

For MSS Emissions

Maintenance emissions are not being evaluated currently for combustion sources, but startup and shutdown emissions can be evaluated and permitted. If the load range for normal operations is sufficiently large, a separate evaluation of startup and shutdown emissions may not be needed. If the normal worst case hourly rates are not sufficient for startup and shutdown, worst case emission rates and the number of startups and shutdowns may require further review to ensure BACT has been proposed. The number of hours of operation in the startup and shutdown will also factor into the evaluation of these emissions.

Please contact a member of the Combustion Team at (512) 239-1250 for additional guidance.
