## ACKNOWLEDGMENTS

---

We are particularly indebted to John Anderson for his suggestion of the acoustic method for mapping. The application described here was really his idea. We thank Aubrey Anderson and Martin Ebel for teaching us how to use the acoustic equipment to greatest efficiency. We thank E. Wilson, R. Callender, P. Weeks, E. Godwin, and J. Leonard for help in the mapping survey. L. Benefield, R. Hofstetter, B. Nelson, J. Nelson and M. Armstrong provided important information about the reefs of Galveston Bay. L. Benefield also provided important information on shell dredging and artificial reef construction. Sammy Ray was responsible for the development of the mapping project. We appreciate his constant encouragement. The boat, the R/V Eddy, were provided through funds from the Texas A&M University (TAMU) Office of University Research. We thank B. Nelson and M. Armstrong for providing docking facilities and R. Ormond and his crew for outfitting and maintaining the Eddy throughout the project. The project was funded by the Environmental Protection Agency through the Galveston Bay National Estuary Program. Computer funds were provided by the College of Geosciences Research Development Fund. J. Simons was supported by a Sea Grant Marine Fellowship. The TAMU Geochemical and Environmental Research Group (GERG) provided computer facilities for the GIS system. We particularly thank GERG for their help. Texas A&M University and the U.S. Army Corps of Engineers provided important resources to purchase and maintain equipment aboard the Eddy. We appreciate this additional support.
