An increase in DC fast charging stations would go a long way to encourage electric vehicle adoption. A Texas state rebate for EV purchase would also be a big help. I do not favor clean diesel or even natural gas vehicles because they still pollute. Furthermore, we need to clean up the power generation system by shutting down coal power plants. Wind and solar are the way to go backed by some natural gas generators and new and improved battery storage.

I would say we should concentrate on these items in this order:

1. Clean up electric power production by increasing solar and wind backed up by some natural gas and battery storage.
2. Give a Texas rebate for electric vehicle purchase.
3. Increase the number of DC fast chargers along the Interstates.
