinder Morgan will continue to closely monitor the recovery rates at these wells and take additional corrective actions if necessary.

SEHB

- Recovery wells MW-5 and MW-25 were observed to exhibit declining recoveries during the reporting period at a rate of more than 25%. Silt and water runoff has affected pump performance in the past. Diversion controls have been installed to prevent future damage to the pump. These two pumps are stuck in the recovery well casings and cannot be repaired. Recovery well-MW-5 has been offline since April 2023. Efforts are ongoing to attempt to dislodge the pumps and initiate repairs.
- MW-13 and NTRW were observed to exhibit declining recoveries during the reporting period at a rate of more than 25%. Both wells are located along the shoreline and may be impacted by similar silt and sand runoff as MW-25 and MW-5 are. The pumps will be pulled and inspected, and the TD of the well will be measured to check for impact or blockage of the screen in 2024.

CP PMZ

- The recovery well in the CP (POE-2) was not activated during the reporting period, except when sampling POE-2, so no performance data was collected.

WP/WC PMZ

- None of the WP/WC PMZ recovery wells production approached a decline of 25% from their established baselines during the reporting period.

TCI

- Recovery wells RW-5 and RW-7 production approached a decline of 25% from their established baselines during the reporting period. However, RW-5 has been offline since July 2023, and RW-7 was intermittently offline throughout the year. The pumps will be pulled and inspected, and the TD of the well will be measured to check for impacts or blockage of the screen and to check the functionality of the pump in 2024.

OPH5

- Groundwater is not recovered at OPH5.

3.2.2.2 Incidental Pump Performance Maintenance and Data

Table 17 contains a summary of the pump and equipment replacement and maintenance activities other than minor activities such as priming and restarting pumps and counter repairs. The following pump performance maintenance activities occurred during the reporting period due to pump interruptions or failures and ensuing repairs and maintenance:

NHB

MW-4 (Zone III)

- 1/5/23 – The pump was offline and stuck in the well casing.
- 1/20/23 – A subcontractor tried to pull the pump with a treble hook, but the eyelet on the pump broke and the attempt failed. Kinder Morgan is having a custom hook developed that will aid in the pump's retrieval.
- 9/14/23 – It was established that the well casing needs to be flushed in order to remove the pump and repair or replace it. Efforts are ongoing to remove the pump from the casing.

MW-6 (Zone IV)

- Water was observed in the vault and pumped out on 1/26/23, 2/2/23, 2/9/23, 5/11/23, 5/18/23, 6/7/23, and 6/14/23.
- The pump was primed and restarted on 3/15/23, 3/30/23, 6/14/23, 7/19/23, and 9/15/23.
- 4/5/23 – the leaking discharge hose was repaired.
- 4/19/23 – the counter was repaired.
- 6/23/23 – a new pump was installed.
- 6/28/23 – the discharge volume for the new pump was measured.
- 7/6/23 – an additional new pump was installed.

MW-7 (Zone III)

- Water was observed in the vault and pumped out on 1/26/23, 2/2/23, 2/9/23, and 6/14/23.
- The pump was primed and restarted on 3/15/23 and 3/30/23.
- 4/19/23 – the counter was repaired.

MW-11 (Zone III)

- The pump was primed and restarted on 5/11/23 and 9/15/23.

MW-15 (Zone IV)

- Water was observed in the vault and pumped out on 1/5/23, 1/18/23, 1/26/23, 2/2/23, 3/30/23, 4/5/23, 4/26/23, 5/11/23, 5/18/23, and 6/7/23.
- The pump was primed and restarted on 1/10/23 and 1/26/23.
- 2/3/23 – the exhaust was adjusted so it was no longer blocked.
- 2/7/23 - The splice on the discharge hose was found leaking and clamps loose. Old clamps were removed, connection below the well cap was adjusted, hoses extended, and the discharge and exhaust hoses were free and clear of the top of casing.

RW-16 (Zone III)

- 1/5/23 – The pump was offline due to calcium carbonate buildup. Efforts are ongoing to dissolve the calcium carbonate so the pump can be pulled and repaired/replaced.
- 1/20/2023 – Due to calcification, the discharge hose and check valves were replaced.

RW-17

- Water was observed in the vault and pumped out on 1/18/23 and 2/9/23.
- The pump was primed and restarted on 3/30/23, 5/4/23, 5/11/23, 5/18/23, and 7/12/23.
- 4/19/23 – the counter was repaired.

- 4/26/23 – it was observed that the vault lid ball socket needed repair. It is working adequately.
- 5/18/23 – the ball socket and vault lid were repaired by a subcontractor.
- 5/24/23 – the counter was repaired.
- 8/3/23 – a new counter was installed.

SEHB

MW-5 (Zone SCF/UNTU)

- 1/5/23 – a vacuum truck pumped out the vault.
- 4/13/23 – the pump was found offline and would not restart. The pump is stuck in the well. Efforts are ongoing to dislodge the pump so it can be repaired/replaced. Kinder Morgan is having a custom hook developed that will aid in the pump's retrieval.

MW-7 (Zone SCF/UNTU)

- 2/2/23 – water in the vault was pumped out.

MW-13 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 2/2/23, 5/18/23, and 11/15/23.
- The counter was cleaned and/or repaired on 3/2/23, 6/1/23, and 8/17/23.
- 10/20/23 – The counter was replaced.

MW-25 (Zone SCF/UNTU)

- 1/5/23 – The pump was found offline and would not restart.
- 1/27/23 – The pump was turned on, it cycled twice and then stopped.
- 2/7/23 – The pump was back online.
- 2/24/23 – The pump was restarted.
- 5/11/23 – The pump was found offline, repaired on 5/12/23.
- 6/14/23 – the pump was restarted.
- 6/21/23 – The pump was observed to be suck in the well casing. Efforts are ongoing to dislodge the pump so it can be repaired/replaced. Kinder Morgan is having a custom hook developed that will aid in the pump's retrieval.

MW-26 – (Zone UNTU)

- 1/5/23 – the vault was observed to be flooded due to a nearby broken fire water line, access was limited until 2/7/23 when it was pumped out and returned to service.
- Water was observed in the vault and pumped out on 2/7/23, 4/13/23, 4/26/23, 5/11/23, 5/18/23, 6/14/23, and 11/15/23.
- The pump was restarted on 6/1/23, and 7/27/23.
- The pump was observed to be stuck in the well casing from 6/29/23 through 7/20/23 when it was pulled and replaced back in the well after restarting.
- 9/31/23 – The pump was stuck in the well casing and was offline.
- 9/14/23 – the counter was replaced.

MW-30 – (Zone UNTU)

- 2/24/23 – The pump was restarted.
- 5/11/23 – Water was observed in the vault and pumped out.

MW-33 – (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 2/2/23 and 4/26/23.

MW-34 – (Zone SCF/UNTU)

- 1/27/23 – It was observed that the pump needed a new bracket for the air regulator.
- 2/2/23 – The bracket and air regulator were replaced.
- 2/24/23 – the pump was restarted.

South Trench – (Zone SCF)

- 4/13/23 – The pump was restarted.

CP PMZ

- The recovery well in the CP (POE-2) was only briefly activated monthly to sample POE-2 during the reporting period and no system maintenance was necessary or conducted. However, during the freeze of December 2022, multiple line breaks occurred, necessitating repair prior to operating the TCI recovery system which pumps through the CP PMZ to Tank 3-10.

WP/WC PMZ

MW-23

- 10/24/23 – It was noted that the ball valve needs to be replaced.
- 11/14/23 – the vault was pumped out and a small air leak was observed.

MW-32

- 10/5/23 – the nitrogen line was observed to be leaking at the valve.
- 10/12/23 – no leak was visible.

MW-39

- The pump was found offline and restarted on 4/18/23 and 4/25/23.

OB-3

- 12/12/23 – the counter was found stuck and it was repaired.

TCI

RW-1 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 7/7/23, 7/13/23, 10/20/23, and 12/15/23.
- The pump was found offline and restarted on 6/2/23, 7/28/23, 8/30/23, 9/15/23, 9/29/23, and 10/13/23.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled.
- 11/14/23 – The air regulator needs to be changed. It was changed out the same day.
- 11/14/23 – The vault lid needs repair.

RW-2 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 5/12/23, 5/19/23, 7/13/23,
- The pump was found offline and restarted on 3/2/23, and 10/13/23.
- 5/19/23 – The pump was found offline and it was established a new pump was needed.

- 6/2/23 – Pump replaced.
- 10/20/23 – it was noted that the lid needed repair.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled. Holes need to be drilled into the concrete in order to hang the regulators. Repairs are in progress.
- 11/9/23 – Label needs to be attached.
- 11/22/23 – The label was replaced.

RW-3 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 5/12/23, 6/12/23, 11/3/23, 12/1/23, and 12/21/23.
- The pump was found offline and restarted on 3/2/23, 10/6/23, and 10/13/23.
- 5/12/23 – It was noted that the pump needs to be swapped out.
- 5/19/23 – The pump was replaced.
- 6/2/23 – The air line was replaced.
- 6/22/23 – It was observed that the support arm was broken.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled. Regulator still works, but its position makes it hard to repair.
- 11/14/23 – The air regulator needs to be changed.
- 11/14/23 – The vault lid needs repair.
- 11/22/23 – The label was replaced. Air regulator was changed out.

RW-4 (Zone SCF/UNTU)

- The pump was found offline and restarted on 8/11/23, 8/25/23, 8/30/23, 9/8/23, 9/15/23, 9/29/23, 10/27/23.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled.
- 11/14/23 – It was observed that the pump needs to be replaced.
- 11/22/23 – The pump and all hoses need to be replaced.
- 12/15/23 – The pump and hoses were replaced.

RW-5 (Zone SCF/UNTU)

- The pump was found offline and restarted on 3/2/23, 3/10/23, 6/30/23, 7/7/23, 7/13/23, 7/28/23, 8/11/23, 8/30/23, 10/13/23, 10/27/23, 11/9/23, 11/14/23, 12/7/23, 12/15/23, and 12/21/23.
- 5/5/23 – It was noted that the hinge was broken.
- 8/11/23 – It was observed that the pump is in need of maintenance.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled. Holes need to be drilled into the concrete in order to hang the regulators. Repairs are in progress.
- 11/14/23 - Completed line extension out of vault.
- 12/15/23 – It was noted that the pump may need to be replaced.

RW-6 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 5/12/23, 5/19/23, 6/12/23, 6/30/23, 7/7/23, 11/3/23, and 12/1/23.
- The pump was found offline and restarted on 10/13/23, 10/27/23, 12/1/23, and 12/21/23.
- 4/25/23 – The hinge was observed to be broken.
- 10/20/23 - Air regulator needs to be re-hung on side well vaults.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled. Holes need to be drilled into the concrete in order to hang the regulators. Repairs are in progress.
- 11/9/23 - Exhaust line extended out of casing.
- 11/22/23 – The label was replaced.

POE-1 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 6/2/23, 9/12/23, 6/16/23, 7/7/23, and 12/1/23.
- The pump was found offline and restarted on 10/6/23 and 10/13/23.
- 5/26/23 – the air hose was mended.
- 10/20/23 – it was noted that the lid needs repair.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled. Holes need to be drilled into the concrete in order to hang the regulators. Repairs are in progress.
- 11/9/23 - Exhaust line extended out of casing.
- 11/22/23 – The label was replaced.
- 12/15/23 –The pump was found offline and may need the check valve replaced.
- 1/5/2024 – Exhaust line replaced. Need to replace discharge hose.

POE-3 (Zone SCF/UNTU)

- 3/16/23 – the air line was replaced.

MW-9 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 4/28/23, 5/5/23, 5/12/23, 7/13/23, 11/3/23, 12/15/23, and 12/21/23.
- The pump was found offline and restarted on 3/2/23, 4/28/23, 5/12/23, 7/13/23, 8/30/23, 9/8/23, 9/29/23, 10/6/23, 11/3/23, 11/14/23, 11/22/23, 12/7/23, 12/15/23, and 12/21/23.
- 4/7/23 – it was noted that the regulator was hissing.
- 6/12/23 – regulator replaced.
- 6/22/23 – counter repaired.
- 10/27/23 – pump replaced.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled.
- 2/23/24 – The label was replaced. Air regulator was reattached.

RW-7 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 5/12/23, 5/19/23, 6/12/23, 7/7/23, 11/3/23, 12/1/23, 12/15/23 and 12/21/23.

- The pump was found offline and restarted on 7/28/23, 8/25/23, 9/29/23, and 10/6/23.
- 7/7/23 – the counter was repaired.
- 10/20/23 - The stainless steel tube on the pump was severely corroded. The pump was replaced.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled.
- 11/9/23 - Exhaust line extended out of casing.
- 11/14/23 – the counter was checked and found to be working.
- 11/22/23 – Label attached.

RW-8 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 5/12/23, 5/19/23, 6/2/23, 6/12/23, 6/22/23, and 7/7/23.
- The pump was found offline and restarted on 3/2/23, 7/13/23, and 9/29/23.
- 8/18/23 – The air line was repaired.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall and that the vault needs to be relabeled.
- 11/9/23 - Exhaust line was extended out of the casing, so it won't blow water in personnel's face. Pump is online and working well.
- 2/23/24 – The air regulator was reattached to the vault wall and the label was replaced.

RW-9 (Zone SCF/UNTU)

- Water was observed in the vault and pumped out on 4/28/23, 5/12/23, 5/19/23, 6/2/23, 6/12/23, 6/22/23, 7/7/23, 9/8/23, 12/1/23, 12/15/23, and 12/21/23.
- The pump was found offline and restarted on 4/28/23, 10/6/23, 10/13/23, 12/15/23.
- 7/13/23 - offline, pump stuck, need to remove air ball valve to pull pump and replace. Ball valve is blocking second casing.
- 8/4/23 - remove ball valve (air) plug, pull pump, replace pump and air regulator hoses as needed.
- 10/20/23 – The pump was offline. Pump was replaced the same day.
- 11/3/23 – It was noted that the air regulator needs to be reattached to the vault wall. Holes need to be drilled into the concrete in order to hang the regulators. Repairs are in progress.

OPH5

- Groundwater is not recovered at OPH5.

3.3 Management of Recovered Groundwater and LNAPL with Quarterly Tabulations and Graphs (Compliance Plan Table VII.11 and Compliance Plan Table VII.20)

Fluids recovered from the NHB, SEHB, and TCI groundwater recovery systems are temporarily stored in the Central Plant aboveground storage Tank 3-10 prior to being pumped into Central Plant Tank 32; both are located in the western portion of the Central Plant. From Tank 32, the recovered water is eventually discharged through a pipeline to the permitted Gulf Coast Waste Disposal Authority (GCWDA) for treatment and disposal along with other waste waters from the Galena Park Terminal. Tank 3-10 has a capacity of approximately 135,000 gallons. Discharges from Tank 3-10 are from an outlet at the lowest point on the cone-shaped bottom in order to prevent LNAPL discharge to the wastewater system. Kinder Morgan manages the recovered groundwater fluids. Fluid levels in Tank 3-10 are maintained at

approximately one-half full and are continuously monitored by Kinder Morgan personnel. Groundwater recovered from the WP/WC PMZ is transported to a wastewater sump that is hard piped to the wastewater system and Tank 32.

Graphs of the operational history (instantaneous and average flow rates) of the NHB, SEHB, WP/WC PMZ, and TCI recovery systems, for this reporting period, are shown on **Figures 13** and **14** respectively. The graphs present the total instantaneous pumping rate measured weekly at each recovery system and the average weekly pumping rate for each recovery system. The total instantaneous pumping rate for each system is calculated by adding the pumping rates measured weekly at the wellhead of each recovery well in the system. The average weekly pump rate is based on weekly pump cycle counter readings taken at each wellhead. Based on the measured rate of gallons per pump counter reading, the counter readings are converted to gallons and recorded weekly. The weekly pump rates for this reporting period are presented in **Table 15**.

Currently the SEHB is the only plant area that has LNAPL recovery as a portion of the recovered groundwater. Measurable LNAPL in was indicated in January 2023 in NTRW (0.11 ft.) and STRW (0.01 ft.). Measurable LNAPL was indicated in July 2023 in wells MW-18 (0.17 ft.), MW-20 (0.98 ft.), MW-23 (0.06 ft.), MW-27 (0.02 ft.), STRW (0.06 ft.), and NTRW (0.11 ft.). The combined volume of fluids (groundwater and LNAPL) recovered by the NHB, SEHB, WP/WC PMZ, and TCI groundwater interception systems was determined by tracking the recovered fluids with pump cycle counters at the wellhead of each recovery pump. The volume of fluids pumped for each pumping cycle is measured periodically for accuracy. An estimated 23,158,455 gallons of total fluids were recovered during this reporting period, and an estimated 9,788 gallons of the total fluids was recovered as LNAPL. These data are presented in **Table 16**. The total LNAPL recovery in **Table 16** includes LNAPL recovered at the SEHB NTRW. This table does not include LNAPL recovered by bailing.

LNAPL is periodically gauged and manually removed from wells in the CP PMZ and WP/WC PMZ that contain LNAPL. Upon manual recovery, the recovered LNAPL is disposed into Pit No. 2, located in in the southern portion of the CP which is pumped into Tank 32 and then discharged to the GCWDA. In summary, during 2023, a total of 8.1 gallons of LNAPL was removed from the WP/WC PMZ and 10.1 gallons was removed from the SEHB for a total of 18.2 gallons. A tabulated summary of removed LNAPL from the CP PMZ, the WP/WC PMZ, and OPH5 is provided as **Table 7**.

LNAPL is no longer recovered from OPH5 per TCEQ approval dated December 19, 2022.

3.4 Updated Table and Maps of Corrective Action Wells (Compliance Plan Table VII.12)

A summary of the Corrective Action Wells and their designations is provided in **Table 8**. The locations of these wells are depicted on **Figure 1** and **Figure 2** for the NHB and SEHB, respectively. **Figure 3** presents the locations of wells in the CP PMZ, **Figure 4** shows wells in the WP/WC PMZ, **Figure 5** shows well locations at TCI, and **Figure 6** shows well locations at OPH5.

In an email correspondence between Kinder Morgan and the TCEQ dated May 29, 2019, The TCEQ approved Kinder Morgan's request to suspend sampling NHB MW-5 and MW-9 completed in Zone III, MW-14 completed in Zone IV, and MW-12 completed in Zone V effective during the 2022 reporting period. The request was initially made as the NHB COC (1,2-dichloroethane) has consistently been below the GWPS in these wells.

3.5 Summary of Chemical Analysis (Table VII.13 and 22)

NHB

The analytical results for the NHB and Panther Creek January and July 2023 sampling events are summarized in **Table 9**. Those wells which exceeded the GWPS for 1,2-dichloroethane, listed in CP Table IIIA, for Zone III, Zone IV, and Zone V are shown on Contaminant Isopleth Maps, **Figures 15a through 15f**, respectively. An historical summary of 1,2-dichloroethane concentrations for the wells associated with

the NHB through the current reporting period is presented in **Appendix B**. In general, detected COC concentrations are consistent with historical concentrations. Copies of the original laboratory analysis reports are maintained at the Kinder Morgan Galena Park Terminal and electronic copies are maintained in the project files and are available upon request.

SEHB

The analytical results for the SEHB January and July 2023 groundwater sampling events are summarized in **Table 10**. Those wells which exceeded the GWPS for the COCs listed in CP Table IIIA, for the UNTU, SCF, and SCF/UNTU for January and July 2023 are shown on Contaminant Concentrations Maps, **Figures 16a through 16f**, respectively. An historical summary of SEHB sampling results is presented in **Appendix B**. In general, detected COC concentrations are consistent with historical concentrations. Copies of the original laboratory analysis reports are maintained at the Kinder Morgan Galena Park Terminal and electronic copies are maintained in the project files and are available upon request.

CP PMZ

The analytical results for the CP PMZ January and July 2023 groundwater sampling events are summarized in **Table 11**. Those wells which exceeded the GWPS for the COCs listed in CP Table IIIA, for the SCF/UNTU for January and July 2023 are shown on Contaminant Concentrations Maps, **Figures 17a and 17b**, respectively. Wells with LNAPL were not sampled and results are not shown on the figures. An historical summary of CP PMZ sampling results is presented in **Appendix B**. In general, detected COC concentrations are consistent with historical concentrations. Copies of the original laboratory analysis reports are maintained at the Kinder Morgan Galena Park Terminal and electronic copies are maintained in the project files and are available upon request.

Semiannual monitoring is performed for COCs for the CP PMZ wells and additional monthly sampling for bis 2-(chloroethyl) ether has been performed for POE-2. POE-2 is historically the only recovery well located within the CP PMZ and has been deactivated since May 9, 2019 to observe the effect of the pumping on the bis 2-(chloroethyl) ether concentrations. In 2023, the bis 2-(chloroethyl) ether concentrations remained below the TCEQ Texas Risk Reduction Program (TRRP) Tier 1 groundwater ingestion Residential Protective Concentration Level (PCL) of 0.00083 mg/L at CP PMZ POE-2 with the exception of March (0.001450 J mg/L), April (0.001490 J mg/L), May (0.001120 J mg/L), June (0.001040 J mg/L), and July (sample was picked up late in August so it has an analysis date of August 1, 2023) (0.000915 J mg/L).

WP/WC PMZ

The analytical results for the WP/WC PMZ February and August 2023 groundwater sampling events are summarized in **Table 12**. Those wells which exceeded the GWPS for the COCs listed in CP Table IIIA, for the SCF/UNTU for February and August 2023 are shown on Contaminant Concentrations Maps, **Figures 18a and 18b**, respectively. Wells with LNAPL were not sampled and results are not shown on the figures. An historical summary of WP/WC PMZ sampling results is presented in **Appendix B**. In general, detected COC concentrations are consistent with historical concentrations. Copies of the original laboratory analysis reports are maintained at the Kinder Morgan Galena Park Terminal and electronic copies are maintained in the project files and are available upon request.

TCI

The analytical results for the TCI February 2023 groundwater sampling event are summarized in **Table 13**. Those wells which exceeded the GWPS for the COCs listed in CP Table IIIA, for the SCF/UNTU for February 2023 are shown on Contaminant Concentrations Maps, **Figure 19**. An historical summary of TCI sampling results is presented in **Appendix B**. In general, detected COC concentrations are consistent with historical concentrations. Copies of the original laboratory analysis reports are maintained at the Kinder Morgan Galena Park Terminal and electronic copies are maintained in the project files and are available upon request.

OPH5

The analytical results for the OPH5 January and July 2023 groundwater sampling events are summarized in **Table 14**. Those wells which had detections for the COCs listed in CP Table IIIA, for the SCF/UNTU for January and July 2023 are shown on Contaminant Concentrations Maps, **Figures 20a and 20b**, respectively. Wells with LNAPL were not sampled and results are not shown on the figures. An historical summary of OPH5 sampling results is presented in **Appendix B**. In general, detected COC concentrations are consistent with historical concentrations and below the GWPS. Copies of the original laboratory analysis reports are maintained at the Kinder Morgan Galena Park Terminal and electronic copies are maintained in the project files and are available upon request.

3.6 Water Level Elevations and NAPL Thickness (Compliance Plan Table VII.14 and Compliance Plan Table VII.19)

A tabulation of water level elevation measurements from the January-February and July-August 2023 monitoring events at Galena Park Terminal is presented in **Tables 1 through 6**. These tables also provide depth to water measurements, total well depth measurements, and LNAPL thickness measurements, where applicable. **Table 7** contains data on LNAPL measurements and amounts bailed throughout 2023.

NHB

LNAPL or dense non-aqueous phase liquid (DNAPL) were not detected in the NHB wells during the January and July 2023 monitoring events.

SEHB

During the January 2023 sampling event, LNAPL was detected in wells MW-18 (0.03 ft.), MW-20 (0.32 ft.), MW-23 (0.02 ft.), MW-27 (0.05 ft.), P-1 (0.01 ft), the North Trench (NTRW) (0.11 ft.), and the South Trench (STRW) (0.01 ft.). The LNAPL thickness measurements in the monitor wells ranged from a thickness of 0.01 ft. (STRW and P-1) to 0.32 ft. (MW-20). LNAPL data for the January 2023 sampling event is presented in Table 2.

During the July 2023 sampling event, LNAPL was detected in wells MW-18 (0.17 ft), MW-20 (0.98 ft), MW-23 (0.06 ft.), MW-27 (0.02 ft.), P-1 (0.01 ft.), the NTRW (0.11 ft.), and the STRW (0.06 ft.). The LNAPL thickness measurements in the monitor wells ranged from a thickness of 0.01 ft. (P-1) to 0.98 ft. (MW-20). LNAPL data for the July 2023 sampling event is presented in Table 2.

Kinder Morgan continued LNAPL gauging and LNAPL removal from SEHB P-1, MW-12, MW-18, MW-20, MW-23, and MW-27, during the reporting period. LNAPL gauging and removal was initialized during the spring of 2019 and the LNAPL is gauged and removed weekly as practicable. The LNAPL thicknesses and recovered LNAPL volumes for the wells is shown in **Table 7**. **Figures 21a and 21b** present the extent of LNAPL during the sampling events. The wells showed a decreasing or stable LNAPL thickness through the reporting period (**Table 7**). During the 2023 monitoring period, a total of 18.2 gallons of LNAPL was removed from these wells. Kinder Morgan will continue to gauge these wells on a regular basis and remove LNAPL as necessary.

DNAPL was not detected during the January and July 2023 sampling events at the SEHB.

CP PMZ

LNAPL and DNAPL were not detected during the January and July 2023 sampling events at the CP PMZ.

WP/WC PMZ

During the February 2023 sampling event, LNAPL was detected in the WP/WC PMZ in wells MW-38 (3.64 ft.), VMW-3 (0.30 ft), VMW-8 (2.26 ft.), and VMW-10 (1.11 ft.). The LNAPL thickness measurements in the wells ranged from a thickness of 0.30 ft (VMW-3) to 3.64 ft (MW-38).

During the August 2023 sampling event, LNAPL was detected in in the WP/WC PMZ in wells MW-38 (6.02 ft), VMW-3 (0.33 ft), VMW-8 (3.31 ft.), and VMW-10 (1.03 ft). The LNAPL thickness measurements in the monitor wells ranged from a thickness of 0.33 ft. (VMW-3) to 6.02 ft. (MW-38).

Discrepancies were noticed between the weekly gauging and product removal volumes and values recorded during the semi-annual groundwater sampling events. The two data sets are obtained by two different parties. Therefore, equipment functionality, procedures, and recordation practices are being reassessed going forward.

Regular LNAPL gauging and removal, if necessary, are conducted at WP/WC PMZ wells MW-38, VMW-8, and VMW-10. A total of 10.1 gallons of LNAPL was removed from WP/WC PMZ MW-38, VMW-8, and VMW-10 during 2023. A LNAPL gauging and summary for WP/WC PMZ is presented in **Table 7**. **Figures 23a** and **23b** present the extent of LNAPL during the sampling events.

TCI

Groundwater elevation measurements were conducted at TCI in February and March and August 2023; no NAPL or DNAPL was detected. Historically, LNAPL has not been observed at TCI.

OPH5

As part of the corrective action program associated with the OPH5 AOC, LNAPL recovery was being conducted, but ceased in 2022 with the approval of the TCEQ, letter dated August 12, 2022. Prior to 2022, during each weekly inspection event, LNAPL thickness was measured in OPHMW-1 (sump), OPHMW-7, and OPHMW-8, manual LNAPL recovery was completed in OPHMW-1 (sump) and OPHMW-8, and volumes recovered were recorded. Additionally, an LNAPL discharge flow rate for the wall drain system was measured, and based on the flow rate, an approximate LNAPL discharge volume, since the last flow measurement, was calculated. LNAPL thickness at the OPH5 AOC ranged from 0.62 ft. (OPHMW-7, July 2023) to 1.81 ft. (OPHMW-8, July 2023) during the reporting period (**Table 6**). The extent of LNAPL during the sampling events is presented in **Figures 22a and 22b**. The TCEQ conditionally approved the cessation of LNAPL recovery due to plume stability and lack of transmissivity in a letter dated August 22, 2022 and granted its formal approval in a following letter dated December 19, 2022. LNAPL is now only gauged during the semi-annual sampling events and no recovery occurred during 2023.

3.7 Potentiometric Surface Maps (Compliance Plan Table VII.15)

As discussed in **Section 2** of this report, groundwater potentiometric surface maps were prepared using the groundwater elevation data collected during the January-February and July-August 2023 sampling events. Potentiometric surface maps (**Figures 7a through 7f**) were completed for the NHB, depicting groundwater flow direction in Zone III, Zone IV, and Zone V, respectively. There is only one well completed in Zone V (MW-12) therefore groundwater contours and flow calculations were not prepared for this zone. Additionally, potentiometric surface maps for the UNTU and SCF (**Figures 8a through 8d**) were completed for the SEHB. CP PMZ potentiometric maps are presented as **Figures 9a and 9b**. WP/WC PMZ potentiometric maps are presented as **Figures 10a and 10b**. TCI potentiometric maps are presented as **Figures 11a and 11b**. OPH5 potentiometric maps are presented as **Figures 12a and 12b**.

3.7.1 Tabulation of Data Evaluation Results and Compliance Tables (Compliance Plan Table VII.16)

Groundwater analytical data collected from the January-February and July-August 2023 semiannual events were evaluated within 60 days, as outlined in Provision XI.F.4. As stated in **Section 3.1**, these groundwater analytical data are presented in **Tables 9 through 14**. In general, the reported 2022 analytical testing results are consistent with historical data.

3.8 Hazardous Constituent and NAPL Extent Maps (Compliance Plan Table VII.22 and Compliance Plan Table VII.23)

Contaminant Isopleth Maps showing the NHB Zone III, Zone IV, and Zone V GWPS exceedances of the constituents listed in Compliance Plan Table IIIA for the reporting period are presented on **Figures 15a through 15f** respectively.

Contaminant Concentration Maps showing the SEHB Zone UNTU, SCF, and SCF/UNTU GWPS exceedances of the constituents listed in Compliance Plan Table IIIA for the reporting period are presented on **Figures 16a through 16f**, respectively.

Contaminant Concentration Maps showing the CP PMZ Zone SCF/UNTU GWPS exceedances of the constituents listed in Compliance Plan Table IIIA for the reporting period are presented on **Figures 17a and 17b**.

Contaminant Concentration Maps showing the WP/WC PMZ Zone SCF/UNTU GWPS exceedances of the constituents listed in Compliance Plan Table IIIA for the reporting period are presented on **Figures 18a and 18b**.

Contaminant Concentration Maps showing the TCI Zone SCF/UNTU GWPS exceedances of the constituents listed in Compliance Plan Table IIIA for the reporting period are presented on **Figure 19**.

Contaminant Concentration Maps showing the OPH5 GWPS exceedances of the constituents listed in Compliance Plan Table IIIA for the reporting period are presented on **Figures 20a and 20b**.

Additionally, LNAPL thickness and areal extent in the SEHB are illustrated on **Figures 21a and 21b**. As stated in **Section 3.6**, above, certain SEHB and WP/WC PMZ wells have historically exhibited LNAPL. Kinder Morgan continued LNAPL gauging and removal from SEHB wells MW-12, MW-18, MW-20, MW-23, MW-27, and P-1 during the reporting period. LNAPL thickness and aerial extent in the OPH5 AOC are presented in **Figures 22a** (January) **and 22b** (July). Additionally, Kinder Morgan continued to gauge and remove LNAPL from MW-38, VMW-8, and VMW-10 in the WP/WC PMZ; LNAPL thickness and aerial extent for the WP/WC PMZ are presented in **Figures 23a** (February 2023) **and 23b** (August 2023).

3.9 Schedule Summary (Table VII.17)

The next semi-annual sampling event is scheduled to occur within the first 60 days of the first quarter of 2024, as required by Provision XI.F.3.b. Analytical results will be evaluated against the GWPSs within 60 days of the collection of the last sample. Weekly inspections will be performed on the groundwater recovery systems to ensure operations are maintained in a functional and leak-free condition. The January 1 through December 31, 2024 Annual Corrective Action Program Report will be submitted to the TCEQ no later than March 1, 2025. The Compliance Plan Schedule is included as **Appendix C**.

3.10 Well Inspections, Repairs and Operational Difficulties (Compliance Plan Table VII.18)

Well inspections were performed at the NHB, SEHB, CP PMZ, WP/WC PMZ, TCI, and OPH5 wells during the 2023 sampling events and well recoveries and performance are monitored weekly. Groundwater recovery system and well maintenance or repairs performed as a result of these inspections, as well as other events, are shown in **Table 17** and described in **Section 3.2**.

In an email correspondence between Kinder Morgan and the TCEQ dated May 29, 2019, The TCEQ approved Kinder Morgan's request to suspend sampling NHB MW-5 and MW-9 completed in Zone III, MW-14 completed in Zone IV, and MW-12 completed in Zone V effective during the next reporting period. The request was initially made as the NHB COC (1,2-dichloroethane) has consistently been below the GWPS in these wells.

The NHB system was shut down and restarted on January 12, 2023 to replace the ball valve on the air line at MW-4. The system was shut down on August 3, 2023 because water was surfacing east of MW-7; the discharge line was excavated, and a new section welded in-place prior to restarting the system on August 30. Additionally, the system was shut down on September 14, 2023 due to a nitrogen leak, it remains shut down pending underground repairs. New infrastructure was constructed on top of the buried piping (i.e., C-5 bullet tank with the dimensions of 11-foot in diameter by 83 feet in length and a capacity of 44,310 gallons (1055 bbls), associated concrete pump pad and ancillary piping and equipment), and piping was located and to be rerouted and replaced in 2024.

The WP/WC PMZ system was shut down from September 19, 2023, through September 27, 2023, due to hot work (welding) next to the sump where the system discharges.

The TCI system was shut down from December 22, 2022, through February 17, 2023 due to breaks in the CP lines caused by a cold freeze event in late 2022.

Additional minor repairs requiring resolution include damaged well vault hinges, vault cover pistons, corroded or worn tubing, connectors, pump cycle counters, pump repairs and damaged well pads and bollards. Several new pumps were installed where the existing pump was beyond repair. Although these conditions do not pose a threat to the integrity or reliability of the system, action has been taken to correct them.

4. Status of Gate 6 Area of Concern (Compliance Plan Table VII.24)

The Gate 6 AOC is located in the eastern portion of the KM Liquids Terminals LLC (Kinder Morgan) Galena Park Terminal in Galena Park Texas. The Gate 6 Area is located on property wholly owned by Kinder Morgan and partially located beneath the active facility currently operated by World Energy for processing biofuels at 550 Clinton Drive. The existing biofuels facility at the site was constructed in 2006.

- Kinder Morgan submitted a Response Action Completion Report (RACR) requesting closure to the TCEQ on October 12, 2022 since response action criteria (stable plume) had been met. The RACR and the request for closure was approved by the TCEQ via email on November 17, 2022 and via letter December 19, 2022 and the monitoring wells (EP-1, EP-2, EP-3, EP-6R, EP-7, and EP-8) were plugged and abandoned in November 29, 2022. Per the TCEQ's condition for terminating corrective action for the Gate 6 AOC, Kinder Morgan will update CP Table II in the Permit renewal application, due in 2024, to officially terminate corrective action for the Gate 6 AOC in accordance with Permit Provisions XI.D. and XI.H.6.

5. Recommendations

The groundwater recovery systems in the NHB, SEHB, CP PMZ, WP/WC PMZ, and TCI are functioning as designed. LNAPL is regularly removed from monitoring wells that are not part of the recovery systems. Per the TCEQ's condition for terminating corrective action for the Gate 6 AOC, Kinder Morgan will update CP Table II in the Permit renewal application, due in 2024, to officially terminate corrective action for the Gate 6 AOC in accordance with Permit Provisions XI.D. and XI.H.6. There are no further recommendations for modifications at this time.

Notes:

1. MSL - *Mean Sea Level*

2. The MW-5 well pad was reconstructed on July 2, 2019. To accommodate the new well pad, 6.65" (0.55') of the top of the well casing was removed yielding an approximate new TOC measurement of 20.80'-0.55' = 20.25'. 20.25' is the assumed TOC until surveyed again.

3. Surveyed June 2019
4. Surveyed December 2021

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	***---***	---		---		---		---		---		---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---		---		---		---	

Notes:
J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B - Compound was found in the blank and sample.
H - Sample was prepped or analyzed beyond the specified holding time
U - Indicates the analyte was analyzed for but not detected.
* - RPD of the LCS and LCSD exceeds the control limits.
BOLD italic - result exceeds the GWPS.

Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	**---**	---		---		---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	***---***	72		108		35		---		---		---		---		---		---		---		---		---		---		---		---		---		---		---	

Notes:
J - Result is less than the RL but greater than or equal to the MDL and the concentration is
B - Compound was found in the blank and sample
H - Sample was prepped or analyzed beyond the specified holding time
U - Indicates the analyte was analyzed for but not detected.
* - RPD of the LCS and LCSD exceeds the control limits
BOLD italic - result exceeds the GWPS

Total Organic Carbon	***---***	---		---		---		---		---		---		---		---		---		---		---		---		---	

Notes:
J - Result is less than the RL but greater than or equal to the MDL and the concentration is an
B - Compound was found in the blank and sample.
H - Sample was prepped or analyzed beyond the specified holding time
U - Indicates the analyte was analyzed for but not detected.
* - RPD of the LCS and LCSD exceeds the control limits.
BOLD italic - result exceeds the GWPS.

Total Organic Carbon	***---***	61		159		71		---		---		---		---		---		---					

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	---	---		---		---		---		---		---		---	---		---		---		---		---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits

BOLD italic - result exceeds the GWPS

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---		---		---		---			

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

General Chemistry (415.1) (mg/L)																															
Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---		---		---		---		---		---	

Notes:
J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B - Compound was found in the blank and sample.
H - Sample was prepped or analyzed beyond the specified holding time
U - Indicates the analyte was analyzed for but not detected.
* - RPD of the LCS and LCSD exceeds the control limits.
BOLD italic - result exceeds the GWPS.

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits

BOLD italic - result exceeds the GWPS

Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	***---***	---		---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits

BOLD italic - result exceeds the GWPS

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Notes:
J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B - Compound was found in the blank and sample.
H - Sample was prepped or analyzed beyond the specified holding time
U - Indicates the analyte was analyzed for but not detected.
* - RPD of the LCS and LCSD exceeds the control limits.
BOLD italic - result exceeds the

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	***---***	---		---		---		---		---		---		---		---		---		---		---		---		---		---		---	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---		---		---	

Notes:
J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B - Compound was found in the blank and sample.
H - Sample was prepped or analyzed beyond the specified holding time
U - Indicates the analyte was analyzed for but not detected.
* - RPD of the LCS and LCSD exceeds the control limits.
BOLD italic - result exceeds the GWPS.

Total Organic Carbon	---	---		---		---		---		---		---		---		---		---		---		---		---		---			

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample.

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits.

BOLD italic - result exceeds the GWPS.

Total Organic Carbon	**---**	**---**		**---**		**---**		**---**	

Notes:

J - Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

B - Compound was found in the blank and sample

H - Sample was prepped or analyzed beyond the specified holding time

U - Indicates the analyte was analyzed for but not detected.

* - RPD of the LCS and LCSD exceeds the control limits

BOLD italic - result exceeds the GWPS
