Attachments: OP-PBRSUP_250303.pdf

Good Morning Mark,

The Working Draft Permit looks good to us – we have no comments on it and you can proceed with it.

I have all of the application updates loaded to STEERS that include the previously submitted OP-UA10 and OP-UA12 and the attached OP-PBRSUP. I have asked out DAR to sign that this morning so this should come through here early this week.

Thanks for your review on this project – if you have any other comments or questions just let me know.

Thank you,
James

Subject: Working Draft Permit - SOP - O3186 ET Gathering & Processing LLC (Renewal 37008)

Mr. VanAssche:

I have completed the Working Draft Permit (WDP) for your Federal Operating Permit (FOP) Renewal issuance permit application of Permit No. O3186 for ET Gathering & Processing LLC / Mi Vida Treater Plant / Renewal project 37008.

Please review the WDP and submit any comments you have at your earliest opportunity, but no later than **March 14, 2025**.

In addition, the following issues must be addressed:

- Updated [OP-PBRSUP](#). The PBR 106.359 for MSS should be reflected on Table B and Table D to show permit monitoring for compliance. Table C is reserved only for “Insignificant Sources” that are not on the list that begins on the first page of the form and instructions.
- Please note that Special Terms and Conditions number 9 of the WDP, which will be updated on the new form and submittal date.

Contact me if you have any questions or if you wish to discuss any other details or deadlines regarding your application or permit.

Regards,
Mark

Review the second portion of the “SOP Technical Review Fact Sheet” located at http://www.tceq.texas.gov/assets/public/permitting/air/Guidance/Title_V/sop_wdp_factsheet.pdf. This guidance contains important information regarding WDP review and comment procedures.

Note that a Certification by Responsible Official (Form OP-CRO1) for any uncertified application information, including application updates supporting the WDP comments, is required. After final review of the WDP, additional changes supported by application updates may require certification. I will advise you of these changes at a later date. Prior to transmittal of the Public Announcement Authorization Package, a duly signed OP-CRO1 form may be required which includes the specific dates or time-period of all submitted application documentation that was not previously certified. I will advise you of this requirement prior to sending the Public Announcement Authorization.

Dear Senator Sparks:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-103.4675,31.525833&level=13>.

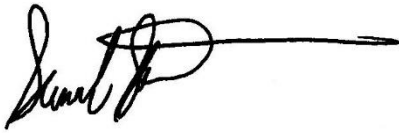

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Kevin Sparks

2.0 PROCESS DESCRIPTION

The Mi Vida Treater Plant (the Plant) is designed with many bypass and interconnecting lines so that inlet streams can be routed through and/or around various equipment and processes as needed to meet specs. To avoid confusion, the following paragraphs present a description of the Plant's equipment and processes as they are primarily designed, rather than addressing every possible path. The primary design represents the Plant operating at full capacity, with all equipment being utilized.

The Plant receives wet natural gas from pipelines gathered from wellheads in the area. The inlet gas streams enter inlet slug catchers where liquids are removed. The liquids from one (1) slug catcher are sent through a 3-phase separator/high-pressure flash tank where water is removed and sent to a flare knockout drum. The condensate liquids from the separator are sent through a low-pressure flash tank and then stabilized to approximately nine (9) pounds per square inch (psi) via the use of a stabilization unit including a heat medium heater (FIN STAB-HTR2). Liquids from a second slug catcher are sent to another low-pressure flash tank and stabilized to approximately nine (9) psi in a second stabilization unit including a heat medium heater (FIN STAB-HTR3). The stabilized liquids may be sent through an additional stabilization unit and separated into Y-grade product and bottoms product. An additional stabilizer heater (FIN STAB-HTR) supplies heat for this stabilizer. The bottoms product and/or stabilized condensate is stored in eleven (11) 500- barrel (bbl) condensate tanks (FINs CND-TNK1 through CND-TNK7 and CND-TNK11 through CND-TNK14) and periodically transported off-site via tank trucks. The loading operations (FINs LOAD3 and LOAD4) are controlled by the truck loading flare (FIN FLARE-2).

Electric overhead compressors operate in tandem to route vapors from the inlet separators/flash tanks and first stabilization unit to the gas processing train. When one (1) of the compressors goes down, either for maintenance or due to an upset condition, the Plant throughput is reduced so the overhead vapors can be controlled by the remaining unit. Any excess vapors produced during transition to single-compressor operation are combusted in the stabilizer flare (FIN FLARE-3).

Vapors from the second stabilization system are routed through two (2) of three (3) 1,380-horsepower (hp) Caterpillar G3516B flash gas compressors (FINs C-11, C-12, and C-13). These compressors act in the same manner as the electric overhead compressors for the first stabilization unit, with any excess vapors produced during transitions between operating compressors being combusted in the stabilizer flare. As part of this project, a portion of the normal operation vapors from both stabilizer units are authorized to be combusted in the stabilizer flare (FIN FLARE-3) at all times.

Water (with small amounts of entrained condensate) separated from the inlet condensate is routed through a flare knockout drum to a 1,000-bbl gun barrel vessel (FIN GBRL-TNK9). The gun barrel also receives liquids from various ground and low-pressure sumps. The small amounts of entrained condensate from the gun barrel and any off-spec condensate are sent to a 500-bbl tank (FIN SLOP-TNK8) and trucked out (FIN LOAD2). The slop loading vapors are sent to the truck loading flare. The water from the gun barrel is routed to a 500-bbl water storage tank (FIN PW-TNK10) and trucked out as needed (FIN LOAD1). The fourteen (14) atmospheric hydrocarbon storage tanks are controlled by a vapor recovery unit (VRU) which is powered by an electric motor. The captured vapors are routed by pipeline to the low-pressure gathering system. When the VRU is down for maintenance, the vapors are routed to the truck loading flare for combustion.

The gas from one (1) inlet slug catcher is compressed by one (1) 1,380-hp Caterpillar G3516B LE engine-driven compressor (FIN C-14) and three (3) 1,300-hp Solar Saturn turbine-driven compressors (FINs 3180, 3182, and 3184) prior to entering the processing train. Gas from the second inlet slug catcher passes through an inlet scrubber directly to the processing train. A bypass stream of inlet gas is sent through a series of knockout vessels and routed out of the Plant by pipeline.

The processing train includes an amine unit (FIN MDEA-STILL2), a triethylene glycol (TEG) dehydration unit (FIN DEHY-STILL2), a molecular sieve regenerator with a regeneration heater (FIN REGEN-HTR), and an HMO heater (FIN DMHTR). After sweetening and dehydration, the treated gas is sent to the cryogenic unit. Residue gas from the cryogenic unit is recompressed before being discharged to the sales line. The recompression equipment includes four (4) 4,735- hp Caterpillar G3616 engine-driven dual drive compressors (FINs C-6, C-7, C-8, and C-9).

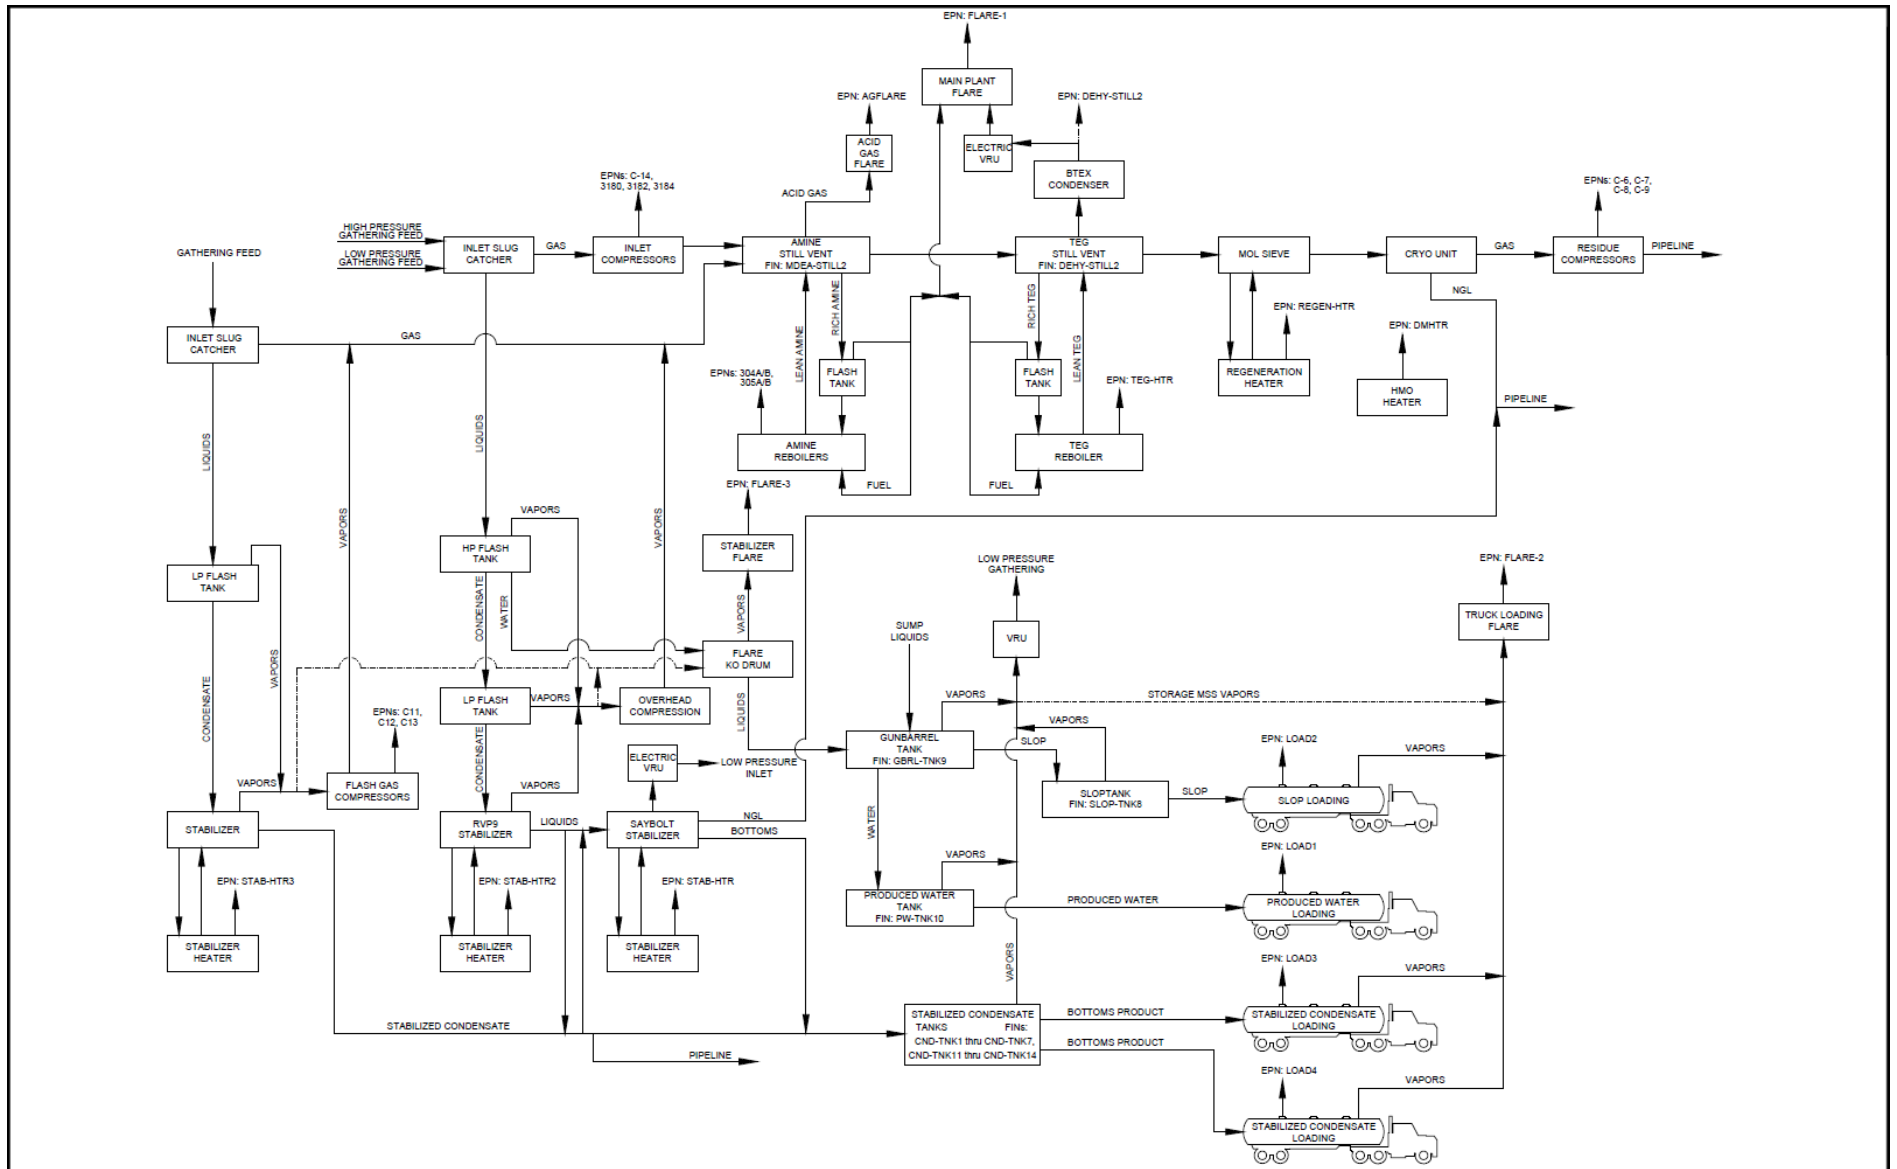

Vapors produced as flash emissions in the amine system flash tank (FIN MDEA-FLTK) are used as fuel in the amine reboilers (FINs AMINE-3A and AMINE-3B). When the reboilers are cycled off, flash tank vapors are combusted by the main plant flare (FIN FLARE-1). Acid gases removed from the inlet gas stream in the amine contactor are combusted by the acid gas flare (FIN AGFLARE).

Hydrocarbon vapors from the TEG dehydration unit still vent are routed to a condenser for HAP reduction. Non-condensable vapors from the condenser are captured by a VRU driven by electric motors and routed to the main plant flare for combustion. When the VRU is down for maintenance, these vapors vent to the atmosphere. The dehydration system's flash tank off-gases (FIN DEHYFLTK) are used as fuel in the glycol reboiler (FIN TEG-HTR). When the reboiler is cycled off, flash tank vapors are combusted by the main plant flare.

There are also various fixed roof tanks for the storage of chemicals used in site operations and maintenance, including diesel fuel (FIN TK-3512), unleaded gasoline (FIN TK-3511), antifreeze (FINs TK-9410, TK-9413, and TK-9414), MDEA (FIN TK-9401), TEG (FIN TK-9408), and lube oil (FINs TK-9409, TK-9411, and TK-9412). Piping components are a source of fugitive emissions (FIN MIVIDAFUG).

A process flow diagram can be found at the end of this section as Figure 2.1.
