Adverse Effects of Cherryville Wastewater Treatment Plant on Ben O Corp Property

Our family farm, in the name of Ben O Corp, was purchased by my parents in 1943. It is now owned by our 3 daughters, our nephew, and me. Our land is the first property on Dickerson Creek that is downstream from the discharge point of the proposed Cherryville wastewater treatment plant.

If the proposed wastewater treatment plant is built and the plant discharges water on a daily basis into Dickerson Creek, we will no longer be able to use our pastureland like we have since the 1940s. This presents a serious problem to us.

We have three areas of concern that affect our property if the Cherryville wastewater treatment plant permit is approved:

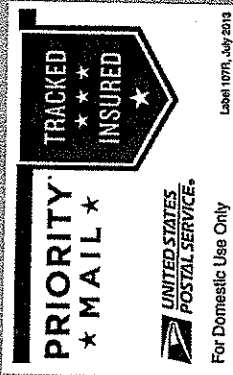

1. The route of Dickerson Creek as shown in the Cherryville application is inaccurate.
 2. Continuous water flow in the creek will adversely affect our pasture grazing and agricultural operations.
 3. The proposed water discharge quality will impair our family use of the creek for recreation.
-
1. The route of Dickerson Creek as shown in the Cherryville application is inaccurate. Attached is a map that shows the route of Dickerson Creek after it crosses under the Hwy 80 bridge, with the route in the application shown in blue. In the early 1970s, TXDOT attempted to reroute the creek along the green line, but they dug a channel for the creek that extends only as far as the arrow on the map. From there, the water spreads out over our pastureland and eventually rejoins the old Dickerson Creek channel in several places (marked with red Xs on the map) near the southern boundary of our property.
 2. Continuous water flow in Dickerson Creek will adversely affect our pasture grazing and agricultural operations. When it rains enough for Dickerson Creek to flow, the water spreads out at the end of the channel and causes several acres of our land to become saturated and marshy, as shown by the cross-hatched area on the map. During these wet times, it is impossible to drive our vehicles (other than a tractor) across the marshy land to get from one side of our pasture to the other and when the pasture is waterlogged and marshy, no grass will grow for the cows to eat. Typically, this is an issue on only a very intermittent basis given today's typical flow. If the plant is built and discharges 160,000 gallons or more of treated wastewater into Dickerson Creek daily, the marshy conditions will become a year-round problem. This will permanently impact our ability to effectively use our pastureland for grazing cattle.
 3. For over 70 years, Dickerson Creek has been used for family recreation. As a child, I and my extended family played and fished in the creek. We seined for perch and crawfish and played in the water. The children of each generation have used the creek for fishing and playing. I now take my grandchildren to the creek to catch perch. It is important to my family that the water quality in the creek allow our traditions to continue for future generations. If the treatment plant is built, it is imperative that the effluent released into Dickerson Creek be treated to the 5-5-2-1 standard.
