The Joint Groundwater Monitoring and Contamination Report was designed and produced by the Texas Groundwater Protection Committee in fulfillment of requirements given in Section 26.406 of the Texas Water Code. The effort was partially funded by the U.S. Environmental Protection Agency. While the information contained in the report represents the contribution of each individual participating agency and group, the report as a whole is the work of the committee and does not necessarily reflect all of the views and policies of each participating organization.

Authorization for use or reproduction of any original material contained in this publication, which is not obtained from other sources, is freely granted. The committee would appreciate acknowledgment.

Published and distributed by the

I. SUMMARY

The Texas Groundwater Protection Committee (TGPC) was created by the 71st Texas Legislature in 1989 to bridge gaps between existing state groundwater programs and to optimize water quality protection by improving coordination among agencies involved in groundwater activities. The legislation, found in Texas Water Code (TWC), [§§26.401 through 26.408](#), accomplishes the following:

- sets out the state's groundwater protection policy;
- provides legislative recognition for the TGPC;
- requires the TGPC to coordinate the groundwater protection activities of state agencies;
- requires the TGPC to develop and update a comprehensive groundwater protection strategy for the state; and
- requires the TGPC to develop the format for notices of groundwater contamination.

State law requires the TGPC to publish an annual report on groundwater monitoring activities as well as cases of documented groundwater contamination associated with activities regulated by state agencies. The TGPC is required to prepare this report based on the activities of its members: the Texas Commission on Environmental Quality (TCEQ), the Texas Water Development Board (TWDB), the Railroad Commission of Texas (RRC), the Texas Department of State Health Services (DSHS), the Texas Department of Agriculture (TDA), the Texas State Soil and Water Conservation Board (TSSWCB), the Texas Alliance of Groundwater Districts (TAGD), the Texas A&M AgriLife Research (TAMAR), the Bureau of Economic Geology of the University of Texas at Austin (UTBEG), and the Texas Department of Licensing and Regulation (TDLR).

This is the TGPC's 29th edition of the *Joint Groundwater Monitoring and Contamination Report*, which was first issued in 1990. As required in the statute, each report is based on data from the previous calendar year.

This report describes the status of groundwater monitoring programs for each participating agency, and describes 3,426 groundwater contamination cases documented or under enforcement during the 2017 calendar year. The report further describes the enforcement status of each case of groundwater contamination in the accompanying tables.

Purpose and Scope

The annual report describes the status of groundwater monitoring activities conducted or required by each agency at regulated facilities or associated with regulated activities. Groundwater monitoring is conducted by members of the TGPC to assure regulatory compliance for groundwater protection, and to assess ambient groundwater quality. The

report provides a general overview of groundwater monitoring by participating members on a program by program basis.

Additionally, the report provides the status of documented groundwater contamination reasonably suspected of having been caused by activities regulated by state agencies. The report contains a description of each case of groundwater contamination newly documented during the previous calendar year, along with a description of each contamination case documented during previous periods for which remedial or enforcement action was incomplete at the time the preceding report was issued. The [report tables](#) contain the status of enforcement action for each listed case.

Groundwater contamination is broadly defined in the report as any detrimental alteration of the naturally occurring quality of groundwater. The definition is limited, however, to contamination suspected of being associated with activities under the jurisdiction of the contributing agencies and affecting usable-quality groundwater.

Naturally occurring groundwater conditions, such as a high degree of mineralization that may exceed established standards for public supplies of drinking water, are not included within the definition. The scope of the report is further limited to groundwater contamination that has been documented and to cases that are currently under enforcement action.

Historical cases of documented contamination have not been included unless enforcement action is still active, open, or ongoing. However, cases that have been included in the reports from 1994 through 2016 as “action completed,” with a notation of “no further action needed,” and those that use institutional or engineering controls where groundwater contamination is still present, are included separately in [Appendix 8](#). For these cases, though no enforcement action is currently active, the appendix provides a record that the groundwater contamination is or may still be present.

The report provides technical and administrative agency file numbers and file locations for groundwater contamination cases, district and regional office locations ([Appendix 6](#)), and agency contacts ([Appendix 7](#)) to assist those who are interested in obtaining or reviewing case-specific data. In addition, for each agency the report includes information on monitoring and regulatory rules and policies of groundwater-related programs. This information is compiled to assist the public and state policy makers in interpreting the status of groundwater contamination in the state and the degree of state agency response directed toward the contamination.

This report satisfies the legislative requirement of TWC, §26.406 to provide the enforcement status of each case. However, there are specific geographic constraints and the enforcement authorities and procedures of each contributing entity that one should consider when interpreting

the report. The conclusions on groundwater contamination and the related specific enforcement actions taken by each individual agency are not subject to the review of the TGPC.

Notification to Local Officials and Public Information

This report is compiled and made available to the public to provide the annual status of groundwater monitoring associated with the regulatory, planning, and administrative programs of state agencies and local groundwater conservation districts (GCD). The report also gives the annual status of documented groundwater contamination, reasonably suspected of having been caused by activities under the jurisdiction of those programs. Monitoring is discussed in the individual program descriptions.

State law (TWC, §26.406) requires the agencies that have groundwater protection responsibilities to maintain a file of all documented cases of groundwater contamination. This information is a matter of public record and is available for public review by arrangement with the reporting agency. All groundwater contamination cases documented or under enforcement during 2017 are listed in [Tables 1, 2, and 3](#) of this document.

While TWC, §26.406 requires the report tabulate all cases of groundwater contamination documented or under enforcement for the preceding calendar year, TWC, §5.236 also requires the TCEQ to provide notice to local officials about groundwater contamination that may affect drinking water supplies in their area. Table 1 identifies these cases with a “Y” in the column headed “SECTION 5.236.”

A copy of this report or a web link to access the report is provided to county judges and local public health entities to supply information on potential groundwater impacts to drinking water supplies within the listed counties. The report serves as the TCEQ’s secondary notice to local officials, who should have received letters advising them of new cases, as well as newly confirmed cases, meeting the criteria of potential impact to drinking water. The TWC, §5.236 cases are identified in the report only during the first year that the case is determined to affect or have the potential to affect a public drinking water supply. There are 106 reported TWC, §5.236 cases identified in Table 1, eleven (11) of which were included because public notice was provided in a previous year that the case was new but not indicated as such.

[TWC, §26.408](#) became effective on September 1, 2003, and requires TCEQ to provide notice of groundwater contamination to affected GCDs and to owners of potentially affected private drinking water wells. This state law requires the TCEQ to provide this notice within 30 days of the date the agency either becomes aware of or documents the contamination, and

requires the TGPC to adopt rules to prescribe the form and content of the required notice. TGPC rules in Title 31, Texas Administrative Code (31 TAC), §601.10, effective on November 12, 2003, prescribe the required TCEQ groundwater contamination notice contents ([Appendix 4](#)).

Groundwater Protection

TWC, Chapter 26 empowers the TCEQ to establish the level of water quality to be maintained, and control sources of pollutants that may affect the quality of water in the state, including groundwater. Certain activities requiring the regulatory protection of groundwater are also under the jurisdiction of the RRC, the TDA, the TSSWCB, and the TDLR.

The TAGD as an organization has no regulatory or enforcement mandate, but some GCDs have limited authority for action on groundwater contamination. The TWDB has certain monitoring responsibilities regarding groundwater characterization and planning, but is not authorized to regulate activities that may contaminate groundwater. The TAMAR and the UTBEG conduct research activities related to groundwater.

The goal of the state's groundwater protection policy as stated in [TWC, §26.401](#), (see [Appendix 2](#)) is that usable and potentially usable groundwater be protected and maintained, recognizing that, among other things, the state's aquifers are variable both in their potential for beneficial use and in their susceptibility to contamination. This policy aims for nondegradation and maintaining water quality for existing and potential uses of groundwater, consistent with protecting the environment and public health and welfare, and maintaining and enhancing the long-term economic health of the state.

The policy recognizes that a goal of nondegradation does not mean zero-contaminant discharge. It is recognized that the responsible state agencies will utilize best professional judgement in attaining the stated goals and policy.

The TGPC identified groundwater classification ([Appendix 3](#)) as an important tool to be used in the implementation of the state's groundwater protection policy and developed such a system for use by state agencies. Through classification, the groundwaters in the state can be categorized, and protection or restoration measures can then be specified by member agencies according to the quality and present or potential use of the groundwater. The classification developed by the TGPC is based on water quality criteria supporting present and potential uses.

The state's policy on groundwater contamination is that the quality should be restored if feasible. Recognizing that, in some cases, it may not be technically possible or cost-effective to clean groundwater to its original quality, the TGPC recommends an approach that focuses on

protection of groundwater for its highest quality use related to human health and the environment, while addressing the costs of available remediation technologies.

Groundwater Monitoring

The groundwater monitoring programs of the participating entities generally fall within one of three categories:

- regulatory agencies that require or conduct monitoring to assure compliance with guidelines and regulations for the protection of groundwater from discharges of contaminants,
- agencies or entities that conduct monitoring to assess ambient or existing groundwater quality conditions and to track changes in water quality over time, or
- agencies or entities that conduct research activities related to groundwater resources and groundwater conservation.

This report includes detailed monitoring program descriptions for each of the participating entities within Section IV, entitled “[Groundwater Protection Program Descriptions](#).”

Each regulatory agency that requires or conducts groundwater monitoring to assure compliance with guidelines and regulations to protect groundwater from discharges of contaminants has its own monitoring program requirements and procedures. Criteria used to assess the need for groundwater monitoring vary among the regulatory entities.

Approximately 48,000 monitoring and water wells are utilized for groundwater monitoring purposes at nearly 13,000 regulated facilities. Most of the monitored facilities (approximately 94 percent) are under the jurisdiction of the TCEQ, with the remainder under the jurisdiction of the RRC (six percent).

The TWDB and the member districts of the TAGD monitor groundwater to assess ambient groundwater quality conditions and to track changes in water quality over time. Monitoring program activities reported by the TWDB and participating organizations involved 418 water wells and monitoring sites (including springs) in 2017.

Additionally, monitoring programs are sometimes developed for water-quality assessment studies that target specific geographic areas, specific contaminants or constituents, or specific activities. Contamination cases discovered by these agencies or entities through groundwater studies or sampling programs are referred to the regulatory agency with appropriate jurisdiction.

The ambient groundwater monitoring network has historic limitations for the parameters that have been analyzed. There are very few historical analyses available for constituents that can generally be attributed to anthropogenic (human-influenced) sources. There are limited analyses available for constituents such as volatile and synthetic organic compounds and certain heavy metals.

Ambient monitoring has not traditionally targeted pesticides. Drinking water analyses conducted under the Safe Drinking Water Act (SDWA) include some pesticides in their suite of chemicals; however, this program targets “finished” water rather than groundwater specifically. Analyses conducted under the United States Geological Survey (USGS) National Water Quality Assessment (NWQA) program also include pesticides in a wide range of constituents. The TCEQ, TWDB, and members of TAGD have conducted a cooperative program since the year 2000 where ambient groundwater samples collected by TWDB and GCD staff are analyzed by TCEQ staff, mainly for the pesticides atrazine and metolachlor.

In general, the waste disposal programs of the TCEQ and the RRC monitor existing and permitted facilities. Groundwater monitoring requirements have been established for the petroleum storage tank (PST), industrial and hazardous waste, municipal waste, underground injection control, pollution cleanup, and enforcement programs. Initiatives in the municipal and industrial wastewater permitting program have required groundwater monitoring at facilities where activities pose a higher risk to groundwater quality. Additionally, permits required for surface storage and disposal of oil and gas waste and brine retention ensure the protection of groundwater by requiring pond liners, leak detection systems, groundwater monitoring, or a combination of these methods.

In the drinking water program, public water supply wells are also regulated by the TCEQ’s Office of Water. Public water systems receive sufficient monitoring to ensure that violations of drinking water standards are detected and addressed before water is distributed to consumers.

Currently, there is no state program for monitoring domestic wells, though some GCDs do have programs that routinely monitor private water wells for ambient conditions or suspected contamination. The TDLR is responsible for licensing water well drillers, responding to complaints and routinely checking compliance with TDLR rules. The TAMAR provides outreach, continuing education programs, and other educational services on water quality to the people of Texas.

Groundwater Contamination

Most of the groundwater contamination cases listed in this report were documented through regulatory requirements for compliance monitoring, with the majority identified during release-detection monitoring in the

TCEQ's PST program. Other information in this report identifies groundwater contamination cases that have been documented through investigations in response to groundwater contamination complaints, permits, or self-reporting. Groundwater contamination is, however, most commonly detected when site-specific groundwater monitoring is conducted at waste disposal or product storage sites.

Groundwater contamination, as defined by the TGPC for this report, is the detrimental alteration of the naturally occurring physical, thermal, chemical, or biological quality of groundwater, reasonably suspected of having been caused by the activities of entities under the jurisdiction of the agencies discussed within this report. The TGPC recognizes that groundwater contamination may result from many sources, including current and past oil and gas production and related practices, agricultural activities, industrial and manufacturing processes, commercial and business endeavors, domestic activities, and natural sources that may be influenced by human activities. The contamination cases identified in this report are primarily those where contaminants have been discharged to the surface, to the shallow subsurface, or directly to groundwater from activities such as the storage, processing, transport, or disposal of products or waste materials.

Documented in this report are 3,426 groundwater contamination cases. These cases are presented in a tabular format in Section V, entitled "[Groundwater Contamination Case Description Tables](#)." Approximately 83.5 percent (2,860) of the documented cases fall under the jurisdiction of the TCEQ. The remainder of the cases fall under the jurisdiction of the RRC (565 cases, or approximately 16.5 percent), and the GCDs, which are members of TAGD (one case, or less than 0.1 percent).

On occasion, a contamination site may be listed more than once for some TCEQ program areas. This occurs because there is more than one occurrence of contamination at the named facility, and each occurrence is being addressed as a separate case. In the case of the Voluntary Cleanup Program (VCP), several parties may be affected by a groundwater contamination plume, and each of these parties is listed as a separate "case" in the VCP. Every effort has been made to distill cases down to a single, individual occurrence of groundwater contamination.

The most common contaminants reported include gasoline, diesel, and other petroleum products. These constituents are reflective of the fact that more than half (54.3 percent) of TCEQ's documented contamination cases were reported by the PST Program. Some of the other contaminants found at the sites in this report include heavy metals; organic compounds such as phenols, trichloroethylene, carbon tetrachloride, dichloroethylene, naphthalene, creosote constituents, and various solvents; and pesticides, such as dieldrin, BHC, and dicamba.

The report indicates the status of enforcement action for each case of groundwater contamination. Codes describing the enforcement status

and the activity status are given in the tables. In general, regulatory programs are structured to achieve the desired degree of environmental protection at the lowest possible level of agency oversight. The enforcement status code represents the level of agency procedural action in pursuing investigation and remediation.

Describing an agency's enforcement actions presents only half the regulatory picture. Enforcement is ineffective if the required corrective actions are not carried out; therefore, agency activities dealing with contamination incidents are assigned an activity status code. This code represents the current action addressing the assessment and mitigation of the contamination case. These two indicators (enforcement status and activity status codes) are plotted as a matrix to illustrate the overall enforcement status of each contamination case.

The cumulative number of cases that have been assigned each enforcement status code is found in the enforcement status summary matrix at the end of each agency's groundwater contamination case table. The enforcement status matrix, enforcement status codes, and activity status codes are discussed in detail in the "[User's Guide](#)" beginning on page 36 of this report. Specific enforcement actions are typically described in each agency's program description.

The total number of groundwater contamination cases documented and identified by the TGPC in this and previous reports are tabulated in [Figure 1](#), along with the activity status for these cases. All of the 3,426 cases listed in the data tables of this report have documented groundwater contamination. The activity status for each case is identified in the tables, and is summarized as follows for calendar year 2017 (the Activity Status Code, or ASC, is noted in parentheses for each item):

- No activity has occurred in 258 reported cases (ASC=0).
- Detection of contamination is confirmed (validated) in 288 cases (ASC=1).
- Investigations are ongoing for the largest number of cases: 1,147 (ASC=2).
- Corrective action planning is complete in 216 cases (ASC=3).
- Action was implemented in 454 cases (ASC=4).
- Monitoring action is ongoing in 615 cases (ASC=5).
- No further action is necessary for 456 cases designated as "action completed" (ASC=6).
- No activity status information was provided for 13 cases.

[Figure 2a](#) is a graph showing the total number of documented contamination cases, the number of new cases of contamination, and the number of sites where enforcement action was completed, plotted

against the calendar year of the report. [Figure 2b](#) is a graph showing the historical activity status of groundwater contamination cases, plotted against the calendar year of the report.

Several general observations may be drawn from the limited data represented in [Figures 1, 2a](#), and [2b](#). The limitations of the data do not allow for forecasting of probable trends. In addition, the use of the term "trend" may be too definitive, and should only be considered as a general observation of the historic data compiled to date.

The number of new cases had annually decreased up to 1995, but increased in that year and continued to increase through 1998. These increases are chiefly attributed to increased release detection activity in the Texas Natural Resource Conservation Commission's (now TCEQ's) Petroleum Storage Tank program, as well as to the initiation of milestone deadlines related to detection monitoring and cleanup expense reimbursement. These milestone deadlines required some types of remediation activities to be in place before the end of 1998 to qualify for reimbursement. Another part of the upward trend in the number of new cases can also be attributed to cases being reported under the Voluntary Cleanup Program of the TCEQ, which was established in 1995.

Historically, the number of new groundwater contamination cases documented each year has been greater than the number of cases in which action was completed during the same year. This was evident in the initial publication of the report in 1989, and continued through the 1999 calendar year. (The elevated number of cases where action had been completed in the initial report was cumulative up to the end of 1989, because this reporting period was open-ended, including historical cases before 1989.)

Starting in 2000, the number of new groundwater contamination cases has remained lower than previous years, and has been relatively stable. New cases have ranged from a low of 272 in 2014 to a high of 654 in 2005. The average number of new cases during that period is approximately 481, which is significantly lower than the number of new cases each year before 2000. The number of new cases reported in 2017 was about 16% higher than the previous year, which is within the general variance seen since 2000.

The number of completed cases has varied over the years, and has remained relatively steady for the past 20 years, with year-to-year variances from the 20-year annual average of 758 cases completed. In 2017 there were 456 cases with the status "action completed," which was a slight increase from 2016.

The number of cases shown as having "contamination confirmed" peaked in 1991 at 1,717 cases, and while they have since fluctuated, there was a general decline until 2013. For the past five years the number of cases has remained relatively steady, between 288 and 373 cases.

Cases listed as being under “ongoing investigation” and “corrective action planning” reached a relative plateau from 1992 through 1996. The number of cases shown as being under “ongoing investigation” began to rise again in 1996, to peak in 1999 and has generally declined since 2000, remaining relatively steady at approximately 1,100 cases for the past three years. This may be because groundwater contamination tends to move slowly, and remediation can be time consuming.

Cases listed as having “action implemented” reached a relative plateau approximately one year after the plateau seen for “corrective action planning” and shows a general trend lower most years beginning in 2000. This may indicate that the cases are moving through the sequence of actions that should ultimately lead to completion. The overall numbers likely reflect the maturing of the TCEQ regulatory programs, though some differences may be seen if there are case increases resulting from regulatory initiatives.

For all the agencies and entities over the 20-year period from 1998 through 2017 ([Figure 1](#)), action was considered “complete” on a total of 15,150 groundwater contamination cases, and each of these cases was dropped from the successive annual report. Action was completed on 456 cases in 2017, meaning the desired remedy was achieved or no further regulatory action was required.

Figure 1. 20-Year Case History of Groundwater Contamination

Figure 2a. 20-Year Case History of Groundwater Contamination: Total, New, and Completed Cases

Figure 2b. 20-Year Case History of Groundwater Contamination: Trends for Activity Status Codes

II. GROUNDWATER PROTECTION

The following section gives an overview of groundwater protection topics, including: the Texas Groundwater Protection Committee (TGPC), the state's groundwater protection policy, the TGPC's recommended groundwater classification system, risk-based cleanup levels for groundwater, the definition of groundwater contamination as it applies to this report, and notification to and from regulatory agencies concerning groundwater contamination. Additional sources of public information are also discussed.

Texas Groundwater Protection Committee

The 71st Texas Legislature created the TGPC in 1989 to bridge gaps between existing state groundwater programs and to optimize water-quality protection by improving coordination among agencies involved in groundwater activities. State law codified in [TWC, §§26.401 through 26.408](#) established the TGPC; outlined the TGPC's powers, duties, and responsibilities; and established the state's groundwater protection policy.

The TGPC actively identifies opportunities to improve existing groundwater quality programs and promotes coordination between agencies. The TGPC also strives to improve or identify areas where new or existing programs could be enhanced to provide added protection. Major responsibilities of the TGPC include:

- improving interagency coordination for groundwater protection;
- developing and updating a comprehensive groundwater protection strategy for the state;
- studying and recommending to the Legislature groundwater protection programs for areas in which groundwater is not protected by current regulation;
- publishing an interagency groundwater monitoring and contamination report;
- each biennium, prior to each regular legislative session, filing a report of the TGPC's activities with the governor, lieutenant governor, and speaker of the House of Representatives, including any recommendations for legislation related to groundwater protection;
- advising the Texas Commission on Environmental Quality (commission, or TCEQ) on the development of agricultural chemical plans to prevent groundwater pollution; and
- developing the form and content groundwater contamination notices.

By statute, the TGPC's membership is composed of the following individuals or their designated representative:

- the executive director of the TCEQ;
- the executive administrator of the Texas Water Development Board;
- the executive director of the Railroad Commission of Texas;
- the commissioner of health of the Texas Department of Health (now the Texas Department of State Health Services);
- the deputy commissioner of the Department of Agriculture;
- the executive director of the State Soil and Water Conservation Board;
- a representative selected by the Texas Alliance of Groundwater Districts;
- the director of the Texas Agricultural Experiment Station (now Texas A&M AgriLife Research);
- the director of the Bureau of Economic Geology, University of Texas at Austin; and
- a representative of the Water Well Drillers and Water Well Pump Installers Program of the Texas Department of Licensing and Regulation selected by the executive director of the department.

The TCEQ is designated as the lead agency for the TGPC and administers the activities of the TGPC. The executive director of the TCEQ serves as the TGPC's chairman and the executive administrator of the TWDB serves as the TGPC's vice-chairman. TGPC members and their designated representatives are listed in [Appendix 1](#).

Federal Involvement and Coordination

The TGPC actively coordinates with federal agencies on groundwater protection issues that affect the state. The TGPC has worked with federal agencies on issues related to a comprehensive state groundwater protection program and the development of pesticide management plans for the prevention of groundwater contamination. In addition, the TGPC has regularly provided national level input to federal agencies on groundwater protection and program issues through the Ground Water Protection Council (an association of state groundwater and underground injection control program directors) and the State FIFRA Issues Research and Evaluation Group, (a group formed by state agricultural regulatory officials and U.S. EPA to discuss and evaluate pesticide matters affecting states), and other state and federal stakeholder and regulatory guidance groups.

The TGPC also works closely with the U.S. Geological Survey (USGS), the federal agency with responsibilities that include national level geologic mapping and hydrologic studies. Staff of the USGS participated in various TGPC-sponsored projects, providing groundwater expertise and opportunities for state input in federally-sponsored research.

In March 1985, the Texas Department of Water Resources, predecessor to the TCEQ and the TWDB, received a grant from the EPA to improve the coordination of groundwater protection activities undertaken by state agencies. In response to this federal initiative, the interagency Groundwater Protection Committee, predecessor to the Texas Groundwater Protection Committee, was formed. Since that time, the coordination of groundwater protection activities of the various state programs and agencies and the development of a groundwater protection strategy have been funded through EPA grants administered under the Clean Water Act (CWA), §106.

State Groundwater Protection Strategy

In evaluating the states' activities under the groundwater protection strategy initiative begun in the early 1980s, the EPA concluded that additional efforts were needed to protect the nation's groundwater. The EPA found that existing groundwater protection programs were a patchwork of federal, state, and local efforts that addressed individual sources of contamination rather than attempting to protect the resource as a whole. During fiscal years 1992 and 1993, the EPA published guidance for the development of comprehensive state groundwater protection programs (CSGWPP). The CSGWPP guidance published early in 1993 encourages the states to further develop existing programs into a more comprehensive approach.

Though the CSGWPP program is no longer an active EPA program, the TGPC is charged by statute with developing a comprehensive strategy that coordinates the activities of all the participating agencies and documents what needs to be done to protect groundwater in the State of Texas. The TGPC addressed this duty directly in 1988 through the formal publication of the *Texas Ground Water Protection Strategy*. Since that time, there have been several documents published that describe changes to the groundwater protection programs and authorities of state agencies with respect to groundwater. This includes the *Texas Ground Water Protection Profiles*, 1991, and later the annual *Joint Groundwater Monitoring and Contamination Report*. There have been many changes in agencies and the programs that they administer since 1988. The more recent publications have focused on the water quality aspects of various programs rather than the state strategy for groundwater protection.

Recognizing the changes that have occurred since the state's first groundwater protection strategy was developed, the TGPC decided in January 2001 to begin the process to update it. That process resulted in the document, *Texas Groundwater Protection Strategy*, TCEQ Publication No. AS-188, February 2003 (see: https://www.tceq.texas.gov/assets/public/comm_exec/pubs/as/188.pdf). This document provides a road map for the current activities of the TGPC. It is divided into thematic sections designed to highlight the state's current protection activities, and importantly, identify any gaps that may need to be filled among those programs. This *Strategy* includes:

- the state's groundwater protection goal as established by the Legislature;
- the statewide groundwater classification system and how the state identifies contamination and quantity issues;
- the roles and responsibilities of the various state agencies involved in groundwater protection and discusses the TGPC as a coordinating mechanism;
- examples of how the various state agencies implement groundwater protection programs through regulatory and non-regulatory models;
- how the local, state, and federal agencies coordinate management of groundwater data for the enhancement of groundwater protection;
- the role that research plays in understanding groundwater's importance and the importance of coordinating research;
- public education related to groundwater being performed in the state;
- public participation in establishing and implementing groundwater policy;
- a plan to update the groundwater strategy;
- proposals for the next document to identify and rank significant threats to the state's groundwater resources, consideration of the vulnerability of groundwater resources, and a prioritization of actions to address those threats; and
- recommendations and possible actions that could be taken to protect groundwater.

The TGPC is currently revising the 2003 *Strategy* to provide an updated road map and address new challenges. Once finalized, this updated *Strategy* will be made available on the [TGPC's website](http://tgpc.state.tx.us/) <<http://tgpc.state.tx.us/>>.

TGPC Meetings

Members of the public are invited to all TGPC meetings and subcommittee meetings. The TGPC and its subcommittees meet once per quarter.

Meeting times and agendas are published on the TGPC's website at <<http://www.tgpc.state.tx.us/meetings>> and in the *Texas Register* on their open meetings website at <<http://www.sos.state.tx.us/open/index.shtml>>.

The TCEQ maintains written records of all TGPC meetings, and maintains a mailing list of TGPC members (designated and alternate members), agency staff, and interested parties for meeting notification.

Groundwater Protection Policy

TWC, §26.401 establishes the state's groundwater protection policy (see [Appendix 2](#)), which establishes a goal of nondegradation of groundwater resources for all state programs. The policy recognizes the variability of the state's aquifers, the importance of maintaining water quality for existing and potential uses, the protection of the environment and the public health and welfare, and the maintenance and enhancement of the long-term economic health of the state. Further, the policy recognizes that groundwater contamination may result from many sources, including current and past oil and gas production and related practices, agricultural activities, industrial and manufacturing processes, commercial and business endeavors, domestic activities, and natural sources that may be influenced by, or may result from, human activities. The use of the best professional judgment by the responsible state agencies in attaining the goal and policy is also recognized.

The policy states that discharges of pollutants, disposal of wastes, and other regulated activities should be conducted in a manner that will maintain present uses and not impair potential uses of groundwater or pose a public health hazard. The programs of the various state agencies are generally coordinated to attain this goal.

Groundwater Classification System

The TGPC and its member agencies recognize that groundwater classification is an important tool to be used in the implementation of the state's groundwater protection policy. Through classification, the groundwater in the state can be categorized and protection or restoration measures can then be specified by member agencies according to the quality and present or potential use of the groundwater.

The TGPC has developed a Groundwater Classification System for use by state agencies. Four groundwater classes are defined based on the concentration of total dissolved solids (TDS). The names and concentration ranges are based on traditional nomenclature associated with each class. Fresh groundwater is classified as having a TDS concentration range from zero to 1,000 milligrams per liter (mg/l); slightly saline groundwater has a TDS concentration range from 1,000 to 3,000 mg/l; moderately saline groundwater, a TDS concentration range from 3,000 to 10,000 mg/l; and very saline groundwater to brine, a TDS concentration greater than 10,000 mg/l. Quality also determines usability; however, it is implicit in the classification that a water-bearing zone must be able to produce sufficient quantities of water to meet its intended use. [Appendix 3](#) contains the Groundwater Classification System developed by the TGPC.

The Groundwater Classification System applies to all groundwater in the state. In assigning a classification, the member agencies attempt to use the natural quality of the groundwater that is unaffected by discharges of

pollutants from human activities. All usable and potentially usable groundwater is subject to the same protection provided by the state's groundwater protection policy. Starting with the nondegradation goal, protection or restoration measures can be varied according to the response level set by the classification so long as the following conditions are met:

- current groundwater uses are not impaired;
- potential groundwater uses are not impaired;
- a public health hazard is not created; and
- the quality of groundwater is restored if feasible.

In determining protection or restoration measures, an agency considers all present or potential beneficial uses of groundwater of a given quality. Generally, drinking water for human consumption would require the highest degree of groundwater protection or restoration. Protection for this use will also, arguably, be protective of all other current or potential uses. These considerations facilitated defining two response levels for purposes of assigning protection or restoration measures that are commensurate with the potential to impact human health and the environment.

- Level I response for the fresh, slightly saline, and moderately saline classes should be based on the current or potential use as a human drinking water supply.
- Level II response for the very saline to brine class should be based on indirect exposure (i.e., by means other than drinking) or no human consumption.

In specifying a protection or restoration measure, member agencies should apply best professional judgment on a case-by-case basis. Evaluations to be made include, but are not limited to, such factors as productivity, the availability of alternate sources of water, background concentrations of naturally occurring constituents, the effects of constituents on usability, traditional and potential beneficial uses of the water, economic and technical feasibility of treatment, and projected needs for and types of impacts on these groundwaters.

The classification system is intended to be implemented by member agencies as an integral part of their groundwater protection programs. In addition to its response-setting function, the classification system fosters consistency among the various programs.

Risk-Based Remediation Programs

The state's policy on groundwater contamination provides that water quality be restored if feasible ([Appendix 2](#)), and consequently requires that groundwater be kept reasonably free of contaminants that would interfere with present uses or impair future uses of groundwater. In response, the TCEQ has developed an approach that focuses on

protection of groundwater for high quality uses, including human health. The TCEQ, which has primary jurisdiction for the regulatory protection of groundwater, has implemented a risk-based approach in setting cleanup levels that is based on sound science, flexibility, and common sense.

There are many ways that risk-based considerations could be incorporated into a groundwater remediation program. Generally, a risk-based approach takes into consideration the current and/or potential future exposure of humans to unprotective concentrations of contaminants. In addition to consideration of exposure pathways, risk-based determinations using dose-response data are used to calculate human health-protective concentrations of chemicals in environmental media. The primary exposure pathway for humans to groundwater is through ingestion. However, humans can also be exposed via air inhalation of chemicals that have volatilized from groundwater to ambient or indoor air. Also, humans may be exposed to contaminants by dermal contact with and the ingestion of surface water that has been affected by the discharge of contaminated groundwater into the surface water body. Likewise, if humans consume fish from such a surface water body, then the person conducting the assessment would also need to consider fish consumption as an additional human exposure pathway when determining cleanup levels for contaminants in groundwater. Since the mid 1990's, some agency rules have required risk-based concentration levels to be protective not only of human health but also of ecological receptors. The process for determining ecologically-protective concentration levels has been substantially improved in the last decade.

Depending on the level of the risk and the current regulatory policies, risk management may involve no-action, engineering solutions such as soil and groundwater remediation or physical controls, or institutional controls such as deed restrictions or limiting access to the site. Thus, risk-based decision-making can be protective of human health and the environment, and offers a scientifically sound and administratively effective way to respond to the pressures for timely action at large numbers of sites and the efficient use of both public and private resources. The TCEQ has incorporated risk-based corrective action into its rules and policies and has made many of the risk management policy decisions up front to streamline and add consistency to the remediation process.

The Texas Risk Reduction Program

Texas Risk Reduction Program (TRRP) rule is the current remediation rule (30 TAC, Chapter 350) with initial effective date of September 23, 1999. Amendments of various parts were effective September 1, 2003, March 19, 2007, and March 19, 2009. TRRP applies, in various manners, to the: State Superfund; Industrial and Hazardous Waste; Voluntary Cleanup; Underground Injection Control; Municipal Solid Waste; Spill Prevention and Control; Composting; Radioactive Substance; and Wastewater Treatment programs. 30 TAC, § 350.2 (Applicability) describes the

manner in which the TRRP rule is applicable to these various TCEQ programs. In addition, the rules of the Dry Cleaner Remediation Program in 30 TAC, Chapter 337 specify use of the TRRP rules for corrective action at eligible dry cleaner sites. The TCEQ has prepared numerous guidance documents to implement the TRRP rules. Please refer to www.tceq.texas.gov/remediation/trrp/guidance.html for a current list of available TRRP guidance documents.

On February 25, 2009, the TCEQ adopted changes to 30 TAC, Chapter 334 (Underground and Aboveground Storage Tanks) and 30 TAC, Chapter 350 to remove the requirement that Leaking Petroleum Storage Tank (LPST) sites comply with both 30 TAC, Chapter 334 and Chapter 350 rules. The changes to the rules became effective on March 19, 2009 and subsequent to that date LPST sites must comply with only the requirements of the 30 TAC, Chapter 334 rules and guidance. Refer to www.tceq.texas.gov/remediation/pst_rp/pst.html for current information regarding the remediation of LPST sites in Texas.

TRRP is a risk-based rule in the sense that many of the cleanup levels for the various environmental media are determined through use of risk-based calculations. However, other risk-related factors, such as the location of human points of exposure (POEs) to environmental media and the response objectives for soil and groundwater, are prescribed in the rule for application to all sites rather than being determined on a site-specific basis.

Cleanup levels for chemicals of concern (COCs) under TRRP are referred to as protective concentration levels (PCLs). TRRP uses the federally-promulgated National Primary Drinking Water Regulations maximum contaminant levels (MCL) as groundwater PCLs, when available for a COC. If an MCL is not available for a COC, then a risk-based calculation is used to define the PCL. The PCL for a carcinogenic COC is set such that the risk level from exposure to that COC in groundwater would not exceed 1×10^{-5} (1 in 100,000) and such that the cumulative risk level from exposure to multiple carcinogenic COCs does not exceed 1×10^{-4} (1 in 10,000). The PCL for a noncarcinogenic COC in groundwater is set such that its hazard quotient does not exceed 1 and such that the hazard index from exposure to multiple noncarcinogens does not exceed 10.

TRRP also establishes a groundwater resource classification process that provides criteria to define whether a groundwater-bearing unit containing potentially usable groundwater is a Class 1, 2, or 3 groundwater resource. A groundwater-bearing unit is described as a saturated geologic formation, group of formations, or part of a formation which has a hydraulic conductivity equal to or greater than 1×10^{-5} centimeters/second. Class 1, 2, and 3 resources are defined as follows:

- A Class 1 groundwater resource must meet at least one of the following conditions:

- a) any groundwater-bearing unit within 1/2 mile of an existing well used to supply drinking water to a public water supply system and that groundwater-bearing unit can contribute COCs to the groundwater production zone of the well based on the chemical properties of the COCs, the hydrogeology, and the construction of the well;
 - b) a groundwater-bearing unit which is the only reliable source of water not more than 800 feet below the land surface that is capable of producing groundwater with a naturally occurring total dissolved solids content of less than 1,000 milligrams per liter (mg/l) and at a sustainable rate greater than 5,000 gallons per day to a well with a four-inch diameter casing or an equivalent sustainable rate in gallons per day to a well with a smaller or larger diameter casing; or
 - c) a groundwater-bearing unit capable of yielding groundwater with a naturally occurring total dissolved solids content of less than or equal to 3,000 mg/l and at a sustainable rate greater than or equal to 144,000 gallons per day to a well with a 12-inch diameter casing or an equivalent sustainable rate in gallons per day to a well with a smaller or larger diameter casing, and the natural quality of that groundwater meets all primary drinking water standards.
- A Class 2 groundwater resource includes:
 - a) any groundwater-bearing unit which is a groundwater production zone for an existing well (other than a public supply well) located within 1/2 mile of the affected property and which is used to supply groundwater for human consumption, agricultural purposes, or any purpose which could result in exposure to human or ecological receptors; or
 - b) any groundwater-bearing unit which is capable of producing waters with a naturally occurring total dissolved solids content of less than 10,000 mg/l and at a sustainable rate greater than 150 gallons per day to a well with a four-inch diameter casing or an equivalent sustainable rate in gallons per day to a well with a smaller or larger diameter casing.
 - A Class 3 groundwater resource includes any groundwater-bearing unit which produces water with a naturally occurring total dissolved solids content of greater than 10,000 mg/l or at a sustainable rate less than 150 gallons per day to a well with a four inch diameter casing or an equivalent sustainable rate in gallons per day to a well with a smaller or larger diameter casing.

The standard groundwater response objectives do not apply typically to those stratigraphic units that do not contain enough groundwater to be

considered a groundwater-bearing unit (that is, a non-groundwater bearing unit). The PCLs for COCs in Class 1 and 2 groundwater are determined as described above. The PCL for a COC in Class 3 groundwater is 100 times greater than the PCL for that COC in Class 1 or 2 groundwater. The volume of groundwater with COC concentrations that exceed the applicable PCL is described as the protective concentration level exceedence (PCLE) zone. Lower cleanup levels than those required for groundwater ingestion may be necessary to be protective for cross-media exposure pathways such as groundwater-to-air and groundwater-to-surface water.

The POE under TRRP is the location within an environmental medium where a receptor (human or ecological) will be assumed to have a reasonable potential to come into contact with COCs. For Class 1 and 2 groundwater resources, the prescribed POE to groundwater is a well which may be completed at all locations throughout the groundwater PCLE zone. For Class 3 groundwater, the prescribed POE to groundwater is set at all locations throughout the groundwater PCLE zone. Provided the person is authorized by the TCEQ to establish a plume management zone (PMZ) in Class 2 or 3 groundwater, the person may establish an alternate human health POE to groundwater. A PMZ is an exposure prevention approach. In other words, the person is not required to “cleanup” the contaminated groundwater, but is required to manage it and to indefinitely prevent its use. If a PMZ is approved, the person may move the POE from throughout the groundwater PCLE zone to the hydraulically downgradient limit of the PMZ. Alternate POEs and PMZs are discussed thoroughly in the TCEQ guidance document titled “Soil and Groundwater Response Objectives” (RG-366/TRRP-29).

If PCLs are exceeded in the groundwater, a person may choose to conduct a response action so as to achieve the objectives of either Remedy Standard A or Remedy Standard B. Remedy Standard A is a pollution cleanup remedy in that all PCLE zones in surface and subsurface soils, groundwater, and other environmental media must be removed and/or decontaminated to the extent that COC concentrations are less than the applicable PCLs. Physical controls are not allowed as a response action under Remedy Standard A. In contrast, Remedy Standard B, when appropriate, allows exposure prevention response actions (that is, use of physical controls). Additional or more stringent program requirements can apply, such as for hazardous and non-hazardous waste. A response action under either of these remedy standards must be completed within a reasonable time frame.

Under Remedy Standard B, unless a person demonstrates that an affected property meets the qualifying criteria for a modified groundwater response approach, he must use either an active restoration approach or monitored natural attenuation to reduce the concentration of the COCs to the applicable PCLs throughout the groundwater PCLE zone within a reasonable time frame.

Modified groundwater response approaches that may be approved for use under Remedy Standard B include: waste control unit (WCU); technical impracticability; and PMZs. A WCU is a landfill with a liner system and an engineered cap that has been closed pursuant to an approved closure plan, previous regulations, or will be implemented pursuant to an approved response action plan. In the circumstance where an existing or planned WCU overlies an existing groundwater PCLE zone, the TCEQ may approve the exclusion of that portion of the groundwater PCLE zone which directly underlies the WCU from the previously described groundwater response objectives. To use a technical impracticability approach, a person must demonstrate that it is not feasible from a physical perspective using currently available remediation technologies due either to hydrogeologic or chemical-specific factors to reduce the concentrations of COCs throughout all or a portion of the groundwater PCLE zone to the applicable groundwater PCLs within a reasonable time frame. The use of PMZs as a potential alternative approach to the general groundwater response objectives has been discussed previously.

The Petroleum Storage Tank Program also uses a risk-based approach to corrective action, combining an exposure potential evaluation with risk-based cleanup levels to determine appropriate actions at LPST sites. The risk-based rules, initially effective as of November 8, 1995, are found in 30 TAC, Chapter 334, Subchapter G (Target Concentration Criteria). Numerous guidance documents and memos provide supporting information.

The adoption of the original Risk Reduction Rules in 1993, the PST risk-based rules in 1995, and the Texas Risk Reduction Program rule in 1999 substantiate the TCEQ's philosophy that risk-based cleanups are an acceptable remedial response to affected environmental media. Risk-based corrective action ensures protection of human health and the environment while making response actions more economically feasible than cleanup to background concentrations.

Municipal Setting Designations

In May 2003, the Texas Legislature passed H.B. 3152, providing the TCEQ with the authority to establish Municipal Setting Designations (MSDs), i.e., properties within which the production of groundwater for potable use (e.g., drinking, showering, bathing, cooking, or food crop irrigation) will be restricted and environmental response actions for protection of potable water use will no longer be required. The goal of this law is to reduce corrective action requirements and associated costs for groundwater-bearing units that are not presently used as a potable supply and are not likely to be used as a potable supply in the future. This law took effect on September 1, 2003, and is codified in the Texas Health and Safety Code (THSC), Chapter 361, Subchapter W. However, groundwater concentrations within a MSD must be protective for cross-media exposure pathways, such as groundwater to surface water, which

are complete or reasonably anticipated to be completed. Additional information regarding the program is available on the TCEQ's MSD web page at <www.tceq.texas.gov/remediation/msd.html>.

Corrective action sites subject to TCEQ jurisdiction can apply for an MSD subject to the following requirements:

- *Municipal Area Location.* The corrective action site must be located within the corporate limits or extra-territorial jurisdiction of a municipality. The 80th Texas Legislature, effective May 25, 2007, removed the requirement that a municipality have a population of 20,000 or more. The 82nd Texas Legislature modified the documentation requirements, effective September 1, 2011, for cities with population of two million or more.
- *Public Water Supply Available.* A public drinking water supply must be presently provided or could be provided to the proposed MSD property and to properties within 0.5 mile of the MSD property.
- *Groundwater Use Restriction.* Potable use of groundwater within the proposed MSD must be restricted subject to an ordinance issued by the local municipality or subject to a restrictive covenant that is supported by a resolution passed by the local city council.

During calendar year 2017, 32 MSDs were certified for a total of 353 MSDs certified since 2003. The status of individual MSD applications can be monitored on the MSD web page. Specific information on individual MSD applications can also be obtained from the status information.

Railroad Commission of Texas Remediation Programs

The Site Remediation Section of the Railroad Commission of Texas (RRC) is responsible for the State Managed Cleanup Program, Operator Cleanup Program (OCP), RRC Voluntary Cleanup Program (RRC-VCP), and the Brownfields Response Program (BRP). Oil and Gas cleanup activities fall under the jurisdiction of the RRC and are subject to regulations under Statewide Rule 8, Statewide Rule 20, Statewide Rule 91 (16 TAC, §§3.8, 3.20, and 3.91), and RRC Special Orders.

The Oil and Gas Regulation and Cleanup Fund was created by the 82nd Texas Legislature in 2011 and provides funding for the State Managed Cleanup Program to clean up abandoned oilfield sites. The OCP is tasked with oversight of complex pollution cleanups performed by the oil and gas industry. Complex sites include those that occur in sensitive environmental areas as defined by 16 TAC3.91 (SWR 91). The (RRC-VCP) and BRP provide programs to clean up Oil and Gas-related pollution for persons/entities who did not cause or contribute to the contamination.

Groundwater Contamination

The definition of *groundwater contamination* adopted by the TGPC (31 TAC, § 601.3) for use in this report is included in [Appendix 4, “Rules of the Texas Groundwater Protection Committee,”](#) and is paraphrased as follows:

Groundwater Contamination - The detrimental alteration of the naturally occurring physical, thermal, chemical, or biological quality of groundwater. Further, groundwater contamination, for purposes of inclusion of cases in the public files and the joint groundwater monitoring and contamination report, shall be limited to contamination reasonably suspected of having been caused by activities of entities under the jurisdiction of the agencies identified in the TWC, §26.406, TGPC rules, and subsequent legislative amendments. Reported contamination cases are generally limited to those affecting usable quality groundwater (less than 10,000 milligrams per liter of dissolved solids).

The first sentence is based upon the definition of pollution given in TWC, §26.001 and suggests that to identify contamination, the quality of groundwater must be detrimentally altered. The definition implies that a comparison can be made between known background or natural water-quality conditions and a sampling event that indicates the presence of a contaminant not occurring naturally, or a naturally occurring constituent in amounts or at a concentration greater than its naturally occurring concentration. The definition then limits the scope of contamination to sites under the jurisdiction of a TGPC member agency. This limitation excludes naturally occurring saline or highly mineralized water and the intrusion of these waters into usable quality groundwater resources. The contamination cases identified in this report are primarily those where contaminants have been discharged to the surface, to the shallow subsurface, or directly to groundwater from activities such as the storage, processing, transport, or disposal of products or waste materials.

TWC, §26.406 requires the listing and description of documented cases of groundwater contamination reasonably suspected of having been caused by activities under the jurisdiction of state agencies with groundwater protection programs. While the definition of groundwater contamination is broadly interpreted to encompass a large universe of identified cases, the documentation of groundwater contamination should be considered more carefully to assure accuracy and fairness in reporting impacts to groundwater resources. Documentation of contamination requires an evaluation of the significance of the data, the reliability of the data, and proper interpretation of the data.

Information and analyses of groundwater conditions should be representative of the actual conditions at the site. The data must be adequate to justify conclusions or further actions regarding documenting contamination. Conditions that should be considered include whether a

well is completed in more than one aquifer, whether a contaminant is present in the aquifer, or whether a contaminant has been introduced into the well from the surface. These factors are considered necessary and are incorporated into the design of monitoring programs and sampling procedures for each regulatory program, and are also important in the design of an ambient groundwater monitoring program.

Groundwater information, especially analytical data, must be reliable. A groundwater sample is subject to inadvertent alteration at many points between its removal from the well to its final laboratory analysis; so, it is important to utilize reliable, verifiable procedures in sampling, handling, and laboratory analysis. Before concluding that contamination has occurred, it is often desirable to verify analytical results, such as with resampling and splitting samples with other entities to compare analyses.

Proper interpretation of information and analytical data is essential to documenting groundwater contamination, and it is often necessary to compare sample results to known background water quality to determine if contamination has occurred. Some compounds, such as refined gasoline or synthetic organic compounds, do not occur naturally and their presence in detrimental amounts constitutes contamination. Other constituents such as sodium, chloride, and nitrate are naturally occurring and a comparison to known background water quality is necessary to determine whether contamination has occurred.

As noted earlier, the occurrence of highly mineralized groundwater or the reporting of significant concentrations of dissolved solids and certain other naturally occurring constituents from groundwater monitoring programs does not, of itself, constitute groundwater contamination. Many aquifers contain water categorized as slightly saline to very saline, ranging from 1,000 milligrams per liter (mg/l) of dissolved solids to 10,000 mg/l and greater. Mineralized waters are the result of natural hydrogeologic processes involving restricted circulation, chemical reactivity, and residence time. These conditions exist in many areas of the state and wells producing poor quality water are common.

Reporting of Groundwater Contamination

The Water Code (see [TWC, §26.121](#)) prohibits the discharge of waste into or adjacent to water in the state, including groundwater, and prohibits other activities that cause pollution of water in the state, including groundwater. This includes unauthorized discharges from activities regulated by the TCEQ that could impact groundwater.

Numerous state and federal laws either: 1) require monitoring of groundwater quality and notification to regulatory entities when such monitoring indicates an unauthorized discharge has impacted groundwater or, 2) direct the TCEQ to adopt requirements for monitoring and notification.

Specific monitoring and reporting requirements addressing unauthorized discharges are typically found in rules and regulations specific to the activity being regulated. Section IV of this report ([GROUNDWATER PROTECTION PROGRAM DESCRIPTIONS](#)), details the status of each program's groundwater monitoring activities and groundwater contamination cases.

Reporting Unauthorized Discharges and Spills

The TCEQ is the state's lead response agency for all hazardous substance discharges or spills, discharges or spills of other substances, and certain inland oil discharges or spills that may cause pollution. This authority is derived from TWC, [§26.039](#) (*Accidental Discharges and Spills*) and TWC, [§§26.261 through 26.268](#) (*Texas Hazardous Substances Spill Prevention and Control Act*). According to TWC, §26.039(b), whenever an accidental discharge or spill occurs at or from any activity or facility which causes or may cause pollution, the individual operating, in charge of, or responsible for the activity or facility shall notify the TCEQ as soon as possible and not later than 24 hours after the occurrence. TWC, §26.039(a) defines an accidental discharge as an act or omission through which waste or other substances are inadvertently discharged into water in the state. The statute further defines a spill as an act or omission in which waste or other substances are deposited where, unless controlled or removed, they will drain, seep, run, or otherwise enter water in the state (including groundwater). These provisions require the individual to notify TCEQ when contamination of soil or groundwater is discovered.

The TCEQ has adopted Spill Prevention and Control Rules at [30 TAC, Chapter 327](#). A reportable quantity (RQ) discharge or spill is an unauthorized or accidental discharge or spill of oil, petroleum product, used oil, hazardous waste, industrial solid waste, or other substances into the environment in a quantity equal to or greater than an RQ as defined in the rules. After determining that an RQ or spill has occurred, the responsible person must notify the TCEQ as soon as possible, but no later than 24 hours after its discovery. [Appendix 5](#) of this report is a summary of the TCEQ's Spill Prevention and Control Rules.

The Railroad Commission of Texas (RRC) is generally responsible for discharges or spills from activities associated with the exploration, development, production, storage, or transportation of oil, gas, and geothermal resources (Texas Natural Resources Code, §§85.042, 91.101, and 91.601). Discharges or spills from brine mining or surface mining are also under the jurisdiction of the RRC. The official rules of the RRC are found in the 16 TAC, Part 1, Chapters 1 through 20 and are available online at <http://www.rrc.texas.gov/general-counsel/rules/current-rules/>.

In general, the RRC has jurisdiction over discharges or spills associated with the transportation of crude oil prior to refining of the oil, and of natural gas prior to its use in manufacturing or as a residential or

industrial fuel. Thus, discharges or spills from crude oil or natural gas pipelines are under the jurisdiction of the RRC.

16 TAC §3.20 requires that operators give immediate notice of a fire, leak, spill, or break to the appropriate commission district office. SWR 20 further requires that operators report what steps have been taken, or are in progress, to remedy the reported situation, including quantity of oil, gas, or geothermal resources, lost, destroyed, or permitted to escape. The report of oil loss shall be necessary only in case such oil loss exceeds five barrels in the aggregate.

Reportable releases should be reported to the commission using the H-8 Form: Crude Oil, Gas Well Liquids, or Associated Products Loss Report. A blank copy of the H-8 form is available online at: <http://www.rrc.state.tx.us/forms/forms/og/pdf/h-8p.pdf>.

Discharges or spills from pipelines transporting refined products such as gasoline, diesel, or other fuel oils fall under the regulatory jurisdiction of the TCEQ, so the Spill Prevention and Control Rules would apply. As specified under the State of Texas Oil and Hazardous Substances Spill Contingency Plan, the TCEQ serves as the lead agency in directing and approving the response for the discharge or spill of a harmful quantity of crude oil (defined as five or more barrels discharged or spilled on the ground or any quantity discharged or spilled into water) during highway or rail transportation.

Notification to Local Officials

[TWC, §5.236](#) requires TCEQ to provide notice to local officials regarding groundwater contamination which may affect drinking water supplies in their area. Notification is provided to county judges and public health officials to supply information on groundwater impacts to drinking water supplies within the county. Notification is also provided to a groundwater conservation district, if the contamination has occurred or is occurring in the jurisdiction of the district. These cases are identified in the report only during the year the case was reported as new.

[Table 1](#) lists the active groundwater contamination cases for the TCEQ in 2017, and those cases requiring notification under TWC, §5.236 are indicated with a “Y” in the column labeled “5.236.” Beginning in 1991, the TGPC identified the number of cases subject to these notices through that date, and at that time the total number to date was 507. In subsequent years the numbers have varied. This report for 2017 includes 106 such cases, bringing the current total to 1,318 cases that have been subject to [TWC, §5.236](#) notification (listed as HB 938 cases prior to 1994). There are a few cases included in 2017 that were notified in previous years but not recorded in this column at the time.

Notification to Private Water Well Owners

Passage of House Bill 3030, 78th Regular Legislative Session (2003), resulted in new TWC, §26.408. The statute requires that when the TCEQ receives notice from another agency or when TCEQ independently documents a case of groundwater contamination, the TCEQ must make every effort to provide notice, via first class mail, to each owner of a private drinking water well that may be affected by the contamination. The notice must be provided within 30 days of the determination, or receipt of information from another agency. Additionally, notice must be provided to any applicable groundwater conservation district.

The TGPC adopted rules ([31 TAC, §601.10](#)) as required by statute to “prescribe the form and content of notice” provided to private drinking water well owners by the TCEQ. These rules became effective on November 12, 2003 (see [Appendix 4](#)). The TCEQ Executive Director sent letters to other members of the TGPC to alert them of the statute and their need to inform TCEQ of new cases of contamination. TCEQ staff meet semimonthly to review groundwater contamination cases resulting in mailed notice to well owners within the mandated timeframe. Twenty-six (26) cases of contamination during calendar year 2017 required notice to private drinking water well owners and are listed in Figure 3.

Public Information

The purpose of this document is to compile and make available to the public an annual report that provides the status of groundwater monitoring associated with the activities regulated by the contributing state agencies. The report also provides an annual status of documented groundwater contamination, including new cases and previous cases still undergoing enforcement actions, reasonably suspected of having been caused by activities regulated by the state agencies. [Tables 1 through 3](#) provide a summarized tabulation of all groundwater contamination cases documented during 2017. Limited information pertaining to specific contamination cases listed in this report may be available by contacting appropriate agency personnel as listed in [Appendix 7](#).

Each agency, or in some cases, individual programs within an agency, may be required by law, rule, or policy to provide notification of groundwater contamination once it has been confirmed through groundwater studies or validation of analyses. A program may require that a notice be provided to identified groups that may include local officials and health officers; public water suppliers; water well drillers; complainants; or affected or potentially affected parties. Such requirements are commonly based on the need to minimize potential adverse impacts to public health.

State Agencies' Files

TWC, [§26.406](#) requires state agencies with responsibilities for groundwater protection to maintain a public file of all documented cases of groundwater contamination. Each agency has procedures for locating, maintaining, and making accessible information related to groundwater contamination cases. Individual regulatory programs within an agency may also have a unique system for maintaining and identifying information related to contamination cases. Contamination case information is a matter of public record and is available for public review

by arrangement with each agency. In some situations, availability of information for certain enforcement actions may either be limited or subject to specific access procedures.

[Appendix 6](#) of this report lists the location and general contact information for RRC district offices, TCEQ regional offices, and GCDs. [Appendix 7](#) includes agency and program contact names and numbers.

Other Reports and Publications

There are numerous water-agency publications that address groundwater contamination in the state. These publications provide a different focus or perspective on groundwater quality conditions and present information not contained within this report. Other publications provide information on statewide groundwater protection and specific protection programs.

This is the 29th edition of this annual *Joint Groundwater Monitoring and Contamination Report*. These reports, which began in 1989, provide a background on the evolution of the state's groundwater protection programs and may also provide insight to historical cases of contamination that are no longer listed.

The *Texas Integrated Report of Surface Water Quality* (TCEQ, 2014) evaluates the quality of surface waters in the state. This report includes a section titled "Groundwater Assessment," which describes the state's groundwater protection program, including monitoring and assessment activities. The report can be found at <https://www.tceq.texas.gov/waterquality/assessment/14twqi/14txir>. The Groundwater Assessment portion of the 2016 and 2018 *Integrated Reports* will be available on the TCEQ's website once the reports are finalized: https://www.tceq.texas.gov/waterquality/assessment/305_303.html.

The TWDB makes available its historic numbered reports, bulletins and publications, and publication catalogs on its web site at: <https://www.twdb.texas.gov/publications/index.asp>. Drought and water condition information is also available from TWDB at: <https://waterdatafortexas.org/groundwater/>.

2017 State Water Plan (TWDB, 2016) is the fourth state water plan adopted by the TWDB since the passage of Senate Bill 1 during the 75th Texas Legislature in 1997. The publication incorporates the 16 approved regional water plans and describes how local government entities throughout the state will address their water supply needs for the next 50 years. A copy of this plan, as well as an interactive plan, is available on the TWDB web site: <https://www.twdb.texas.gov/waterplanning/swp/index.asp>.

Advisory Committee on Water Information, Subcommittee on Ground Water (SOGW): In 2007, the SOGW was commissioned by the Federal Advisory Committee on Water Information (ACWI) to develop a framework to establish and encourage implementation of a nationwide, long term ground-water quantity and quality monitoring framework, which would provide information necessary for the planning, management, and development of ground-water supplies to meet current and future water needs, and ecosystem requirements.

The SOGW published a 2009 report, "A National Framework for Ground-Water Monitoring in the United States," and initiated five pilot studies with partners Illinois-Indiana, Minnesota, Montana, New Jersey and Texas. In conjunction with the pilot programs SOGW established an internet based data portal. In 2011, the SOGW published the results of the pilot studies, and began revising the framework document. In 2013 SOGW published "A National Framework for Ground-Water Monitoring in the United States." All the studies and reports are available at: <<https://acwi.gov/sogw/index.htm>>.

III. USER'S GUIDE

The remaining portion of this report is divided into two sections. [Section IV, "Groundwater Protection Program Descriptions,"](#) provides a narrative, program-specific overview for each contributing agency or organization. [Section V, "Groundwater Contamination Case Description Tables,"](#) includes a tabular listing of individual contamination cases that were documented in calendar year 2017. Appendices included at the end of the report provide more detailed information supporting or supplementing the body of the report.

Groundwater Protection Program Descriptions. This section describes the specific regulatory programs within each agency, including regulated activities, required standards and approvals, monitoring of regulated entities' compliance with the specific conditions of the authorizations, monitoring of groundwater to detect problems, and actions required if groundwater contamination is discovered.

This section includes the status of each program's required groundwater monitoring, including comments on quality assurance policies and procedures as well as the number of facilities that are required to perform monitoring, the status of groundwater contamination, and a summary of the information contained in the case description table.

Groundwater Contamination Case Description Tables. This section describes the individual groundwater contamination cases for each contributing agency that has regulatory groundwater protection authority. Each table lists contamination cases by county for a state agency and contains several fields (columns) of data specific to each case.

Rules and Definitions Related to Report Compilation

TWC, §26.406, requires the TGPC to adopt rules defining the conditions that constitute groundwater contamination for inclusion of cases in this report (see Appendix 4). In accordance with these requirements, on March 5, 1991 the TGPC adopted rules at 31 TAC, Subchapter A (§§601.1 through 601.5), entitled "General Provisions Relating to Public Files and Joint Report," which include these conditions. Minor clarifying revisions were made on August 13, 1998, which became effective September 13, 1998. The rules were further amended to add Subchapter B (31 TAC, §601.10), "Notice of Groundwater Contamination," 31 TAC §601.10, in response to passage of HB 3030 (78th Legislature, 2003), codified as TWC, §26.408, effective November 12, 2003.

The rules define *groundwater*, *groundwater contamination*, and *enforcement action* in broad terms so that the varying jurisdictional abilities and programs of the contributing agencies could be compiled in similar formats and compared. Broad definitions also enable the report to include the largest possible universe of documented contamination from

human-induced activities. These definitions are in 31 TAC, §601.3, and are summarized below:

- *Groundwater* is defined as water existing below the land surface in a zone of saturation. That is, the water which completely fills the interconnected pore spaces of the rock or sediment.
- *Groundwater contamination* is defined as any detrimental alteration of the naturally occurring quality of groundwater. It is limited, however, to contamination suspected of being associated with activities under the jurisdiction of the contributing agencies and affecting usable quality groundwater.
- *Enforcement action* is defined very broadly to include any action of a member agency that accomplishes or requires the identification, documentation, monitoring, assessment, or remediation of groundwater contamination.

Using the Contamination Case Description Tables

This report includes tabular summaries of current groundwater contamination cases for each contributing agency that has enforcement authority. While TCEQ is primarily responsible for the regulatory protection of groundwater, other agencies do have some requirements related to groundwater protection. These include the RRC, TDA, TSSWCB, and TDLR. The TAGD has no regulatory or enforcement authority as an organization, but individual GCDs may have limited authority for action regarding groundwater contamination.

Groundwater contamination case descriptions for the TCEQ, RRC, and member districts of the TAGD are listed in [Tables 1, 2](#) and 3, respectively. No contamination cases were reported for 2017 by the DSHS, TSSWCB, TDLR, TDA, TWDB, TAMAR, or UTBEG.

Data Fields

The first page of each table, entitled “EXPLANATION OF FIELDS / COLUMN HEADINGS” includes a legend of the column headings and a brief description of each heading. The legend describes attributes that may be unique to that table; however, several of the heading descriptions repeat the field definitions provided in this section. The contamination cases are grouped according to the county in which the site is located, with a secondary grouping according to division or specific regulatory program within an agency. Figure 4 below describes the data fields used in the tables:

Figure 4. Groundwater Contamination Case Descriptions - Data Fields

Data Field Name	Data Field Description
New Cases	An asterisk (*) indicates that the record was reported as “New” for the current year.
File Name / Site Name	This is provided by the program area or agency and typically means the responsibly party or geographic location. It may consist of a company name, city, person, or other entity considered a potentially responsible party or otherwise associated with the case. It may also be a geographic location name or well number.
File Number	Identification number assigned to the case based on the numbering system used by the agency or program with jurisdiction for the case. ¹
Location / Operator	References the location of the contamination site. Most location descriptions refer to cities and addresses, others are geographic locations using distances from known points. For RRC sites this may include the operator name or location description, along with a latitude and longitude.
Contamination Description	Consists of a listing of contaminants or general group of contaminants (such as "gasoline" or "creosote constituents"). Abbreviations, explained at the beginning of each table, may also be used.
Date (Table 1)	The earliest date contamination was confirmed at the site by the jurisdictional agency or program. More detail on the significance of this field is given at the beginning of each table if the date represents something other than the above definition. For agencies other than TCEQ (i.e. Tables 2 or 3) this information is available by contacting the agency.
Enforcement Status	A two- to four-character code representing the status of the case with respect to agency enforcement action and contamination site activity. ²
Data Quality	A code (up to 6 characters) describing the reliability of analytical data used by each regulatory agency to analyze the case. Addresses field and laboratory quality assurance procedures and data reliability and quality in determining conclusions for each case.
§5.236 (Table 1)	Included in Table 1 (TCEQ) to distinguish cases subject to notification requirements under TWC, §5.236. A "Y" code identifies cases in which contamination has affected or may potentially affect a public drinking water supply. ³ A "Y" code will appear in the report only once for a site, during the year that the case is listed as new. If a case was identified in a previous report as “Y” this column will be blank in this report.

^{1.} File numbers can be used to access the files of the regulating agency to obtain data on each groundwater contamination case listed in Tables 1 through 4. Cases without file numbers may be accessed in the regulating agencies' files with the case file name.

^{2.} Each regulatory agency and program that report contamination cases have procedures and internal structures that may differ among programs. Definitions and descriptions for enforcement or activity status have been generalized to account for these differences. A more detailed explanation is given in the following section entitled “[Enforcement Status Codes.](#)”

^{3.} An entry in this field constitutes secondary notification from the TCEQ to local officials for cases reported since the publication of the previous report.

Locating Specific Cases

To find a specific contamination case, look at the table for the appropriate state agency, and then in the first column locate the county where the case is located. All documented contamination cases for that agency and county are listed under the respective heading for each division or regulatory program that has jurisdiction over that case. Under each program heading, contamination case descriptions are listed in alphabetical order according to file names. Check each division or regulatory program heading for the desired contamination case description. Also, check the other agency tables for the desired contamination case descriptions for the county of interest. A location reference is provided in the tables under the field heading LOCATION and can be used to locate a specific case if the file name is unknown.

Enforcement Status Matrix

TWC, §26.406 requires that this report indicate the status of enforcement action for each case of groundwater contamination included in the report. For this report, enforcement action includes any agency action that accomplishes or requires the identification, documentation, monitoring, assessing, or remediation of groundwater contamination. However, the objectives of enforcement action and how enforcement is conducted vary among the regulatory programs.

To describe only an agency's enforcement action presents a minimal observance of the regulatory undertaking. Enforcement is ineffective if required actions to address the assessment and mitigation of the contamination cases are not carried out. Therefore, agency actions dealing with contamination events are also placed in context of the activities necessary to address the events. This comparison of the level of agency action and the status or level of contamination assessment and mitigation is presented in the enforcement status matrix (see [Figure 5](#)).

The enforcement status matrix allows a one-to-one correspondence between an agency's response and the completion of the discrete phases in the progression of contamination investigation and clean-up. The vertical (Y) axis of the matrix gives the level of agency response (enforcement status), and corresponds to the first number given in the *ENFORCEMENT STATUS* field in the table. The horizontal (X) axis gives the level or status of contamination site activity (activity status), and corresponds to the second number in the *ENFORCEMENT STATUS* field in the table.

Different circumstances at the same level of agency response or the same level of contamination site activity may be indicated using an alphabetical code associated with each of the two numerical codes. These codes (YA, XA), presenting the enforcement status, followed by the activity status, are tabulated for each contamination case listed in this report. Once familiar with the matrix, a reader should be able to quickly discern the

status of a case and relate its progress in the respective regulatory program to all other cases.

The matrix also serves as a summary of the status of all cases by showing how many occur within each grid of the matrix. Each agency table is followed by an *Enforcement Status Summary*, which consists of an enforcement status matrix summarizing the number of cases in each grid space. For the purpose of this summary, any TCEQ cases that list more than one Activity Status Code were placed in the grid corresponding to the highest code, which is the code describing the furthest action attained at the site. For example, if the Enforcement Status Code was “2” and the Activity Status Code listed “4,5” then the case would be placed in the grid corresponding to 2 (vertical) and 5 (horizontal).

Tables 1 (TCEQ) and 2 (RRC) are each accompanied by a statewide map showing the number of groundwater contamination cases in each county ([Figure 10 - TCEQ](#) and [Figure 12 -RRC](#)).

Figure 5. Enforcement Status Matrix

Enforcement Status Codes

In general, regulatory programs are structured to achieve the desired degree of environmental protection and mitigation with the lowest possible level of agency oversight. Routine monitoring is an example of this type of oversight activity. When monitoring or other activities indicate that greater agency involvement is necessary to address a contamination case, the agency may take enforcement action. Enforcement status codes are described in Figure 6a. The enforcement status codes are ordered to reflect the progression of enforcement actions available to most of the agencies.

Figure 6a. Enforcement Status Matrix - Enforcement Status Codes

Code	Enforcement	Description
0	Voluntary Action	An entity addresses the contamination incident without being compelled to do so by enforcement action and either: A) reports its actions to the agency, or B) enters into an agency's voluntary cleanup program.
1	Staff Discovery	The agency confirms identification of a contamination incident through its activities, such as: A) inspections, B) reviews of self-reported data, C) complaints received, or D) referrals received from other agencies.
2	Staff Action	The agency initiates an action to address a contamination incident, such as: A) an information request of the entity, B) approval of a work plan (e.g., assessment, corrective action, etc.), C) sending a notice of contamination to parties who may be affected, or D) referring the incident to another agency with jurisdiction.
3	Executive Action	Action at the highest level of the agency, such as: A) issuing a permit that includes corrective action provisions; B) issuing an administrative order; C) other executive level action such as letter of approval or revocation, or conditional or final release of liability; or, D) referral to federal authorities such as U.S. EPA.
4	Court or Federal Agency Action	When other options fail or do not apply, an agency can: A) seek legal representation by the Texas Attorney General before the courts, or B) let federal agencies seek resolution according to federal laws or programs.
5	State or Federal Funds	The agency, by utilizing special A) federal or B) state funds, finances the cost of addressing contamination incidents. Examples are the federal and state "superfunds" for abandoned waste sites, and the state fund for plugging oil and gas wells.

Note: Enforcement action includes any agency action which accomplishes or requires the identification, documentation, monitoring, assessing, or remediation of groundwater contamination. The achievements of these objectives vary among the regulatory programs. Not all agencies or programs within an agency will follow this exact sequence; for example, the TCEQ's Superfund program starts at Status Code 5.

Activity Status Codes

Once groundwater contamination has been confirmed, either the regulated entity or the appropriate agency will address the groundwater contamination case. Confirmed cases of contamination are generally addressed by following a prescribed sequence of actions until it is concluded that no further actions are necessary or required. Once contamination has been detected or is suspected, initial actions consist of validation of sampling results or quality assurance controls to confirm contamination has occurred and is human-induced. An investigation to study the extent, composition, and circumstances of the contamination follows the confirmation of contamination.

Additional actions may or may not be required based on the investigation findings. If the investigation finds that further actions are required, the planning of corrective action measures to address the contamination and source are initiated. Following the development of the corrective action plan, actions are taken to implement the plan and physically address the removal, mitigation or treatment of contamination and source. The effectiveness of the corrective action measures is generally monitored during and after the implementation of the plan. Ultimately, the corrective action measures are considered completed when the site has been remediated, the source has been removed, or when no further actions are required. The activity status codes are further described in Figure 6b.

Figure 6b. Enforcement Status Matrix - Activity Status Codes

Code	Activity	Description
0	No Activity (TCEQ only)	No actions have been conducted at the incident site. The code is also given to cases that did not have any activity in the reported calendar year, mainly used by the Voluntary Cleanup Program of the TCEQ.
1	Contamination Confirmed	Contamination is being verified, such as with resampling or data quality validation, but has not been fully investigated. Based on the confirmation findings, additional actions such as further investigation may or may not be required (1A or 1B).
2	Investigation	The incident is being studied to determine the extent, composition, or other properties and circumstances of the contamination. Based on the findings additional action may or may not be required (2A or 2B).
3	Corrective Action Planning	A remedy (corrective action plan) for the contamination is being developed based on the investigation findings. Examples may include remedies such as a plan to remove the source of contamination, remediate impacted groundwater, disinfect impacted wells, or replace wells.
4	Implement Action	The planned remedy (corrective action plan) is being carried out and actions to address the contamination are being conducted.
5	Monitor Action	The effectiveness of the remedy is being monitored. This may be a long-term or short-term action and may be performed during and after implementation.
6	Action Completed	The remedy is considered complete when the desired result has been achieved. Options in which contamination is no longer present include: 6A) remediation or 6B) source removal; Options in which contamination may still be present but action is complete include: 6C) determination that no further action is needed, 6D) institutional controls (agency action is final; however, contamination still exists under institutional controls such as deed records noting contamination, use and exposure restrictions, or required maintenance of engineering controls), or 6E) engineering controls (agency action is final; however, contamination still exists under required engineered controls). <i>For RRC, "6C" is the code used when no further action is required/institutional or engineering controls are in effect.</i>

IV. GROUNDWATER PROTECTION PROGRAM DESCRIPTIONS

Texas Commission on Environmental Quality

The Texas Commission on Environmental Quality (TCEQ) is responsible for regulatory groundwater protection programs that aim to prevent contamination and to identify, assess, and remediate existing problems. The TCEQ implements these programs through education, voluntary action assistance, permitting, and enforcement. As the state's lead agency for water quality protection, the TCEQ administers both state and federally mandated programs. Federal programs that TCEQ administers include the Resource Conservation and Recovery Act (RCRA); the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA); the Clean Water Act (CWA); and the Safe Drinking Water Act (SDWA). The TCEQ also develops state management plans under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) aimed to prevent the contamination of groundwater by pesticides.

The TCEQ's Enforcement Division, in the Office of Compliance and Enforcement (OCE), is responsible for ensuring that groundwater resources are protected during enforcement activities at municipal solid waste, hazardous and nonhazardous waste, petroleum storage tank, agricultural and watershed management, water utility, and public water supply sites.

Personnel in the TCEQ OCE Regional Offices work within one of four general areas: The North Central & West Texas Area, the Border & Permian Basin Area, the Coastal & East Texas Area, or the Central Texas Area. Regional personnel conduct field investigations of contamination complaints and inspect permitted and non-permitted facilities. In addition, the Central Texas Area is primarily responsible for the Edwards Aquifer Protection Program (EAPP). The Program Support Section regulates the construction and operation of on-site sewage treatment facilities (OSSF).

The Office of Waste (OOW) includes the Permitting and Registration Support Division (PRSD), Radioactive Material Division (RMD), Remediation Division (REM), and Waste Permits Division (WPD).

- PRSD contributes to the protection of the state's groundwater resources by issuing licenses. The division issues ten different types of licenses that contribute to the protection to the groundwater resources of Texas.
- RMD includes the Radioactive Materials Section and the Underground Injection Control Permits Section. The division addresses questions pertaining to the disposal of low-level

radioactive wastes and by-product material waste, recovery of uranium, and the commercial processing and treatment of radioactive substances. The division also regulates a wide range of activities that utilize injection wells for storage or disposal.

- REM oversees the investigation and cleanup of hazardous waste and pollutants released into the environment. This includes the regulatory programs governing petroleum storage tanks (PSTs), hazardous and nonhazardous industrial waste sites, voluntary cleanup activities, innocent owner/operator certifications, state brownfields initiatives, and Superfund activities.
- WPD is responsible for permitting facilities that store, process, or dispose of hazardous and nonhazardous industrial waste or municipal solid waste.

The Office of Water includes the Water Quality Division (WQD), the Water Quality Planning Division (WQPD), the Water Availability Division (WAD), and the Water Supply Division (WSD).

- WQD is responsible for issuing wastewater permits under the Texas Pollutant Discharge Elimination System and implementing the Texas Surface Water Quality Standards (TSWQS), 30 TAC, Chapter 307. WQD also reviews applications and issues permits for the land application of wastewater.
- WQPD implements surface water quality management programs and develops the TSWQS. This division also implements the Texas Non-Point Source (NPS) Pollution Management program, authorized by CWA § 319.
- WAD provides technical support to promote effective and coordinated management of water resources in the state. The division includes the agency's Water Rights Permitting & Availability programs, Watermaster programs, River Compacts, and Groundwater Planning and Assessment program. The Groundwater Planning & Assessment Team (GPAT) is responsible for providing support to the Texas Groundwater Protection Committee (TGPC).
- WSD ensures compliance with state drinking water standards by monitoring public water systems and conducts the Source Water Protection Program.

Enforcement Division

Program Description. The Enforcement Division drafts formal agreements to resolve compliance issues discovered at facilities and sites regulated by the TCEQ. Enforcement actions that involve groundwater contamination are resolved primarily through administrative Agreed

Orders that require investigation, monitoring, and remediation activities in accordance with state and federal rules and regulations.

Status of Groundwater Contamination. Seven Enforcement cases are listed in this report under the division heading “ENF.” Notification under TWC, §5.236 was not required for any case during the current reporting period. Three of the sites are newly added during 2017.

Regional Offices

Program Description. Waste Program personnel of the TCEQ Regional Offices are generally the first responders to complaints, spills, or various other situations that may result in groundwater contamination. Reports of alleged groundwater contamination received from citizens or referred from other agencies or entities are assigned for investigation to the appropriate Regional Office Waste Program or referred to the appropriate TCEQ Central Office Program Area. Regulated activities investigated may include industrial and municipal wastewater discharges, on-site sewage facility discharges, industrial hazardous and solid waste storage and disposal, municipal solid waste transfer and disposal, and the use of petroleum storage tanks.

Information about the potential contamination may be gathered through site investigation, well inventories, and/or water quality sampling. After an investigation is completed and contamination is confirmed, Regional Office personnel will refer the case to the appropriate TCEQ Central Office Program Area for coordination.

Regional Office staff analyze the information gathered from the investigation and attempt to either effect remediation or initiate enforcement as necessary. Investigation reports are maintained in TCEQ's Central Records.

In accordance with 30 TAC Chapter 213, the Austin and San Antonio Regional Offices also administer the Edwards Aquifer Protection Program (EAPP). Implementation of the EAPP consists of review and approval of water pollution abatement plans, sewage collection system plans, and static hydrocarbon and hazardous substance storage facility plans for regulated activities on the recharge, transition, or contributing zones of the Edwards Aquifer.

Status of Groundwater Monitoring Programs. Investigation of groundwater contamination by Regional Office personnel is essentially a response program that does not require monitoring of groundwater in association with a regulated activity in order to detect contamination. However, during certain remediation activities for identified groundwater contamination, the TCEQ may perform or require groundwater monitoring to evaluate remediation progress or success.

Status of Groundwater Contamination. There are no listed cases of groundwater contamination for this year's report.

Field Operations Program Support Section

Program Description. The Program Support Section administers the regulation of on-site sewage treatment facility (OSSF) construction as authorized in THSC Chapter 366 and guided by 30 TAC Chapter 285. In addition to establishing rules for the installation and maintenance of OSSFs, the TCEQ's OSSF Program performs compliance reviews of local regulating entities to evaluate their enforcement of the state's minimum requirements.

Construction of an OSSF treatment and disposal system must be isolated from certain areas such as water wells, lakes, roads, and other objects subject to contamination from the OSSF or that may prevent the proper operation of the system. To further ensure protection of groundwater, no individual may install, construct, alter, extend, or repair an OSSF unless the individual holds a valid license or registration issued by the executive director of the TCEQ or has a valid exemption from licensing requirements.

Status of Groundwater Monitoring Programs. The Field Operations Program Support Section's OSSF Program serves a complaint response function with regard to claims concerning contamination from OSSFs. Responses to OSSF complaints are coordinated with either the appropriate TCEQ Regional Office or the local authorized agent and do not generally involve the monitoring of groundwater to detect contamination. When appropriate, during certain remediation or enforcement activities involving potential groundwater contamination, the TCEQ may perform or require groundwater monitoring to evaluate remediation progress or success.

Status of Groundwater Contamination. There are no identified cases of groundwater contamination attributed to systems which fall under the OSSF program.

Permitting and Registration Support Division

The Permitting and Registration Support Division (PRSD) within the Office of Waste (OOW) contributes to the protection of the state's groundwater resources by functioning as a licensing entity. The PRSD licenses those environmental professionals who design, construct, install, remove, operate, and maintain environmentally sensitive equipment, facilities, and systems that provide commercial and residential irrigation, water and petroleum storage, drinking water protection and treatment, wastewater processing, on-site sewage facilities, and waste disposal services.

The PRSD regulates 10 different types of occupational licenses lending protection to the groundwater resources of Texas. During FY 2017, the

PRSD maintained 55,849 licensed environmental professionals, issued 20,796 new and renewal certifications, and administered 10,817 examinations.

The PRSD also contributes to protection of groundwater by the timely processing and accurate review of licensing applications to include all education, training, experience and examination qualification requirements; the administration and validation of licensing examinations; the development and approval of training courses and instructors; the efficient issuance of new and renewal licenses; the investigation and resolution of competency reviews and enforcement cases; and the establishment and maintenance of licensing rules and standards.

Radioactive Materials Division

The Radioactive Materials Division regulates disposal of low-level radioactive wastes and by-product material waste; commercial processing and treatment of radioactive substances; recovery of uranium by the in-situ solution mining process; underground injection of industrial and municipal waste; and use of injection wells for groundwater remediation and other miscellaneous purposes in protection of underground sources of drinking water. Currently, the Radioactive Material Division consists of the Radioactive Materials Section and the Underground Injection Control Permits Section that perform the functions listed below.

Licensing for Radioactive Material Processing, Storage, and Disposal

Program Description. The division regulates disposal of radioactive substances, including low-level radioactive wastes or non-oil and gas naturally occurring radioactive materials (NORM) through a radioactive material licensing program. The program is overseen by the U.S. Nuclear Regulatory Commission. One commercial low-level radioactive waste processing, storage, treatment and disposal site, one non-commercial low-level radioactive waste disposal site, one commercial byproduct waste disposal site, one additional storage and processing site, and one inactive non-commercial waste site are licensed in the state of Texas. Currently there are no non-oil and gas NORM disposal facilities licensed in the state of Texas.

Status of the Groundwater Monitoring Program. Licensees currently monitor groundwater at the licensed commercial processing, storage, treatment and disposal facility, the licensed non-commercial disposal facility, the licensed commercial byproduct disposal facility and one inactive non-commercial licensed facility. Groundwater monitoring is conducted according to the license requirements for each facility.

Status of Groundwater Contamination. The licensed inactive non-commercial facility has radionuclide contamination in groundwater from tritium (H-3) detected in monitor wells. Additional groundwater samples taken at this facility in 2017 indicated one monitor well above the

drinking water standard, with decreasing levels of radionuclides in the remaining monitor wells. There are no additional cases of groundwater contamination at the licensed commercial facility or the licensed non-commercial facility or the waste processing and storage sites.

Licensing for Uranium Recovery

Program Description. The division is responsible for licensing and technical reviews in the areas of uranium recovery. This work includes evaluation of in-situ uranium recovery sites for radioactive materials licensure, covering scientific and engineering topics as required by the radiation control regulations and health physics topics related to operational health and safety. The division also evaluates the decommissioning and reclamation of historic tailings impoundments at former commercial uranium mill sites (UMTRCA Title II sites) and review of groundwater monitoring results associated with these sites. These sites will eventually be transferred to the control of the Department of Energy.

Status of Groundwater Monitoring Programs. Licensees routinely monitor groundwater for general water-quality, radionuclides, and other specified hazardous and potentially-hazardous constituents, as defined in their respective radioactive materials licenses. Licensed facilities currently include three UMTRCA Title II sites and a byproduct waste disposal site. The three Title II sites require approval of groundwater compliance programs by the TCEQ and the Nuclear Regulatory Commission for final closure completion and transfer to the Department of Energy.

Status of Groundwater Contamination. Groundwater at the UMTRCA Title II sites contains contaminants which have seeped from old, pre-regulation unlined impoundments. All are located within areas where naturally occurring uranium and associated metals in groundwater are common. Historically, the Conoco Phillips Conquista site has been considered contaminated. At Conquista, six monitor wells in the shallow sand unit (Dubose), have had one or more of the following contaminants in excess of regulatory levels; arsenic, cadmium, molybdenum, selenium, uranium, gross alpha, or radium. Of the contaminated monitor wells in the lower sand unit (Deweeseville), nine wells, including the background well, exhibited values of one or more of the following contaminants in excess of regulatory levels; cadmium, selenium, uranium, or radium.

Permitting for Underground Injection Control

Program Description. The Underground Injection Control (UIC) Program, administered under the authority of the federal Safe Drinking Water Act and the Texas Injection Well Act, regulates a wide range of activities using injection wells to ensure protection of underground sources of drinking water. The specific injection wells under TCEQ jurisdiction include Class I industrial and municipal waste disposal injection wells, Class III injection wells for in-situ mining of subsurface mineral deposits,

Class IV and Class V (miscellaneous, mostly shallow) injection wells. There are two additional classes of injection wells not listed which do not fall under direct responsibility of TCEQ's UIC Program. These are Class II oil and gas industry injection wells under the Railroad Commission jurisdiction and Class VI injection wells used in geologic carbon sequestration (no such wells in Texas). The Railroad Commission also has jurisdiction for permitting Class III injection wells used for brine mining.

Class I injection wells are used to inject hazardous and non-hazardous liquid industrial and municipal waste below the lowermost underground source of drinking water (USDW). Presently there are 99 Class I injection wells in operation. Approximately half of these wells are permitted to inject both hazardous and non-hazardous waste. There are thirteen (13) operational Class I injection wells authorized for commercial disposal of off-site generated waste; all other Class I wells in the state are limited to disposal of on-site and captured facility generated waste. Additionally, TCEQ has developed a general permit for injection of nonhazardous desalination and drinking water treatment residuals that is substantially equivalent to the nonhazardous Class I well permit. To date, five (5) such wells have been registered under one general permit.

Applications for Class I injection wells must demonstrate that the location is geologically suitable and that the injection zone and confining zone are free of transmissive faults and fractures, and also abandoned wells have to be properly plugged to prevent them from being possible conduits for leakage of waste from the injection zone. Monitoring required for Class I wells consists of (1) continuous monitoring of wells for leaks, (2) surveys of the area for newly constructed wells, and (3) annual integrity tests and measurement of injection zone pressure. Continuous monitoring of wells for leaks coupled with annual mechanical integrity tests enables small leaks within a well to be quickly identified and repaired before any waste can escape from the injection zone and possibly migrate into underground sources of drinking water.

Class III injection wells are used for in-situ mining of minerals. In this process, water is injected underground into ore deposits to dissolve (or in the case of Frasch sulfur mining, to melt) the target mineral so it may be pumped in a dissolved state to the land surface through one or more production wells for processing. The injected solution used for in-situ mining of uranium by dissolution is typically water with the addition of sodium bicarbonate and oxygen; in Frasch sulfur mining, the injected fluid is water heated sufficiently to mobilize the sulfur

Producible minerals at Class III injection sites in Texas are generally found in USDWs. Therefore, as an essential part of the UIC program, permits require monitoring of groundwater before, during, and after mining occurs at a Class III injection well project.

Since 1975, when the first Class III injection well permit was issued, 45 sites have been permitted for uranium mining, six for Frasch sulfur

mining, and three for sodium sulfate mining. Groundwater monitoring varies for each of the three types of mining. The three sites which mined sodium sulfate and all six of the Frasch sulfur mining sites are closed and have had all wells plugged in response to unfavorable economic conditions. Off-site contamination from the sulfur mining sites is highly unlikely since sulfur must be super-heated to a liquid state in order for it to flow. Any movement away from the mine area would cause the sulfur to cool and harden.

The most extensive groundwater monitoring occurs at in-situ uranium mining sites. Currently, monitoring is being performed at five active in-situ uranium mining sites. At the uranium Class III sites, groundwater samples must be analyzed prior to any injection for mining in order to determine background or pre-mining values. In many cases, the natural background values of radium and uranium may exceed Environmental Protection Agency drinking water standards because of the existence of the ore body itself. The injection and production wells at each site are also Class III wells, but these are not subject to sampling and are not included in the regulatory well count. The monitor wells surround the production areas to detect any excursions during the mining process. There are currently approximately 4,651 injection/production wells.

During the mining, groundwater restoration, or stand-by phases of the in-situ uranium mining process, the mining companies are required to submit quarterly monitoring reports for review and approval. The reports contain groundwater analyses from within the zone being mined as well as groundwater from possible aquifers overlying and underlying the mined zone. Analyses include conductivity, uranium, chloride, and in some cases sulfate or alkalinity. These control parameters are monitored in the groundwater in monitoring wells surrounding each mined area, and are used to detect and correct movement of mining fluids toward USDW's. If the early stages of such fluid movement are detected at the monitoring well network, additional monitoring is required and steps must be taken by the company to keep all mining fluid within the uranium production zone of the mine area and away from USDW's. A company's failure to conduct such monitoring and control the movement of the mining fluid is a violation of the permit, which could result in appropriate enforcement action by the TCEQ.

When in-situ uranium mining is completed, the affected groundwater must be restored to levels consistent with pre-mining baseline values and with pre-mining groundwater use. Groundwater quality must remain stable for a minimum one-year period before the area can be declared restored and the monitor wells can be plugged. To ensure the aquifer is restored to levels approved by the TCEQ, groundwater samples (stability samples) are taken by the company at a minimum of thirty (30) day intervals for a minimum of three sample sets. The TCEQ may split samples with the company for verification purposes. Samples are analyzed by independent NELAC approved laboratories.

TCEQ also regulates Class IV and Class V (miscellaneous) injection wells under the federal Safe Drinking Water Act and the Texas Injection Well Act. Class IV wells are those that inject hazardous constituents into or above USDWs and are generally prohibited unless specifically authorized. The UIC Program is aware of six facilities that utilize a total of 145 Class IV injection wells in association with groundwater remediation projects. These facilities are regulated under Superfund or the federal Resource Conservation and Recovery Act (RCRA). Class V injection wells include all injection wells not in Classes I through IV. Class V wells are generally shallow, with injection into or above USDWs. As with all injection wells, Class V wells must provide adequate protection of ground and surface fresh water from pollution. Examples of Class V wells include groundwater remediation wells, stormwater drainage wells, domestic wastewater disposal wells, aquifer storage and retrieval wells, and closed-loop wells for air conditioning and heating. Possible pollutants that must be considered and assessed in regulation of Class V wells include industrial and agricultural chemicals, pathogens, metals, and salts. Class V injection wells are generally authorized by rule. Operators are required to submit well inventory information and obtain written approval before construction and operation of a Class V well. Reporting of injected materials is also required, and groundwater monitoring is often deferred to the TCEQ's appropriate program area, depending on the use of the wells, and is reported by those program areas.

Status of the Groundwater Monitoring Program. Under the UIC regulations, in-situ uranium mining facilities are monitored for groundwater quality through groundwater samples taken to verify permit compliance, with a self-reporting process overseen by the TCEQ. Each uranium mining site has one or more production areas. All of these areas are required to have groundwater monitoring. A total of 10,421 groundwater samples were collected in 2017. The number of wells and samples collected may fluctuate from year to year, increasing as new in-situ mining sites are developed and decreasing as sites complete post-mining monitoring operations.

Status of Groundwater Contamination. There are no known cases of contamination of drinking water supplies by Class I, Class III, Class IV or Class V injection wells in 2017.

Remediation Division

The Remediation Division is responsible for overseeing the investigation and cleanup of hazardous waste and pollutants released into the environment. The regulatory programs addressed by this division include petroleum storage tank sites, hazardous and nonhazardous industrial waste sites, voluntary cleanups, innocent owner/operator certification, state brownfields initiatives, dry cleaner remediation and Superfund activities. With the exception of the Innocent Owner/Operator Program (IOP), the goal of these programs is to remediate soil and groundwater contamination. The IOP does not require innocent owners or operators to

investigate or remediate contamination. Ideally, soil and groundwater contamination reported at IOP sites is being or will be remediated under another program. The following programs of the Remediation Division regulate sites with known groundwater contamination.

Voluntary Cleanup Program

Program Description. The Voluntary Cleanup Program was created by amendment to the Texas Solid Waste Disposal Act and became effective on September 1, 1995. The state rules that guide decision making in this program are found in 30 TAC §§333.1-333.11. The purpose of the Texas Voluntary Cleanup Program is to provide a streamlined, incentive-based process for persons to pursue cleanup of contaminated properties. The Voluntary Cleanup Law provides the TCEQ's administrative and technical requirements and conditions necessary for persons to voluntarily cleanup sites within this program. The following attributes of the law encourage lenders, developers, and prospective purchasers to clean up abandoned or under-utilized properties: non-binding voluntary cleanup agreements with the TCEQ, agreement by the TCEQ not to pursue enforcement action on sites that are being voluntarily remediated, and a release of non-responsible parties from liability to the State of Texas for cleanup of existing contamination in areas covered by the Certificate of Completion.

Sites are investigated to determine if groundwater impacts have occurred. If groundwater contamination is verified, then the persons conducting the voluntary cleanup propose response actions to address the contamination. The TCEQ assesses their proposal to ensure that the proposed remedy is capable of achieving the goals of the groundwater cleanup. Due to the voluntary nature of the program, some sites may withdraw from the program prior to completing restoration of the groundwater. These sites are indicated with an activity status of "0" in Table 1. Only sites that pose an imminent threat to human health or the environment and withdraw prior to completion of the response action are referred for potential enforcement action to compel the completion of any necessary response actions.

Status of Groundwater Monitoring. There are an estimated 7,126 monitor wells in place under the Voluntary Cleanup Program regulatory program. During 2017, approximately 12,114 groundwater samples were collected from 666 sites. Approximately 6,663 of these samples showed groundwater contamination.

Status of Groundwater Contamination. For 2017, 557 cases are listed by county in Table 1 under the division heading "REM/VC." Six cases required notification to local officials under TWC §5.236 and six cases required private water well owner notification under TWC §26.408 in 2017. There were 65 new cases of groundwater contamination identified and 49 cases were deleted due to action completed status in the 2016 report (activity status "6").

Innocent Owner/Operator

Program Description. The Innocent Owner/Operator Program was created by amendment to the Texas Solid Waste Disposal Act and became effective on September 1, 1997. The program is handled administratively through the Voluntary Cleanup Program. The purpose of the legislative amendment is to provide liability relief for owners or operators of property that has become contaminated as a result of a release or migration of contaminants from a source or sources not located on or at the owner's/operator's property. Also, a person who, after appropriate inquiry consistent with good commercial or customary practice, did not know or have reason to know of contamination on their property at the time the person acquired the property is released from liability to the State. The program reviews the site investigation report to confirm, through the issuance of a certificate, that the person is an innocent owner or operator.

The number of facilities subject to regulation is "0" because the source of the groundwater contamination is not the owner's or operator's property. Due to the fact that sites reported under the Innocent Owner/Operator Program are not subject to remediation by the "innocent owners," most of these sites are not currently being remediated. These sites are indicated with an activity status of "0" and an enforcement status of "0" in Table 1 until an Innocent Owner/Operator Program certificate is issued, at which time the site is indicated with an enforcement status of "6".

Status of Groundwater Monitoring. There are an estimated 446 monitor wells in place under the Innocent Owner/Operator Program. Approximately 535 groundwater samples were collected during 2017 and approximately 321 of these samples showed groundwater contamination.

Status of Groundwater Contamination. For 2017, 104 cases are listed by county in Table 1 under the division heading "REM/VCIO." Of these, none required notification to local officials under TWC §5.236 and no cases required private water well owner notification under TWC §26.408 in 2017. Of the 104 cases, 26 are new cases of groundwater contamination identified and added in 2017. One-hundred and forty-nine cases were deleted from the 2016 report; 33 were deleted due to action completed (activity status "6") in the 2016 report and an additional 116 sites were dropped that new information indicates should have been dropped in prior years.

Brownfields Site Assessments

Program Description. The Brownfields Site Assessment (BSA) program provides for the assessment and cleanup of properties that would otherwise remain abandoned. Many former industrial properties lie dormant or underutilized due to liability associated with real or perceived contamination. These properties are broadly referred to as brownfields.

The TCEQ, in close partnership with EPA, other federal, state, and local redevelopment agencies, and stakeholders, facilitates cleanup, transferability, and revitalization of brownfields through the development of regulatory, tax, and technical assistance tools. In addition, TCEQ will provide technical advice, education, and project partnering for brownfields redevelopment projects to local governments at no cost.

Status of Groundwater Monitoring. In 2017, there were no groundwater monitor wells in place under the BSA program.

Status of Groundwater Contamination. For 2017, no cases are listed in Table 1 under the division heading "REM/VCBSA." No cases are newly identified groundwater contamination cases in 2017, and none required notification to local officials under TWC § 5.236, and no cases required private water well owner notification under TWC § 26.408 in 2017. There were no groundwater contamination cases deleted from the 2016 report due to action completed (activity status "6").

Corrective Action Program

Program Description. The Corrective Action Program oversees remediation activities for many sites under the TCEQ's jurisdiction. These sites include 1) facilities with industrial and hazardous waste permits which have released hazardous contaminants to environmental media from RCRA-regulated units; 2) facilities with contamination caused by releases from the Solid Waste Management Units (HSWA Corrective Action); 3) facilities closing RCRA and non-RCRA Solid Waste Management Units; 4) RCRA and non-RCRA facilities which conduct corrective action through Enforcement Orders; 5) facilities which self-implement the cleanup regulations of 30 TAC, §§335 and 350; and 6) federal facilities which may include all the five items listed above.

Status of Groundwater Monitoring. There are approximately 7,040 monitor wells in place under the Corrective Action Program. During 2017, an estimated 11,264 groundwater samples were collected and approximately 6,758 of these samples showed groundwater contamination.

Status of Groundwater Contamination. For 2017, 628 cases are listed by county in Table 1 under the division heading "REM/CA." There were four cases that required notification to local officials under TWC § 5.236. Three cases required private water well owner notification under TWC, § 26.408 in 2017. The Corrective Action Program identified 111 new cases of groundwater contamination in the 2017 report and 19 cases were deleted due to action completed status in the 2016 report (activity status "6").

Dry Cleaner Remediation Program

Program Description. In 2003, the Texas legislature passed House Bill 1366, establishing an environmental regulation and remediation program for dry cleaning facilities and dry cleaning drop stations in Texas. The program is administered by the TCEQ. Under the program, operating dry cleaning facilities and drop stations in Texas pay registration and solvent fees into a fund (the Dry Cleaning Facility Release Fund) that is then used by the TCEQ to investigate and address eligible contaminated dry cleaning sites. In addition, certain property owners and preceding property owners may also choose to pay annual registration fees in order to become eligible for participation in the program. The legal requirements related to the Dry Cleaner Remediation Program (DCRP) are found in THSC Chapter 374 and 30 TAC Chapter 337.

Interested parties may submit an Application for Ranking to the DCRP. Complete applications are ranked and accepted to the program within 90 days of receipt. Once accepted into the program, the TCEQ conducts corrective action at DCRP sites in accordance with the requirements of 30 TAC Chapter 350, the Texas Risk Reduction Program or in accordance with other guidance established by the TCEQ.

Under the DCRP, corrective action is taken at sites that have been ranked pursuant to THSC § 374.154 and 30 TAC §337.30. Corrective action is conducted in accordance with site prioritization pursuant to 30 TAC §337.31. Corrective action under the DCRP is predicated on available funding, as set out in THSC Chapter 374. Upon completion of corrective action at a site, the TCEQ DCRP issues a letter of completion to the applicant.

Status of Groundwater Monitoring. By the end of 2017, there were approximately 2,190 regulatory monitor wells located at 219 Dry Cleaner Remediation Program sites. Of these sites 114 were subject to groundwater monitoring with approximately 1,140 sampled monitor wells and 684 showing contamination. During 2017, approximately 1,710 groundwater samples were collected from these DCRP sites. Approximately 1,026 of these groundwater samples showed contamination.

Status of Groundwater Contamination. In 2017, 219 DCRP sites were reported as having groundwater contamination. There were 13 new cases of groundwater contamination identified and added in 2017 and one case transferred to the DCRP in 2017. Two groundwater contamination cases required notification of private water well owners under TWC, §26.408 and one case required notification of local officials under TWC, §5.236 in 2017. Five cases were deleted due to action completed status in the 2016 report (activity status “6”).

Superfund

Overall Program Description. In 1980, the United States Congress passed the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as the “Superfund” law. The purpose of the federal Superfund legislation was to protect public health and the environment from hazardous substances by authorizing federal action in response to releases into the environment from abandoned hazardous waste sites. Potentially contaminated sites are referred to the Remediation Division (REM) by the TCEQ’s regional offices, the EPA, local government entities, and individuals and are evaluated and ranked according to the degree of hazard presented to the public health and the environment. High-ranking sites are referred to the EPA for placement on the National Priorities List (NPL). When sites are listed on the NPL, the TCEQ either provides management assistance or takes the lead in investigating and remediating the site through federal grants. After the remedial action is completed, the TCEQ funds any post-completion care activities required during the operations and maintenance phase.

To address those sites not eligible for funding under the Federal Superfund Program, the Texas Legislature amended the Texas Solid Waste Disposal Act in 1985 to create the Texas State Superfund Program. The State Superfund Program follows the same step-by-step process, from corrective action planning to remediation, as described for the federal program. The Texas Solid Waste Disposal Act requires that sites placed on the Texas Superfund Registry first seek funding for site cleanup from responsible parties or federal resources before using funds from the Hazardous and Solid Waste Remediation Fee Account.

Groundwater monitoring activities occur throughout the Superfund process, from investigation through remediation and into the operation and maintenance phase. Residential, public, and industrial wells near a potential site, in addition to existing or newly installed site monitoring wells, would typically be sampled to help determine whether a site warrants placement on the NPL. If not, the site would be evaluated for possible inclusion on the Texas Superfund Registry for remediation under the State Superfund Program. Once placed on either the NPL or Texas Superfund Registry, the potentially responsible parties (PRPs) are provided the opportunity to enter into an enforceable administrative order to conduct all aspects of site investigation and remediation. If the PRPs are unwilling or unable to enter into an enforceable order, the state proceeds with this work.

A site investigation is conducted to characterize the type and volume of contaminants at a site, the contaminated media (such as soil or groundwater), the lateral and vertical extent of contamination, the risk the site poses to human health and the environment, and to allow the selection of a cleanup remedy during the feasibility study or presumptive remedy study. Groundwater monitoring wells are installed during the site

investigation to determine the nature and extent of groundwater contamination.

The remediation technology selected to address groundwater contamination is site-specific, but may involve controlling the source of the contamination or removing contaminants from the groundwater. After the site remediation is complete, groundwater monitoring may occur as part of the operation and maintenance phase until remediation goals are met.

Program Description. Superfund includes the Superfund Site Discovery and Assessment Program and the Superfund Program. The Superfund Site Discovery and Assessment Program investigates potential Superfund sites to determine if they are eligible for listing on either the Texas Superfund Registry or the NPL. Once a site is eligible for Superfund, the role of the TCEQ varies depending on the program and funding source.

Federal Superfund Sites: The TCEQ provides management assistance, through EPA grants, to the EPA on federally-funded or PRP-funded NPL sites as they progress through the Superfund investigation and remediation process. The TCEQ can also take the lead role on investigating NPL sites when provided EPA grant funds.

State Superfund Sites: The Texas Solid Waste Disposal Act requires that sites placed on the Texas Superfund Registry first seek funding for site cleanup from potentially responsible parties before using funds from the Hazardous and Solid Waste Remediation Fee Account. The TCEQ provides regulatory oversight on PRP-funded sites as they progress through the Superfund investigation and remediation process.

If PRPs are not willing or able to fund a State Superfund site, the TCEQ takes the lead in the Superfund investigation and remediation process with funds from the Hazardous and Solid Waste Remediation Fee Account.

Status of Groundwater Monitoring. In 2017, the Superfund Site Discovery and Assessment Program sampled 90 wells at four sites and 33 wells were affected by contamination. The Superfund Program sampled approximately 2,138 wells at 81 sites and approximately 1,507 wells were affected by contamination.

Status of Groundwater Contamination. The Superfund Site Discovery and Assessment Program had ten cases and the Superfund Program had 81 cases of groundwater contamination in 2017. These cases are in Table 1 under the Division heading “REM/SSDAP” and “REM/SF,” respectively.

There are three new SSDAP cases of groundwater contamination identified and added in the 2017 report. No new groundwater contamination cases were identified in Superfund. One SSDAP case was deleted due to action-completed status in 2016 and one case was

transferred to the LPST program. No Superfund cases were transferred to other programs.

One SSDAP case and one Superfund case of groundwater contamination required notification to local officials under Texas Water Code (TWC) §5.236 and to private well owners under TWC §26.408.

Petroleum Storage Tank Program

Program Description. The Petroleum Storage Tank (PST) program regulates underground and aboveground product storage tanks as authorized by the federal Solid Waste Disposal Act of 1970, as amended by RCRA of 1976, and empowered by TWC, Chapter 26, Subchapter I. Approximately 95 percent of the regulated storage tanks contain petroleum products with the remainder containing regulated hazardous substances.

At regulated facilities, where a product release has impacted groundwater, groundwater monitoring is required in conjunction with any necessary remedial activities. Groundwater monitoring is required until contaminant concentrations reach acceptable levels as determined by the PST guidance and rules on a site-by-site basis.

Status of Groundwater Monitoring. There are an estimated 8,211 monitor wells in place under the PST program. In 2017, the PST program received monitoring reports from 466 leaking petroleum storage tank (LPST) sites, which contain approximately 3,262 monitor wells. Of these, approximately 2,330 monitor wells have contamination to groundwater. During 2017, approximately 4,515 groundwater samples were collected from the 466 LPST sites. Approximately 3,225 of these samples showed groundwater contamination.

Status of Groundwater Contamination. For 2017, 1,173 cases are listed by county in Table 1 under the division heading "REM/PST." Of these, there are 19 cases that required notification to local officials under TWC, §5.236, and 19 cases that required notification to private water well owners under TWC, §26.408. There were 275 cases added in 2017 of which 263 were newly identified cases of groundwater contamination and 271 cases were deleted due to action completed status in the 2017 report (activity status "6").

Summary

The Remediation Division has a total of 2,772 groundwater contamination case descriptions listed by county in Table 1. In 2017, 32 of the Division's cases required notification to local officials under TWC, §5.236, and 32 required notification to private well owners under TWC, §26.408.

Waste Permits Division

The Waste Permits Division includes the Municipal Solid Waste Permits Section and the Industrial and Hazardous Waste Permits Section.

Municipal Solid Waste (MSW) Permits

MSW Program Description. The MSW Permits Section regulates the storage, processing, and disposal of municipal solid waste in Texas, under the authority of the Texas Solid Waste Disposal Act, as amended (THSC Chapter 361), and under the federal Resource Conservation and Recovery Act (RCRA), Subtitle D, as amended. These statutes are implemented in state regulations in 30 TAC Chapters 326, 328, 330, and 332.

The MSW Permits Section audits groundwater monitoring results from municipal solid waste landfills and reviews corrective action plans and remedial activities if groundwater contamination occurs. The MSW Permits Section also audits groundwater monitoring results from permitted composting facilities.

MSW Type I landfills, which may receive putrescible waste and household waste, are required to have groundwater monitoring systems, monitor groundwater quality, and evaluate the results statistically in accordance with 30 TAC Chapter 330, Subchapter J, §§330.401 through 330.415 unless they qualify for an arid exemption under 30 TAC §330.5(b), or obtain a groundwater monitoring suspension under §330.401(d).

For Type I landfills, if groundwater analyses indicate an increase from background concentrations for any constituent, the owner or operator must initiate assessment monitoring unless it is demonstrated that a source other than the landfill caused the increase, or that the increase resulted from natural variation in groundwater quality, or an error in sampling, analysis, or statistical evaluation. During assessment monitoring, there are three possible outcomes: (1) if the concentrations of all assessment constituents are shown to be at or below background values for two consecutive sampling events, the owner or operator may return to detection monitoring; (2) if the concentrations of any assessment constituents are above background values, but all are below groundwater protection standards (which may be drinking water maximum contaminant levels, background concentrations, or health-based concentrations), the owner or operator continues assessment monitoring; or (3) if one or more constituents are detected at statistically significant levels above groundwater protection standards, the facility owner or operator must characterize the nature and extent of the release, notify persons who own or occupy the land that directly overlies any part of the plume of contamination if contaminants have migrated off-site, assess potential corrective measures, select a remedy, and implement the remedy (corrective action). Remedies are considered complete when the concentrations of all assessment constituents are at or below

groundwater protection standards for a period of three consecutive years. Upon completion of a remedy, the owner or operator may return to detection monitoring if the concentrations of all assessment constituents have been at or below background values for two consecutive sampling events. MSW landfills that closed before implementation of RCRA Subtitle D, but were required under earlier rules to conduct groundwater monitoring, continue to follow pre-Subtitle D groundwater monitoring requirements during their post-closure care maintenance periods.

MSW Type IV landfills, which are limited to brush, construction and demolition waste, and other rubbish free of putrescible waste and household waste, may be required to conduct groundwater monitoring at the discretion of TCEQ executive director according to 30 TAC §330.417. For Type IV landfills, if the owner or operator finds the facility to have contaminated or be contaminating the uppermost aquifer, the executive director may order corrective action appropriate to protect human health and the environment up to and including assessing potential corrective measures, selecting a remedy, and implementing the remedy.

Nuisance and abandoned building landfills are landfills owned by counties or municipalities with a population of 12,000 people or less, for disposal of demolition waste from properties with nuisance or abandoned buildings. The landfills are regulated under 30 TAC §330.7(i), and are not required to monitor groundwater.

Composting facilities that compost grease trap waste or mixed municipal solid waste are subject to groundwater monitoring requirements under 30 TAC §332.47(6)(C)(ii).

At the end of calendar year 2017, there were 560 MSW landfills and nine permitted composting facilities in TCEQ databases with permits in issued status. Of the 560 landfills, 235 were active (or could become active), and 325 are closed. All nine composting facilities are active or could become active.

Status of the Groundwater Monitoring Program. Of the 235 landfills in 2017 that are active or could become active, 121 (97 Type I and 24 Type IV) were subject to the program area's groundwater regulations. Of the 325 closed landfills in 2017, 30 (all Type I) were subject to groundwater regulations. Landfills not subject to the program area's groundwater regulations include: landfills that closed before requirements for monitoring were applicable, landfills that have qualified for an arid exemption, landfills that were not yet constructed or had not yet begun to receive waste, landfills that have been granted a suspension from groundwater monitoring, and landfills for nuisance and abandoned buildings. In addition, in 2017, nine composting facilities were subject to the program area's groundwater regulations. In total, during 2017, 160 MSW facilities were subject to the program area's groundwater regulations.

Groundwater monitoring is conducted semiannually or annually, depending on the type of facility and its permit provisions. Groundwater monitoring reports are due from owners and operators 60 to 90 days after the last monitoring event in a calendar year. At the time this report was prepared, the TCEQ had not yet received groundwater monitoring reports for some facilities for 2017. For those facilities, the activity status of the facility, the number of wells sampled, and the contamination status were based on the most recent reports received.

The 160 MSW facilities subject to groundwater monitoring in 2017 have a total of approximately 2,240 groundwater monitor wells. Approximately 2,100 of the wells were sampled in 2017; 140 wells were not sampled because they were dry or did not yield enough water for sampling, or were inaccessible. Approximately 3,810 groundwater samples were collected from the MSW groundwater monitor wells in 2017.

Status of Groundwater Contamination. Fifty-five (55) MSW landfill facilities are listed by county in Table 1 under the heading “MSW.” Groundwater contamination was reported at 51 of the 55 facilities, in 343 samples from a total of 191 monitor wells. Constituent concentrations returned to background levels at four facilities in 2017. There were no new contamination cases in 2017.

At the end of 2017, confirmation of contamination or an investigation (activity status code 2) was under way at 35 facilities. During 2017, corrective action (activity status codes 3, 4, and 5) took place at 15 facilities. No further action was required (activity status code 6C) for four (4) facilities in 2017 (MSW Permit Nos. 62, 517A, 576C, and 1273A). Traces of contamination reappeared at two (2) facilities for which it was reported for 2016 that no further action was required (MSW Permit Nos. 42D and 556). One (1) facility had no activity in 2017 (MSW Permit No. 144). Of the MSW landfills where contamination was detected in 2017, only one is known to consist only of cells constructed to Subtitle D standards (that landfill, MSW Permit No. 2190, lies adjacent to a closed, pre-Subtitle D landfill and an oil field). The other landfills consist of a mix of pre Subtitle D and Subtitle D cells (MSW Permit Nos. 42D, 47A, 62, 66B, 69, 73A, 79, 151A, 203A, 208A, 242A, 261B, 262C, 358B, 360A, 517A, 568A, 576C, 720, 948A, 956B, 996C, 1003, 1025B, 1273A, 1307D, 1312B, 1384A, 1444C, 1447A, 1454B, 1506A, 1521, 1522A, 1554A, 1558A, 1562A, 1571A, 1590A, 1605B, 1663B, 1866, and 2105A), or solely of pre Subtitle D cells (MSW Permit Nos. 44A, 144, 302, 464A, 556, 633, 1062A, 1140A, 1236A, and 1237); one landfill is a Type IV landfill (MSW Permit No. 1403).

Industrial and Hazardous Waste Permits

IHW Program Description. The IHW Permits Section regulates the treatment, storage and disposal of hazardous solid waste and the commercial treatment, storage and disposal of nonhazardous industrial solid waste under the authority of the Texas Solid Waste Disposal Act, as amended (THSC, Chapter 361), and under federal authorization to administer the RCRA, as amended. In addition to operating federally-authorized programs, the IHW Permits program also refers cases to the Office of Compliance and Enforcement when they involve violations of TWC, §26.121, which prohibits unauthorized discharges into or adjacent to waters in the state, including groundwater.

Under RCRA authorization and THSC, Chapter 361, as amended, the IHW Permits program regulates approximately 180 industrial facilities. Of these, approximately 48 facilities conduct groundwater detection monitoring programs. Land disposal units subject to groundwater detection monitoring include landfills, surface impoundments, land treatment units, and waste piles.

Operators monitor the waste units according to provisions in the facility's permit. A detection monitoring program is required for units for which no release has been indicated. The sampling program is based on hazardous constituents specific to the waste being disposed. If a release occurs, the operator is subject to a compliance monitoring program wherein the monitor well system is sampled for all hazardous constituents and a concentration limit is established for each detected constituent. If this value is exceeded in subsequent sampling events, the operator must implement a corrective action program. Compliance monitoring and the corrective action program are administered by the Remediation Division.

Status of the Groundwater Monitoring Program. The IHW groundwater detection monitoring program relies upon operators to correctly sample, analyze, interpret, and report on the groundwater quality at their facilities. The TCEQ inspectors and staff check the compliance status of operators annually and perform periodic in-depth reviews, including agency sampling of monitor wells for all hazardous waste facilities. Similar actions are performed for nonhazardous waste sites as the situation dictates. The TCEQ analyses are compared to the facility's reported results, sampling procedures, data quality, and interpretations in order to determine the validity of the self-reported data.

Status of Groundwater Contamination. The IHW Permits program oversees detection monitoring at permitted hazardous and nonhazardous industrial waste facilities. If a release to groundwater is confirmed at a facility, the case is transferred to the TCEQ Remediation Division which oversees continued groundwater monitoring and corrective action.

There are two IHW cases reported for 2017. These two cases are carried over from previous years. One case was added in 2014 and is pending transfer to the Remediation Division. Two cases were added in 2015; one was transferred to the Remediation Division in 2017, and the other case is still pending. There were no new cases of contamination in 2017.

Water Quality Division

The Water Quality Division is responsible for the issuance of wastewater permits under the Texas Pollutant Discharge Elimination System; implementation of the Texas Surface Water Quality Standards; and updating the Water Quality Management Plan.

The division is subdivided into three sections, Wastewater Permitting, Water Quality Assessment, and Water Quality Division Support. The Water Quality Assessment Team of the Water Quality Assessment Section actively monitors and reports cases of groundwater contamination.

Water Quality Assessment Section

Program Description. The Water Quality Assessment Team evaluates permit applications for municipal and industrial wastewater treatment facilities, concentrated animal feeding operations (CAFO), sludge disposal, and wastewater land application sites for their potential to impact groundwater, and provides recommended permit provisions to the Wastewater Permitting Section that will aid in the protection of groundwater quality. Permit applications are reviewed for their compliance with applicable portions of Texas Administrative Code, Texas Water Code, and the Code of Federal Regulations.

Status of Groundwater Monitoring Programs. Groundwater monitoring is required by rule for certain wastewater facilities, and the Water Quality Assessment Team may recommend groundwater monitoring for additional facilities in order to be protective of groundwater quality. Information submitted in accordance with groundwater monitoring and TCEQ enforcement order requirements are routinely reviewed and evaluated. Any noncompliance may be referred to the Enforcement Division/Water Section for coordination of appropriate enforcement action.

There are approximately 3,451 individual municipal, industrial, CAFO, and sludge permits under programs of the Water Quality Division. Of those facilities, approximately 60 are currently required to conduct groundwater monitoring. Due to the nature of monitoring and reporting requirements, an exact number of monitor wells cannot be ascertained; however, it is believed that 650 to 800 wells are monitored regularly by permit holders.

Status of Groundwater Contamination. The Water Quality Assessment Team has a total of 15 groundwater contamination cases listed in Table

1. The cases are listed by county under the division heading "WQD/WQAS." There were no new cases added to this year's report.

Water Quality Planning Division

Total Maximum Daily Loads. A total maximum daily load (TMDL) is a tool for improving water quality. TMDLs are based on the relationship between pollution sources and instream water quality conditions. They provide a basis for planning and implementing pollution controls, land management practices, and projects to protect and restore water quality. A TMDL establishes the maximum allowable loading of a particular pollutant that a waterway can assimilate and still meet water quality standards. This allowable loading is the scientific basis for restoring impaired surface waters.

A natural waterway is considered impaired if it does not meet the criteria for support of one or more of its beneficial uses, as defined in the Texas Surface Water Quality Standards. The CWA requires all states to identify the water bodies in their jurisdiction that do not meet these standards. This list of impaired segments, also called the 303(d) list, is a section of the Texas Integrated Report of Surface Water Quality for Clean Water Act Sections 305(b) and 303(d).

When developing TMDLs, the TCEQ may collect additional data to better understand the water quality concerns, such as the origin of point and nonpoint sources of the pollution. In some areas, groundwater contamination could be contributing to some of the impaired segments if groundwater interacts with surface waters and pollutants are exchanged during this interaction. For example, mineralized groundwater might be discharged to nearby surface water sources. In a TMDL, instances of such groundwater contamination discharged to surface water would be addressed through the load allocation component.

While TMDLs are being developed, stakeholders in the watershed develop an implementation plan for the TMDL. They take a realistic look at where they are, where they need to get to, and how to get there. They work on how to fairly share the load of reducing pollution and identify financial and technical resources available to them. For example, wastewater treatment facilities may commit to reducing the concentrations of a particular pollutant in their discharges. Cities may work to control and treat runoff from their streets through management of stormwater. Farmers and ranchers may decide to use new or improved "best management practices" to reduce pollution in runoff water. Government agencies or educational institutions may help by providing educational and promotional materials.

Nonpoint Source Pollution Program. The Texas Nonpoint Source (NPS) Program, authorized by CWA §319(h), is also implemented within this division. The primary activity of the NPS Program is oversight of outgoing grants to public sector and nonprofit organizations to support voluntary

measures to reduce NPS pollution. Nonpoint source pollution generally results from land surface runoff, atmospheric deposition, or hydrologic modification. As the runoff moves, it picks up and carries away natural and human-made pollutants, finally depositing them into lakes, rivers, wetlands, coastal waters and ground waters.

As required by federal guidelines, the NPS program uses 50% of its 319(h) grant funding to support implementation of Texas watershed-based plans. Implementation activities frequently funded include installation of Low Impact Development features including rainwater harvesting, bioretention, and permeable pavement; inspection, repair and replacement of failing septic systems; education and outreach; and supplemental water quality data collection. The remaining funds are used to develop these plans, and other Program priorities. The NPS Program coordinates its planning and implementation activities with other TCEQ water quality programs through the Watershed Action Planning (WAP) process.

The NPS Program also develops the statewide Texas NPS Management Program in cooperation with the Texas State Soil and Water Conservation Board (TSSWCB). This statewide plan includes both groundwater and surface water components and outlines the State's comprehensive strategy to protect and restore waters impacted by NPS pollution. The TCEQ and TSSWCB have established goals and objectives for managing and tracking the progress of NPS reduction in Texas. Success in achieving the goals and objectives are reported annually in the Annual Report on Managing NPS Water Pollution in Texas.

Water Availability Division

Groundwater Planning and Assessment

Status of Groundwater Monitoring Programs. The Groundwater Planning and Assessment Team compiles and maintains the Interagency Pesticide Database, which contains the results of groundwater monitoring for pesticides collected by various agencies and other entities that sample groundwater. The database is one of several tools that TGPC utilizes to assess groundwater impacts from the label-specified use of agricultural chemicals. The database includes analyses of approximately 14,812 samples from approximately 6,760 different wells. The reason for the changes in these numbers from the previous year is due to adding some sampling results for the year. The United States Geological Survey groundwater pesticide monitoring results were downloaded and entered into the IPD, adding data from December 14, 2016 through September 20, 2017. The USGS data included 27 new wells, 69 samples, and 14,812 analyte analyses. There were no changes for detections from 2016, with the data still indicating a total of 367 confirmed pesticide detections, including the following: 123 confirmed detections of atrazine, 86 of triazine metabolites, 46 of simazine, 25 of prometon, 15 of propazine, seven of Fipronil, six of metolachlor, six of DEET, five of diazinon, four of

carbon disulfide, three each of 2,4-D, hexazinone, 3,4-dichloroaniline, terbacil, two each of dieldrin, bromacil, tebuthiuron, p,p'-DDT, 1,1-dichloroethane, 1,4-dichlorobenzene, 1,2-dichloropropane, carbaryl, imidacloprid, p,p'-DDE, pentachlorophenol, endrin, and one each of endrin, 1,1,1-trichloroethane, 2,4,5-T, chlorobenzene, desulfinyl fipronil, dichloromethane, heptachlor epoxide, imazaquin, 1,3-dichloropropene, 1,1-dichloroethene, and tetrachloromethane.

GPAT conducts its agricultural chemical monitoring programs as outlined in the Texas State Management Plan for Prevention of Pesticide Contamination of Groundwater. The monitoring represents ambient screening for atrazine and other constituents depending on location, funding, and specific immediate concerns. As necessary, monitoring also addresses initial efforts at contamination response and enforcement for the PMP.

The TCEQ and TWDB have an ongoing Cooperative Monitoring agreement to screen the state's groundwater for the presence of pesticides. In FY2017 GPAT coordinated with the TWDB to analyze certain samples collected by TWDB for pesticides. TWDB sampled over 200 wells, obtaining 74 primary samples, and 28 duplicates and field blanks, from the following aquifers: Gulf Coast, Queen City, Sparta, Yegua-Jackson, Evangeline, Jasper, Chicot, and Brazos River Alluvium. For these 102 samples collected for immunoassay (IA) analysis, the only target analyte was atrazine.

Analyses were performed for atrazine by conducting four immunoassay runs from May 1, 2017 through August 24, 2017. Monitoring revealed no quantifiable detections (>0.1 parts per billion, or ppb).

The On-Going sampling by TCEQ provided 17 samples from seven areas in the Panhandle for analysis by IA. The 21 samples were analyzed by IA for atrazine. The TDSHS Laboratory sent eight parallel samples for pesticide analysis using USEPA Methods 525.2 and 515.4. Except for one detected concentration of picloram (0.4 ppb, City of Kress well #3), the laboratory analytical results for all pesticides were negative. The atrazine concentrations by immunoassay were lower than in previous years. The Kress well #3 also had the highest atrazine concentration at 0.41 ppb, but did not detect any by laboratory analysis indicating the immunoassay result was a false positive, likely the result of the method not being as specific for atrazine as the laboratory method. Typically the immunoassay method also detects other triazines and degradates of atrazine. All other well samples were below 0.3 ppb, which typically are analyzed as non-detections by laboratory analysis for atrazine. All laboratory and immunoassay detects were considerably lower than action levels, defined as the Maximum Contaminant Level (MCL) or the Health Advisory Level (HAL). The MCL for atrazine is 3.0 ppb.

Status of Groundwater Contamination. Cases of confirmed groundwater contamination that do not fall under the jurisdiction of an individual

division or agency are tracked by the Water Availability Division. These cases include contamination that has not been directly linked to a single activity or source; historic enforcement cases where groundwater contamination is known to exist but where no further regulatory action is required by law, rule, or order; existing cases that are outside the current regulatory scope; and cases that are confirmed in the IPD that do not require regulatory action. Out of the total five groundwater contamination cases listed in Table 1 under the heading “WAD,” three cases are pesticide related. No cases required notification to local officials in 2017 under TWC, §5.236 (the Superfund-related program under which detections are reported). Additionally, all pesticide monitoring data is entered into the IPD.

Water Supply Division

Public Drinking Water Section

Status of Groundwater Monitoring Programs. In 2017, the Drinking Water Standards Section of the Water Supply Division monitored 6,979 public water supply systems in its regulatory program. Of these public water systems, 5,536 use groundwater as a primary or secondary source of drinking water. These systems have 8,934 entry points supplying groundwater from 13,811 active public water supply wells. An additional 10,956 wells are classified as inactive. Community and non-transient/non-community systems routinely monitor for regulated and unregulated inorganic and synthetic organic chemicals at least once every three years as well as annually for volatile organic chemicals. All transient/non-community systems monitor for most of the required inorganic chemicals once every three years. Technically defensible source water assessments determine well and geologic vulnerability. The monitoring for source water contaminants may change as source water assessments are updated.

The majority of chemical monitoring for source water contaminants of public drinking water is performed at the entry point where the water enters into the distribution system after all treatment has been applied. Distribution sampling is not addressed here. For many entry point samples, the water analyzed is a blend of water from more than one water well, underground spring, and/or surface water intake. Monitoring of untreated groundwater is conducted when a new public water supply well is constructed, where groundwater is highly vulnerable to microbiological contamination, or when groundwater contamination is suspected based on entry point sampling. In 2017, 39,056 samples were collected from groundwater sources represented by 8,099 entry points and 97 wells. The chemical groups included in the sampling were minerals, metals, nitrates, radio-chemicals, volatile organic chemicals, and synthetic organic chemicals. 124 samples showed contamination from wells or entry points served by wells that have confirmed contamination. In 2017, there were many samples with detections of

volatile organic chemicals (attributed to tank coatings, artifacts, etc.), but none showed new groundwater contamination for volatile organic chemicals. Most inorganic and radiochemical contaminants are not assessed for man-made chemical contamination at this time. The potential natural occurrence or the long history of man-made chemical use of some contaminants such as nitrates and arsenic makes the assessment difficult.

Currently, all EPA-certified drinking water chemical analyses under this program are performed by the Texas Department of State Health Services Bureau of Laboratories or the Lower Colorado River Authority Environmental Laboratory Services, both accredited by the TCEQ.

Microbial monitoring may also find contaminated wells. Water systems conduct monthly bacterial (coliform) testing in distribution. Though systems are required to maintain a disinfectant residual, sometimes contaminated wells (usually groundwater under the influence of surface water, or GUI) are discovered. Additional well testing before treatment is conducted. The Drinking Water Standards Section maintains this database of GUIs. Microbiological analyses are conducted by laboratories that have been accredited by the TCEQ.

Status of Groundwater Contamination. For the 2017 report, no new wells were added. A total of 213 unique current or former public water supply wells are considered to be contaminated and are reported in the Historic Table (Table 4). This number includes only contaminations where actual well water was sampled and found to be contaminated. Groundwater contamination is not inferred from entry point sampling alone. A detection of a contaminant in raw water collected directly from a well is required to confirm contamination. The Water Supply Division does not have authority over remediation of groundwater contamination. Compliance with public drinking water rules and regulations is based on the ability to provide water that meets the standards; therefore, a water system can stop using a well, blend the water, treat the water, or use the water as long as the drinking water delivered to customers meets the standards. In addition, at this time, few of the contaminations initiate activities for remediation in other programs of the TCEQ or other state agencies. Currently, the Water Supply Division will not remove contamination cases from the list unless the contamination is known to have undergone remediation.

Texas Water Development Board

Program Description. The Texas Water Development Board (TWDB) conducts an active groundwater resource assessment program. TWDB personnel have identified boundaries and various characteristics for all of the state's major and minor aquifers including geologic information, water availability, and recharge. In addition, TWDB has identified the major entities using groundwater within each river basin, the aquifer(s) from which they pump, the quality of water being developed, and the quantity of water needed for a 50-year planning period. To accomplish this, TWDB has been collecting data on the occurrence, availability, quality, and quantity of groundwater present and the current and projected demands on groundwater resources. The statewide groundwater level measurement programs, groundwater quality sampling program, and groundwater studies are vital to the state's regional water planning efforts.

The purpose of the ambient groundwater quality sampling program is to collect data to: 1) monitor changes, if any, in the quality of groundwater over time and 2) establish, as accurately as possible, the baseline quality of groundwater occurring naturally in the state's aquifers. TWDB conducts the groundwater quality monitoring program in accordance with procedures established in its *Field Manual for Groundwater Sampling*. It also obtains data collected by other entities that follow these and similar procedures, such as groundwater conservation districts, the U.S. Geological Survey, and other state and federal agencies.

TWDB personnel process and store collected data by state well number in the TWDB groundwater database, which also contains indicators of sample reliability, collecting entity, and analytical laboratory along with sample results. Using the geographical coordinates stored in TWDB's groundwater database, statewide water quality data are analyzed using geographical information systems software. Through the TWDB's Water Data Interactive portal, these data are available on the TWDB's Groundwater Data Viewer

<<https://www2.twdb.texas.gov/apps/waterdatainteractive/groundwaterdataviewer>>, an internet-based mapping application. They are also available from specific reports at <<http://www.twdb.texas.gov/groundwater/data/gwdbbrpt.asp>>.

Status of Groundwater Monitoring Programs. The TWDB sampled 217 wells in 2017, cooperators sampled at 188 sites (wells and springs), and 13 wells were sampled by other state agencies, for a total of 418 sampling sites. The ambient groundwater quality sampling program comprises TWDB personnel's and cooperators' collection (and analysis by contracted lab) of such samples annually. TWDB enters these water-quality data reports in its groundwater database, scans accompanying images for an image-file database, also available through the Groundwater Data Viewer, and files them in the Located Well Data file

room at the TWDB agency's office in Austin. The sites have accurate latitude and longitude data for use with geographic information systems.

[Figure 7](#) tabulates the number of analyses collected by the TWDB and its cooperators that contained selected constituents in excess of their primary and secondary standards, or Maximum Contaminant Levels (MCLs).

TWDB contracts with analytical laboratories to measure the concentrations of major ions, selected trace elements, and, on occasion, the isotopic content of groundwater samples. During 2017, TWDB concentrated its sampling in the Gulf Coast aquifer (184 wells): the Queen City Aquifer (12 wells), the Yegua-Jackson Aquifer (11 wells), the Sparta Aquifer (7 wells), local aquifers (2 wells) and Igneous Aquifer (1 well). In 2017, five cooperating groundwater conservation districts, following TWDB procedures, also collected samples from the Trinity (59) Edwards (Balcones Fault Zone) (50 samples), Edwards-Trinity (Plateau) (22), local (13), Ellenburger-San Saba (11), Other (9), Hickory (5), Igneous (5), Marble Falls (3), Carrizo-Wilcox (2) and one from West Texas Bolson and newly designated Cross Timbers aquifers.

The TWDB is not a regulatory agency and has no groundwater protection regulatory programs. Consequently, the TWDB does not have regulatory jurisdiction over contamination cases detected by the agency. TWDB informs the well owner of any detection of generally naturally-occurring contamination and provides suggestions on appropriate means of contaminant removal. The accompanying map ([Figure 8](#)) shows the location of the 418 sites sampled by the TWDB and the five cooperating groundwater conservation districts in 2017.

Figure 7. Texas Water Development Board Results of Analyses - 2017

Category	Constituent	MCL	Number greater than MCL
Primary MCLs	Antimony	6 µg/L	0
	Arsenic	10 µg/L	18
	Barium	2 mg/L	1
	Beryllium	4 µg/L	0
	Cadmium	5 µg/L	0
	Chromium	100 µg/L	0
	Fluoride	4 mg/l	14
	Gross Alpha	15 pCi/L	15
	Lead	Any detection	18
	Mercury	2 µg/L	0
	NO ₂ + NO ₃ (N)	10 mg/L	4
	Radium ^{226 + 228}	5 pCi/L	NA
	Selenium	50 µg/L	0
	Thallium	2 µg/L	0
	Uranium	30 µg/L	2
	Secondary	Aluminum	50-200 µg/L
Chloride		300 mg/L	48
Copper		1 mg/L	0
Fluoride *		2 mg/L	50
Iron		300 µg/L	69
Manganese		50 µg/L	58
pH		<7.0	251
Silver		100 µg/L	0
Sulfate		300 mg/L	62
Total Dissolved Solids		1,000 mg/L	83
Zinc		5 mg/L	0

*Greater than 2.0 mg/l and less than 4.0 mg/l

MCL = Maximum Contaminant Level

mg/L = milligrams per liter

µg/L = micrograms per liter

pCi/L = picocuries per liter

Figure 8. TWDB and Cooperator Sampling Locations - 2017

Railroad Commission of Texas

Oil and Gas Division

Class II Underground Injection Control Program Description. The Railroad Commission of Texas (RRC) regulates the disposal by injection of oil and gas wastes generated in connection with activities associated with the exploration, development, and production of oil or gas or geothermal resources (Statewide Rule 9), the injection of fluid for enhanced oil recovery (Statewide Rule 46), and the underground storage of hydrocarbons (Statewide Rules 95, 96, and 97). As of December 31, 2017, the inventory of active wells in these categories was 36,037 out of 54,216 currently permitted wells. The RRC's Underground Injection Control Program for these categories of wells (Class II) is administered under authority issued by EPA under the Safe Drinking Water Act. The focus of the program is the protection of underground sources of drinking water. Class II wells must meet permitting standards and be tested and monitored to demonstrate mechanical integrity.

Class III Brine Mining Injection Well Program Description. Brine mining injection wells (Class III) are typical of solution mining wells. The RRC Class III Brine Mining Injection Well Program was approved on March 29, 2004. Since then, all active brine-mining facilities were re-permitted per the provisions of Statewide Rule 81. As of December 31, 2017, there are 163 currently permitted brine mining injection wells in Texas. A majority of brine mining facilities are required to monitor groundwater quality and submit groundwater-monitoring reports from approximately 130 total monitoring wells. Groundwater monitoring is not conducted at facilities where usable quality groundwater is not present, typically located on salt domes along the Gulf Coast.

Statewide Rule 8 Water Protection and Chapter 4, Subchapter B Commercial Recycling Program Description. Through the Texas Administrative Code (TAC), Title 16, Part 1, Chapter 3.8 (Statewide Rule 8 Water Protection) and Chapter 4, Subchapter B (Recycling Programs), the Railroad Commission of Texas (RRC) regulates the treatment, storage, recycling, and disposal at or near ground surface of oil and gas wastes. The waste streams are generated from activities associated with the exploration, development, and production of oil, gas, or geothermal resources. Statewide Rule 8 prohibits the waste of petroleum resources and the pollution of surface and subsurface waters of the state, and requires permits for various pits and other waste management units that are not specifically authorized by rule. Chapter 4, Subchapter B specifies permit requirements and provides guidance for the recycling of generated fluids and solids into a reusable product(s).

There are currently 178 commercial facilities permitted for disposal, treatment, or recycling of oil and gas waste, and approximately 4016 pits permitted for storage, handling or disposal of oil and gas waste. Of the

4016 pit permits, 1576 pits (39% percent) are authorized for use as short-term storage (48-72 hours) of produced water during emergency situations. The remaining permits are for various other categories of pits, including disposal pits, collecting pits, washout pits, skimming pits, brine pits, brine mining pits, and gas plant evaporation or retention pits. Most of the pit permits require liners and leak detection methods.

There are currently 24 permits issued for the commercial recycling of solid oil and gas waste. Statewide Rule 8 and Chapter 4, Subchapter B permits require liners, leak detection systems, and groundwater monitoring requirements in certain circumstances. The RRC responds to citizen complaints regarding alleged groundwater or soil contamination, or alleged unauthorized activities that may endanger vadose zone soils, surface water or groundwater. Commission responses may include inspection by the local District Office, referral to enforcement and possible penalty action as appropriate.

Oil field Cleanup Program Description. Oil-field cleanup activities fall under the jurisdiction of the Railroad Commission of Texas (RRC) and are subject to regulations under Statewide Rule (SWR) 8, SWR 20, SWR 91, and RRC Special Orders. Other rules that protect groundwater and influence cleanup activities include: SWR 13 (well completion requirements), SWR 14 (plugging requirements), SWR 9 (injection [disposal] into a non-productive zone), SWR 46 (injection into a productive zone), SWR 57 (reclamation plants), SWR 93 (water quality certification), SWR 98 (standards for management of hazardous oil and gas waste), and 16 TAC §4.601-4.632 (disposal of oil and gas NORM waste). Through SWR 30 (Memorandum of Understanding), the RRC maintains jurisdiction over natural gas plants and compressor stations.

If groundwater contamination occurs at a site, the responsible party is required to remediate to acceptable levels. Responsible parties may volunteer remedial action, or cleanup may be required by legal action (Operator Cleanup Program). Operators, developers, or individuals who are not responsible for the contamination may participate in the Voluntary Cleanup Program. When investigation and research cannot locate a responsible party, the Site Remediation Section of the Oil and Gas Division will oversee the remediation of the groundwater contamination with Oil and Gas Regulatory and Cleanup (OGRC) funds (State Funded Cleanup Program).

Monitoring wells are associated with all cases involving groundwater contamination. The number of monitoring wells at a site depends on the severity of the impact, the expanse of the plume, the toxicity of the contaminants of concern, and the sensitivity of the site. Most of the confirmed groundwater cases listed in this report under RRC jurisdiction are under the purview of the Site Remediation Section of the Oil and Gas Division. There are 462 Operator Cleanup Program (OCP) sites, 30 Voluntary Cleanup Program (VCP) sites, six (6) Brownfields Response Program (BRP) sites, and 36 State Funded Cleanup Program (CU) sites in

this report. Complaints, District Office-managed sites, and sites managed by other sections of the Oil and Gas Division of the RRC comprise the remaining listings on the RRC portion of the report (31 in number).

Status of Groundwater Contamination. There are 565 groundwater contamination cases, listed by county, in Table 2 under the heading RRC. The 565 cases are located in 121 counties. There are 25 new cases under RRC regulations that have been added to the report in 2017. Activities were completed on 32 cases that are listed in the 2017 report. A total of 37 cases were removed. The 23 new cases were due to self-reporting, routine investigation, review of data, complaints, violation letters, and legal enforcement action.

Surface Mining and Reclamation Division

Program Description. The Surface Mining and Reclamation Division (SMRD) of the Railroad Commission of Texas (Commission) is authorized to enforce State laws and regulations consistent with the Texas Surface Coal Mining and Reclamation Act (Vernon's Texas Codes Annotated, Ch. 134, Texas Natural Resources Code) and the Texas Uranium Surface Mining and Reclamation Act (Vernon's Texas Codes Annotated, Ch. 131). As part of the groundwater information required in the Regulations, determination of the quality of subsurface water includes the analysis of common inorganic groundwater constituents plus certain trace metals. Monitoring plans for pre-mining, mining, and post-mining conditions are required, normally on a three-month basis, in order to track variations in water-quality parameters.

There are currently 29 coal mine permits in the state of Texas. Six (6) different companies at 12 permitted sites are currently active, but one has not yet mined coal. Six (6) companies at 16 permitted sites have mines that are under reclamation operations and one company has one (1) permitted site where mining activities have not commenced. One company has a permitted site that does not entail any mining, but consists of a facilities area to support a nearby active surface coal mining and reclamation project. Five (5) different companies are conducting uranium exploration activities at 10 permitted sites. Groundwater monitoring, both sampling for water-quality analysis and measurement of water levels, is required for one year on a quarterly basis for the baseline information that is submitted with the initial coal mining permit application. There is no monitoring requirement for uranium exploration permits. The coal mining companies are also required to submit plans for quarterly groundwater monitoring during mining and post-mining reclamation activities for Commission review and approval. Monitoring is done by or on behalf of the mining companies, which are required to submit the analytical results to the Commission on a quarterly basis, usually for the following parameters, in milligrams per liter (mg/L):

- Calcium
- Magnesium

- Sodium
- Potassium
- Iron (Total and Dissolved)
- Manganese (Total and Dissolved)
- Total Dissolved Solids
- Bicarbonate
- Carbonate
- Sulfate
- Chloride
- Fluoride
- Nitrate, as Nitrogen

Typically, an annual sample is also analyzed in a subset of these wells (spoils wells) for the following trace metals, in milligrams per liter:

- Aluminum
- Arsenic
- Barium
- Boron
- Cadmium
- Chromium
- Copper
- Lead
- Mercury
- Molybdenum
- Selenium
- Zinc

Continued quarterly samples during the entire permit period (mining and reclamation) include the chemical analysis of at least the following parameters:

- Sulfate
- Chloride
- Total Dissolved Solids
- Electrical Conductivity and Temperature
- Iron (Dissolved)
- Manganese (Dissolved)

Monitoring by the Commission is generally conducted only during investigations for some specific reason, such as water-quality complaints. The Commission no longer maintains a laboratory, and samples collected by enforcement personnel are sent to a commercial laboratory under contract with the Division for chemical and physical analyses. Typically, between one and five water-quality and quantity complaints are investigated annually by Commission field personnel. To date, investigations have not borne out any confirmed contamination cases.

Status of Groundwater Monitoring Programs. The above-mentioned mining facilities, including those under reclamation operations, are

subject to groundwater monitoring. Staff estimates that about 800 wells are being sampled four times per year (approximately 1,840 samples and >5,600 analyses). To date, results of the sampling program do not indicate that any contamination attributable to mining and reclamation activities has occurred.

Various commercial laboratories perform chemical analyses for the mining companies and some have in-house laboratories. The Commission has no control over the actual sampling and sample preparation procedures, except to recommend generally accepted procedures (USEPA, USGS, etc.). Therefore, the Commission has no direct control over the quality of the chemical analyses reported by the companies. Methods for evaluating the results of chemical analyses (ionic balance) are being exercised by the mining companies and the Commission.

Status of Groundwater Contamination. There have been no confirmed contamination cases in the SMRD. Groundwater impacts related to the initial and current mining activities are almost totally associated with aquifer head draw-downs and declines. It may take years to decades for the spoils areas to become re-saturated and the groundwater contributions from the spoils areas to start affecting adjacent aquifers and stream base-flow. At that time, the preventive nature of the Commission permitting activities should minimize the type of groundwater contamination expected from the spoils areas.

Texas Department of State Health Services

Program Description. The Texas Department of State Health Services (DSHS) is responsible for promoting and protecting the health and well-being of Texans. With regard to groundwater issues, DSHS has several programs related to groundwater safety and public health concerns.

The DSHS Health Assessment and Toxicology (HAT) Program is responsible for preventing or reducing the harmful effects of exposure to hazardous substances on human health in Texas. The program offers support when issues arise regarding potential contamination of drinking water, including drinking water that is produced from a groundwater source. DSHS performs Public Health Assessments (PHAs) and Health Consultations to determine if adverse health effects might result from exposures to hazardous substances. Through a cooperative agreement with the Agency for Toxic Substances and Disease Registries, DSHS performs PHAs for all sites on or proposed for listing on the National Priorities List (NPL) of Superfund sites. DSHS provides toxicological and epidemiological support with the goal of protecting public health.

The DSHS Texas Fluoridation Program (TFP) assists the Public Water Systems (PWS) in adjusting the fluoride level in the drinking water thus helping Texans improve their oral health by reducing and preventing tooth decay. TFP promotes community water fluoridation by assisting PWS with the design, installation, maintenance, and inspection of fluoride systems; and providing training on water fluoridation for the PWS personnel engaged in fluoridation. The program also collects and records fluoride levels in the drinking water for quality control.

The DSHS Radiation Control Program (RCP) regulates radioactive materials in Texas. Intermittently, the RCP samples groundwater as a result of an incident, complaint, or situation that leads the RCP to believe there may be groundwater contamination.

The DSHS Laboratory Services Section is the principal drinking water laboratory in the state of Texas. The laboratory performs water quality testing, including chemical and radiological analyses required by the U.S. Environmental Protection Agency (EPA) Safe Drinking Water Act, and other analyses in support of any DSHS program requiring testing of drinking water samples. The Laboratory Services Section also accepts water samples for routine microbiological analysis from the public for a fee.

Texas Department of Agriculture

The Texas Department of Agriculture (TDA) has lead authority for pesticide regulation in Texas. TDA recognizes certain pesticides as potential groundwater contaminants and is responsible for preventing unreasonable risk to human health and the environment from the use of pesticides.

The agency conducts a variety of activities designed in part or entirely to reduce the potential of groundwater contamination by pesticides:

- **Product Registration** - All pesticide products sold and used in Texas must be registered with TDA. This process ensures these products have met all EPA requirements for pesticide product labeling.
- **Pesticide Label Compliance and Enforcement** - The agency has responsibility and authority under the Texas Agricultural Code to enforce pesticide labels, which include usage information and precautions that directly or indirectly reduce the potential of groundwater contamination.
- **Pesticide Applicator Training** - All prospective users of restricted-use or state limited-use pesticides are required to obtain an applicator's license. Obtaining a license includes receiving training in the proper and legal use of pesticides, applicator testing, and continuing education. This includes both agricultural pesticide applicators as well as those for structural pest control. Each structural pest control applicator must be properly registered, trained and supervised or properly licensed to make applications regardless of the classification of the pesticide.
- **Pesticide Laboratory Services** - Although TDA does not routinely conduct groundwater monitoring for pesticides, the agency maintains a fully equipped laboratory at Texas A&M University. The lab conducts pesticide residue analysis to assist the department's efforts in enforcing pesticide laws and regulations and as a participant in USDA's Pesticide Data Program.

Texas State Soil and Water Conservation Board

The Texas State Soil and Water Conservation Board (TSSWCB) is the state agency that administers Texas' soil and water conservation law and coordinates the state's conservation and nonpoint source pollution abatement programs. Headquartered in Temple, Texas, the TSSWCB offers technical assistance to the state's 216 Soil and Water Conservation Districts (SWCDs).

Nonpoint source pollution originates from different sources that cannot be traced to any single point, such as a pipe. The TSSWCB administers several programs as the lead state agency for the planning, management, and abatement of agricultural and silvicultural (forestry) nonpoint source pollution.

The Water Quality Management Plan (WQMP) Program offers landowners and operators of agricultural and silvicultural lands a voluntary mechanism for being protective of state water quality with respect to nonpoint source pollution. This program offers cost-share funding for the installation of soil and water land improvement measures to serve as an incentive for participating. Additionally, the TSSWCB offers grants for assessment, demonstration, implementation, education, and research related to nonpoint source pollution.

The Water Supply Enhancement Program (formerly the Texas Brush Control Program) protects groundwater resources by controlling invasive brush species which use a lot of water. Controlling the brush and restoring native grasses leaves more water available to recharge the aquifer below. This program has helped restore seeps and springs that had been dormant for decades due to the invasion of non-native brush species.

The Flood Control Dam Grant Program provides funding to the sponsors of more than 2,000 structures for operation and maintenance, structural repair, and rehabilitation to protect lives, property, and infrastructure.

Texas Alliance of Groundwater Districts

Program Description (General). The Texas Alliance of Groundwater Districts (TAGD), formerly the Texas Groundwater Conservation Districts Association, was formed on May 12, 1988. Its core District Membership is restricted to groundwater conservation districts (GCDs, or districts) in Texas who have the powers and duties to manage groundwater as defined in TWC, Chapter 36; other organizations with an interest in groundwater management may become Associate Members. TAGD is organized exclusively for charitable, educational, or scientific purposes within the meaning of Section 501(c)(3) of the Internal Revenue Code. As such it can accept tax-deductible donations and use these donations to educate the public to the growing need for water conservation and groundwater protection.

The purpose of TAGD is to educate the public, further groundwater conservation and protection activities, and to provide a communications vehicle for the exchange of information between individual districts and the general public. TAGD maintains contact with members of the private sector and various local, state, and federal officials and their agencies to obtain, and provide, timely information on activities and issues relevant to groundwater conservation districts. To date there are 88 district members of TAGD. Appendix 6 includes a map with all the current GCDs, including those which are members of TAGD.

The districts are created by the Legislature or by the TCEQ with the purpose and responsibility of preserving and protecting groundwater. GCDs can be created by one of three procedures: (1) special law districts can be established by the legislature; (2) districts can be created through a property-owner petition filed with the TCEQ; and (3) districts can be created in priority groundwater management areas through procedures initiated by the TCEQ. Districts are local or regional in their jurisdiction and typically have elected boards of directors. Among other things, groundwater conservation districts have been granted authority to monitor groundwater quality. A number of districts also have the authority to bring civil court proceedings for injunctive relief against an entity causing groundwater contamination.

Status of Groundwater Monitoring Programs (General). The groundwater monitoring programs of groundwater districts are primarily reconnaissance in nature. On a long-term basis the districts monitor changes in ambient or natural water quality conditions. Most programs are designed to track water quality trends and identify possible contaminants with minimal expenditure and with the most efficient use of district resources. Groundwater studies of specific areas, contaminants, or constituents are also conducted by some districts. District groundwater quality monitoring can be used to identify problems that may then be referred to appropriate state agencies for more detailed investigation, analysis, and remedial action.

Status of Groundwater Contamination (General). There is one case of groundwater contamination listed in Table 3 that was reported in past years by the Evergreen Underground Water Conservation District (EUWCD), which is a member of TAGD. No further action was conducted in 2017 for this case.

Texas A&M AgriLife Research

Regulatory Programs. The Texas A&M AgriLife Research has no regulatory authority and does no regulatory monitoring associated with groundwater. Groundwater samples may be collected and analyzed in connection with research investigations.

Program Description. Texas A&M AgriLife Research is the state's premier research and technology development agency in agriculture, natural resources and the life sciences. Headquartered in College Station, AgriLife Research has a statewide presence, with scientists and research staff on other Texas A&M University System campuses and at the 13 regional Texas A&M AgriLife Research and Extension Centers. The agency conducts basic and applied research to improve the productivity, efficiency and profitability of agriculture, with a parallel focus on conserving natural resources and protecting the environment. AgriLife Research has more than 550 doctoral-level scientists, many of whom are recognized internationally for their work. The Texas Water Resources Institute is an administrative unit of AgriLife Research and coordinates much of the internal water-related research.

Broad goals of the AgriLife Research program include those specifically targeted to protect, preserve and efficiently use groundwater resources. Groundwater programs of AgriLife Research stress the development of management strategies, technologies and educational programs to support sustainable quality water supplies.

AgriLife Research scientists are working to address a variety of groundwater planning, supply, quality and use issues:

Planning

- Aquifer characterization
- Policy analysis
- Modeling
- Irrigation water conservation

Supply

- Water conservation methods
- Enhancing aquifer recharge
- Rainwater harvesting for aquifer recharge

Water quality

- Waste and wastewater management

- Proper use of agriculture chemicals (nutrients and pesticides)
- Pathogens
- Remediation of contaminated groundwater

Use

- Irrigation systems research and development
- Economics of water use
- Efficiency of irrigation and water management
- Crop selection keyed to water availability
- Development of drought-resistant crop varieties
- Conservation in urban and agriculture sectors

Some of the recent AgriLife Research groundwater-related research activities include:

- Developing technologies, procedures and strategies for deficit irrigation applications and effective water management policies to efficiently use and protect the Ogallala Aquifer
- Optimizing limited early season irrigation, overcoming poor germination associated with subsurface drip irrigation and evaluating crop rotations among drought-tolerant crops with the goal of sustaining agriculture through adaptive management to preserve the Ogallala Aquifer under a changing climate
- Investigating locations and techniques appropriate for managed aquifer recharge in Harris County
- Evaluating the depth and water quality as well as examining plant-based polymers as treatment agents to remove dissolved solids and radioactive materials of the Dockum Aquifer
- Analyzing current and potential groundwater conservation policies across the Southern Great Plains to determine if they provide profit-driven farmers with incentives to save water
- Developing a distributed network of field observatories in the Brazos River corridor, for better understanding of the hydrologic flow across various natural and man-made reservoirs in the critical zone at various space and time scales.
- Investigating the unconfined aquifer as the source of low-pH in surface waters
- Developing a novel chemical water treatment technology that can be used to treat impurities in groundwater used in municipal water supplies.

- Using remote-sensing technologies to detect plant disease early and save groundwater
- Developing a policy assessment tool for the Texas High Plains to guide impacts of water conservation policies and strategies to manage groundwater resources
- Developing bioenergy crops that can use saline groundwater, among other water
- Assessing the impacts of land-use change, climate change and rangeland management on hydrology and environment
- Developing a web-based irrigation scheduling tool to efficiently irrigate cotton with limited water
- Identifying and assessing the condition of transboundary aquifers between the United States and Mexico
- Determining links between pathogens in surface or near-surface sources, runoff and streams and their impacts on groundwater
- Examining the effects of land-cover change (grasslands versus woodlands) on portfolios of ecosystem services including groundwater recharge and streamflow
- Developing integrated research to enhance water use, water reuse and brackish and saline groundwater use, including using brackish and saline groundwater as a source water for hydraulic fracturing, to conserve fresh groundwater
- Improving drought tolerance of crops (corn, cotton and others), including plant breeding, conservation tillage systems and water management strategies to conserve groundwater
- Evaluating effects of conservation practices on soil and water resources, including groundwater
- Improving technologies for multi-well managed aquifer recharge systems
- Training future groundwater professionals through undergraduate and graduate education and research programs at Texas A&M University and other System institutions; Many of AgriLife Research scientists at Texas A&M University in College Station also hold joint teaching appointments, thus providing the latest research results to students.

AgriLife Research efforts are complimented by the outreach educational programs of the Texas A&M AgriLife Extension Service. For example, AgriLife Extension specialists provide educational and training programs and meetings and provide easy-to-read fact sheets and other publications for specific targeted clientele, such as landowners interested in pumping and desalinating brackish groundwater, proposed guidelines for injection wells and groundwater management among others. Other AgriLife

Extension activities include field demonstrations and educational programs for youth and adults.

Specifically, AgriLife Extension specialists provide leadership for educational programs on educating private water well owners about potential pollutant sources and what steps can be taken to lessen potential impacts from these sources and plugging abandoned wells to protect groundwater quality and groundwater conservation districts. In response to the extreme flooding from Hurricane Harvey, this group of AgriLife Extension specialists helped provide testing and resources to affected communities. Extension specialists also provide technical leadership for development of pesticide-specific management plans adapted to Texas.

Status of Groundwater Monitoring Programs. AgriLife Research has no regulatory monitoring authority. AgriLife Extension operates soil and water testing laboratories in College Station. Through these laboratories in conjunction with subject matter specialists and county-based education agents, AgriLife Extension provides information on groundwater quality to thousands of rural Texans.

The Bureau of Economic Geology of The University of Texas at Austin

Program Description. Established in 1909, the Bureau of Economic Geology of The University of Texas at Austin (UTBEG) is a research entity of the University and functions as the State Geological Survey. The Bureau is also a research unit within UT Austin's Jackson School of Geosciences. The Bureau conducts basic and applied research, including projects related to groundwater resources and quality, water and energy issues, and brackish groundwater assessments in support of other state agency missions. Research activities involve original field research, data collection and analysis, and evaluation of water-quality data from existing databases.

Recent Bureau of Economic Geology groundwater-related research topics include the following:

- Regional groundwater-quality issues related to nitrate and arsenic
- Brackish groundwater resource assessment for the Carrizo/Wilcox and Queen City/Sparta aquifers in southwest Texas
- Water-quality impacts of energy production, focusing on methane sources using isotopes
- Groundwater/surface-water interactions and impacts on endangered species

Status of Groundwater Monitoring Programs. As part of sponsored-research projects, Bureau staff measure groundwater quality and water levels in selected public and private wells across many parts of Texas. Most water-quality data collected in these studies consist of pH, temperature, conductivity, major and minor inorganic ions, total organic carbon, isotopes, and other constituents of interest. Data are used to interpret rates and modes of hydrologic processes and the source and movement of groundwater. Project-specific data are collected in data reports or topical reports. Periodically, digitized data are compiled for inclusion in the Texas Natural Resources Information System.

Status of Groundwater Contamination. The UTBEG is not a regulatory agency and has no groundwater-protection regulatory programs. Consequently, the Bureau does not have regulatory jurisdiction over contamination cases that might be detected in the course of its hydrogeologic investigations. Any detection of contamination is referred to the proper regulatory or sponsoring agency.

Texas Department of Licensing and Regulation

Program Description. Well Drillers/Pump Installers. The need for identification and protection of the state's groundwater resources was recognized by the Legislature through the creation of the Water Well Drillers Board (Board) in 1965. In 1991, the 72nd Legislature expanded the Board's functions to include licensing and regulation of water well pump installers.

Senate Bill 1955 (75th Legislature, 1997) transferred the Water Well Driller Advisory Council and the Well Driller/Pump Installer Program from the Texas Natural Resource Conservation Commission to the Texas Department of Licensing and Regulation (TDLR) effective September 1, 1997.

The Well Driller/Pump Installer/Abandoned Well Referral and Notification Program maintains communications with the Council, industry, various state agencies, and groundwater conservation districts and investigates all alleged violations of Chapters 1901 and 1902 of the Texas Occupations Code and 16 TAC, Chapter 76 (Rules). The Program also investigates consumer complaints filed against well drillers, pump installers, and performs compliance investigations of water, monitor, injection, and dewatering wells to insure compliance with well construction standards.

Investigations include, but are not limited to, surface completions, depth of annular cement, regulated distances from contamination sources and property lines, abandoned and deteriorated water wells, and licensing requirements. In addition, rules requiring isolation of zones containing undesirable or poor-quality water are enforced to prevent commingling with and degradation of fresh water zones.

The TDLR's Well Driller/Pump Installer/Abandoned Well Referral and Notification Program staff also administers the Abandoned Well Notification Program. Chapters 1901 and 1902 of the Texas Occupations Code authorize this function. Investigations are conducted and landowners are notified that within one-hundred eighty (180) days of notification, the abandoned and/or deteriorated water well must be plugged, completed, or capped in accordance with 16 TAC, Chapter 76 specifications.

Violations of Chapters 1901 and 1902 of the Texas Occupations Code and the Rules are enforced by the TDLR's Enforcement Division through TDLR orders requiring administrative penalties and corrective actions, cease and desist orders or referral to the Office of the Attorney General. Investigations that involve groundwater contamination are referred to the appropriate state agency with jurisdiction for the activity believed to be the cause of the contamination.

Status of Groundwater Monitoring Programs. The Well Driller/Pump Installer/Abandoned Well Referral and Notification Program does not conduct or require groundwater monitoring. At the end of December 2017, there were 1,769 licensed professionals including drillers and pump installers, regulated by the TDLR/ Well Driller/Pump Installer Program. As of December 30, 2017, TDLR has been registering apprentices and we have registered 340 apprentices.

During Fiscal Year 2017, there were 715 investigations conducted by Well Driller/Pump Installer Program, Field Office, or Enforcement Division staff with all documented violations either remediated or in the enforcement process. Investigations refer to the information gathering activities conducted in response to complaints received by the TDLR. Compliance investigations refer to on-site inspections of wells that are randomly chosen from the State of Texas Well Reports that are submitted to the TDLR.

Twenty-five (25) abandoned wells were reported in 2017, sixteen (16) have been plugged, one (1) well was determined not to be an abandoned well, two (2) complaints referred to local Groundwater Conservation District for investigation and possible administrative action, and eighteen (18) are in various stages of notification, review or investigation. Program, Field Office, and/or Enforcement Division staff collected four (4) water well (groundwater) samples in response to complaints received in 2017.

V. GROUNDWATER CONTAMINATION CASE DESCRIPTION TABLES

Table 1. TCEQ Groundwater Contamination Case Descriptions

EXPLANATION OF FIELDS / COLUMN HEADINGS

COUNTY: EACH COUNTY IS LISTED FOR THE FIRST OCCURRENCE IN THE COUNTY AND AT THE TOP OF A NEW PAGE IF APPLICABLE.

DIVISION: FOR EACH COUNTY, A DIVISION IS LISTED ONLY FOR THE FIRST OCCURRENCE OR AT THE TOP OF A NEW PAGE.

- . ENF - ENFORCEMENT DIVISION
- . RMD - RADIOACTIVE MATERIALS DIVISION
- . REM/CA - REMEDIATION DIVISION, CORRECTIVE ACTION SECTION
- . REM/DCRP - REMEDIATION DIVISION, DRY CLEANER REMEDIATION PROGRAM
- . REM/PASI - REMEDIATION DIVISION, PRELIMINARY ASSESSMENT / SITE ASSESSMENT PROGRAM
- . REM/PST - REMEDIATION DIVISION, PETROLEUM STORAGE TANK PROGRAM
- . REM/SF - REMEDIATION DIVISION, SUPERFUND PROGRAM
- . REM/SSDAP - REMEDIATION DIVISION, SUPERFUND SITE DISCOVERY AND ASSESSMENT PROGRAM
- . REM/VC - REMEDIATION DIVISION, VOLUNTARY CLEANUP PROGRAM
- . REM/VCIO - REMEDIATION DIVISION, VOLUNTARY CLEANUP/INNOCENT OWNER PROGRAM
- . WAD/GPAT - WATER AVAILABILITY DIVISION /GROUNDWATER PANNING AND ASSESSMENT TEAM
- . WPD/IHW - WASTE PERMITS DIVISION, INDUSTRIAL AND HAZARDOUS WASTE SECTION
- . WPD/MSW - WASTE PERMITS DIVISION, MUNICIPAL SOLID WASTE SECTION
- . WQD/WQAS - WATER QUALITY DIVISION, WATER QUALITY ASSESSMENT SECTION
- . WSD/PDW - WATER SUPPLY DIVISION, PUBLIC DRINKING WATER SECTION

NEW CASES: AN ASTERISK (*) INDICATES THAT THE RECORD WAS REPORTED AS NEW FOR THE CURRENT YEAR.

FILE NAME: FILE NAME IS PROVIDED BY THE PROGRAM AREA, AND TYPICALLY MEANS THE RESPONSIBLE PARTY OR GEOGRAPHIC LOCATION.

FILE NUMBER: FILE NUMBER IS ASSIGNED BY EACH PROGRAM ACCORDING TO ITS NUMBERING SYSTEM AND IS USED TO LOCATE THE FILE IN THE TCEQ RECORDS.

LOCATION: ADDRESS OR A GEOGRAPHIC LOCATION DESCRIPTION

CONTAMINATION DESCRIPTION: CONSISTS OF A LISTING OF CONTAMINANTS OR GENERAL GROUP OF CONTAMINANTS (SUCH AS "GASOLINE" OR "CREOSOTE CONSTITUENTS"). ABBREVIATIONS IN THIS COLUMN REFER TO VARIOUS CONTAMINANTS, INCLUDING:

AS = ARSENIC; BA = BARIUM; BTEX = BENZENE, TOLUENE, ETHYLBENZENE, XYLENES; CARBON TET = CARBON TETRACHLORIDE; CB = CHLOROGENZENE; CO = COBALT; CR = CHROMIUM; CU = COPPER; DBCM = DIBROMOCHLOROMETHANE; DCA = DICHLOROETHANE (1,1-/1,2-DCA = 1,1-/1,2-DICHLOROETHANE); DCB = DICHLOROGENZENE (1,2-/1,4-DCB = 1,2-/1,4-DICHLOROGENZENE); DCE = DICHLOROETHYLENE /ETHENE (1,1-/CIS-1,2-/TRANS-1,2-DCE = 1,1-/CIS-1,2-/TRANS-1,2-DICHLOROETHYLENE/-ETHENE); HEX CR = HEXAVALENT CHROMIUM; HG = MERCURY; MECL = METHYLENE CHLORIDE; MEK = METHYL ETHYL KETONE; MTBE = METHYL TERTIARY-BUTYL ETHER; NI = NICKEL; NO3 = NITRATE; ORG = ORGANIC CHEMICALS; PAH = POLYCYCLIC AROMATIC (POLYAROMATIC) HYDROCARBONS; PB = LEAD; PCB = POLYCHLORINATED BIPHENYLS; PCE = TETRACHLOROETHYLENE/-ETHENE; PCP = POLYCHLORINATED PHENYLS; RA = RADIUM (RA-226/228 = RADIUM 226/228); SE = SELENIUM; SO4 = SULFATE; TCA = TRICHLOROETHANE (1,1,1-TCA = 1,1,1-TRICHLOROETHANE); TCE = TRICHLOROETHYLENE/-ETHENE; TCFM = TRICHLOROFLUOROMETHANE; TDS = TOTAL DISSOLVED SOLIDS; TOC = TOTAL ORGANIC CARBON/COMPOUNDS; TPH = TOTAL PETROLEUM HYDROCARBONS; VC = VINYL CHLORIDE; VOC/VOCS = VOLATILE ORGANIC COMPOUND(S); ZN = ZINC.

DATE: DATE OF EARLIEST KNOWN CONTAMINATION CONFIRMATION.

ENFORCEMENT STATUS: THE FIRST ENTRY INDICATES THE LEVEL OF AGENCY RESPONSE, THE SECOND IS THE SITE ACTIVITY STATUS. SOME CASES DO NOT HAVE COMPLETE CODES DUE TO INSUFFICIENT DATA. IF THE SITE STATUS IS IN BORDERLINE BETWEEN LEVELS IT MAY BE ENTERED AS MULTIPLE CODES. SEE THE ["ENFORCEMENT STATUS CODES"](#) SECTION OF THIS REPORT FOR A DESCRIPTION OF THE CODES.

DATA QUALITY: DATA QUALITY REFERS TO THE METHOD OF SAMPLING UTILIZED TO CONFIRM CONTAMINATION:

- E - EPA APPROVED ANALYTICAL PROCEDURES
- Q - QUALITY CONTROL PROGRAM ESTABLISHED FOR SAMPLING PROCEDURES
- V- VERIFICATION OF CONTAMINATION THROUGH PROCEDURES LISTED BELOW:
 1. SPLITTING SAMPLES WITH REGULATED ENTITY OR OTHER AGENCY FOR COMPARISON OF ANALYSIS RESULTS
 2. RESAMPLING FOR VERIFICATION ANALYSIS RESULTS
 3. SUPERVISORY OR COMMITTEE REVIEW OF SAMPLING PROCEDURES AND ANALYSIS RESULTS

SECTION 5.236: A "Y" MEANS THAT TCEQ NOTIFIED LOCAL OFFICIALS PURSUANT TO TEXAS WATER CODE, SECTION 5.236, WHICH REQUIRES TCEQ TO NOTIFY COUNTY JUDGES AND LOCAL PUBLIC HEALTH OFFICIALS BECAUSE CONTAMINATION MAY POTENTIALLY AFFECT A PUBLIC DRINKING WATER SUPPLY OR HAS RESULTED IN POINT-OF-USE IMPACTS. SITES MARKED "Y" MEANS TCEQ PROVIDED NOTIFICATION FOR THOSE CASES REPORTED DURING THE MOST RECENT CALENDAR YEAR THAT WERE NOT INCLUDED IN THE PREVIOUS YEAR'S REPORT. INCLUSION IN THIS REPORT SERVES AS A BACK-UP TO STANDARD NOTIFICATION PROCEDURES

Table 2. RRC Groundwater Contamination Case Descriptions

TABLE 2
GROUNDWATER CONTAMINATION CASE DESCRIPTION BY COUNTY
RAILROAD COMMISSION OF TEXAS

EXPLANATION OF FIELDS / COLUMN HEADINGS

COUNTY:	THE COUNTY NAME IS THE FIRST ENTRY IN THE LEFT PORTION OF THE TABLE. IT IS LISTED ONLY ONCE FOR ALL OF THE CASES IN THAT COUNTY.
DIVISION:	THESE ARE THE SPECIFIC REGULATORY PROGRAMS WITHIN THE RAILROAD COMMISSION. DIVISIONS ARE LISTED ONLY ONCE FOR THEIR RESPECTIVE CASES IN EACH COUNTY.
NEW CASES:	AN ASTERISK (*) IS PLACED IN EACH RECORD THAT IS REPORTED AS NEW FOR THE YEAR.
SITE NAME:	SITE NAMES REFLECT RESPONSIBLE PARTIES OR GEOGRAPHIC LOCATION
FILE NUMBER:	FILE NUMBERS ARE ASSIGNED ACCORDING TO RRC DISTRICT COMPLIANT NUMBERING SYSTEMS. SOME DISTRICTS INCLUDE THE YEAR IN THE COMPLIANT NUMBER. SOME CASES HAVE NO NUMBERS BECAUSE THE CASE WAS INITIATED BY INSPECTION OR SOME OTHER MANNER. A FEW CASES ARE CODED ACCORDING TO A RRC HEARING DOCKET NUMBER.
OPERATOR OR LOCATION:	LOCATION DESCRIPTIONS VARY DEPENDING ON THE SCOPE OF THE INVESTIGATION AND WHETHER OR NOT THE COMPLAINANT'S PROPERTY IS ON AN OIL AND GAS LEASE. THE INVESTIGATIONS THAT ARE NARROWER IN GEOGRAPHIC SCOPE ARE DESCRIBED BY LATITUDE AND LONGITUDE.
CONTAMINATION:	CONSISTS OF A LISTING OF CONTAMINANTS OR GENERAL GROUP OF CONTAMINANTS. ABBREVIATIONS IN THIS COLUMN REFER TO VARIOUS CONTAMINANTS, INCLUDING: CL - CHLORIDE, BA - BARIUM, BTEX - BENZENE, TOLUENE, ETHYLBENZENE, AND XYLENE, HCL - HYDROCHLORIDE ACID, GW - GROUNDWATER, NACL - SODIUM CHLORIDE, NG- NATURAL GAS, PSH - PHASE SEPARATED HYDROCARBONS, TDS- TOTAL DISSOLVED SOLIDS, SW - SURFACE WATER. MOST CASES CITE SODIUM CHLORIDE AS CONTAMINATION. SOME CASES INVOLVE REFINED HYDROCARBONS, OTHERS CITE CHLORIDE BECAUSE CATIONS OTHER THAN SODIUM MAY BE PRESENTS IN HIGH CONCENTRATION.
ENFORCEMENT STATUS:	ACTIONS AND NOTICES OF VIOLATIONS ARE TAKEN AT STAFF LEVEL AND MAY BE CONCURRENT. THE CLOSURE OR SHUT-IN OF FACILITIES AND PLUGGING OF WELLS MAY ALSO BE DIRECTED AT STAFF LEVEL. STAFF DIRECTIVES ARE IDENTIFIED AS ENFORCEMENT STATUS. ACTIONS MAY BE STEPPED UP TO A FORMAL ENFORCEMENT LEVEL WHICH CAN BE CATEGORIZED AS EXECUTIVE ACTION AND INCLUDE ADMINISTRATIVE PENALTIES AND ORDERS. IN SOME CASES, GROUNDWATER CONTAMINATION MAY BE DOCUMENTED BUT SPECIFIC SOURCE OR AN ACTUAL RESPONSIBLE PARTY CANNOT BE IDENTIFIED. ENFORCEMENT STATUS WOULD BE CATEGORIZED AS STAFF DISCOVERY. ACTIONS OF RESPONSIBLE PARTIES WHO DISCOVER AND REPORT GROUNDWATER CONTAMINATION ARE CATEGORIZED AS VOLUNTARY ACTIONS EVEN THOUGH INVESTIGATIVE OR REMEDIAL PLANS ARE REVIEWED AND APPROVED BY THE OIL AND GAS DIVISION.
DATA QUALITY:	E - EPA APPROVED ANALYTICAL PROCEDURES Q - QUALITY CONTROL PROGRAM ESTABLISHED FOR SAMPLING PROCEDURES V - VERIFICATION OF CONTAMINATION THROUGH PROCEDURES LISTED BELOW: 1. SPLITTING SAMPLES WITH REGULATED ENTITY OR OTHER AGENCY FOR COMPARISON OF ANALYSIS RESULTS 2. RESAMPLING FOR VERIFICATION ANALYSIS RESULTS 3. SUPERVISORY OR COMMITTEE REVIEW OF SAMPLING PROCEDURES AND ANALYSIS RESULTS

ENFORCEMENT STATUS

ACTIVITY STATUS

Contamination Confirmed:	Investigation:	Corrective Action Planning:	Action Implemented:	Action Monitoring:	Action Completed:
Contamination confirmed but not fully investigated	2A-Violations and contamination due to current activities found. 2B-No violations and historical contamination.	Corrective action pending review and approval.	Corrective action underway.	Corrective action periodically observed for effectiveness.	6A-Remediation completed. No further action or inspection required. 6B-Source eliminated. No further action required. 6C-No further action required - institutional or engineering controls in effect.

Figure 12. RRC County Contamination Map

Texas Commission on Environmental Quality

This map was generated by the Water Availability Division of the Texas Commission on Environmental Quality. This product is for informational purposes and may not have been prepared for or be suitable for legal, engineering, or surveying purposes. It does not represent an on-the-ground survey and represents only the approximate relative location of property boundaries. For more information concerning this map, contact the Water Availability Division at (512) 239-4691.

TCEQ

Map published in 2018.

Table 3. TAGD Groundwater Contamination Case Descriptions

TABLE 3
GROUNDWATER CONTAMINATION CASE DESCRIPTION BY COUNTY
TEXAS ALLIANCE OF GROUNDWATER DISTRICTS

EXPLANATION OF FIELDS

COUNTY: THE COUNTY NAME IS THE FIRST ENTRY IN THE LEFT PORTION OF THE TABLE. IT IS LISTED ONLY ONCE FOR EACH OF THE CASES IN THAT COUNTY.

DISTRICT: THE NAME OF THE GROUNDWATER CONSERVATION DISTRICT WITH THE CASE. "EUWCD" MEANS EVERGREEN UNDERGROUND WATER CONSERVATION DISTRICT.

NEW CASES: AN ASTERISK (*) IS PLACED IN EACH RECORD THAT IS REPORTED AS NEW FOR THE YEAR.

FILE NAME: EITHER THE RESPONSIBLE PARTY OR THE GEOGRAPHIC LOCATION

FILE NUMBER: ASSIGNED ACCORDING TO THE DISTRICT OR AGENCY NUMBERING SYSTEM.

LOCATION: LOCATIONS ARE GIVEN AS ADDRESSES OR GEOGRAPHIC LOCATION DESCRIPTIONS.

CONTAMINATION DESCRIPTION: A LIST OF CONTAMINATION SOURCES

DATE: DATE INVESTIGATION WAS BEGUN

ENFORCEMENT STATUS:
THE FIRST ENTRY INDICATES THE LEVEL OF AGENCY RESPONSE, THE SECOND IS THE SITE ACTIVITY STATUS. SOME CASES DO NOT HAVE COMPLETE CODES DUE TO INSUFFICIENT DATA. IF THE SITE STATUS IS IN BORDERLINE BETWEEN LEVELS IT MAY BE ENTERED AS MULTIPLE CODES. SEE THE ["ENFORCEMENT STATUS CODES"](#) SECTION OF THIS REPORT FOR A DESCRIPTION OF THE CODES.

DATA QUALITY: DATA QUALITY REFERS TO THE METHOD OF SAMPLING UTILIZED TO CONFIRM CONTAMINATION:
 E - EPA APPROVED ANALYTICAL PROCEDURES
 Q - QUALITY CONTROL PROGRAM ESTABLISHED FOR SAMPLING PROCEDURES
 V- VERIFICATION OF CONTAMINATION THROUGH PROCEDURES LISTED BELOW:
 1. SPLITTING SAMPLES WITH REGULATED ENTITY OR OTHER AGENCY FOR COMPARISON OF ANALYSIS RESULTS
 2. RESAMPLING FOR VERIFICATION ANALYSIS RESULTS
 3. SUPERVISORY OR COMMITTEE REVIEW OF SAMPLING PROCEDURES AND ANALYSIS RESULTS

Appendix 2. Texas Groundwater Protection Policy

Texas Water Code, Subchapter J (Groundwater Protection), Section [26.401](#) (Legislative Findings), effective September 1, 1989

- a) “The legislature finds that:
 - 1) in order to safeguard present and future groundwater supplies, usable and potentially usable groundwater must be protected and maintained;
 - 2) protection of the environment and public health and welfare requires that groundwater be kept reasonably free of contaminants that interfere with present and potential uses of groundwater;
 - 3) groundwater contamination may result from many sources, including current and past oil and gas production and related practices, agricultural activities, industrial and manufacturing processes, commercial and business endeavors, domestic activities, and natural sources that may be influenced by or may result from human activities;
 - 4) the various existing and potential uses are important to the state economy; and,
 - 5) aquifers vary both in their potential for beneficial use and in their susceptibility to contamination.
- b) The legislature determines that consistent with the protection of the public health and welfare, the propagation and protection of terrestrial and aquatic life, the protection of the environment, the operation of existing industries, and the maintenance and enhancement of the long-term economic health of the state, it is the goal of groundwater policy in this state that the existing quality of groundwater not be degraded. This goal of nondegradation does not mean zero-contaminant discharge.
- c) It is the policy of this state that:
 - 1) discharges of pollutants, disposal of wastes, or other activities subject to regulation by state agencies be conducted in a manner that will maintain present uses and not impair potential uses of groundwater or pose a public health hazard; and
 - 2) the quality of groundwater be restored if feasible.
- d) The legislature recognizes the important role of the use of the best professional judgment of the responsible state agencies in attaining the groundwater goal and policy of this state.”

Appendix 3. Groundwater Classification System

Purpose

The Texas Groundwater Protection Committee and its member agencies recognize that groundwater classification is an important tool to be used in the implementation of the groundwater policy contained in TWC, §26.401. Through classification, the groundwaters in the state can be categorized and protection or restoration measures can then be specified by member agencies according to the quality and present or potential use of the groundwater.

There are four basic classes of groundwater, each defined based on general quality as determined by the total dissolved solids concentration ([Figure 13](#)). The names and concentration ranges are based on traditional nomenclature associated with each class. Quality also determines usability; however, it is implicit in this classification that a water-bearing zone must be able to produce sufficient quantities of water to meet its intended use. The examples of use are intended to describe some of the common uses of these classes and are not meant to be exclusive of other uses which might arise due to unusual circumstances or application of new technology such as desalinization.

Applications

This groundwater classification system applies to all groundwaters in the state. In assigning a classification, the member agencies shall endeavor to use the natural quality of the groundwater that is unaffected by discharges of pollutants from human activities.

All usable and potentially usable groundwaters are subject to the same protection afforded the nondegradation policy goal of the TWC, §26.401. This section further states that nondegradation does not mean zero-contaminant discharge. Starting with this nondegradation policy goal, protection or restoration measures can be varied according to the response level set by the classification and guidance of this narrative so long as the following conditions are met:

- a) Current groundwater uses are not impaired;
- b) Potential groundwater uses are not impaired;
- c) A public health hazard is not created; and
- d) The quality of groundwater is restored if feasible.

In determining protection or restoration measures, the member agencies should consider all beneficial uses to which groundwater of a given quality can currently or potentially be put. Generally, the use of groundwater requiring the highest degree of protection or restoration is human consumption as drinking water. Protection for this use will also be protective of all other current or potential uses in almost all circumstances. The suitability of a zone for use as a human drinking water supply can be based on the quality and quantity of the water it contains as well as its ability to produce enough water to meet its intended use. These considerations facilitate defining two response levels for assigning protection or restoration measures that are commensurate with the potential to impact human health and the environment.

- **Level I** response for the fresh, slightly saline and moderately saline classes should be based on the current or potential use as a human drinking water supply.
- **Level II** response for the very saline to brine class should be based on indirect exposure (i.e., by means other than drinking) or no human consumption.

Evaluations

In specifying a protection or restoration measure, member agencies must apply best professional judgement on a case-by-case basis. Evaluations to be made include but are not limited to such factors as yield, the availability of alternate sources of water, any background concentrations of naturally occurring constituents, the effects of constituents on usability, traditional and potential beneficial uses of the water, economic and technical feasibility of treatment and projected needs for and types of impacts on these groundwaters. In instances where there is a likelihood of hydrologic interconnection with resultant potential for contaminant movement from a given groundwater zone to a surface water body or other groundwater zones, protection and restoration measures for that zone should be determined by the quality and current and potential use of the receiving waters.

Additional Function

This classification system is intended to be implemented by member agencies as an integral part of their groundwater quality programs. In addition to its response setting function, the classification system can also serve as a common basis among the various programs to foster consistency. It can also be used as a mapping tool to delineate specific areas in need of more detailed groundwater quality management. The Committee recognizes the important contributions of all agencies that compile such data and supports the continuing efforts to enhance the statewide database.

Figure 13. Groundwater Classification System of the TGPC

CLASS	QUALITY (TDS concentration)*	EXAMPLES OF USE	AGENCY RESPONSE
Fresh	0 - 1,000 mg/l	Drinking and all other uses.	Level I: Protection or restoration measures based on current use as a human drinking water supply.
Slightly Saline	>1,000 - 3,000 mg/l	Drinking if fresh water is unavailable, livestock watering, irrigation, industrial, mineral extraction, oil and gas production.	Level I
Moderately Saline	>3,000 - 10,000 mg/l	Potential/future drinking and limited livestock watering and irrigation if fresh or slightly saline water is unavailable; industrial, mineral extraction, oil and gas production.	Level I
Very Saline to Brine	>10,000 mg/l	Mineral extraction, oil and gas production.	Level II: Protection or restoration measures based on indirect exposure or no human consumption.

*"Quality" refers to the concentration range of total dissolved solids (TDS) in milligrams per liter (mg/l) of water.

Appendix 4. Rules of the TGPC

Title 31. NATURAL RESOURCES AND CONSERVATION, Part 18. TEXAS GROUNDWATER PROTECTION COMMITTEE

Chapter 601. GROUNDWATER CONTAMINATION REPORT

Subchapter A. GENERAL PROVISIONS RELATING TO PUBLIC FILES AND JOINT REPORT

§601.1. Purposes of Rules, adopted to be effective March 29, 1991, and amended to be effective August 16, 2006.

“The purposes of this chapter are:

- (1) to implement duties and responsibilities assigned to the committee under Texas Water Code, §26.406, concerning the maintenance by member agencies of public files containing documented cases of groundwater contamination and the publication by the committee, in conjunction with the commission, of annual groundwater monitoring and contamination reports;
- (2) to establish general policies of the committee to guide that implementation; and
- (3) to specify the form and content of the notice of groundwater contamination required under [Texas Water Code, §26.408.](#)”

§601.2. Applicability, adopted to be effective March 29, 1991, and amended to be effective September 13, 1998, July 28, 2002, August 16, 2006, and August 10, 2014.

“This chapter specifically applies to each state agency or organization having membership on the committee. The committee is composed of:

- (1) the Texas Commission on Environmental Quality;
- (2) the Texas Department of State Health Services;
- (3) the Texas Department of Agriculture;
- (4) the Railroad Commission of Texas;
- (5) the Texas Water Development Board;
- (6) the Texas Alliance of Groundwater Districts;
- (7) the Texas A&M AgriLife Research;
- (8) the Bureau of Economic Geology of the University of Texas at Austin;
- (9) the Texas State Soil and Water Conservation Board; and
- (10) the Water Well Drillers and Water Well Pump Installers Program of the Texas Department of Licensing and Regulation.”

§601.3. Definitions, adopted to be effective March 29, 1991, and amended to be effective September 13, 1998, July 28, 2002, and August 16, 2006.

“The following words and terms, when used in this chapter, have the following meanings.

- (1) Act - House Bill 1458 (71st Legislature, 1989) codified, with amendments, as [Texas Water Code, §§26.401 - 26.408.](#)
- (2) Commission - Texas Commission on Environmental Quality.
- (3) Committee - Texas Groundwater Protection Committee.

- (4) Documented groundwater contamination - A case of groundwater contamination in which a member agency has an established procedure for making a determination based on the quality of groundwater and the information pertinent to making the determination is maintained by that member agency under §601.4(b) of this title (relating to Public Files).
- (5) Enforcement action - Any action of the member agencies, identified in §601.2 of this title (relating to Applicability), that accomplishes or requires the identification, documentation, monitoring, assessing, or remediation of groundwater contamination.
- (6) Groundwater - Water below the land surface in a zone of saturation.
- (7) Groundwater contamination - The detrimental alteration of the naturally occurring physical, thermal, chemical, or biological quality of groundwater. Except for an underground source of drinking water granted an aquifer exemption by the commission with concurrence from the United States Environmental Protection Agency in accordance with 40 Code of Federal Regulations Parts 144 - 146, and 30 TAC Chapter 331 (relating to Underground Injection Control), groundwater contamination, for purposes of inclusion of cases in the public files and the joint groundwater monitoring and contamination report, is limited to contamination reasonably suspected of having been caused by activities or by entities under the jurisdiction of the member agencies identified in §601.2 of this title (relating to Applicability) and affecting groundwater that contains a concentration of:
 - (A) less than or equal to 10,000 milligrams per liter (mg/liter) of dissolved solids; or
 - (B) greater than 10,000 mg/liter of dissolved solids if it is:
 - (i) currently extracted for beneficial use such as domestic, industrial, or agricultural purposes; or
 - (ii) hydrologically connected with, and with the potential for contaminant movement to, a surface water body or another zone of groundwater that has a concentration of less than or equal to 10,000 mg/liter of dissolved solids.
- (8) Member agency - A state agency or organization designated by law under Texas Water Code, §26.403(c), to serve on the committee and be subject to its rules. Member agencies are listed in §601.2 of this title (relating to Applicability). Member agencies having responsibilities related to protection of groundwater include the commission, the Department of Agriculture, the Railroad Commission of Texas, and the State Soil and Water Conservation Board.”

§601.4. Public Files, adopted to be effective March 29, 1991, and amended to be effective September 13, 1998 and August 16, 2006.

- (a) “Subject to the limitations provided by the [Texas Water Code, §§26.401-26.408](#) (the Act), and the Texas Public Information Act, Texas Government Code, Chapter 552, information collected, assembled, or maintained by the committee and the member agencies having responsibilities related to protection of groundwater under the Act is a public record open to inspection and copying during regular business hours.
- (b) Each member agency having the responsibilities related to the protection of groundwater under the Act shall maintain a public file of all documented cases of groundwater contamination that are reasonably suspected of having been caused by activities regulated by the member agency.”

§601.5. Joint Groundwater Monitoring and Contamination Report, adopted to be effective March 29, 1991, and amended to be effective September 13, 1998, July 28, 2002, and August 16, 2006.

“In conjunction with the commission, the committee shall publish not later than April 1 of each year a joint groundwater monitoring and contamination report covering the activities and findings of the committee made during the previous calendar year. The report must:

- (1) describe the current status of groundwater monitoring programs conducted by or required by each member agency at regulated facilities or in connection with regulated facilities;

- (2) contain a description of each case of groundwater contamination documented during the previous calendar year and of each case of groundwater contamination documented during previous years for which enforcement action was incomplete at the time of issuance of the preceding report; and
- (3) indicate the status of enforcement action for each case of groundwater contamination that is included in the report.”

Subchapter B. NOTICE OF GROUNDWATER CONTAMINATION

§601.10. Form and Content of Groundwater Contamination Notice, effective November 12, 2003

“When notice of groundwater contamination, as defined in §601.3(7) of this title (relating to Definitions), is provided under [Texas Water Code, §26.408](#) to the owner of a private drinking water well that may be affected by the contamination and to each applicable groundwater conservation district, the notice shall:

- (1) be in writing; and
- (2) contain, at a minimum, the following information;
 - a) the name of the contaminant or contaminants;
 - b) the range of analytical results for the contaminant or contaminants measured in the area or well to date;
 - c) possible health effects of the contaminant or contaminants;
 - d) possible source or sources for this type of contamination;
 - e) suggested actions and precautions potentially impacted well owners could take; and
 - f) who to contact for more information.”

Appendix 5. TCEQ Rules on Spill Prevention and Control

The TCEQ adopted [30 TAC §§327.1-327.5](#) (“Spill Prevention and Control”), effective on May 23, 1996. 30 TAC, §327.1 (Applicability) was amended with effective dates of December 26, 1996 and June 2, 2016; and §327.5 (Actions Required) was amended with effective dates of December 26, 1999 and September 23, 1999. In addition, §327.32, related to Reporting Requirements for Certain Accidental Discharges or Spills of Treated or Untreated Wastewater at Wastewater Treatment Facilities or Collection Systems, was adopted with an effective date of June 2, 2016.

A reportable discharge or spill is an unauthorized discharge or spill of oil, petroleum product, used oil, hazardous waste, industrial solid waste, or other substances into the environment in a quantity equal to or greater than a reportable quantity (RQ) listed in Figure 14.

Figure 14. Spill Response Reportable Quantities (RQ)

Adapted [From 30 TAC, §327.4](#)

Type of Material Spilled	Released Onto Land	Released Into Water
Hazardous substances	Refer to specific substances as listed in Title 40, CFR §302.4, (“Designation of Hazardous Substances). The RQ is included in Table 302.4, the column marked “Final RQ.”	See the “Final RQ” in Table 302.4 in 40 CFR, §302.4; however, if the final RQ is >100 pounds in Table 302.4, then the RQ is 100 pounds.
Crude oil and oil other than that defined as petroleum product or used oil	210 gallons (five barrels)	quantity sufficient to create a sheen
Petroleum product and used oil	25 gallons; except for petroleum storage tank exempted facilities, the RQ is 210 gallons (five barrels)	quantity sufficient to create a sheen
Industrial solid waste or other substances	---	100 pounds

¹ CFR means the Code of Federal Regulations

Notification Requirements

According to 30 TAC, §327.3, upon determining that a reportable discharge or spill has occurred, the responsible person must notify the TCEQ as soon as possible but no later than 24 hours after its discovery. The responsible person must notify one of the following entities:

1. For all spills other than petroleum industry spills:
 - a. the State Emergency Response Center at 1-800-832-8224;

- b. if during normal business hours, the TCEQ Regional Office in which the discharge or spill occurred (TCEQ's Regional Office telephone numbers are included in Appendix 6); or
 - c. the TCEQ's 24-hour spill reporting hotline at 1-800-832-8224.
2. For petroleum industry spills: the Texas Railroad Commission (RRC), at (512) 463-6788.

The initial notification must contain, to the extent known, the following information:

1. the name, address, and telephone number of the person making the telephone report;
2. the date, time, and location of the discharge or spill;
3. a specific description or identification of the substances discharged or spilled;
4. an estimate of the quantity discharged or spilled;
5. the duration of the incident;
6. the name of the surface water or a description of the waters in the state affected or threatened by the discharge or spill;
7. the source of the discharge or spill;
8. a description of the extent of actual or potential water pollution or harmful impacts to the environment and an indication of any environmentally sensitive areas or natural resources at risk;
9. if other than the person making the telephone report, the names, addresses, and telephone numbers of the responsible person and the contact person at the location of the discharge or spill;
10. a description of any actions that have been taken, are being taken, and will be taken to contain and respond to the discharge or spill;
11. any known or anticipated health risks;
12. the identity of any governmental representatives, including local authorities or third parties, responding to the discharge or spill; and
13. any other information that may be significant to the response action.

If the discharge or spill creates an imminent health threat, the responsible person (RP) must immediately notify and cooperate with local emergency authorities in providing support to implement appropriate notification and response actions (e.g., the fire department, fire marshal, law enforcement authority, health authority, or Local Emergency Planning Committee as appropriate). The local emergency authority must implement (as necessary) its emergency management plan, which may include notifying and evacuating affected persons. In the absence of a local emergency authority, the RP must take reasonable measures to notify potentially affected persons of the imminent health threat.

The RP must immediately abate and contain the discharge or spill and must cooperate fully with the TCEQ and local emergency authorities. The RP must also begin reasonable response actions, which may include:

1. arrival of the responsible party or response personnel hired by the RP to the site of the discharge or spill,
2. attempting to stop the discharge or spill,
3. minimizing the impact to the public health and the environment,
4. neutralizing the effects of the incident,
5. removing the discharged or spilled substances, or

6. managing the wastes.

Within 30 working days of the discovery of the discharge or spill, the RP must submit written information to the appropriate TCEQ Regional Manager describing the details of the discharge or spill and supporting the adequacy of the response action. A report is not required for spills occurring during the normal course of transportation which are reported to the U.S.

Department of Transportation under 49 CFR, §171.16. If a spill cannot be cleaned up within 180 days of the date it was reported, the RP is required to clean up the spill in accordance with the TCEQ's risk-based corrective action rules.

Applicability

The TCEQ's Spill Prevention and Control Rules apply to discharges or spills that result in a release to the environment within the territorial limits of the state, including the coastal waters of the state. The rules do not apply to the following:

1. Discharges or spills of oil that enter or threaten to enter the coastal waters of the state. Except for spills of oil of 240 barrels or less for which the Railroad Commission of Texas (RRC) is the on-scene coordinator, such discharges or spills are regulated by the Texas General Land Office under the Oil Spill Prevention and Response Act of 1991, the Texas Natural Resources Code, Chapter 40, Subchapters C, D, E, F, and G;
2. Discharges or spills from activities subject to the jurisdiction of the RRC under TWC, §26.131;
3. Releases only to air;
4. The lawful placement of waste or accidental discharge of material into a solid waste management unit registered or permitted under 30 TAC Chapter 335, Subchapter A (relating to Industrial Solid Waste and Municipal Hazardous Waste in General);
5. Units and activities regulated under the authority of the TWC, Chapter 26, Subchapter I (relating to Underground and Aboveground Storage Tanks);
6. The lawful application of materials, including but not limited to fertilizers and pesticides, to land or water;
7. Discharges that are authorized by a permit, order, or rule issued under federal law or any other law of the state, provided, that discharges not so authorized are reported under the Spill Prevention and Control Rules unless the permit, order, or other TCEQ rule provides an applicable reporting requirement;
8. Discharges or spills that are continuous and stable in nature, and are reported to the U.S. Environmental Protection Agency under 40 CFR, §302.8; or
9. Discharges or spills occurring during the normal course of rail transportation about which carriers are required to give notice and report in accordance with 49 CFR, §§171.15 and 171.16.
10. Accidental discharges or spills of treated or untreated wastewater that are reported in accordance with 30 TAC §305.132 (relating to Special Conditions for Certain Wastewater Discharges).

Wastewater Spills and Accidental Discharges

Additionally, the TCEQ adopted 30 TAC §§319.302.1-302.3 (Public Notice of Spills or Accidental Discharges from Wastewater Facilities Owned or Operated by Local Governments), which became effective December 30, 1999. These rules require:

1. The owner of a facility must designate a responsible individual to comply with the rules. For the purposes of these requirements, "owner" may refer to this responsible individual designated by the owner.

2. In addition to the noncompliance notification to the TCEQ required by 30 TAC, §305.125(9) (relating to Standard Permit Conditions) and any notification required under 30 TAC, Chapter 327 (relating to Spill Prevention and Control), the owner must notify appropriate local government officials and the local media whenever one of the following types of spills occurs:
 - a. a spill that the facility owner knows or has reason to know, will adversely affect a public or private source of drinking water (regardless of volume);
 - b. a spill with a volume of 50,000 gallons or more where one or more of the following conditions also exists:
 - i. the spill occurs within ½-mile of a public or private source of drinking water;
 - ii. the spill occurs within ½-mile of a private drinking water well and that private well is located within ½-mile of a public water supply well;
 - iii. the spill occurs within ½-mile up-gradient of a surface water intake for a drinking water source;
 - iv. the spill occurs in an active groundwater recharge area;
 - v. the spill occurs up-gradient and within ½-mile of a karst terrain or shallow alluvial well that is a source of drinking water; or
 - c. a spill of 100,000 gallons or more.
3. The owner must issue the notice using a TCEQ approved form as provided in 30 TAC, §319.303 as quickly as possible, but not later than 24 hours after becoming aware of the spill. The notice must be delivered in an expeditious manner, either by hand-delivery, facsimile, e-mail, or by phone with follow-up written notice.
4. Immediately after giving notice to appropriate local government officials and local media, the owner must report to the appropriate TCEQ regional office that it made the required notice.

Reporting of Certain Spills at Facilities Owned or Operated by Local Government

Senate Bill (SB 912), passed by the 84th Texas Legislature, 2015, amended the TWC, §26.039 to allow individuals to report certain accidental discharges or spills of treated or untreated wastewater on a monthly basis from wastewater treatment facilities or collection systems owned or operated by a local government. The legislation also required TCEQ to establish standard methods for calculating the volume of accidental discharges or spills of treated or untreated wastewater related to this section; to consider compliance history of the individual; and to establish procedures for formatting and submitting a monthly summary. To implement this legislation, TCEQ amended 30 TAC, Chapter 327 to add §327.32, effective June 2, 2016.

In order to qualify for the monthly reporting option under the new rules, each individual accidental discharge or spill must meet the following characteristics:

- (1) Have a volume of no more than 1,000 gallons
- (2) Not be associated with another simultaneous accidental discharge or spill of treated or untreated wastewater;
- (3) Is controlled or removed before it enters water in the state or adversely affects a public or private source of drinking water; and
- (4) Is not otherwise subject to local regulatory control and reporting requirements.

In addition, the monthly reporting is only available if the TCEQ has not required more frequent reporting based on the RP's history of noncompliance.

If the above requirements are met, the RP must submit a monthly summary by the 20th day of the month for each accidental discharge or spill that occurred during the previous month. The summary must include, at a minimum:

- (1) the location, volume, and content of the accidental discharge or spill;
- (2) a description of the accidental discharge or spill;
- (3) the cause of the accidental discharge or spill;
- (4) dates and times of the accidental discharge or spill; and
- (5) steps taken to reduce, eliminate, and prevent recurrence of the accidental discharge or spill.

Records of all accidental discharges or spills of treated or untreated wastewater under these rules must be kept on-site for at least three years.

This rule amendment at 30 TAC, §327.32(e) also provides methods to determine the volume of an accidental discharge or spill, including:

- (1) *Visual estimate.* If the accidental discharge or spill is less than 55 gallons, then using a standard five-gallon bucket for reference, first estimate the number of buckets that the discharge/spill would fill, then multiply the result by five to obtain the number of gallons. If the discharge/spill is larger than 55 gallons, then using a standard 55 gallon barrel for reference, estimate the number of barrels that would be filled and then multiply by 55 to estimate the number of gallons.
- (2) *Measured volume.* Identify the length, width, and depth of the contained accidental discharge or spill in feet and calculate the volume by multiplying length by width by depth by 7.5 (the conversion factor from cubic feet to gallons).
- (3) *Duration and flow rate.* Identify separate estimates for the duration and the flow rate of the accidental discharge or spill. The estimated volume is calculated by multiplying the duration (hours or days) by the flow rate (gallons/hour or gallons/day).
- (4) *Other methods.* The RP may use other volumetric calculation methodologies, so long as such methodologies include procedures to identify a duration, flow rate, depth, affected area, and total quantity of each spill (including, as appropriate, reference to estimation tools such as barrels, for example), and such methodology is consistent with standard and accepted industry practices. Such alternative methodologies must be identified in the monthly report.

Texas Groundwater Conservation Districts (May 2018)

Texas Commission on Environmental Quality

This map was generated by the Water Availability Division of the Texas Commission on Environmental Quality. This product is for informational purposes and may not have been prepared for or be suitable for legal, engineering, or surveying purposes. It does not represent an on-the-ground survey and represents only the approximate relative location of property boundaries. For more information concerning this map, contact the Water Availability Division at (512) 239-4691

Map printed May 1, 2018.

Date indicates date established by law or by election.
 ASRCD - Aquifer Storage and Recovery Conservation District
 CD - Conservation District
 CRD - Conservation and Reclamation District
 GCD - Groundwater Conservation District
 RA & GWD - River Authority & Ground Water District
 UFWCD - Underground and Fresh Water Conservation District
 UWCSD - Underground Water Conservation & Supply District
 UWCD - Underground Water Conservation District
 WCD - Water Conservation District
 WD - Water District

Appendix 7. Contacts for Agency Programs

The following persons may be contacted for further information regarding individual programs or for guidance on specific groundwater contamination cases listed under their program's jurisdiction.

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Office of Compliance and Enforcement

Enforcement Division: Rebecca Boyett, Work Leader, Order Compliance Team 512-239-2503
Regional Offices: Tom Heitman, Program Support Section 512-239-3257

Office of Waste

Waste Permits Division: Arten Avakian, P.G., Municipal Solid Waste Permits Section 512-239-4419
Remediation Division: Kelly Peavler, Special Assistant 512-239-1352
Permitting & Registration Support Division: Ivan Messer, Ph.D., Occupational Licensing Section 512-239-6133
Radioactive Materials Division: Brad Broussard, Technical Specialist 512-239-6380

Office of Water

Water Quality Division: April Hoh, P.G., Team Leader, Water Quality Assessment Team 512-239-3567
Water Supply Division: Gary Regner, Public Drinking Water Section 512-239-4528
Water Availability Division: Cindy Hooper, P.G., Groundwater Planning & Assessment Team 210-403-4080
Water Quality Planning Division: Kerry Niemann, Manager, Planning & Implementation Section 512-239-0483

BUREAU OF ECONOMIC GEOLOGY

Center for Sustainable Water Resources: Bridget R. Scanlon, Ph.D. 512-471-8241

DEPARTMENT OF STATE HEALTH SERVICES

Environmental Surveillance and Toxicology Branch: Emily Hall, MPH, Manager 512-776-2652

RAILROAD COMMISSION OF TEXAS

Oil and Gas Division: Eric Newman, P.G., Site Remediation 512-463-6812

TEXAS DEPARTMENT OF AGRICULTURE

Environmental & Biosecurity Program: David Villarreal, Ph.D. 512-463-7481

TEXAS A&M AGRILIFE RESEARCH

Texas Water Resources Institute: John C. Tracy, Director 979-862-7221

TEXAS STATE SOIL AND WATER CONSERVATION BOARD

Nonpoint Source Program: T.J. Helton, Coordinator 254-773-2250
ext. 234

TEXAS WATER DEVELOPMENT BOARD

Groundwater Monitoring: Janie Hopkins, P.G., Manager

512-936-0841

TEXAS DEPARTMENT OF LICENSING AND REGULATION

Well Driller/Pump Installer/Abandoned Well Referral Program: David Gunn

512-334-5539

TEXAS ALLIANCE OF GROUNDWATER DISTRICTS

Dirk Aaron, President

254-933-0120

Appendix 8. Closed Cases

The following table ([Table 4](#)) lists 1,090 cases from the 1994 through 2016 Joint Groundwater Monitoring and Contamination Reports that have been closed by a program area or agency, and have been listed in previous reports with an **Activity Status Code of 6C, 6D, or 6E**. As described in [Figure 6b](#), these codes refer to sites in which agency action is final, though contamination that requires certain controls may still exist at the site.

While enforcement actions may be closed on these cases, the Activity Status Code descriptions allow that groundwater contamination may still be present at the site, and may therefore be of interest to regulatory agencies and the general public.

This list is not a comprehensive inventory. The Activity Status Codes "6D" and "6E" were first implemented in 1995, which is the primary reason that closed case data prior to 1994 was not included in this table. Additionally, an agency or agency program area may have closed an enforcement case in any previous report without providing details on the closure, and groundwater local to the site may still be impacted by contamination. Finally, closed cases will not be reflected in this table for instances where groundwater was determined to have been impacted, but analysis indicated that the contamination was below regulatory action levels and the case was "closed" during the investigation stage.

The codes used in this table are the same as those in the three main agency tables, however a code indicating the agency originally responsible for the case is included. "TCEQ" is the Texas Commission on Environmental Quality or predecessor agencies; "RRC" is the Railroad Commission of Texas; and "TAGD" is the Texas Alliance of GCDs. A field showing the calendar year of the last report in which the cases were listed is also included.

Additional information regarding these cases may be obtained from the agencies listed in the table. Contact information for agency staff members can be found in [Appendix 7](#).

Table 4. Historic Groundwater Contamination Cases, 1994-2016

TABLE 4 (APPENDIX 8)
HISTORIC GROUNDWATER CONTAMINATION CASE DESCRIPTION BY COUNTY
ALL AGENCIES, 1994-2016

EXPLANATIONS OF FIELDS

COUNTY: THE COUNTY NAME IS THE FIRST ENTRY IN THE LEFT PORTION OF THE TABLE. IT IS LISTED ONLY ONCE FOR EACH OF THE CASES IN THAT COUNTY.

AGENCY: TCEQ - TEXAS COMMISSION ON ENVIRONMENTAL QUALITY, OR PREDECESSOR AGENCIES
RRC - RAILROAD COMMISSION OF TEXAS
TAGD - TEXAS ALLIANCE OF GROUNDWATER DISTRICTS

DIVISION: DIVISIONS ARE LISTED ONLY ONCE WITH THEIR RESPECTIVE CASES FOR EACH COUNTY.
ENF - ENFORCEMENT DIVISION, TCEQ
FO - FIELD OPERATIONS, TCEQ
RMD - RADIOACTIVE MATERIALS DIVISION, TCEQ
REM/CA - REMEDIATION DIVISION/CORRECTIVE ACTION SECTION, TCEQ
REM/DCRP - REMEDIATION DIVISION/ DRY CLEANERS PROGRAM, TCEQ
REM/PST - REMEDIATION DIVISION/ PETROLEUM STORAGE TANK PROGRAM, TCEQ
REM/SF - REMEDIATION DIVISION/ SUPERFUND PROGRAM, TCEQ
REM/SSDAP - REMEDIATION DIVISION/SUPERFUND SITE DISCOVERY AND ASSESSMENT, TCEQ
REM/VC - REMEDIATION DIVISION/VOLUNTARY CLEANUP PROGRAM, TCEQ
REM/VCIO - REMEDIATION DIVISION/VOLUNTARY CLEAN UP/INNOCENT OWNER, TCEQ
REM/VCBSA - REMEDIATION DIVISION/VOLUNTARY CLEANUP/BROWNFIELDS SITE ASSESSMENT, TCEQ
WPD/MSW - WASTE PERMITS DIVISION/MUNICIPAL SOLID WASTE SECTION, TCEQ
WPD/IHW - WASTE PERMITS DIVISION/ INDUSTRIAL AND HAZARDOUS WASTE SECTION, TCEQ
WQD/WQAS - WATER QUALITY DIVISION /WATER QUALITY ASSESSMENT SECTION, TCEQ
WSD/PDW - WATER SUPPLY DIVISION /PUBLIC DRINKING WATER SECTION, TCEQ
WAD/GPAT - WATER AVAILABILITY DIVISION/ GROUNDWATER PLANNING AND ASSESSMENT TEAM, TCEQ
OIL & GAS - OIL AND GAS DIVISION, RRC
SLUWCD - SANDYLAND UNDERGROUND WATER CONSERVATION DISTRICT, MEMBER OF TAGD

SECTION: PROGRAM AREA WITHIN DIVISION OF AGENCY RESPONSIBLE FOR CASE, IF APPLICABLE

FILE NAME: FILE NAMES REFLECT RESPONSIBLE PARTIES OR GEOGRAPHIC LOCATION

FILE NUMBER: FILE NUMBERS ARE ASSIGNED ACCORDING TO THE RESPECTIVE DIVISION NUMBERING SYSTEM. FILE NUMBER IS USED TO LOCATE FILE IN TCEQ RECORDS.

LOCATION: LOCATIONS ARE GIVEN AS ADDRESSES OR GEOGRAPHIC LOCATIONS DESCRIPTIONS.

CONTAMINATION DESCRIPTION: AS - ARSENIC; BTEX - BENZENE, TOLUENE, ETHYLBENZENE, AND XYLENES; CARBON TET - CARBON TETRACHLORIDE; CR - CHROMIUM; DCA - DICHLOROETHANE; DCE - DICHLOROETHENE/ETHYLENE; MEK - METHYL ETHYL KETONE; MTBE - METHYL-TERT(IARY)-BUTYL-ETHER; NO3 - NITRATE; ORG - ORGANIC CHEMICALS; PAH - POLYCYCLIC AROMATIC (POLYAROMATIC) HYDROCARBONS; PB - LEAD; PCB - POLYCHLORINATED BIPHENYLS; PCE - TETRACHLOROETHENE/-ETHYLENE; PCP - POLYCHLORINATED PHENYLS; SO4 - SULFATE; TCA - TRICHLOROETHANE; TCE - TRICHLOROETHENE/-ETHYLENE; TDS - TOTAL DISSOLVED SOLIDS; TOC - TOTAL ORGANIC COMPOUNDS; TPH - TOTAL PETROLEUM HYDROCARBONS; VOC - VOLATILE ORGANIC COMPOUNDS.
**THE MAJORITY OF CASES INVOLVE PETROLEUM CONTAMINATION.*

YEAR: THE CALENDAR YEAR THAT THE CASE WAS DROPPED FROM THE ACTIVE REPORT (TABLES 1, 2, OR 3)

ENFORCEMENT STATUS: THE FIRST ENTRY IN THIS FIELD INDICATES THE LEVEL OF AGENCY RESPONSE, THE SECOND INDICATES THE SITE ACTIVITY STATUS. SOME CASES DO NOT HAVE COMPLETE ENFORCEMENT STATUS CODES BECAUSE OF INSUFFICIENT DATA. STATUS CODES MAY BE BORDER-LINE BETWEEN TWO LEVELS ON THE ENFORCEMENT STATUS MATRIX AND ARE ENTERED AS A COMBINATION OF ENFORCEMENT STATUS CODES, E.G., "3A,B" OR "4,5." SEE [THE "ENFORCEMENT STATUS CODES" SECTION OF THIS REPORT](#) FOR A DESCRIPTION OF THESE CODES.
