

ACKNOWLEDGEMENTS

The authors of the Fisheries chapter thank Ed Klima of the National Marine Fisheries Service for providing shrimp and crab landings data and computer files at no expense to the project. Ms. Nevenna Travis of the Texas System of Natural Laboratories courteously provided information on black drum, blue crab, and grass shrimp. We thank Bonnie Smith for preparing the manuscript and James Hinson for making the base maps of Galveston Estuary used to show catch distributions. The analysis of gill net data was initiated by Dean Keddy-Hector. Dr. Wen Lee offered valuable assistance during all phases of the study.

We would like to thank Robert Kemp, C. E. Bryan, Gary Matlock, and Jim Weaver for having the foresight to recognize that a long-term standard fishery monitoring program was needed to evaluate the status of Texas estuarine living resources. These people were instrumental in designing, implementing, and improving this program and along with Tom Heffernan, Ed Hegen, Larry McEachron and Hal Osburn all played key roles in its execution: assuring the appropriate collection of samples, and the recording, editing, and correction of the data were done.

Space does not permit us to name each Coastal Fisheries Biologist and Technician who actually took the thousands of samples that produced the data in this report, but our thanks go to every one of them. Without their work this report would not have been possible. In spite of freezing weather and coastal storms, they did not miss more than a half a dozen samples out of the several thousand required during the fourteen year period, a truly remarkable record. We especially thank Brenda Bowling for diligently looking through old data records and getting corrections back to us quickly. We also thank her and her colleagues for giving us a taste of sampling in the field.

We thank Gary Matlock, Hal Osburn, C. E. Bryan, David Hankla, Ken Teague, B. D. King, Julie Massey, Brenda Bowling, and Catrina Martin for critically reviewing the manuscript.

The authors of the chapter on Birds and Alligators thank Keith Arnold for graciously allowing us access to years of catalogued CBC data. We also acknowledge Rudolph Freund and John Eltinge for their guidance and suggestions on statistical analyses. Donna Renfrow provided helpful editorial comments.

All of us thank the Environmental Protection Agency and the Galveston Bay National Estuary Committee for providing the funds that made these data analyses and the report possible.
