These comments are directed to Project Number 2007-016-SP-NR the propose Regional Haze SIP revisions.

I am very disappointed in TCEQs failure to propose regional haze SIP revisions that will result in reasonable progress toward meeting the national goal of achieving natural visibility in our national parks by 2064. The inadequacy of your regional haze SIP will mean that Guadalupe Mountains National Park would not achieve natural visibility until 2081, and Big Bend National Park would not achieve clear air until 2155. Moreover, national parks and/or wilderness areas in nearby states are being affected by lack of adequate air pollution control on Texas sources.

While I realize that some of the sources of air pollutants that affect the national parks in Texas are from other states and even other countries, even your own calculations indicate that roughly half of the air pollution that dirties the air at Big Bend and the Guadalupe Mountsins comes form Texas sources. Despite that, your regional haze SIP calls for no new air pollution control strategies to directly address the haze issue. You are relying only on existing state and federal requirements on air polluters that address other issues; and the result is our national parks will suffer from poor air quality long after the air should have been cleared.

I urge you to take back your proposed regional haze SIP and rewrite it to include specific air pollution control measures that will move us closer toward the national goal to clear the air in our national parks in Texas and also in neighboring states.

Thanks for the opportunity to submit these comments.

sincerely,

Jennifer Frasier

Despite that, your regional haze SIP calls for no new air pollution control strategies to directly address the haze issue. You are relying only on existing state and federal requirements on air polluters that address other issues; and the result is our national parks will suffer from poor air quality long after the air should have been cleared.

I urge you to take back your proposed regional haze SIP and rewrite it to include specific air pollution control measures that will move us closer toward the national goal to clear the air in our national parks in Texas and also in neighboring states.

Thanks for the opportunity to submit these comments.

These comments are directed to Project Number 2007-016-SP-NR the propose Regional Haze SIP revisions.

I am very disappointed in TCEQs failure to propose regional haze SIP revisions that will result in reasonable progress toward meeting the national goal of achieving natural visibility in our national parks by 2064. The inadequacy of your regional haze SIP will mean that Guadalupe Mountains National Park would not achieve natural visibility until 2081, and Big Bend National Park would not achieve clear air until 2155. Moreover, national parks and/or wilderness areas in nearby states are being affected by lack of adequate air pollution control on Texas sources.

While I realize that some of the sources of air pollutants that affect the national parks in Texas are from other states and even other countries, even your own calculations indicate that roughly half of the air pollution that dirties the air at Big Bend and the Guadalupe Mountains comes from Texas sources. Despite that, your regional haze SIP calls for no new air pollution control strategies to directly address the haze issue. You are relying only on existing state and federal requirements on air polluters that address other issues; and the result is our national parks will suffer from poor air quality long after the air should have been cleared.

I urge you to take back your proposed regional haze SIP and rewrite it to include specific air pollution control measures that will move us closer toward the national goal to clear the air in our national parks in Texas and also in neighboring states.

Please consider my opinion, as a person who has visited Big Bend and the Guadalupe Mountains since 1970. We simply must do something to reverse the trend of the air pollution building up in these remote national park areas. It is hazy so much of the time, that these vistas are hidden from the public right now, and they are getting worse every year. How thick does the smog have to be, before we consider it an emergency and a health hazard? I'm ashamed for Texas that we can't do better!

Moreover, national parks and/or wilderness areas in nearby states are being affected by lack of adequate air pollution control on Texas sources.

While I realize that some of the sources of air pollutants that affect the national parks in Texas are from other states and even other countries, even your own calculations indicate that roughly half of the air pollution that dirties the air at Big Bend and the Guadalupe Mountains comes from Texas sources. Despite that, your regional haze SIP calls for no new air pollution control strategies to directly address the haze issue. You are relying only on existing state and federal requirements on air polluters that address other issues; and the result is our national parks will suffer from poor air quality long after the air should have been cleared.

I urge you to take back your proposed regional haze SIP and rewrite it to include specific air pollution control measures that will move us closer toward the national goal to clear the air in our national parks in Texas and also in neighboring states.

Thanks for the opportunity to submit these comments.

These comments are directed to Project Number 2007-016-SP-NR the propose Regional Haze SIP revisions.

I am very disappointed in TCEQs failure to propose regional haze SIP revisions that will result in reasonable progress toward meeting the national goal of achieving natural visibility in our national parks by 2064. The inadequacy of your regional haze SIP will mean that Guadalupe Mountains National Park would not achieve natural visibility until 2081, and Big Bend National Park would not achieve clear air until 2155. Moreover, national parks and/or wilderness areas in nearby states are being affected by lack of adequate air pollution control on Texas sources.

YOU BREATHE THE AIR, TOO. Fouling the air in one area is like peeing in a swimming pool--the contamination spreads out everywhere and affects everyone.

These comments are directed to Project Number 2007-016-SP-NR the propose Regional Haze SIP revisions.

I lived in Alpine, Texas as a child in the late 1950's, and remember well how crystal clear the air was. The sky was a deep blue, the mountain ridges crisp, and the stars shown as nowhere else I've lived since. However, when I visit west Texas now, the air is not clear. The haze has robbed us of the vistas and the stars. My 13 year old son has never experienced the clear air as I did. I hope to see the day when he and possibly my grandchildren can experience west Texas as it should be.

I am very disappointed in TCEQs failure to propose regional haze SIP revisions that will result in reasonable progress toward meeting the national goal of achieving natural visibility in our national parks by 2064.
