THE HONORABLE LOIS KOLKHORST
TEXAS SENATE

Regulated Entity Number: RN100215136

Dear Senator Kolkhorst:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-96.888055,30.005&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Lois Kolkhorst

The Plant also operates under a PBR claim per 30 TAC §106.359 for maintenance, startup and shutdown (MSS) activities and various other Standard Exemption (SE) and PBR claims as detailed in form OP-REQ1 Section XXII.I.

With this application, ETGP is requesting renewal of its Site Operating Permit (SOP) No. O3098.

The Plant is located in Fayette County and is in attainment with all relevant National Ambient Air Quality Standards (NAAQS).

There are no updates incorporated into this renewal application.

This document was prepared in accordance with Texas Commission on Environmental Quality's (TCEQ's) Site Operating Permit (SOP) Renewal Application Guidance (APDG 6401v3, Revised 07/17))) and the requirements listed in 30 TAC Section (§) 122.241, Permit Renewals.

An area map showing the location of the Plant is included in this section as Figure 1.1 and a plot plan is included in this section as Figure 1.2.

2.0 PROCESS DESCRIPTION

The La Grange Plant is a cryogenic natural gas processing and condensate stabilization plant. The Plant processes field gas into three primary products: (1) lean, dry residue natural gas, (2) a Y-Grade product, which consists of ethane and heavier natural gas liquids (NGL) and (3) a stabilized condensate product. The Plant consists of natural gas separation, treating, molecular sieve dehydration, stabilization, cryogenic processing, compression, and ancillary equipment.

Inlet gas enters the Plant from gathering systems and passes through horizontal separators, or slug catchers, that separate entrained liquids from the field gas prior to processing. The inlet gas may be routed through a scavenger system to reduce the composition of hydrogen sulfide (H_2S), if necessary, and is then compressed to a higher pressure by an existing natural gas turbine and a new electric compressor. A portion of the compressed gas stream will be routed to an amine treater and the remaining portion of the stream will bypass the treater. Approximately 140 MMscf/d is treated and the remaining 100 MMscf/d is untreated. The amine treater removes acid gases (i.e., H_2S and carbon dioxide [CO_2]) from the natural gas stream. The acid gases are sent to the amine reboiler, where they are driven off through the amine reboiler vent, which is the regenerator vent for the amine treater, and sent to the plant's thermal oxidizer for control. The treated gas stream is re-blended with the untreated stream, which results in a reduction in the overall acid-gas content of the gas stream.

The re-blended gas stream is then routed to the Plant's TEG dehydrator, which uses lean glycol to remove water vapor from the gas stream. Lean glycol removes both water vapor and volatile organic compounds (VOC) from the gas stream in the dehydrator contactor towers, after which the glycol is considered rich. The rich glycol is sent through a flash tank and then regenerated back into lean glycol for reuse in the contactor tower. Flash gas will be captured and routed to the thermal oxidizer for control. The regenerator consists of a natural gas-fired reboiler that drives off VOCs and water from the rich glycol through the dehydrator still vent. The VOC waste stream will be sent through a BTEX condenser for removal of VOCs, including benzene, toluene, ethyl benzene, and xylenes (BTEX). After passing through the condenser, the waste stream will be directed to the new thermal oxidizer for control.

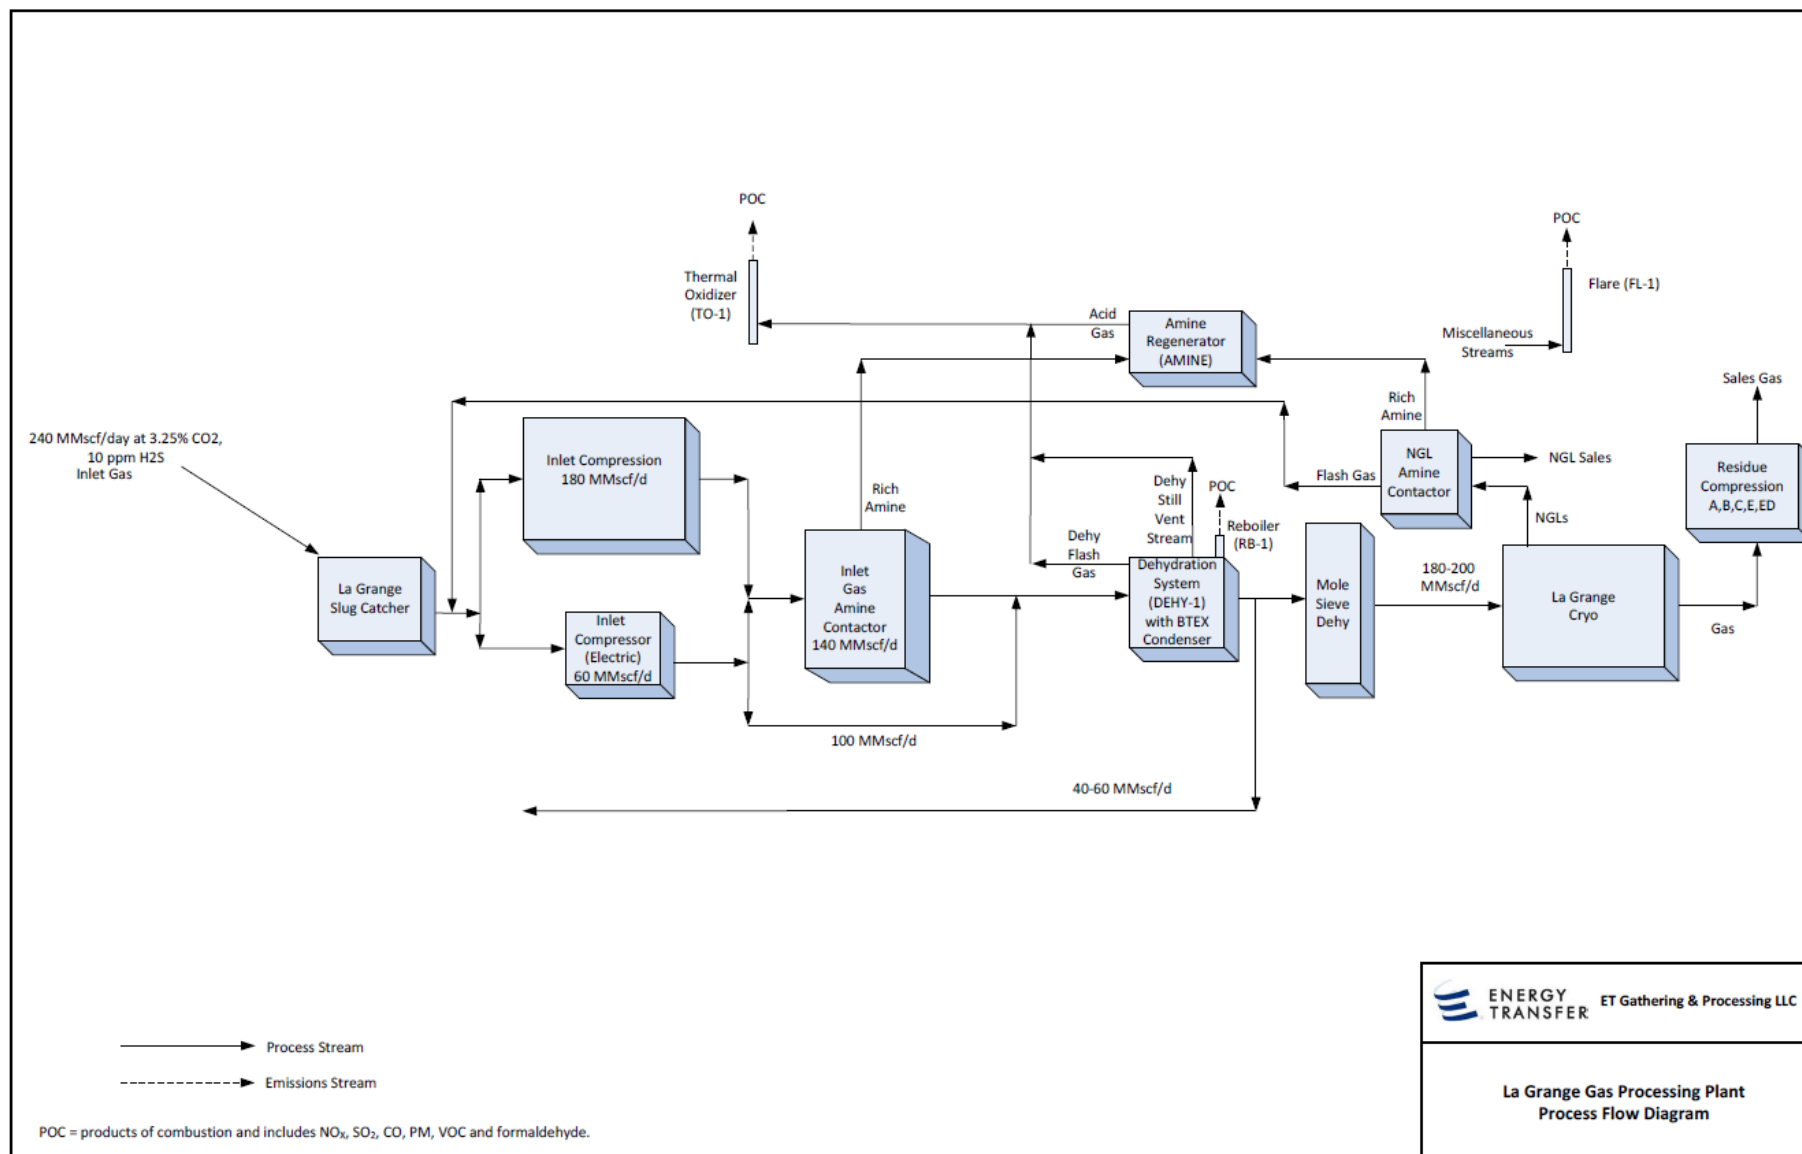

After passing through the glycol dehydrator, the dehydrated gas stream will be split. Most of the gas, approximately 180-200 MMscf/d, will remain in La Grange, while the remaining portion, approximately 40-60 MMscf/d, will be delivered to another plant for processing.

The dehydrated gas stream will be sent through a molecular sieve dehydration unit, where additional water is removed. The purpose of this unit is to remove sufficient water to meet specifications designed to prevent the cryogenic unit from freezing up due to water when the gas stream enters this unit. The gas is then sent to a cryogenic unit to remove NGL from the gas by cooling the stream. The natural gas exiting the cryogenic unit is lean and dry. The gas is then compressed and routed to the sales pipeline. The NGL (Y-Grade product) collected from the cryogenic process is then sent through a liquids amine contactor to remove any remaining CO_2 and H_2S and then exits the site via pipeline. The acids that are removed by the liquids amine contactor are sent to the amine reboiler, which is a unit that is common to both the inlet gas contactor and the liquids contactor streams. As with the acid gas removed by the inlet gas contactor, these acids are also driven off through the amine reboiler vent and sent to the plant's thermal oxidizer for control.

The Plant's process flare is used for the control of numerous low-pressure and low-flow rate gas streams from Plant, including those from various relief valves.

A process flow diagram can be found at the end of this section as Figure 2.1.
