BACKGROUND

The Texas Commission on Environmental Quality (TCEQ) works with local planning districts, the Texas Department of Transportation (TxDOT), and the Texas Transportation Institute (TTI) to provide on-road mobile source emissions inventories of air quality pollutants. TxDOT typically funds transportation conformity determinations required under 40 CFR Part 93. TCEQ funds mobile source inventory work in support of the Federal Clean Air Act Amendment (CAAA) requirements, such as attainment of the National Ambient Air Quality Standards (NAAQS, 42 USCA 7409), and the study and control of hazardous air pollutants (HAPs), including those from motor vehicles and/or motor vehicle fuels (as mandated under CAAA sections 202 and 211).

TCEQ emissions inventory development activities include inventory development, methodology updates, data gathering, analysis and assessment, and planning for future requirements. In addition to meeting the basic inventory development requirements, Texas has consistently used state-of-the-art methodologies and up-to-date data sets to develop highly detailed, completely defensible on-road mobile State Implementation Plan (SIP) inventories. This level of commitment requires a constant update of emissions inventory and control strategy reduction estimates to include the latest methodologies and data.

TCEQ is continuing its progress toward meeting the requirements of EPA's eight-hour ozone standard. As part of the eight-hour attainment SIP planning and development process, new modeling episodes are being selected for the Houston/Galveston/Brazoria (HGB) area. To support the analysis required for the new episodes, base case, on-road mobile emissions inventories are needed. The vehicle miles of travel (VMT) profiles used to develop these inventories must be compatible with the specific time periods of the ozone episodes under review.

TASK 2: DEVELOPMENT AND PRODUCTION OF VEHICLE MILES TRAVELED PROFILES FOR NON-SCHOOL, MEMORIAL DAY, AND LABOR DAY WEEKENDS

Task 2 Background

As part of developing the eight-hour attainment demonstration SIP for HGB, TCEQ will be performing photochemical modeling analyses for new ozone exceedance episodes from 2005 and 2006. Some of these episodes include Memorial Day, Labor Day, and periods from May through August when local elementary and high schools are not in session. It will be necessary to develop area wide VMT profiles for these periods because transportation data sets often assume "in-school" periods of time and "regular" weekends.

The on-road emissions inventories used by TCEQ for SIP purposes are often based on transportation models that assume a "typical" weekday when local elementary and high schools are in session. Alternate, area wide VMT distribution profiles are needed to develop on-road mobile source emissions inventories for high ozone episodes that occur during "non-school" periods and/or include long holiday weekends, such as Memorial Day and Labor Day.

Task 2 Description

This task requires the development and production of area wide VMT distribution profiles for different times of the year for various areas in Texas. Those areas include:

- the five-county Austin near-nonattainment area composed of Bastrop, Caldwell, Hays, Travis, and Williamson counties;
- the three-county Beaumont/Port Arthur nonattainment area composed of Hardin, Jefferson, and Orange counties;
- the nine-county Dallas/Fort Worth nonattainment area composed of Collin, Dallas, Denton, Ellis, Johnson, Kaufman, Parker, Rockwall, and Tarrant counties;
- El Paso County;
- the eight-county HGB nonattainment area composed of Brazoria, Chambers, Fort Bend, Galveston, Harris, Liberty, Montgomery, and Waller counties;
- the four-county San Antonio near-nonattainment area composed of Bexar, Comal, Guadalupe, and Wilson counties;
- the five-county Tyler/Longview near-nonattainment area composed of Gregg, Harrison, Rusk, Smith, and Upshur counties;
- an “urban” conglomeration containing all 35 counties referenced above;
- a “rural” conglomeration containing the 219 Texas counties not mentioned above; and
- an aggregate statewide summary for all 254 Texas counties.

For each of the county groups referenced above, profiles were developed and produced that compare VMT distributions for:

- a “typical” weekday when local grammar and high schools are in session versus a “typical” weekday when these schools are not in session;
- Memorial Day weekend versus non-holiday weekends in late May and June; and
- Labor Day weekend versus non-holiday weekends in late August and September.

At TCEQ’s request, the July 4 holiday was specifically excluded from this analysis because it falls on a different day of the week. Consequently, it would be difficult to identify a repeatable variation in area wide VMT distribution that results from the July 4 holiday. Since Memorial and Labor Days always fall on a Monday, any “holiday effect” on VMT for these weekends is both more repeatable and more predictable.

For each of the “non-school,” Memorial Day, and Labor Day periods, TTI determined how both hourly and daily VMT distributions differ from the “typical” transportation data sets that assume VMT distributions for “in-school” and “regular” weekends.

TTI assembled all available applicable TxDOT automatic traffic recorder (ATR) data. The most recent available six years of ATR data for each area were used in the analysis. As anticipated, only TxDOT ATR data are appropriate for this analysis, since the collection equipment is constantly operated at the same location over several years. Typically, non-ATR data are only collected for short periods at varying locations.

TTI verified the TxDOT ATR data sets for each area for consistency and completeness, consistent with the use of this data in other applications. Daily and hourly area wide VMT profiles were subsequently produced for each area and other geographic regions defined, for each analysis period defined above.

TASK DELIVERABLES

Interim deliverables are an informal Technical Note (a narrative in memorandum format that explains the task, the approaches used, and the findings) provided to the Project Manager in the specified format, which is supported by electronic document files. All pertinent data are being submitted in the specified electronic format. (No FORTRAN source code or executable files were developed under this task.) CD-ROM is used to record the final data and supporting documentation. TTI is providing five copies of both the review draft and the final report. One of the copies is an unbound original suitable for copying. Electronic copies of all materials related to the task report, to document results and conclusions (e.g., data, work files, text files, etc.), or developed as work products under this contract were provided as requested by TCEQ.

Acknowledgments

Dennis Perkinson, Ph.D., performed the statistical analyses used in this study. Gary Lobaugh, of TTI, was responsible for editing, design, and production of this Technical Note. Dr. Perkinson was the principle investigator for this project. This work was performed by TTI under contract to TCEQ. Christopher Kite was the TCEQ project technical manager.

INTRODUCTION

The accuracy of oxides of nitrogen (NO_x) and volatile organic compounds (VOC) emissions estimates are critical in SIP modeling and control strategy development. Due to the selection of new modeling episodes for the HGB ozone nonattainment area, on-road mobile source emissions inventories are needed to support development of the SIP updates that would include analysis of the new episodes. This project is part of ongoing efforts to ensure that accurate and detailed mobile source emissions inventories are developed on a schedule to assure availability of all inventories required to support SIP development and TCEQ planning activities. Typically, transportation activity data sets often assume “in-school” scenarios, but some of the ozone episodes under consideration by TCEQ include “non-school” periods, along with both Memorial Day and Labor Day weekends. This task calls for VMT profiles that distinguish between:

- “school” versus “non-school” periods; and
- “regular” weekends versus “holiday” weekends that occur in the Spring and Summer.

ATR DATA AND ANALYTICAL STRATEGY

TxDOT collects ATR vehicle counts at selected locations on a continuous basis throughout Texas. These counts are available by season, month, and day type, as well as on an annual average daily basis (i.e., annual average daily traffic [AADT]). Since they are continuous, they are especially well suited for making seasonal, day-of-week, and time-of-day comparisons (i.e., adjustment factors), even though there may be relatively few ATR data collection locations in any given area. (The TxDOT *Traffic Data and Analysis Manual*, September 2001 constitutes the definitive statement on ATR data collection and control procedures.)

Individual ATR counts vary little from year-to-year. However, using multiple years provides additional stability and robustness to estimates based on these data.

Multiple years of ATR vehicle counts (2000 through 2005) were aggregated by each of the defined areas (region, group, and statewide) for each defined episode (school session, Memorial Day holiday, and Labor Day holiday) to develop geographic and episode-specific VMT hourly profiles and holiday versus control factors. Specifically, for each geographic sub-division and period, holiday versus control period hourly VMT distributions of VMT are compared, and the ratio of holiday VMT to control period VMT is compared. Hourly VMT distributions are compared directly and discussed separately. Daily VMT is compared using a holiday episode to control period factor, which is defined as:

$$Episode\ VMT\ Factor_{(Region)} = \left[\frac{\sum_{Episode} VMT}{\sum_{Control} VMT} \right]_{Region}$$

Hourly VMT is compared as a distribution of hourly values for each area and episode, defined as:

$$Hourly\ VMT\ Factor_{(Episode, Region)} = \left[\frac{\sum_{Hour} VMT}{\sum_{24\ Hour} VMT} \right]_{Hour, Episode, Region}$$

Two comparisons are provided — a comparison of daily VMT for the episode period versus the VMT for the control period, and the hourly distribution itself. A direct test of the significance of the daily VMT comparisons is not possible, since the parameter is a ratio of the two means.

However, a test of the significance of the difference between the two mean values used to produce the ratio is possible, and is provided. This is the standard t test, which is a function of the mean and dispersion of the two sets, generally expressed as:

$$t = (\bar{X} - \bar{Y}) \sqrt{\frac{n(n-1)}{\sum_{i=1}^n (\hat{X}_i - \hat{Y}_i)^2}}$$

Where:

$$\hat{X}_i = (X_i - \bar{X}_i)$$

$$\hat{Y}_i = (Y_i - \bar{Y}_i)$$

The critical role of variance is clearly shown. In the summary tables of episode versus control period VMT for each scenario, significance levels of 0.10 or greater are indicated with an asterisk. The technical interpretation of this statistical test is that one would expect the observed difference to occur by chance with the probability of the significance level (i.e., 0.10 or less). However, in the current context and application, the critical parameter is often the underlying variance. Therefore, the observed significance levels should not be taken to mean that there is no difference between the non-starred observations. Rather, these differences are more sensitive to the inherent variance in the data and may be themselves more variable (and less consistent over time).

The hourly distributions are not amenable to tests of significance, however, an examination and summary of the key aspects is provided (i.e., peaks and duration), as well as comparative plots and tables of the hourly distributions for the episode and control groups. Note that for many of the episode days, especially the holidays themselves, there are no AM peaks and sometimes no PM peaks.

The discussion and presentation of results is organized by episode period (i.e., school session, Memorial Day holiday, and Labor Day holiday). Summary tables and extensive appendices are provided.

Table 1. Scenario Summary – Episode versus Control Periods

Scenario	Episode	Control
School Session	School Days / September through May (Omitting November and December)	Non-School / Summer Day (June - August)
Memorial Day	Memorial Day Weekend (Fridays separate): 26 - 29 May 2000 25 - 28 May 2001 24 - 27 May 2002 23 - 26 May 2003 28 - 31 May 2004 27 - 30 May 2005	Non-Memorial Day Weekend (May - June)
Labor Day	Labor Day Weekend (Fridays separate): 1 - 4 September 2000 31 August - 3 September 2001 30 August - 2 September 2002 29 August - 1 September 2003 3 - 6 September 2004 2 - 5 September 2005	Non-Labor Day Weekend (August - September)

Note that for Memorial Day and Labor Day, the “Weekday” episode is the holiday itself versus control period non-holiday weekdays, and the “Friday” episode is the Friday preceding the holiday weekend versus control period non-holiday Fridays.

School Days

For this analysis, VMT for a “typical” day when local elementary and high schools are in session is compared to a “typical” day when these schools are not in session. Specifically, school days are defined as September through May, omitting November and December to avoid Thanksgiving and Christmas holiday effects. Non-school days are defined as June through August (i.e., summer). The few days in May when school may not be in session in some areas in some years, and the few days in August when school may be in session in some years and some areas vary and are not separated.

Beginning with the more aggregate daily comparisons, Table 2 shows the results of the daily VMT comparisons (significance at 0.10 indicated by an asterisk).

**Table 2. Daily School Day VMT Comparisons
Daily School VMT/Non-School VMT**

Region	Weekday	Friday	Saturday	Sunday
Rural	0.95738*	0.95996*	0.93214*	0.90370*
Austin	0.96824*	0.98479	0.97328	0.96722
Beaumont	0.96247	0.95320	0.94531	0.93777
Dallas	0.95422*	0.97469	0.95315*	0.95391*
El Paso	1.06373*	1.06113	1.04835	1.01469
Houston	1.07544*	1.08810*	1.07365*	1.05635*
San Antonio	0.98194	0.98875	0.97544	0.96405*
Tyler	0.91884*	0.91558*	0.88496*	0.88410*
Urban	0.99166	1.00410	0.98776	0.97842*
Statewide	0.97856*	0.98677	0.96711	0.95237*

As noted, these are factors representing the episode over the control. In other words, these are the factors multiplied by the control VMT to yield the episode VMT. A value of less than 1.0 means the episode VMT (school day) is less than control period VMT (non-school day). A value of greater than 1.0 means that episode VMT (school day) is greater than control period VMT (non-school day). A value of exactly 1.0 means there is no difference between episode (i.e., school year) and control (i.e., non school year) VMT.

Overall, school days show slightly less VMT than non-school days, possibly reflecting increased VMT associated with vacation travel during the non-school period. Exceptions are the El Paso and Houston areas, where average school day VMT is higher than comparable non-school day VMT.

Regarding hourly distributions, no concise summary format is possible, since there are 24 observations for each episode and each control for each geographic aggregation. Tables 3 and 4 show the Weekday and Friday summaries. All the hourly data are provided as an appendix. The principal parameters of hourly VMT distributions are the peaks, specifically their timing and relative magnitude. Peak duration is also a parameter of interest, though more difficult to summarize. Descriptive comments are provided where appropriate. Ultimately, however, recourse to the actual values in the appendices is the best basis for interpretation of peak duration and shape. These are provided in the appendices.

Table 3. Summary of School Year Weekday AM Peak and PM Peak

Memorial Day Weekend

For this analysis, VMT for the individual days of the Memorial Day holiday are compared with a control group of non-holiday days from May and June. The variation of Memorial Day by year is captured, and the pre-Memorial Day Friday is also shown.

Beginning with the more aggregate daily VMT comparisons, Table 5 shows the results of the daily VMT comparisons (significance at 0.10 indicated by an asterisk).

**Table 5. Memorial Day Weekend VMT Comparisons
Memorial Day Weekend VMT/Control (May-June) Weekend VMT**

Region	Holiday	Friday	Saturday	Sunday
Rural	1.04559	1.09888*	1.09350*	0.97475
Austin	0.74075*	1.04008	0.99629	0.90822
Beaumont	0.91013	1.13894	1.10220	1.07708
Dallas	0.71478*	1.04404	0.97681	0.97375
El Paso	0.65273*	1.00911	0.96500	1.01647
Houston	0.74306*	1.01490	1.00259	1.00807
San Antonio	0.72054*	1.00908	1.00060	0.98024
Tyler	1.14445	1.15124	1.09982	1.01411
Urban	0.72760*	1.02472	0.98837	0.97310
Statewide	0.77430*	1.01752	0.99053	0.94709

As anticipated, increased pre-holiday Friday travel is reflected at all levels of aggregation. Similarly, decreased holiday travel is shown for most areas, except for areas with dominant tourist/vacation destinations (e.g., Tyler area). Vacation destinations may have increased distant and local travel reflected in their ratios. Differences on Saturday and Sunday for some of the urban areas, possibly reflects the departure and absence of vacation travelers from those areas. The rural aggregation captures traffic en route, as expected. The statewide pattern is the most typical, reflecting the traditional Friday exodus, followed by reduced travel for the rest of the period. Note the relative lack of statistical significance for the non-holiday days. (See the preceding discussion on interpretation of significance.)

Regarding hourly distributions, no concise summary format is possible, since there are 24 observations for each episode and each control, for each geographic aggregation. Tables 6 and 7 show the Weekday and Friday hourly distribution summaries. All the hourly data are provided as an appendix for further explanation of the following discussion. Recall that the “Weekday” episode is the holiday itself versus control period non-holiday weekdays, and the “Friday” episode is the Friday preceding the holiday weekend versus control period non-holiday Fridays.

The principal parameters of hourly VMT distributions are the peaks, specifically their timing and relative magnitude. Peak duration is also a parameter of interest, though more difficult to summarize. Clearly multiple hour peaks are indicated in the summary tables. Descriptive comments are also provided where appropriate. Ultimately, however, refer to the actual values in the appendices for the best basis of interpreting peak duration and shape.

Table 6. Summary of Memorial Day Holiday AM Peak and PM Peak

San Antonio	0.70055*	1.03027	0.99550	0.98403
Tyler	1.17016	1.13459	1.10787	1.01376
Urban	0.70759*	1.00253	0.97874	0.94085*
Statewide	0.77903*	1.02000	1.00522	0.93823*

Here the traditional pre-holiday Friday exodus is still visible, with the Tyler tourist destination or tourist route dominating, again arguably with both distant and local travel contributing. Note the relative lack of statistical significance for the Tyler area holiday, as well as the non-holiday days in general. (See the earlier discussion on interpretation of significance.)

Regarding hourly distributions, no concise summary format is possible, since there are 24 observations for each episode and each control, for each geographic aggregation. Tables 9 and 10 show the Weekday and Friday hourly distribution summaries. All the hourly data are provided for further explanation of the following discussion. Note that the “Weekday” episode is the holiday itself versus control period non-holiday weekdays, and the “Friday” episode is the Friday preceding the holiday weekend versus control period non-holiday Fridays.

The principal parameters of hourly VMT distributions are the peaks, specifically their timing and relative magnitude. Peak duration is also a parameter of interest, though more difficult to summarize. Clearly multiple hour peaks are indicated in the summary tables. Descriptive comments are also provided where appropriate. Ultimately, however, refer to the actual values in the appendices for the best basis of interpreting peak duration and shape.

Table 9. Summary of Labor Day Weekday AM Peak and PM Peak

Region	Weekday AM Peak				Weekday PM Peak			
	Episode Labor Day		Control August-September Weekday		Episode Labor Day		Control August-September Weekday	
	Hour	Proportion	Hour	Proportion	Hour	Proportion	Hour	Proportion
Rural	NA	NA	08	0.063724	16	0.082641	18	0.078372
Austin	NA	NA	08	0.070726	16	0.074968	17-18	0.067984
Beaumont	NA	NA	08	0.064199	17	0.078408	18	0.078451
Dallas	NA	NA	08	0.072227	16	0.075150	18	0.077266
El Paso	NA	NA	08	0.080515	15	0.070223	18	0.077031
Houston	NA	NA	08	0.074633	15-16	0.073497	18	0.078562
San Antonio	NA	NA	08	0.078057	15	0.078742	18	0.081847
Tyler	NA	NA	08	0.051158	15-16	0.078371	18	0.070636
Urban	NA	NA	08	0.073930	15-16	0.074603	18	0.076829
State	NA	NA	08	0.071840	15-16	0.076845	18	0.077144

NA = No AM Peak.

Note: Hour = local standard time; 08 = 7 a.m.-to-8 a.m.; and 18 = 5 p.m.-6 p.m.; typically, there is no difference at the fourth decimal place for multiple-hour peaks (see Appendix C)

Table 10. Summary of Labor Day Friday AM Peak and PM Peak

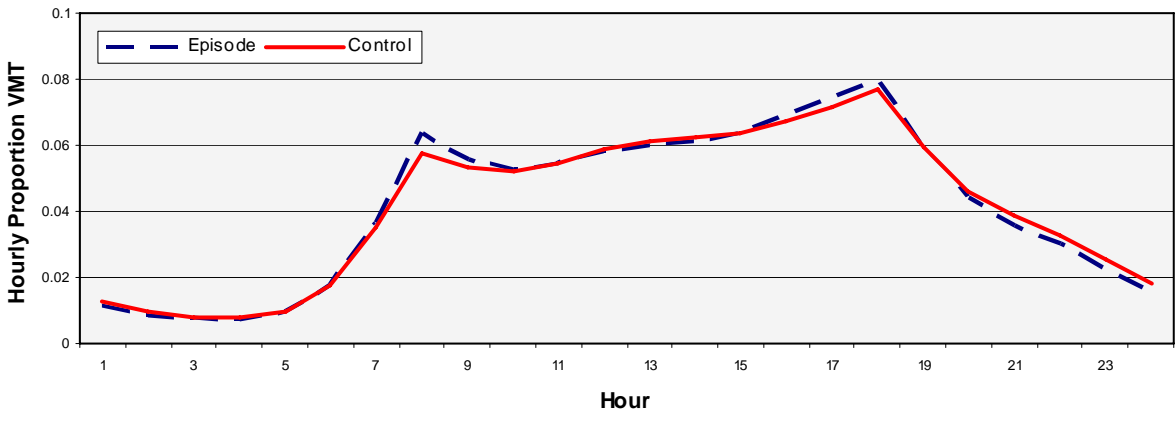

Region	Friday AM Peak				Friday PM Peak
