Subject: [WARNING: UNSCANNABLE EXTRACTION FAILED]Working Draft Permit - FOP O3073/Project 38072, ET Gathering & Processing, LLC/Sunray Compressor Station

Good afternoon,

I have conducted a technical review of renewal application for ET Gathering & Processing, LLC, Sunray Compressor Station. An electronic copy of the Working Draft Permit (WDP) is attached for your review. This WDP contains the TCEQ determination of applicable requirements based on the information submitted in your application, and any updates provided.

Please review the WDP and submit to me any comments you have on the working draft permit by 10/17/2025. Please submit a written response by this deadline, even if you are not making any comments on the content of the WDP.

Please review the second portion of the “SOP Technical Review Fact Sheet” located at http://www.tceq.texas.gov/assets/public/permitting/air/Guidance/Title_V/sop_wdp_factsheet.pdf. This guidance contains important information regarding WDP review and comment

procedures.

Note that a Certification by Responsible Official (Form OP-CRO1) for any uncertified application information, including application updates supporting the WDP comments, is required. After final review of the WDP, additional changes supported by application updates may require certification. I will advise you of these changes at a later date. Prior to transmittal of the Public Notice/Announcement Authorization Package, a duly signed OP-CRO1 form may be required which includes the specific dates or time-period of all submitted application documentation that was not previously certified. I will advise you of this requirement prior to sending the Public Notice/Announcement Authorization.

Application updates may now be submitted through Title V STEERS. Any application updates that are submitted by the RO/DAR through STEERS are certified and do not require the submittal of an original signature OP-CRO1. Application updates that are provided through email or physical mail require certification using an original signature OP-CRO1.

As required on Form OP-1, question IV.D, please remember the FOP application and all application updates must be submitted to EPA Region 6 at R6AirPermitsTX@epa.gov and to the TCEQ regional office having jurisdiction. This submittal information can be found on our website at [Where to Submit FOP Applications and Permit-Related Documents](#).

Please contact me if you have any questions regarding the guidelines, the project schedule, or any other details regarding your application or permit.

Emission Limitations and Standards, Monitoring and Testing, and Recordkeeping and Reporting

1. Permit holder shall comply with the following requirements:
 - A. Emission units (including groups and processes) in the Applicable Requirements Summary attachment shall meet the limitations, standards, equipment specifications, monitoring, recordkeeping, reporting, testing, and other requirements listed in the Applicable Requirements Summary attachment to assure compliance with the permit.
 - B. The textual description in the column titled "Textual Description" in the Applicable Requirements Summary attachment is not enforceable and is not deemed as a substitute for the actual regulatory language. The Textual Description is provided for information purposes only.

A citation listed on the Applicable Requirements Summary attachment, which has a notation [G] listed before it, shall include the referenced section and subsection for all commission rules, or paragraphs for all federal and state regulations and all subordinate paragraphs, subparagraphs and clauses, subclauses, and items contained within the referenced citation as applicable requirements.
 - D. When a grouped citation, notated with a [G] in the Applicable Requirements Summary, contains multiple compliance options, the permit holder must keep records of when each compliance option was used.

- E. Emission units subject to 40 CFR Part 63, Subpart HH as identified in the attached Applicable Requirements Summary table are subject to 30 TAC Chapter 113, Subchapter C, § 113.390 which incorporates the 40 CFR Part 63 Subpart by reference.
 - F. For the purpose of generating discrete emission reduction credits through 30 TAC Chapter 101, Subchapter H, Division 4 (Discrete Emission Credit Banking and Trading), the permit holder shall comply with the following requirements:
 - (i) Title 30 TAC § 101.372 (relating to General Provisions)
 - (ii) Title 30 TAC § 101.373 (relating to Discrete Emission Reduction Credit Generation and Certification)
 - (iii) Title 30 TAC § 101.374 (relating to Mobile Discrete Emission Reduction Credit Generation and Certification)

2. The permit holder shall comply with the following sections of 30 TAC Chapter 101 (General Air Quality Rules):
- A. Title 30 TAC § 101.1 (relating to Definitions), insofar as the terms defined in this section are used to define the terms used in other applicable requirements

3. Permit holder shall comply with the following requirements of 30 TAC Chapter 111:
- A. Visible emissions from stationary vents with a flow rate of less than 100,000 actual cubic feet per minute that are not listed in the Applicable Requirements Summary attachment for 30 TAC Chapter 111, Subchapter A, Division 1, shall not exceed 20% opacity

averaged over a six minute period. The permit holder shall comply with the following requirements for stationary vents at the site subject to this standard:

- (i) Title 30 TAC § 111.111(a)(1)(B) (relating to Requirements for Specified Sources)
- (ii) Title 30 TAC § 111.111(a)(1)(E)
- (iii) Title 30 TAC § 111.111(a)(1)(F)(i), (ii), (iii), or (iv)
- (iv) For emission units with vent emissions subject to 30 TAC § 111.111(a)(1)(B), complying with 30 TAC § 111.111(a)(1)(F)(ii), (iii), or (iv), and capable of producing visible emissions from, but not limited to, particulate matter, acid gases and NO_x, the permit holder shall also comply with the following periodic monitoring requirements for the purpose of annual compliance certification under 30 TAC § 122.146. These periodic monitoring requirements do not apply to vents that are not capable of producing visible emissions such as vents that emit only colorless VOCs; vents from non-fuming liquids; vents that provide passive ventilation, such as plumbing vents; or vent emissions from any other source that does not obstruct the transmission of light. Vents, as specified in the "Applicable Requirements Summary" attachment, that are subject to the emission limitation of 30 TAC § 111.111(a)(1)(B) are not subject to the following periodic monitoring requirements:
 - (1) An observation of stationary vents from emission units in operation shall be conducted at least once during each calendar quarter unless the emission unit is not operating for the entire quarter.
 - (2) For stationary vents from a combustion source, if an alternative to the normally fired fuel is fired for a period greater than or equal to 24 consecutive hours, the permit holder shall conduct an observation of the stationary vent for each such period to determine if visible emissions are present. If such period is greater than 3 months, observations shall be conducted once during each quarter. Supplementing the normally fired fuel with natural gas or fuel gas to increase the net heating value to the minimum required value does not constitute creation of an alternative fuel.
 - (3) Records of all observations shall be maintained.
 - (4) Visible emissions observations of emission units operated during daylight hours shall be conducted no earlier than one hour after sunrise and no later than one hour before sunset. Visible emissions observations of emission units operated only at night must be made with additional lighting and the temporary installation of contrasting backgrounds. Visible emissions observations shall be made during times when the activities described in 30 TAC § 111.111(a)(1)(E) are not taking place. Visible emissions shall be determined with each stationary vent in clear view of the observer. The observer shall be at least 15 feet, but not more than 0.25 mile, away from each stationary vent during the observation. For outdoor locations, the observer shall select a position where the sun is not directly in the observer's eyes. When condensed water vapor is present within the plume, as it emerges from the emissions outlet, observations must be made beyond the point in the plume at which condensed water vapor is no longer visible. When water vapor within the plume condenses and becomes visible at a distance from the emissions outlet, the observation shall be evaluated at the outlet

prior to condensation of water vapor. A certified opacity reader is not required for visible emissions observations.

(5) Compliance Certification:

- (a) If visible emissions are not present during the observation, the RO may certify that the source is in compliance with the applicable opacity requirement in 30 TAC § 111.111(a)(1) and (a)(1)(B).
- (b) However, if visible emissions are present during the observation, the permit holder shall either list this occurrence as a deviation on the next deviation report as required under 30 TAC § 122.145(2) or conduct the appropriate opacity test specified in 30 TAC § 111.111(a)(1)(F) as soon as practicable, but no later than 24 hours after observing visible emissions to determine if the source is in compliance with the opacity requirements. If an opacity test is performed and the source is determined to be in compliance, the RO may certify that the source is in compliance with the applicable opacity requirement. However, if an opacity test is performed and the source is determined to be out of compliance, the permit holder shall list this occurrence as a deviation on the next deviation report as required under 30 TAC § 122.145(2). The opacity test must be performed by a certified opacity reader.
- (c) Some vents may be subject to multiple visible emission or monitoring requirements. All credible data must be considered when certifying compliance with this requirement even if the observation or monitoring was performed to demonstrate compliance with a different requirement.

B. Certification of opacity readers determining opacities under Method 9 (as outlined in 40 CFR Part 60, Appendix A) to comply with opacity monitoring requirements shall be accomplished by completing the Visible Emissions Evaluators Course, or approved agency equivalent, no more than 180 days before the opacity reading.

C. Emission limits on nonagricultural processes, except for the steam generators specified in 30 TAC § 111.153, shall comply with the following requirements:

- (i) Emissions of PM from any source may not exceed the allowable rates as required in 30 TAC § 111.151(a) (relating to Allowable Emissions Limits)
- (ii) Sources with an effective stack height (h_e) less than the standard effective stack height (H_e), must reduce the allowable emission level by multiplying it by $[h_e/H_e]^2$ as required in 30 TAC § 111.151(b)
- (iii) Effective stack height shall be calculated by the equation specified in 30 TAC § 111.151(c)

4. The permit holder shall comply with the requirements of 30 TAC Chapter 113, Subchapter C, § 113.100 for units subject to any subpart of 40 CFR Part 63, unless otherwise stated in the applicable subpart.

5. The permit holder shall comply with certified registrations submitted to the TCEQ for purposes of establishing federally enforceable emission limits. A copy of the certified registration shall be maintained with the permit. Records sufficient to demonstrate compliance with the established limits shall be maintained. The certified registration and records demonstrating compliance shall be provided, on request, to representatives of the appropriate TCEQ regional office and any local air pollution control agency having jurisdiction over the site. The permit holder shall submit updated certified registrations when changes at the site require establishment of new emission limits. If changes result in emissions that do not remain below major source thresholds, the permit holder shall submit a revision application to codify the appropriate requirements in the permit.

New Source Review Authorization Requirements

6. Re: 40 C.F.R. Part 63, Subpart HH Affected Facility in Sunray, Texas
Request for Alternative Monitoring of Ethylene Glycol in Cooling Jacket Water
Service for Leak Detection on Ancillary Equipment

Dear Mr. Moritz:

This letter is in response to your January 27, 2009 request for alternative monitoring under the National Emission Standards for Hazardous Air Pollutants from Oil and Natural Gas Production Facilities (40 C.F.R. Part 63, Subpart HH). Specifically, you are seeking approval for alternative monitoring of ancillary equipment in ethylene glycol service on a quarterly basis using visual inspections at the Sunray Compressor Station located on FM Route 119, three miles south of Sunray, TX (AFS # 4834100027) in Moore County.

Pursuant to definitions in 40 C.F.R. Part 63, §63.761, the cooling jacket water service at the Sunray Compressor Station is considered "ancillary equipment" that operates "in VHAP service" since ethylene glycol is used in concentrations equal to or greater than 10 percent by weight. Therefore, pursuant to 40 CFR §63.769(a), equipment leak standards apply to the jacket water service since it is located at a natural gas processing plant and operates in VHAP service equal to or greater than 300 hours per calendar year. Regulations under 40 CFR §63.769(c) require the Sunray Compressor Station to follow the equipment leak standards specified in 40 CFR Part 61, Subpart V, §§61.241 through 61.247. These sections specify EPA Reference Method 21 (found in Appendix to 40 CFR Part 60) as the monitoring method with which to comply.

The jacket water at the Sunray Compressor Station is a mixture of ethylene glycol and water and it is used to cool various pieces of equipment throughout the compressor station, mainly compressor engines. As stated in your letter, although the jacket water becomes hot during this process, the mixture exists in the system as a liquid, not as a gas. Ethylene glycol's high boiling point of 198°C also ensures that any leak would be visible as a liquid (or a solid if the ambient temperature in Texas were to fall below ethylene glycol's melting point of -11.5°C). An accurate measurement cannot be made using a portable field analyzer as prescribed in Method 21, due to ethylene glycol's low volatility (vapor pressure = 0.06 mm Hg at 20°C). Therefore it is difficult to obtain a reproducible and useful response factor as required in Method 21. This is described in EPA report EPA-453/R-95-017, "Protocol for Equipment Leak

Emission Estimates". Appendix D of this report provides a detailed listing of published Response Factors for ~190 compounds at actual concentrations of 10,000 ppmv and 500 ppmv for 6 different analyzers. Due to its low volatility, no useable response factors could be developed for ethylene glycol (EPA Reference Method 21 §8.1.1.2 states that the response factor for each individual VOC to be measured shall be less than 10). This issue is addressed by a previously approved request that is posted on EPA's Applicability Determination Index (Control Number: 0100078).

Due to the limitation in the application of Method 21 to ethylene glycol, you have proposed to substitute quarterly visual inspections of the equipment in jacket water service. Visual evidence of ethylene glycol liquid on or dripping from the equipment in jacket water service would indicate an equipment leak, and repair would be conducted meeting the requirements of Part 61, Subpart V. This proposed alternative monitoring is consistent with a previously approved request that is posted on EPA's Applicability Determination Index (Control Number: 0100078) where quarterly visual monitoring was accepted as a substitute for Method 21 which is required under Part 60, Subpart VV for ethylene glycol service.

Pursuant to the General Provisions of 40 C.F.R. Section 63.8(b)(ii), monitoring shall be conducted as set forth in this section and the relevant standards unless the Administrator approves the use of an intermediate or major change or alternative to any monitoring requirements or procedures. Based on our review of BP America Production Co's request, we have determined that the proposed alternative monitoring is acceptable as a substitute for Method 21 for the equipment in jacket water service at the Sunray Compressor Station.

EPA shall notify the Texas Commission on Environmental Quality (TCEQ) on our determination and approval of this alternative monitoring plan so that it may be incorporated into the facility's operating permits.

This alternative monitoring determination does not alter any of the other requirements of Part 61, Subpart V or Part 63, Subpart HH which may apply to Sunray Compressor Station. If you have any questions regarding this letter, please contact Mr. Himanshu Vyas of my staff at 214-665-2709 or vyas.himanshu@epa.gov.

For David Garcia

Subject: Technical Review -- FOP O3073/Project 38072, ET Gathering & Processing, LLC/Sunray Compressor Station

Good morning,

I have been assigned to the Federal Operating Permit (FOP) renewal application of Permit No. O3073 for ET Gathering & Processing, LLC, Sunray Compressor Station. This application has been assigned Project No. 38072. Please address all correspondence pertaining to this permit application, including any updates, to me at the address below, and use both the Permit and Project reference numbers above to facilitate tracking.

In addition, I wanted to let you know that EPA has, on occasion, objected to Title V permits based on the following:

- a. NSR permit and PBR monitoring sufficiency –please refer to our periodic monitoring guidance for reference of monitoring that EPA has, so far, considered sufficient.
- b. Reference to confidential business information (CBI) in NSR permits and PBR submittals.
- c. High level terms in the SOP Applicable Requirement Summary Table. The high-level terms are sometimes used in SOPs when unit attribute forms have not yet been updated due to regulatory amendments.
- d. Accuracy of PBR information provided on the supplemental table and in the permit – please refer to Forms OP-PBRSUP and OP-REQ1 Instructions.

If you have any questions or concerns on any of these items or think you need to do any additional updates, let me know and we can discuss further.

Application updates may now be submitted through Title V STEERS. Any application updates that are submitted by the RO/DAR through STEERS are certified and do not require the submittal of an original signature OP-CRO1. Application updates that are provided through email or physical mail require certification using an original signature OP-CRO1.

As required on Form OP-1, question IV.D, please remember the FOP application and all application updates must be submitted to EPA Region 6 at R6AirPermitsTX@epa.gov and to the TCEQ regional office having jurisdiction. This submittal information can be found on our website at [Where to Submit FOP Applications and Permit-Related Documents](#).

Please review the “SOP Technical Review Fact Sheet” located at http://www.tceq.texas.gov/assets/public/permitting/air/Guidance/Title_V/sop_wdp_factsheet.pdf. This guidance contains important information regarding the review process and application update procedures. Contact me if you have any questions regarding the guidelines, the project schedule, or any other details regarding your application or permit.

I will begin my technical review within the next two weeks. Please contact me if you have any questions, thank you.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

2.0 PROCESS DESCRIPTION

This section describes the processes that are conducted at the Station.

The Sunray Compressor Station (the Station) is a natural gas compressor station located in Moore County, Texas. The Station is collocated with the Sunray Gas Plant.

Natural gas enters the station from the compressor station suction and is split between three (3) natural gas-fired internal combustion (IC) engine-driven compressors. (Unit IDs ENGINE 1, ENGINE2, and ENGINE 4) The gas is then discharged to the Sunray Gas Plant. Residue gas from the gas plant is recompressed by two (2) electric engine-powered compressor units (6 and 7) and one (1) natural gas-fired IC engine-driven compressor (Unit ID ENGINE 3) before being discharged to sales. The natural gas engine-driven compressor is a secondary unit for recompression.

Produced water from nearby fields is delivered to the Station at atmospheric pressure. The water is stored in one (1) off-permit 210 barrel (bbl) produced water storage tank and one (1) 300 bbl produced water storage tank (UNIT ID PW-TK). Since the water is delivered at atmospheric pressure, no tank flash emissions are expected to occur. Produced water is loaded out of and into trucks for transportation on-site and off-site.

Fugitives associated with equipment leaks (Unit IDs AREA1 and FUG-PW) as well as tank degassing and other planned maintenance activities are additional off-permit sources of emissions at the Station.

Re: 40 C.F.R. Part 63, Subpart HH Affected Facility in Sunray, Texas
Request for Alternative Monitoring of Ethylene Glycol in Cooling Jacket Water
Service for Leak Detection on Ancillary Equipment

Dear Mr. Moritz:

This letter is in response to your January 27, 2009 request for alternative monitoring under the National Emission Standards for Hazardous Air Pollutants from Oil and Natural Gas Production Facilities (40 C.F.R. Part 63, Subpart HH). Specifically, you are seeking approval for alternative monitoring of ancillary equipment in ethylene glycol service on a quarterly basis using visual inspections at the Sunray Compressor Station located on FM Route 119, three miles south of Sunray, TX (AFS # 4834100027) in Moore County.

Pursuant to definitions in 40 C.F.R. Part 63, §63.761, the cooling jacket water service at the Sunray Compressor Station is considered "ancillary equipment" that operates "in VHAP service" since ethylene glycol is used in concentrations equal to or greater than 10 percent by weight. Therefore, pursuant to 40 CFR §63.769(a), equipment leak standards apply to the jacket water service since it is located at a natural gas processing plant and operates in VHAP service equal to or greater than 300 hours per calendar year. Regulations under 40 CFR §63.769(c) require the Sunray Compressor Station to follow the equipment leak standards specified in 40 CFR Part 61, Subpart V, §§61.241 through 61.247. These sections specify EPA Reference Method 21 (found in Appendix to 40 CFR Part 60) as the monitoring method with which to comply.

The jacket water at the Sunray Compressor Station is a mixture of ethylene glycol and water and it is used to cool various pieces of equipment throughout the compressor station, mainly compressor engines. As stated in your letter, although the jacket water becomes hot during this process, the mixture exists in the system as a liquid, not as a gas. Ethylene glycol's high boiling point of 198°C also ensures that any leak would be visible as a liquid (or a solid if the ambient temperature in Texas were to fall below ethylene glycol's melting point of -11.5°C). An accurate measurement cannot be made using a portable field analyzer as prescribed in Method 21, due to ethylene glycol's low volatility (vapor pressure = 0.06 mm Hg at 20°C). Therefore it is difficult to obtain a reproducible and useful response factor as required in Method 21. This is described in EPA report EPA-453/R-95-017, "Protocol for Equipment Leak

Emission Estimates". Appendix D of this report provides a detailed listing of published Response Factors for ~190 compounds at actual concentrations of 10,000 ppmv and 500 ppmv for 6 different analyzers. Due to its low volatility, no useable response factors could be developed for ethylene glycol (EPA Reference Method 21 §8.1.1.2 states that the response factor for each individual VOC to be measured shall be less than 10). This issue is addressed by a previously approved request that is posted on EPA's Applicability Determination Index (Control Number: 0100078).

Due to the limitation in the application of Method 21 to ethylene glycol, you have proposed to substitute quarterly visual inspections of the equipment in jacket water service. Visual evidence of ethylene glycol liquid on or dripping from the equipment in jacket water service would indicate an equipment leak, and repair would be conducted meeting the requirements of Part 61, Subpart V. This proposed alternative monitoring is consistent with a previously approved request that is posted on EPA's Applicability Determination Index (Control Number: 0100078) where quarterly visual monitoring was accepted as a substitute for Method 21 which is required under Part 60, Subpart VV for ethylene glycol service.

Pursuant to the General Provisions of 40 C.F.R. Section 63.8(b)(ii), monitoring shall be conducted as set forth in this section and the relevant standards unless the Administrator approves the use of an intermediate or major change or alternative to any monitoring requirements or procedures. Based on our review of BP America Production Co's request, we have determined that the proposed alternative monitoring is acceptable as a substitute for Method 21 for the equipment in jacket water service at the Sunray Compressor Station.

EPA shall notify the Texas Commission on Environmental Quality (TCEQ) on our determination and approval of this alternative monitoring plan so that it may be incorporated into the facility's operating permits.

This alternative monitoring determination does not alter any of the other requirements of Part 61, Subpart V or Part 63, Subpart HH which may apply to Sunray Compressor Station. If you have any questions regarding this letter, please contact Mr. Himanshu Vyas of my staff at 214-665-2709 or vyas.himanshu@epa.gov.

Sincerely,

for David Garcia
