Our Review of Your Application

The Edwards Aquifer Program staff conducts an administrative and technical review of all applications. The turnaround time for administrative review can be up to 30 days as outlined in 30 TAC 213.4(e). Generally administrative completeness is determined during the intake meeting or within a few days of receipt. The turnaround time for technical review of an administratively complete Edwards Aquifer application is 90 days as outlined in 30 TAC 213.4(e). Please know that the review and approval time is directly impacted by the quality and completeness of the initial application that is received. In order to conduct a timely review, it is imperative that the information provided in an Edwards Aquifer application include final plans, be accurate, complete, and in compliance with 30 TAC 213.

Administrative Review

1. Edwards Aquifer applications must be deemed administratively complete before a technical review can begin. To be considered administratively complete, the application must contain completed forms and attachments, provide the requested information, and meet all the site plan requirements. The submitted application and plan sheets should be final plans. Please submit one full-size set of plan sheets with the original application, and half-size sets with the additional copies.

To ensure that all applicable documents are included in the application, the program has developed tools to guide you and web pages to provide all forms, checklists, and guidance. Please visit the below website for assistance: [http://www.tceq.texas.gov/field/eapp](http://www.tceq.texas.gov/field/eapp).

2. This Edwards Aquifer Application Cover Page form (certified by the applicant or agent) must be included in the application and brought to the administrative review meeting.

3. Administrative reviews are scheduled with program staff who will conduct the review. Applicants or their authorized agent should call the appropriate regional office, according to the county in which the project is located, to schedule a review. The average meeting time is one hour.

4. In the meeting, the application is examined for administrative completeness. Deficiencies will be noted by staff and emailed or faxed to the applicant and authorized agent at the end of the meeting, or shortly after. Administrative deficiencies will cause the application to be deemed incomplete and returned.

   An appointment should be made to resubmit the application. The application is re-examined to ensure all deficiencies are resolved. The application will only be deemed administratively complete when all administrative deficiencies are addressed.

5. If an application is received by mail, courier service, or otherwise submitted without a review meeting, the administrative review will be conducted within 30 days. The applicant and agent will be contacted with the results of the administrative review. If the application is found to be administratively incomplete, it can be retrieved from the regional office or returned by regular mail. If returned by mail, the regional office may require arrangements for return shipping.

6. If the geologic assessment was completed before October 1, 2004 and the site contains “possibly sensitive” features, the assessment must be updated in accordance with the Instructions to Geologists (TCEQ-0585 Instructions).

Technical Review

1. When an application is deemed administratively complete, the technical review period begins. The regional office will distribute copies of the application to the identified affected city, county, and groundwater conservation district whose jurisdiction includes the subject site. These entities and the public have 30 days to provide comments on the application to the regional office. All comments received are reviewed by TCEQ.
2. A site assessment is usually conducted as part of the technical review, to evaluate the geologic assessment and observe existing site conditions. The site must be accessible to our staff. The site boundaries should be clearly marked, features identified in the geologic assessment should be flagged, roadways marked and the alignment of the Sewage Collection System and manholes should be staked at the time the application is submitted. If the site is not marked the application may be returned.

3. We evaluate the application for technical completeness and contact the applicant and agent via Notice of Deficiency (NOD) to request additional information and identify technical deficiencies. There are two deficiency response periods available to the applicant. There are 14 days to resolve deficiencies noted in the first NOD. If a second NOD is issued, there is an additional 14 days to resolve deficiencies. If the response to the second notice is not received, is incomplete or inadequate, or provides new information that is incomplete or inadequate, the application must be withdrawn or if not withdrawn the application will be denied and the application fee will be forfeited.

4. The program has 90 calendar days to complete the technical review of the application. If the application is technically adequate, such that it complies with the Edwards Aquifer rules, and is protective of the Edwards Aquifer during and after construction, an approval letter will be issued. Construction or other regulated activity may not begin until an approval is issued.

**Mid-Review Modifications**

It is important to have final site plans prior to beginning the permitting process with TCEQ to avoid delays.

Occasionally, circumstances arise where you may have significant design and/or site plan changes after your Edwards Aquifer application has been deemed administratively complete by TCEQ. This is considered a “Mid-Review Modification”. Mid-Review Modifications may require redistribution of an application that includes the proposed modifications for public comment.

If you are proposing a Mid-Review Modification, two options are available to you:

- You can withdraw your application, and your fees will be refunded or credited for a resubmittal.
- TCEQ can continue the technical review of the application as it was submitted, and a modification application can be submitted at a later time.

If the application is withdrawn, the resubmitted application will be subject to the administrative and technical review processes and will be treated as a new application. The application will be redistributed to the effected jurisdictions.

Please contact the regional office if you have questions. If your project is located in Williamson, Travis, or Hays County, contact TCEQ’s Austin Regional Office at 512-339-2929. If your project is in Comal, Bexar, Medina, Uvalde, or Kinney County, contact TCEQ’s San Antonio Regional Office at 210-490-3096

Please fill out all required fields below and submit with your application.

## Application Distribution

Instructions: Use the table below to determine the number of applications required. One original and one copy of the application, plus additional copies (as needed) for each affected incorporated city, county, and groundwater conservation district are required. Linear projects or large projects, which cross into multiple jurisdictions, can require additional copies. Refer to the ‘Texas Groundwater Conservation Districts within the EAPP Boundaries’ map found at:

For more detailed boundaries, please contact the conservation district directly.

Contributing Zone Exception Request Form

Texas Commission on Environmental Quality
for Regulated Activities on the Contributing Zone to the Edwards Aquifer and Relating to 30 TAC §213.24(1), Effective June 1, 1999

To ensure that the application is administratively complete, confirm that all fields in the form are complete, verify that all requested information is provided, consistently reference the same site and contact person in all forms in the application, and ensure forms are signed by the appropriate party.

Note: Including all the information requested in the form and attachments contributes to more streamlined technical reviews.

Signature

To the best of my knowledge, the responses to this form accurately reflect all information requested concerning the proposed regulated activities and methods to protect the Edwards Aquifer. This Contributing Zone Exception Request Form is hereby submitted for TCEQ review and executive director approval. The request was prepared by:

Print Name of Customer/Agent: Blake Allison, P.E.
Date: 9/30/2019
Signature of Customer/Agent: ____________________

Regulated Entity Name: Wilson Creek Dam

Project Information
1. County: Hays
2. Stream Basin: Wilson Creek
3. Groundwater Conservation District (if applicable): ______________
4. Customer (Applicant):
   Contact Person: Kelli Vesper
   Entity: Owner
   Mailing Address: PO Box 679
   City, State: Cotulla, Texas Zip: 78014
   Telephone: 903-436-3606 Fax: _____
   Email Address: ______

TCEQ-10262 (Rev. 03-13-15)
5. Agent/Representative (If any):
   Contact Person: Blake Allison, P.E.
   Entity: M&S Engineering
   Mailing Address: 376 Landa St
   City, State: New Braunfels Zip: 78130
   Telephone: 830-629-2988 Fax: ______
   Email Address: ballison@msengr.com

6. Project Location
   □ This project is inside the city limits of ______.
   □ This project is outside the city limits but inside the ETJ (extra-territorial jurisdiction) of ______.
   ☑ This project is not located within any city limits or ETJ.

7. ☑ The location of the project site is described below. Sufficient detail and clarity has been provided so that the TCEQ’s Regional staff can easily locate the project and site boundaries for a field investigation.
   The project site is located in Hays County, approximately 1 mile South and 0.7 miles East of the intersection of FM 2325 and Fischer Store Road.

8. ☑ Attachment A - Road Map. A road map showing directions to and location of the project site is attached. The map clearly shows the boundary of the project site.

9. ☑ Attachment B - USGS Quadrangle Map. A copy of the USGS Quadrangle Map (Scale: 1" = 2000’) is attached. The map(s) should clearly show:
   ☑ Project site boundaries.
   ☑ USGS Quadrangle Name(s).

10. ☑ Attachment C - Project Narrative. A detailed narrative description of the proposed project is provided at the end of this form. The project description is consistent throughout the application and contains, at a minimum, the following details:
    ☑ Area of the site
    ☑ Offsite areas
    ☑ Impervious cover
    ☑ Permanent BMP(s)
    ☑ Proposed site use
    ☑ Site history
    ☑ Previous development
    ☑ Area(s) to be demolished

11. Existing project site conditions are noted below:
    □ Existing commercial site
    □ Existing industrial site
    □ Existing residential site
☐ Existing paved and/or unpaved roads
☐ Undeveloped (Cleared)
☑ Undeveloped (Undisturbed/Not cleared)
☐ Other: ______

12. ☑ Attachment D - Nature Of Exception. A narrative description of the nature of each exception requested is attached. All provisions of 30 TAC §213 Subchapter B for which an exception is being requested have been identified in the description.

13. ☑ Attachment E - Equivalent Water Quality Protection. Documentation demonstrating equivalent water quality protection for surface streams which enter the Edwards Aquifer is attached.

**Administrative Information**

14. ☑ Submit one (1) original and one (1) copy of the application, plus additional copies as needed for each affected incorporated city, groundwater conservation district, and county in which the project will be located. The TCEQ will distribute the additional copies to these jurisdictions.

15. ☑ The applicant understands that prior approval under this section must be obtained from the executive director for the exception to be authorized.
ATTACHMENT A - ROAD MAP
**PROJECT DESCRIPTION**

The Wilson Creek Lake is a new/proposed dam within the property of Heaton Hollow, Lot 15, 156.14-acre tract of land. Property ID: R164825. The lake is within the Wilson Creek watershed and will be located approximately 3-miles upstream of the City of Wimberley.

The dam will be designed as a Small Size structure with a High Hazard classification based on the criteria found in Subchapter B: Design and Evaluation of Dams. A small size classification is defined as an impoundment maximum storage of equal to or greater than 15 acre-foot and less than 1,000 acre-foot and a dam height of equal to or greater than 25 foot and less than 40 foot. The lake is proposed to impound approximately 155 acre-feet of water at the permanent pool elevation of 1,000 ft-MSL and a maximum storage capacity of 366.00 acre-foot at 1,010 ft-MSL and the dam height is 42.0 foot at the centerline of the structure.

The emergency spillway is required to pass 75% PMF based on the Hydrologic Criteria for Dams requirements found in TCEQ Chapter 299 Dams and Reservoirs. The emergency spillway was also sized to pass 75% PMF. The emergency spillway is a 150-foot bottom trapezoidal weir with 3:1 side slopes. The spillway will be cut out of the existing impermeable rock adjacent to the proposed dam. The invert of the emergency spillway will be 1,001 ft-MSL. The water surface elevation in the lake and flowing through the spillway under 75% PMF storm is 1,006.90 ft-MSL. The emergency spillway will outfall into Wilson Creek.

A principle spillway will be installed to maintain a permanent pool elevation of 1,000 ft-MSL. The principle spillway will be a concrete catch basin on the upstream side of the dam with a 48-inch outfall pipe through the dam. The spillway has a maximum outfall of 455.00 cubic feet per second. Rock Rip-Rap will be used at the outfall of the principle spillway to reduce flows to non-erosive levels.

The Wilson Creek Dam is located within the Blanco River watershed. The entire project site falls in the 100-year floodplain area based on panel 48209C0219F effective 9/2/2005.
Attachment D

NATURE OF EXCEPTION

The nature of the exception request is for a waiver from preparing a full CZP application for Wilson Creek Lake Dam. The proposed dam will be completely earthen and no impervious cover will be added with the proposed improvements.
Attachment E

EQUIVALENT WATER QUALITY PROTECTION

Temporary BMPs such as silt fence and rock berms will be used during construction of the dam to prevent pollution of stormwater. Since no impervious cover is being added to the site no permanent BMPs are needed.

Signature of Customer/Agent: [Signature]

Regulated Entity Name: Wilson Creek Dam

Project Information

Potential Sources of Contamination

Examples: Fuel storage and use, chemical storage and use, use of asphaltic products, construction vehicles tracking onto public roads, and existing solid waste.

1. Fuels for construction equipment and hazardous substances which will be used during construction:

☐ The following fuels and/or hazardous substances will be stored on the site: ______

These fuels and/or hazardous substances will be stored in:

☐ Aboveground storage tanks with a cumulative storage capacity of less than 250 gallons will be stored on the site for less than one (1) year.
Aboveground storage tanks with a cumulative storage capacity between 250 gallons and 499 gallons will be stored on the site for less than one (1) year. Aboveground storage tanks with a cumulative storage capacity of 500 gallons or more will be stored on the site. An Aboveground Storage Tank Facility Plan application must be submitted to the appropriate regional office of the TCEQ prior to moving the tanks onto the project.

Fuels and hazardous substances will not be stored on the site.

2. **Attachment A - Spill Response Actions.** A site specific description of the measures to be taken to contain any spill of hydrocarbons or hazardous substances is attached.

3. **Temporary aboveground storage tank systems of 250 gallons or more cumulative storage capacity must be located a minimum horizontal distance of 150 feet from any domestic, industrial, irrigation, or public water supply well, or other sensitive feature.**

4. **Attachment B - Potential Sources of Contamination.** A description of any activities or processes which may be a potential source of contamination affecting surface water quality is attached.

**Sequence of Construction**

5. **Attachment C - Sequence of Major Activities.** A description of the sequence of major activities which will disturb soils for major portions of the site (grubbing, excavation, grading, utilities, and infrastructure installation) is attached.

   - For each activity described, an estimate (in acres) of the total area of the site to be disturbed by each activity is given.
   - For each activity described, include a description of appropriate temporary control measures and the general timing (or sequence) during the construction process that the measures will be implemented.

6. Name the receiving water(s) at or near the site which will be disturbed or which will receive discharges from disturbed areas of the project: Wilson Creek

**Temporary Best Management Practices (TBMPs)**

*Erosion control examples: tree protection, interceptor swales, level spreaders, outlet stabilization, blankets or matting, mulch, and sod. Sediment control examples: stabilized construction exit, silt fence, filter dikes, rock berms, buffer strips, sediment traps, and sediment basins. Please refer to the Technical Guidance Manual for guidelines and specifications. All structural BMPs must be shown on the site plan.*

7. **Attachment D – Temporary Best Management Practices and Measures.** TBMPs and measures will prevent pollution of surface water, groundwater, and stormwater. The construction-phase BMPs for erosion and sediment controls have been designed to retain sediment on site to the extent practicable. The following information is attached:
A description of how BMPs and measures will prevent pollution of surface water, groundwater or stormwater that originates upgradient from the site and flows across the site.

A description of how BMPs and measures will prevent pollution of surface water or groundwater that originates on-site or flows off site, including pollution caused by contaminated stormwater runoff from the site.

A description of how BMPs and measures will prevent pollutants from entering surface streams, sensitive features, or the aquifer.

A description of how, to the maximum extent practicable, BMPs and measures will maintain flow to naturally-occurring sensitive features identified in either the geologic assessment, TCEQ inspections, or during excavation, blasting, or construction.

8. ☑ The temporary sealing of a naturally-occurring sensitive feature which accepts recharge to the Edwards Aquifer as a temporary pollution abatement measure during active construction should be avoided.

☐ Attachment E - Request to Temporarily Seal a Feature. A request to temporarily seal a feature is attached. The request includes justification as to why no reasonable and practicable alternative exists for each feature.

☑ There will be no temporary sealing of naturally-occurring sensitive features on the site.

9. ☑ Attachment F - Structural Practices. A description of the structural practices that will be used to divert flows away from exposed soils, to store flows, or to otherwise limit runoff discharge of pollutants from exposed areas of the site is attached. Placement of structural practices in floodplains has been avoided.

10. ☑ Attachment G - Drainage Area Map. A drainage area map supporting the following requirements is attached:

☐ For areas that will have more than 10 acres within a common drainage area disturbed at one time, a sediment basin will be provided.

☐ For areas that will have more than 10 acres within a common drainage area disturbed at one time, a smaller sediment basin and/or sediment trap(s) will be used.

☐ For areas that will have more than 10 acres within a common drainage area disturbed at one time, a sediment basin or other equivalent controls are not attainable, but other TBMPs and measures will be used in combination to protect down slope and side slope boundaries of the construction area.

☐ There are no areas greater than 10 acres within a common drainage area that will be disturbed at one time. A smaller sediment basin and/or sediment trap(s) will be used in combination with other erosion and sediment controls within each disturbed drainage area.
There are no areas greater than 10 acres within a common drainage area that will be disturbed at one time. Erosion and sediment controls other than sediment basins or sediment traps within each disturbed drainage area will be used.

11. **Attachment H - Temporary Sediment Pond(s) Plans and Calculations.** Temporary sediment pond or basin construction plans and design calculations for a proposed temporary BMP or measure have been prepared by or under the direct supervision of a Texas Licensed Professional Engineer. All construction plans and design information must be signed, sealed, and dated by the Texas Licensed Professional Engineer. Construction plans for the proposed temporary BMPs and measures are attached.

12. **Attachment I - Inspection and Maintenance for BMPs.** A plan for the inspection of each temporary BMP(s) and measure(s) and for their timely maintenance, repairs, and, if necessary, retrofit is attached. A description of the documentation procedures, recordkeeping practices, and inspection frequency are included in the plan and are specific to the site and/or BMP.

13. All control measures must be properly selected, installed, and maintained in accordance with the manufacturer’s specifications and good engineering practices. If periodic inspections by the applicant or the executive director, or other information indicate a control has been used inappropriately, or incorrectly, the applicant must replace or modify the control for site situations.

14. If sediment escapes the construction site, off-site accumulations of sediment must be removed at a frequency sufficient to minimize offsite impacts to water quality (e.g., fugitive sediment in street being washed into surface streams or sensitive features by the next rain).

15. Sediment must be removed from sediment traps or sedimentation ponds not later than when design capacity has been reduced by 50%. A permanent stake will be provided that can indicate when the sediment occupies 50% of the basin volume.

16. Litter, construction debris, and construction chemicals exposed to stormwater shall be prevented from becoming a pollutant source for stormwater discharges (e.g., screening outfalls, picked up daily).

**Soil Stabilization Practices**

_Examples: establishment of temporary vegetation, establishment of permanent vegetation, mulching, geotextiles, sod stabilization, vegetative buffer strips, protection of trees, or preservation of mature vegetation._

17. **Attachment J - Schedule of Interim and Permanent Soil Stabilization Practices.** A schedule of the interim and permanent soil stabilization practices for the site is attached.
18. Records must be kept at the site of the dates when major grading activities occur, the
dates when construction activities temporarily or permanently cease on a portion of the
site, and the dates when stabilization measures are initiated.

19. Stabilization practices must be initiated as soon as practicable where construction
activities have temporarily or permanently ceased.

**Administrative Information**

20. All structural controls will be inspected and maintained according to the submitted and
approved operation and maintenance plan for the project.

21. If any geologic or manmade features, such as caves, faults, sinkholes, etc., are
discovered, all regulated activities near the feature will be immediately suspended. The
appropriate TCEQ Regional Office shall be immediately notified. Regulated activities
must cease and not continue until the TCEQ has reviewed and approved the methods
proposed to protect the aquifer from any adverse impacts.

22. Silt fences, diversion berms, and other temporary erosion and sediment controls will be
constructed and maintained as appropriate to prevent pollutants from entering
sensitive features discovered during construction.
Attachment A

Spill Response Actions
SPILL RESPONSE ACTIONS

Contractors who work onsite with materials which could potentially cause pollution shall provide for the following measures to help reduce the stormwater impacts of leaks and/or spills.

Education of Employees or Subcontractors Who Handle Materials Which Can Cause Pollution

1. Employees should know what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills. Employees should also be aware of when a spill must be reported to the TCEQ. Information is available in 30 TAC 327.4 and 40 CFR 302.4.
2. Educate employees and subcontractors on the potential dangers to humans and the environment from spills and leaks, and provide training in spill prevention and cleanup.
3. Hold regular meetings to discuss and reinforce appropriate disposal procedures (incorporate into regular safety meetings).
4. Establish a continuing education program to indoctrinate new employees, who will use or handle potential pollutants.
5. Provide for a superintendent or representative to oversee and enforce proper spill prevention and control measures.

General Measures

1. To the extent that work can be accomplished safely, spills of oil, petroleum products, and substances listed under 40 CFR part 110,117, and 302, and sanitary and septic wastes should be contained and cleaned up immediately.
2. Store hazardous materials and waste in covered containers and protect from vandalism.
3. Place spill cleanup materials where it will be readily accessible.
4. Spills should be covered and protected from stormwater runon during rainfall to the extent that it doesn't compromise clean up activities.
5. Do not bury spills onsite.
6. Store and dispose of used clean up materials, contaminated materials, and recovered spill material that is no longer suitable for the intended purpose in conformance with the provisions in applicable BMP’s.
7. Do not allow water used for cleaning and decontamination to enter storm drains or watercourse. Collect and dispose of contaminated water in accordance with applicable regulations.
SPILL RESPONSE ACTIONS

8. Contain contaminate water overflow or minor water spillage and do not allow it to discharge into drainage facilities or watercourses.
9. Place Material Safety Data Sheets (MSDS), as well as proper storage, cleanup, and spill reporting instructions for hazardous materials stored or used on the project site in an open, conspicuous, and accessible location.
10. Keep waste storage areas clean, well-organized, and equipped with ample cleanup supplies as appropriate for the materials being stored. Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

Cleanup

1. Clean up leaks and spills immediately, or as soon as it is safely practical.
2. Use a rag for small spills on paved surfaces, a damp mop for general cleanup, and absorbent materials for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be disposed of as hazardous waste.
3. Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly.

Minor Spills

1. Minor spills such as small quantities of oil, gasoline, paint, etc, should be controlled by the first responder at the discovery of the spill.
2. Use absorbent materials on small spills rather than hosing down or burying the spill.
3. Absorbent materials should be promptly removed and disposed of properly.
4. Follow the practice below for a minor spill:
   a. Contain the spread of the spill.
   b. Recover spilled materials.
   c. Clean the contaminated area and properly dispose of contaminated materials.
SPILL RESPONSE ACTIONS

Semi-Significant Spills

Semi-significant spills may also be controlled by the first responder along with the aid of other personnel such as labors and the foreman, etc. This response may require the cessation of all other activities.

Spills should be cleaned up immediately, or as soon as safely practical

1. Contain spread of the spill.
2. Notify the project foreman immediately.
3. If the spill occurs on paved or impermeable surfaces, clean up using "dry" methods (absorbent materials, cat litter and/or rags). Contain the spill by encircling absorbent materials and do not let the spill spread widely.
4. If the spill occurs in dirt areas, immediately contain the spill by constructing an earthen dike. Dig up and properly dispose of contaminated soil.
5. If the spill occurs during rain, cover spill with tarps or other materials to prevent contaminating runoff.

Significant/Hazardous Spills

1. Notify the TCEQ by telephone as soon as possible and within 24 hours at 512-339-2929 (Austin) or 210-490-3096 (San Antonio) between 8 AM and 5 PM. After hours, contact the Environmental Release Hotline at 1-800-832-8224. It is the contractor's responsibility to have all emergency phone numbers at the construction site.
2. For spills of federal reportable quantities, in conformance with the requirements in 40CFR parts 110, 119 and 302, the contractor should notify the National Response Center at (800) 424-8802.
3. Notification should first be made by telephone and followed up with a written report.
4. The services of a spill contractor or a Haz-Mat team should be obtained immediately. Construction personnel should not attempt to clean up until the appropriate and qualified staffs have arrived at the job site.
5. Other agencies which may need to be contacted include, but are not limited to, the City Police Department, County Sheriff Office, Fire Departments, etc.
SPILL RESPONSE ACTIONS

Vehicle and Equipment Maintenance

1. If maintenance must occur onsite, use a designated area and a secondary containment, located away from drainage courses, to prevent the runon of stormwater and the runoff of spills.
2. Regularly inspect onsite vehicles and equipment for leaks and repair immediately.
3. Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles onsite.
4. Always use secondary containment, such as drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
5. Place drip pans or absorbent materials under paving equipment when not in use.
6. Use absorbent materials on small spills rather than hosing down or burying the spill. Remove the absorbent materials promptly and dispose of properly.
7. Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.
8. Oil filters disposed of in trashcans or dumpsters can leak oil and pollute stormwater. Place the oil filter in a funnel over a waste oil-recycled. Ask the oil supplier or recycler about recycling oil filters.
9. Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries even if you think all the acid has drained out. If you drop a battery, treat if as if it cracked. Put into the containment area until you are sure it is not leaking.

Vehicle and Equipment Maintenance

1. If fueling must occur on site, used designated areas, located away from drainage courses, to prevent the runon of stormwater and the runoff of spills.
2. Discourage "topping off" on fuel tanks.
3. Always use secondary containment, such as drain pan, when fueling to catch spill/leaks.
Attachment B

Potential Sources of Contamination
POTENTIAL SOURCES OF CONTAMINATION

Asphalt products used on this project

- Preventative measures
  - After placement of asphalt, emulsion or coatings, the contractor will be responsible for immediate cleanup should an unexpected rain occur. For the duration of the asphalt product curing time, the contractor will maintain standby personnel and equipment to contain any asphalt wash-off should an unexpected rain occur. The contractor will be instructed not to place asphalt products on the ground within 48 hours of a forecasted rain.

Oil, grease fuel and hydrocarbon fluid contamination from construction equipment and vehicle drippings.

- Preventative measures
  - Vehicle maintenance when possible will be performed within the construction staging area.
  - Construction vehicles and equipment shall be checked regularly for leaks and repaired immediately.

Accidental leaks or spills of oil, petroleum products and substances listed under 40 CFR parts 110, 117, and 302 used or stored temporarily on site.

- Preventative measures
  - Contractor to incorporate regular safety meetings, a discussion of spill prevention and appropriate disposal procedures.
  - Contractor’s superintendent or representative overseer shall enforce proper spill prevention and control measures.
  - Hazardous material and wastes shall be stored in covered containers and protected from vandalism.
  - A stockpile of spill cleanup materials shall be stored on site where it will be readily available.
POTENTIAL SOURCES OF CONTAMINATION

Miscellaneous trash and litter from construction workers and material wrappings.

- Preventative measures
  - Trash containers will be placed throughout the site to encourage proper trash disposal.

Construction Debris

- Preventative measures
  - Construction debris will be monitored daily by contractor. Debris will be collected weekly and placed in disposal bins. Situations requiring immediate attention will be addressed on a case by case basis.

Spills/ Overflow of waste from portable toilets

- Preventative measures
  - Portable toilets will be placed away from high traffic vehicular areas and storm drain inlets.
  - Portable toilets will be placed on a level ground surface.
  - Portable toilets will be inspected regularly for leaks and will be serviced and sanitized at time intervals that will maintain sanitary conditions.
Sequence of Major Activities
The sequence of major activities that disturb the soil during construction of the proposed site will be broken down into two stages. The first stage is site preparation that will include clearing and grubbing of vegetation. The second stage will be construction of the site, grading, landscaping and site cleanup. Both stages will disturb approximately 8.62 acres of the site.
Temporary Best Management Practices and Measures
7a A description of how BMPs and measures will prevent pollution of surface water, groundwater or stormwater that originates upgradient from the site and flows across the site.

In order to prevent pollution of surface water, groundwater or stormwater that originates upgradient from the site, the following measures will be implemented:

1. Upgradient offsite stormwater will be routed through the Permanent BMP’s and treated before being discharged from the site.

7b A description of how BMPs and measures will prevent pollution of surface water or groundwater that originates on-site or flows off-site, including pollution caused by contaminated stormwater runoff from the site.

Site preparations will disturb the largest amount of soil. Therefore, before any of this work can begin, the clearing and grading contractor will be responsible for the installation of all on-site control measures. The methodology for pollution prevention of on-site stormwater will include:

1. Erection of silt fence along downgradient boundary of construction activities for temporary erosion and sedimentation controls.
2. Installation of rock berms with silt fencing downgradient from areas of concentrated stormwater flow for temporary erosion control.
3. Installation of stabilized construction entrance/exits to reduce the dispersion of sediment from the site.
4. Installation of concrete truck washout.
5. Installation of construction staging areas.

Prior to the initiation of construction, all previously installed control measures will be repaired or reestablished for their designed purpose. The construction contractor will be responsible for the installation of the remaining on-site control measures that includes installation of the concrete truck washouts.

7c A description of how BMPs and measures will prevent pollutants from entering surface streams, sensitive features, or the aquifer.

Temporary measures are intended to provide a method of slowing the flow of runoff from the construction site in order to allow sediment and suspended solids to settle out of the runoff. By containing the sediment and suspended solids within the site, they will not enter the aquifer, surface streams and/or sensitive features that may exist downstream of the site.
7d A description of how, to the maximum extent practicable, BMPs and measures will maintain flow to naturally-occurring sensitive features identified in either the geologic assessment, TCEQ inspections, or during excavation, blasting, or construction

BMP measures utilized in this plan are intended to allow stormwater to continue downstream after passing through the BMPs. This will allow stormwater runoff to continue downgradient to streams or features that may exist downstream of the site. Features discovered during construction will be reported and assessed in accordance with applicable regulations.
Attachment F

Structural Practices
**STRUCTURAL PRACTICES**

The structural practices listed below are shown on the SWPPP plans and are listed on Attachment D of the CZP application.

1. Install stabilized construction entrance/exit prior to the initiation of any site preparation activities.

2. Silt fencing will be installed adjacent to any drainage way which receives sheet flow from upgradient-disturbed areas and along the sideslope perimeter of disturbed areas.

3. Silt fencing with rock berms will be installed in areas where upgradient flow from disturbed areas is concentrated, and washout of silt fencing may occur. Silt fencing with rock berms will also be installed along the sideslope perimeter of disturbed areas if the upgradient flow is concentrated so that washout of silt fencing may occur.
Attachment G

Drainage Area Map
Attachment H

Temporary Sediment Pond(s) Plans and Calculations
TEMPORARY SEDIMENT POND(S) PLANS AND CALCULATIONS

Temporary Sedimentation Ponds

There is no temporary sedimentation ponds required because there are no disturbed areas within this site which will exceed ten (10) acres, and drain to a common outfall point. The sizes of the various drainage areas are shown on the Drainage Area Map.

Other Temporary BMP's

Full size copies of Temporary BMP’s are shown on the SWPPP Detail Sheet.
Attachment I

Inspection and Maintenance of BMPs
INSPECTION AND MAINTENANCE FOR BMPs

The following list of items outlines and dictates Inspection and Maintenance for BMPs practices. Inspection and maintenance guidelines come from TCEQ RG-348.

In addition to these measures the contractor will be subject to the provisions of the TCEQ General Permit Number TXR 150000 relating to discharges from construction activities.

Silt Fence
1. Inspect all fencing weekly, and after any rainfall.
2. Remove sediment when buildup reaches 6 inches.
3. Replace any torn fabric or install a second line of fencing parallel to the torn section.
4. Replace or repair any sections crushed or collapsed in the course of construction activity. If a section of fence is obstructing vehicular access, consider relocating it to a spot to where it will provide equal protection, but will not obstruct vehicles. A triangular filter dike may be preferable to a silt fence at common vehicle access points.
5. When construction is complete, the sediment should be disposed of in a manner that will not cause additional siltation and the prior location of the silt fence should be revegetated. The fence itself should be disposed of in an approved landfill.

Rock Berm
1. Inspection should be made weekly and after each rainfall by responsible party. For installations in streambeds, additional daily inspections should be made.
2. Remove sediment and other debris when buildup reaches 6 inches and dispose of the accumulated silt in an approved manner that will not cause any additional siltation.
3. Repair any loose wire sheathing.
4. The berm should be reshaped as needed during inspection.
5. The berm should be replaced when the structure ceases to function as intended due to silt accumulation among the rocks, washout, construction traffic damage, etc.
6. The rock berm should be left in place until all upstream areas are stabilized and accumulated silt removed.

Sand Bag Berm
1. The sand bag berm should be inspected weekly and after each rain.
2. The sandbags should be reshaped or replaced as needed during inspection.
3. When silt reaches 6 inches, the accumulated silt should be removed and disposed of at an approved site in a manner that will not contribute to additional siltation.
4. The sandbag berm should be left in place until all upstream areas are stabilized and accumulated silt removal; removal should be done by hand.

Attachment I
Inlet Protection Barrier

1. Inspection should be made weekly and after each rainfall. Repair or replacement should be made promptly as needed by the contractor.
2. Remove sediment when buildup reaches a depth of 3 inches. Removed sediment should be deposited in a suitable area and in such a manner that it will not erode.
3. Check placement of devices to prevent gaps between device and curb.
4. Inspect filter fabric and patch or replace if torn or missing.
5. Structures should be removed and the area stabilized only after the remaining drainage area has been properly stabilized.
Schedule of Interim and Permanent Soil Stabilization Practices
Onsite construction activities shall be conducted in accordance with the SWPPP for the project which included the provisions of the TPDES General Permit Discharge Waste N. TXR150000.

Interim on-site stabilization measures will include minimizing soil disturbances by exposing the smallest practical area of land required for the shortest period of time and maximizing the use of natural vegetation. All disturbed soil will be stabilized as per project specifications in accordance with pages 1-35 to 1-60 of TCEQ Technical Guidance Manual RG-348 (2005).

Stabilization measures shall be initiated as soon as practicable in portions of the site where construction activities have temporarily or permanently ceased, but in no case more than 14 days after the construction activity in that portion of the site has temporarily or permanently ceased. Where the initiation of stabilization measures by the 14th day after construction activity temporarily or permanently cease is precluded by weather conditions, stabilization measures shall be initiated as soon as practicable. Where construction activity on a portion of the site is temporarily ceased, and earth disturbing activities will be resumed within 21 days, temporary stabilization measures do not have to be initiated on that portion of the site. In areas experiencing droughts where the initiation of stabilization measures by the 14th day after construction activity has temporarily or permanently ceased is preclude by seasonal arid conditions, stabilization measures shall be initiated as soon as practicable.

Interim Stabilization Measures will include one or more of the following methods.

1. Temporary Vegetation
2. Installation of blankets or matting material
3. Hydraulic Mulch
4. Sod

The interim and permanent stabilization will be installed in accordance with the standard specifications for the county or city having jurisdiction over the project, which ever is more stringent. In the event that the governing entity does not have specifications for these items, the work shall be completed in compliance with the procedures and specifications outlined in the current Technical Guidance Manual published by the TCEQ.
Permanent Stabilization measures will include one or more of the following methods.

1. Permanent Vegetation including landscape planting with trees, shrubs or ground cover.
2. Installation of blankets or matting material
3. Hydromulch
4. Grass Sodding
5. Rock or concrete rip-rap

STORMWATER POLLUTION PREVENTION PLAN

A full-size copy of the Stormwater Pollution Prevention Plan (SWPPP) follows this page.
**NOTES:**

1. **SILT FENCE:**
   - Use only open graded rock 4-8 inches diameter for stream flow conditions; use open graded rock 3-5 inches diameter for other conditions.
   - Use woven wire sheathing having maximum 1 inch openings and minimum wire diameter of 20 gauge.
   - The rock berm shall be inspected weekly or after each rainfall, and the stone and/or fabric core—woven wire sheathing, shall be replaced when the structure ceases to function as intended, due to silt accumulation among the rocks, washout, construction traffic damage, etc.
   - When silt reaches a depth equal to one-third the height of the berm or one foot, whichever is less, the silt shall be removed and disposed of in an approved site and in such a manner as to not create a siltation problem.
   - Daily inspection shall be made on severe service rock berms; silt shall be removed when accumulation reaches 6 inches.
   - When the site is completely stabilized, the berm and accumulated silt shall be removed and disposed of in an approved manner.

2. **STEEL POSTS:**
   - Which support the silt fence shall be installed on a slight angle toward the anticipated runoff source. Post must be embedded a minimum of one foot.
   - The toe of the silt fence shall be trenched in with a spade or mechanical trencher, so that the downslope face of the trench is flat and perpendicular to the line of flow. Weight fabric flap with washed gravel on uphill side to prevent flow under fence.
   - The trench must be a minimum of 6 inches deep and 6 inches wide to allow for the silt fence fabric to be laid in the ground and backfilled with compacted material.
   - Silt fence should be securely fastened to each steel support post or to woven wire, which is in turn attached to the steel fence post.
   - Inspection shall be made weekly or after each rainfall event and repair or replacement shall be made promptly as needed.
   - Silt fence shall be removed when the site is completely stabilized so as not to block or impede storm flow or drainage.
   - Accumulated silt shall be removed when it reaches a depth of 6 inches. The silt shall be disposed of in an approved site and in such a manner as to not contribute to additional siltation.
Agent Authorization Form

to represent and act on the behalf of the above named Corporation, Partnership, or Entity for the purpose of preparing and submitting this plan application to the Texas Commission on Environmental Quality (TCEQ) for the review and approval consideration of regulated activities.

I also understand that:

1. The applicant is responsible for compliance with 30 Texas Administrative Code Chapter 213 and any condition of the TCEQ's approval letter. The TCEQ is authorized to assess administrative penalties of up to $10,000 per day per violation.

2. For those submitting an application who are not the property owner, but who have the right to control and possess the property, additional authorization is required from the owner.

3. Application fees are due and payable at the time the application is submitted. The application fee must be sent to the TCEQ cashier or to the appropriate regional office. The application will not be considered until the correct fee is received by the commission.

4. A notarized copy of the Agent Authorization Form must be provided for the person preparing the application, and this form must accompany the completed application.

5. No person shall commence any regulated activity on the Edwards Aquifer Recharge Zone, Contributing Zone or Transition Zone until the appropriate application for the activity has been filed with and approved by the Executive Director.
