## TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

*Protecting Texas by Reducing and Preventing Pollution*

October 7, 2024

THE HONORABLE JOAN HUFFMAN  
TEXAS SENATE  
PO BOX 12068  
AUSTIN TX 78711-2068

Re: Accepted Federal Operating Permit Initial Issuance Application  
Project Number: 37211  
Permit Number: O4689  
The Dow Chemical Company  
Polyethylene 7 Plant  
Freeport, Brazoria County  
Regulated Entity Number: RN100225945  
Customer Reference Number: CN600356976

Dear Senator Huffman:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) initial issuance application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-95.421111,28.995&level=13>.

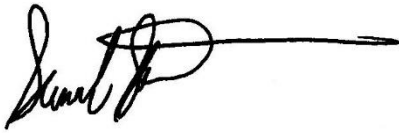

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

Process Description

# Polyethylene 7 Plant

## Process Description

### Step 1 – Raw Material Feeds and Purification

Raw material feeds include: ethylene, comonomers, solvent, hydrogen, and catalyst.

- a. Ethylene is introduced into the plant via pipeline and then purified prior to use in the process.
- b. Comonomers (hexene and octene) are introduced into the plant via individual pipelines and stored in dedicated storage tanks. The comonomers are purified prior to being used in the process.
- c. Solvent is delivered into the plant via rail car or truck and is stored in an existing tank. The solvent is purified prior to being used in the process.
- d. Catalyst components are brought into the plant by cylinders, isotainers, and by pipeline and are stored on site or in dedicated tanks.
- e. Hydrogen is introduced into the plant via pipeline.

### Step 2 – Reaction

The ethylene is mixed with purified solvent, comonomer, hydrogen, and catalyst in the reactors and a reaction takes place to produce polyethylene.

### Step 3 – Separation and Cooling

The crude product mix is then forwarded to equipment that separates the unreacted ethylene and the solvent from the polyethylene product.

### Step 4 – Ethylene and Solvent Recycle

Most of the unreacted ethylene is recovered and used again in the process. A portion of it is compressed and forwarded to a unit that recycles it into its process. When the unit is unable to take this ethylene, this gas is burned as fuel in the plant furnace or in the plant flare.

The solvent is recovered and recycled for reuse in the reaction step.

### Step 5 – Solidification and Pelletization

Molten polymer is pumped from the separation area to a pelletizer where the polymer is solidified and pelletized under water. The water is then separated from the pelletized product that is finally dried in the spin dyers (centrifugal screened devices). The pellets are then size classified and separated in a closed vibrating screen classifier. The water is collected, cooled, and recirculated back to the pelletizer.

### Step 6– Polymer Handling / Storage

The pelletized polyethylene product is air conveyed to the holdup hopper and then to silos. The vents from these silos are routed to the furnace to be burned as combustion air. The pellets are then gravity fed into rail cars for shipment to customers. During this operation, an air sweep is drawn across the vapor space in the rail car and out through a filter to remove particulate matter.

After pelletization, solvent is emitted from the solidified pellets through a comparatively slow diffusion process. Most of this solvent is diffused out of the pellets and purged out of the silos to the furnace. A portion of the solvent is diffused out in the spin dryer and the pellet transfer operations and is discharged to the atmosphere.

## Process Description, continued

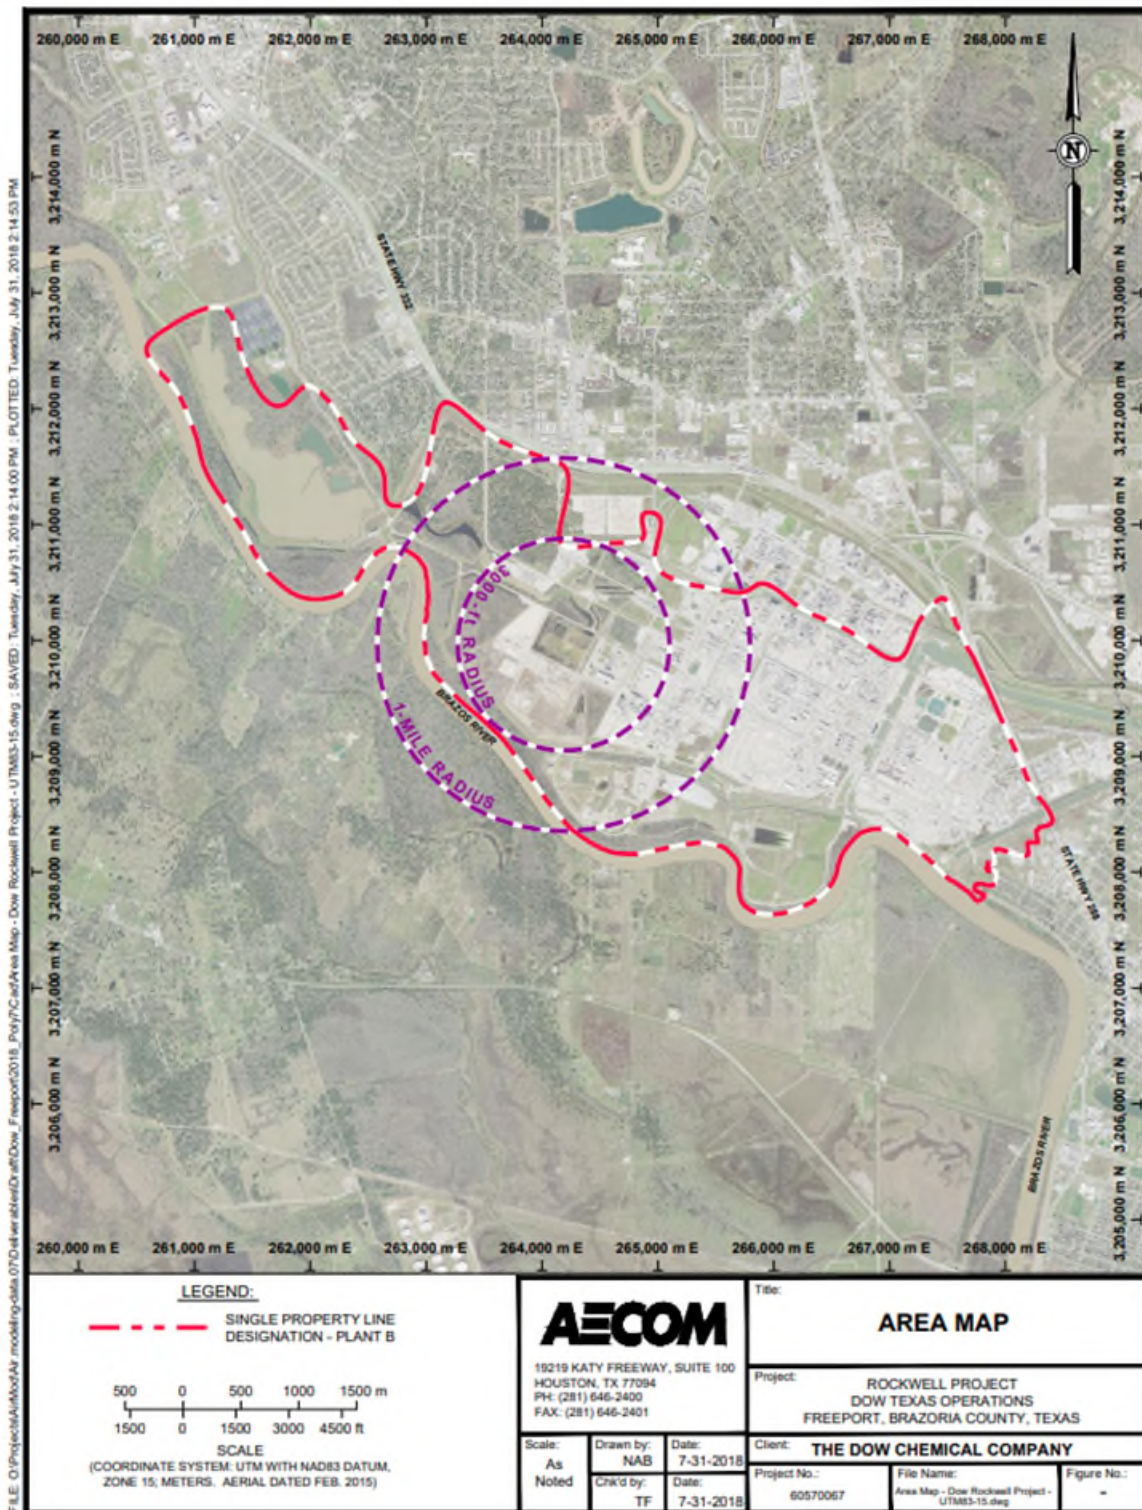

<b>Process Flare</b>	The flare burns the vent streams from the storage tanks, the packing on the propylene compressors, the purification bed regeneration systems, and from the catalyst and additive system vessels. The flare also serves as emergency treatment during process upsets.
<b>Heat Transfer Fluid System</b>	Heat Transfer fluid is heated in a fuel gas fired (natural gas or hydrogen) furnace and circulated in the process to provide the heat needed for the polymer/solvent separation.
<b>Cooling Systems</b>	<p>There is one cooling tower. Water from the cooling tower is used for cooling process streams in exchangers and tank/piping jackets in the process area.</p> <p>There is also a closed-loop propylene refrigeration system for cooling of various process streams. A refrigeration unit is used to chill the propylene.</p>
