TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

October 21, 2024

THE HONORABLE JUDITH ZAFFIRINI
TEXAS SENATE
PO BOX 12068
AUSTIN TX 78711-2068

Re: Accepted Federal Operating Permit Renewal Application
Project Number: 37271
Permit Number: O3093
ETC Texas Pipeline, Ltd.
Tilden Gas Plant
Tilden, McMullen County
Regulated Entity Number: RN100216621
Customer Reference Number: CN601587652

Dear Senator Zaffirini:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-98.528888,28.410277&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Judith Zaffirini

1.0 INTRODUCTION

ETC Texas Pipeline, Ltd. (ETC) owns and operates the Tilden Gas Plant (Plant) located in McMullen County, TX. ETC is identified by Customer Reference Number (CN) 601587652 and the Plant operates under Regulated Entity Number (RN) 1002106621. The Plant holds a construction permit authorization under Standard Permit No. 85028.

The Station also operates under a PBR claim per 30 TAC §106.359 for maintenance, startup and shutdown (MSS) activities as detailed in form OP-REQ1 Section XXII.I.

With this application, ETC is requesting renewal of its Site Operating Permit (SOP) No. O3093.

The Plant is located in McMullen County and is in attainment with all relevant National Ambient Air Quality Standards (NAAQS).

There are multiple updates incorporated into this renewal application

This document was prepared in accordance with Texas Commission on Environmental Quality's (TCEQ's) Site Operating Permit (SOP) Renewal Application Guidance (APDG 6401v3, Revised 07/17))) and the requirements listed in 30 TAC Section (§) 122.241, Permit Renewals.

An area map showing the location of the Plant is included in this section as Figure 1.1 and a plot plan is included in this section as Figure 1.2.

This Title V renewal application includes the following TCEQ forms:

- TCEQ Form OP-CRO1
- TCEQ Form OP-1
- TCEQ Form OP-2

2.0 PROCESS DESCRIPTION

The Tilden Gas Plant consists of one 100 gallons per minute (GPM) gas treating train, one 400 GPM gas treating train, and one 500 GPM gas treating train. There are multiple inlet streams entering the plant and processing will be very similar at each train.

Wet inlet gas enters slug catchers and the liquids are routed to inlet separators. The vapors from the separator are captured by a vapor recovery unit (VRU) which is powered by a lean burn natural gas engine (Facility Identification Number [FIN] 06-ENG) and routed back to the slug catcher inlet. The vapors from the slug catchers/separators are compressed by five natural gas-fired lean burn internal combustion (IC) reciprocating engine driven compressors (FINs 01-ENG, 02-ENG, 03-ENG, 04-ENG and 05-ENG). The IC engines have associated auxiliary tanks for antifreeze, lube oil, and waste oil (FIN TK-MISC). Used waste oil is periodically loaded out (FIN LRK-3) and transported off-site for disposal. Compressed gas is sweetened by the amine units (FIN AMNSTILLS). The acid gas produced by the units is re-injected into formation via four acid gas injection (AGI) systems. When one AGI is down, the acid gas is distributed among the other AGI units. Heat for regeneration of the rich amine is provided by three regenerator heaters (FINs HEAT-1, HEAT-2, and HEAT-6). The amine units are equipped with flash tanks (FIN AMN-FLASH), which are routed to VRUs for control. The VRUs are powered by a natural gas-fired IC engine (FIN 08-ENG).

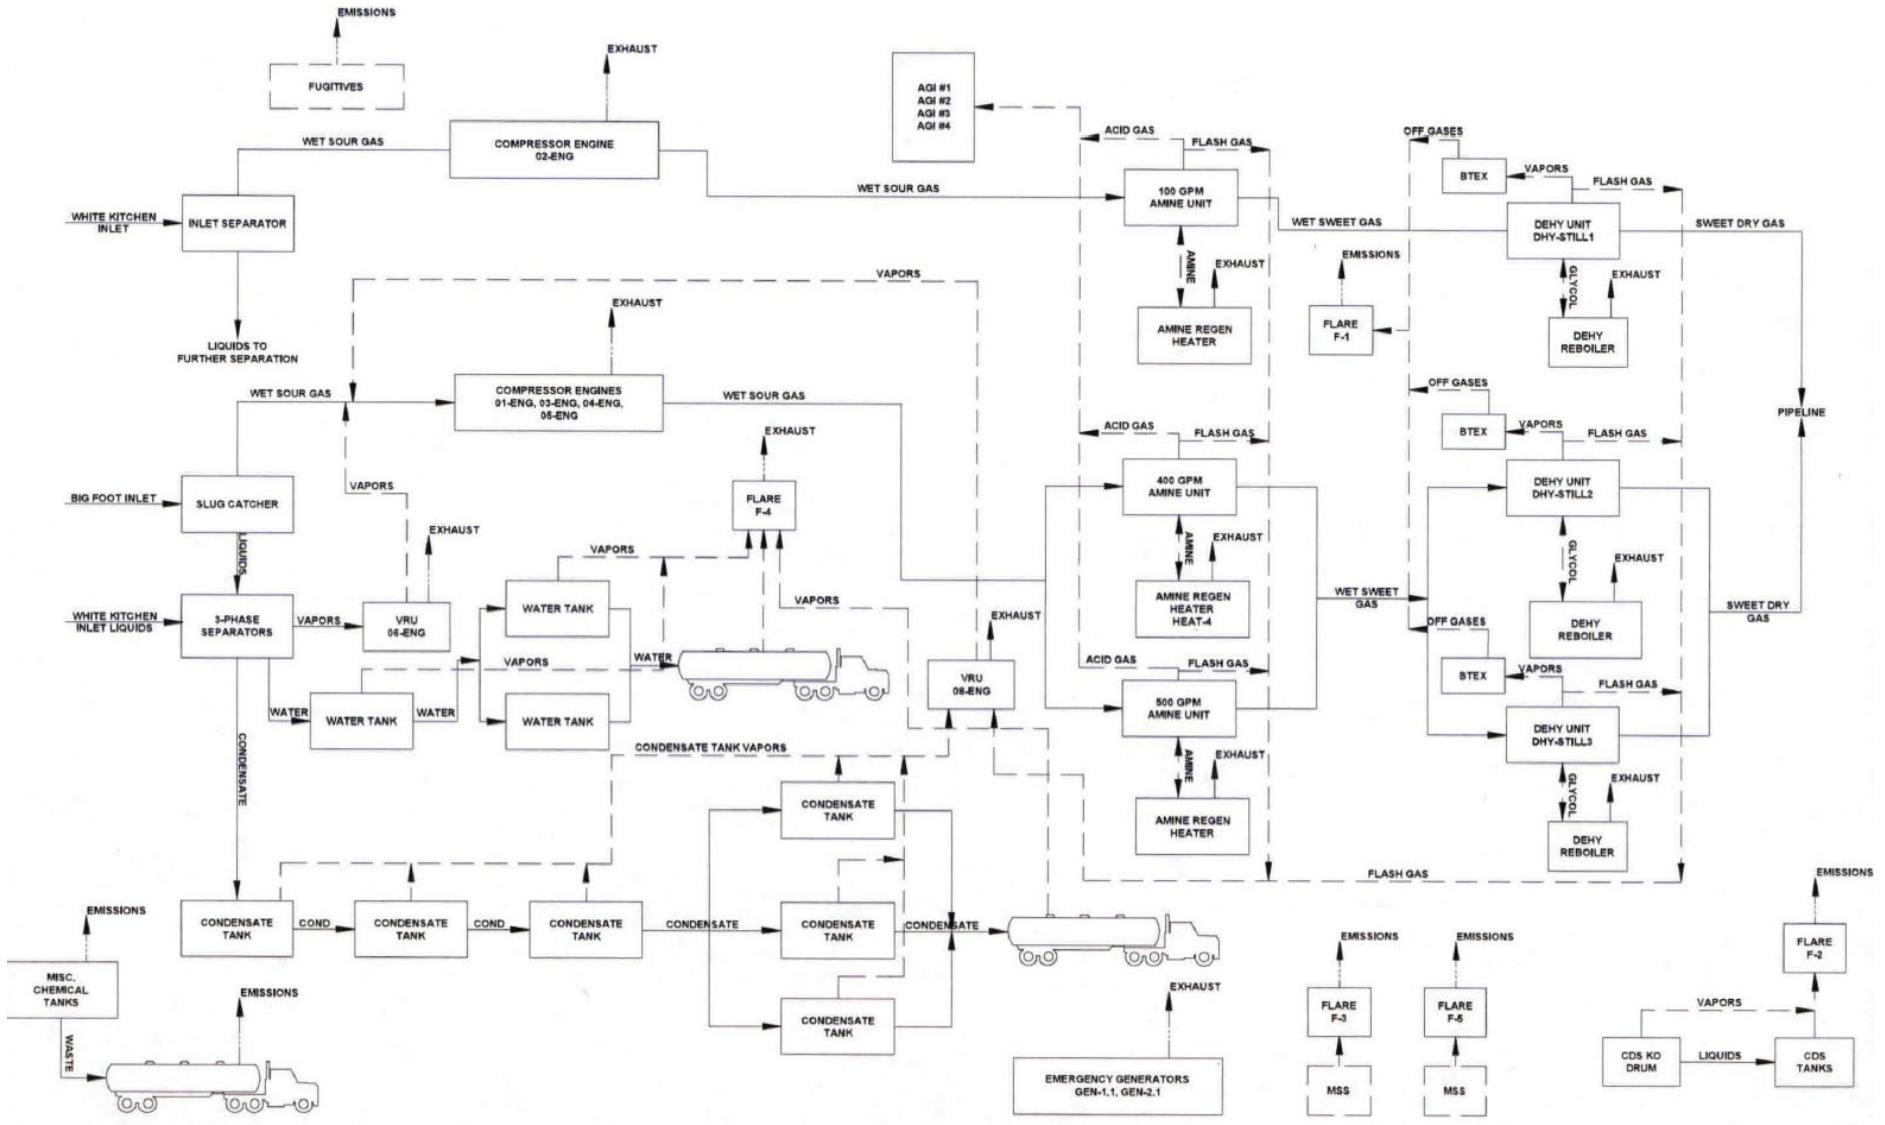

Sweet natural gas exiting the amine contactors enters the glycol dehydration (dehy) units, which are regenerated by natural gas-fired glycol reboilers (FINs HEAT-3, HEAT-4, and HEAT-5). The dehy unit still vents are equipped with BTEX condensers. Non-condensables from the BTEX condensers are combusted by a vapor combustor (VCU). Flash tank gas from the dehy units are recovered back to the process via a flash gas compressor. The dehy units reduce the water content of the gas to pipeline specifications prior to the gas being sent via pipeline for delivery to customers. The scrubbers at the plant collect any extraneous fluid that prevents the intended fluids from entering the contactors, dehydrators, compressors, etc. Once the level of collected fluid reaches a certain point, the scrubbers “dump” the fluid into the plant’s closed drain system. The closed drain system liquids are routed to the flare knockout drum (FIN KD) where they flash. The flash vapors from the knockout vessel then go to flare F-2 and the stabilized liquids are sent to four closed drain liquid storage tanks. Vapors from these tanks are also controlled by flare F-2.

The water from the inlet separators is stored in three produced water tanks. The condensate is cascaded through three condensate tanks in series and then stored in three condensate tanks configured in parallel. The condensate storage tanks are controlled by VRU (FIN 08-ENG), which route the vapors back to the plant inlet. Produced water and condensate are loaded into trucks (FINs LRK-1 and LRK-2, respectively) for transportation off-site. The loading operations and produced water tanks are controlled by flare F-4.

The plant also operates two emergency diesel generators (FINs GEN-1.1 and GEN-2.1), which provide backup power for the computers in the control room. Fugitives associated with equipment leaks (FIN FUGITIVES) are another source of emissions. The plant also has three 60,000-gallon pressurized condensate tanks and associated loading racks but there are no emissions from this equipment.

A process flow diagram can be found at the end of this section as Figure 2.1.
