

Improving Water Quality in Oso Bay

A TMDL Project to Protect Recreational Uses

Water quality testing found that concentrations of bacteria are sometimes elevated in Oso Bay (Segment 2485). Bacteria from human and animal waste may indicate the presence of disease-causing microorganisms that pose a threat to people who swim or wade in the creek and bay—activities called “contact recreation” in the state’s standards for water quality.

In response to these conditions, the TCEQ developed a total maximum daily loads for Oso Bay. The goal of a TMDL is to determine the amount (or load) of a pollutant that a body of water can receive and still support its beneficial uses. The allowable load is then allocated among categories of sources within the watershed.

Learn more about water quality standards, monitoring, and TMDLs by reading *Preserving and Improving Water Quality*, available on our website at www.tceq.texas.gov/goto/tmdl/.

Oso Bay Watershed

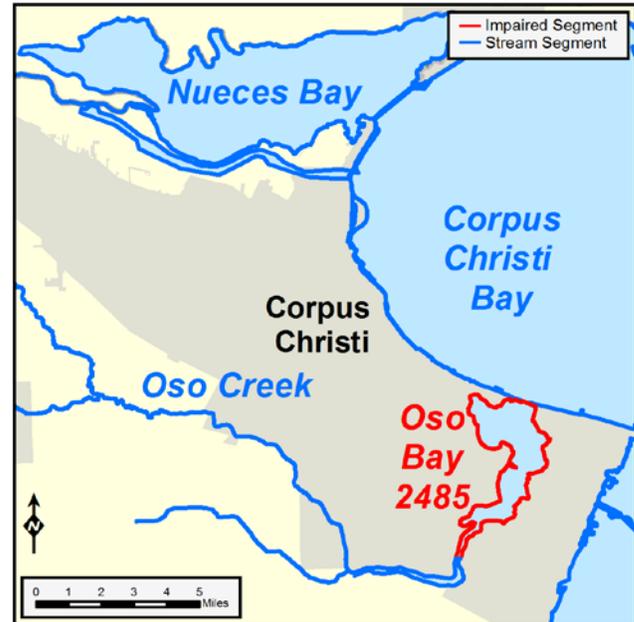

The Oso Bay watershed drains an area of approximately 255 square miles and is located in the northern-most portion of the Nueces-Rio Grande Coastal Basin. The watershed is wholly contained within Nueces County. The bay is an enclosed, shallow body of water situated along the southern shore of Corpus Christi Bay, with a surface area of approximately seven square miles.

Oso Bay receives fresh water from Oso Creek, a stream whose flow is dominated by permitted discharges. Oso Bay exchanges saltwater with Corpus Christi Bay. Ecologically, Oso Bay provides habitat for many plants and animals, and plays an influential role in water purification and storm protection.

Corpus Christi is the only major metropolitan area that lies within the watershed’s boundaries. The only other large community within the watershed is Robstown. Economic activities in and around the bay include oil and gas refining and production, agriculture, manufacturing, and tourism.

Project Development

The TCEQ initiated the TMDL project for Oso Bay in September 2004. The Center for Coastal Studies at Texas A&M University—Corpus Christi did most of the technical studies that supported development of the TMDL. Their work included collecting additional data,

analyzing microbial data, developing a model for bacteria loading to the bay, and completing a technical report of their observations and conclusions.

In a separate but related project, the TCEQ is also developing TMDLs for bacteria concentrations in Oso Creek. Stakeholders are working with the TCEQ to develop a plan to implement the TMDLs (I-Plan). An I-Plan explains the measures that will be used to reduce bacteria in the streams. The stakeholders decided to develop one plan to address both the creek and the bay.

Public Participation

In all its projects, the TCEQ gathers opinion and information from people who represent government, permitted facilities, agriculture, business, environmental, and community and private interests in the watershed. Staff from the Center for Coastal Studies at Texas A&M-Corpus Christi are facilitating stakeholder participation in the I-Plan.

Oso Bay TMDL Status

TCEQ Adoption: August 22, 2007

EPA Region 6 Approval: June 6, 2008

I-Plan Development Status

TCEQ Approval:

Highlights

- The commission adopted the Oso Bay TMDL on August 22, 2007. The EPA approved it on June 6, 2008.
- In summer 2014, the Center for Coastal Studies at Texas A&M University–Corpus Christi began leading the stakeholder effort to develop an I-Plan for Oso Bay and Oso Creek.
