## ATTACHMENT TO WOLF HOLLOW I, LP TCEQ APPLICATION

The Wolf Hollow plant is constructed as a Combined Cycle facility, and as such utilizes a Heat Recovery Steam Generator (HRSG) as a key component of its process. The HRSG is designed to capture exhaust gases from a combustion turbine, and to convert this heat energy into high pressure and temperature steam. Heat transfer occurs through banks of finned tubes in the HRSG that contain water on the inside, contacted by the hot exhaust gases on the outside.

The use of a HRSG in Combined Cycle facilities results in an improvement in efficiency of the thermal cycle of a traditional power plant from approximately 36% to 50%. This allows more electrical energy to be produced for a given heat input than is possible by a simple cycle or traditional steam boiler/turbine (Rankin cycle) configuration. Since less fuel is utilized per kilowatt of power produced, less exhaust gas emissions (NO<sub>x</sub>, CO, CO<sub>2</sub>, etc) are produced as a result. The HRSG' primary purpose of capturing and converting waste heat therefore results in positive environmental benefits.

Wolf Hollow I LP is claiming 61.2% of the cost of the HRSG is pollution control equipment.

The calculation is based upon the difference between the thermal efficiency in simple cycle versus combined cycle mode.

Efficiency gain due to HRSG:  $(50\%/36\%) - 1 = 38.8\%$

Environmental benefit :  $(1 - \text{efficiency gain of } 38.8\%) = 61.2\%$
