Hi Mark,

I apologize for the late response. I have no further comments on the draft permit. Thank you for making the changes we requested.

Also, Colleen is out on maternity leave. Can you please copy James Gay with NRG on future correspondence? I included him on this email.

Thank you,
Laura

Laura,
I have updated the working draft permit (WDP). I added the OP-UA15 for the Lube Oil Vents (THWGT61-LOV and THWGT62-LOV) and deleted the OP-UA3 entries. This makes a small change to the OP-SUM. Per our discussion, there are no issues with the OP-PBRSUP, as there was an issue with dates lining up, but it was on our end and has been resolved.

Please review the final WDP and let me know if you have any additional comments at your earliest opportunity, but no later than **September 3, 2025**.

I will wait to ask for a final OP-CRO1 until after this project has been through the QAQC process and before the PNAP issued, in case additional information is needed.

Regards,
Mark

*Note that a Certification by Responsible Official (Form OP-CRO1) for any uncertified application information, including application updates supporting the WDP comments, is required. After final review of the WDP, additional changes supported by application updates may require certification. I will advise you of these changes at a later date. **Prior to transmittal of the Public Announcement Authorization Package, a duly signed OP-CRO1 form may be required which includes the***

specific dates or time-period of all submitted application documentation that was not previously certified. I will advise you of this requirement prior to sending the Public Announcement Authorization.

Subject: Working Draft Permit - Title V Permit O4712, NRG THW GT LLC (Initial Project 37517)

Mark,

Thank you for the opportunity to review the WDP for NRG THW. We have one comment on the Lube Oil Vents (THWGT61-LOV and THWGT62-LOV). The original application requested a permit shield for these units from NSPS Kc and Chapter 115, Storage of VOCs. Upon discussion internally, it has been determined that these units are not tanks and should be treated as process vents with respect to Chapter 115, Subchapter, B, Vent Gas Control. As such, we are requesting that THWGT61-LOV and THWGT62-LOV be removed from the Permit Shield. A revised OP-REQ2 is attached. In addition, an OP-UA15, Table 2 is attached representing these units as process vents.

In addition, please find attached the revised OP-SUM and OP-AR1 to reflect the correct naming convention of THWGT61 and THWGT62 to match the COR and OP-UA2 Table 5a to update the manufacture date to the correct codes.

I am not sure I understand your second request pertaining to the OP-PBRSUP form. The form submitted was the most updated PBRSUP form and the date on the form included with the application matches the date of submittal on the cover letter. Can you please let me know what I am missing? If it is easier to discuss on the phone, please call me at 972-489-9648.

Please let me know if you have any questions or comments on the enclosed information.

Thank you,
Laura

Dear Senator Cook:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) initial issuance application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-95.531388,29.943888&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Molly Cook

1.0 INTRODUCTION

NRG Texas Power LLC (NRG Texas) owns and operates the T. H. Wharton Electric Generating Station (Wharton) located in Houston, Harris County, Texas. The Wharton station currently consists of six simple cycle gas-fired electric generating units and two 4x1 combined cycle gas-fired electric generating units, authorized under numerous New Source Review permits and Permits by Rule (PBR) and Federal Operating Permit (FOP) O77. NRG THW GT LLC (NRG THW) recently submitted an Electric Generating Unit (EGU) Standard Permit Registration to authorize the addition of two simple cycle gas-fired electric generating unit combustion turbines to the Wharton station. The new turbines will be controlled via SCR. Each simple cycle combustion turbine is an affected unit as defined in 40 Code of Federal Regulations Part 72 subject to the requirements of the Acid Rain Program and per §122.120(a)(1), an FOP is required. In addition to the two simple cycle gas-fired EGUs, emergency generators, a process heater, natural gas and ammonia piping components, and lube oil reservoirs are also present at the site.

The following documentation is provided with this application: all required Texas Commission on Environmental Quality (TCEQ) FOP application forms, including forms addressing application certification, administrative information, site-wide applicability information, and unit attribute information. This FOP application seeks to include sources authorized under Permit No. 170969 as well as PBRs.

2.0 PROCESS DESCRIPTION

This section contains an overall process description of operations at the Plant.

2.1 Combustion Turbines

This FOP will consist of two natural gas-fired simple cycle combustion turbines, Unit IDs THWGT-61 and THWGT-62, and ancillary equipment. The turbine model that will be installed is the Siemens SGT6-5000F(4), nominally rated at 196 Megawatts (MW) output. Natural gas will be mixed with the combustion inlet air and combusted in the combustor section of the turbine units. The hot combustion gases will expand through the turbine, causing rotation of the turbine, which drives the electric generator. The hot exhaust gases will then exit through stacks (Unit IDs THWGT-61 and THWGT-62). The hot exhaust gases will be routed through a SCR system to reduce NO_x emissions prior to exiting through the stack. The hot exhaust will then pass through an oxidation catalyst to reduce carbon monoxide (CO) and volatile organic compound (VOC) emissions.

2.2 Emergency Generators

Two diesel engine-driven emergency generator will be installed to provide electric power during emergencies. The engines will operate up to 100 hours per year for non-emergency testing and maintenance. Emissions from the emergency engine will be exhausted through a stack (Unit IDs EGEN1 and EGEN2).

2.3 Process Heater

One natural gas-fired auxiliary fuel gas heater, rated at 14.20 MMBtu/hr, will be operated to heat the incoming natural gas fuel to prevent freezing of the gas regulating valves under certain gas operating conditions and to ensure moisture does not form in the inlet gas lines. The heater will fire natural gas and use ultra-low NO_x burners to control NO_x emissions. Emissions from the fuel gas heater will be exhausted through the stack (Unit ID HEATER).

2.4 Oil Systems

The turbines and generators will include closed-loop lube oil recirculation systems to lubricate the moving parts of each turbine and generator. Additionally, the turbines will include a hydraulic fluid service. Oil vapor (constituting VOC) and oil mist (constituting particulate matter (PM)) emissions will be generated by oil vaporization resulting from heating of lube oil in the turbines and subsequent condensation of droplets when the vapor is cooled in the cooler zones of the storage reservoir compartment. Lube oil mist emissions from the reservoir compartment will be controlled by a mist eliminator exhausted through a dedicated reservoir vent (Unit IDs THWGT61-LOV and THWGT62-LOV).

2.5 Other Equipment

Piping components associated with the distribution of ammonia and natural gas between the turbines will be sources of fugitive emissions. There are no regulatory requirements applicable

to the piping components, and no permit shield is needed to document negative applicability. Therefore, the piping components are not listed on Form OP-SUM, Individual Unit Summary.
