Regulated Entity Number: RN102516937 Customer Reference Number: CN604147603

Dear Senator Sparks:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. https://gisweb.tceq.texas.gov/LocationMapper/?marker=-101.777777,31.361111&level=13.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

2.0 PROCESS DESCRIPTION

Benedum Gas Plant is a natural gas compression, treating, and natural gas liquids (NGL) recovery plant. High- and low-pressure inlet gas streams enter the plant from pipelines. The low-pressure gas is compressed and flows through an amine gas sweetening unit to remove primarily hydrogen sulfide (H_2S) and carbon dioxide (CO_2) from the gas. The H_2S and CO_2 rich acid gas stream from the amine unit is flared. The sweetened gas from the amine unit mixes with the high-pressure inlet gas stream and then flows through a molecular sieve gas dehydration unit to remove any water present in the gas. The gas is further compressed and flows to a cryogenic unit which separates NGL from the gas. The separated NGL exits the plant via pipeline.

A process flow diagram can be found at the end of this section as Figure 2.1.
