TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

THE HONORABLE CHARLES PERRY
TEXAS SENATE

Re: Accepted Federal Operating Permit Renewal Application

Regulated Entity Number: RN100213438

Dear Senator Perry:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-99.648333,32.341388&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Charles Perry

TITLE V PERMIT RENEWAL – O-01074

March 2025

2025 Renewal Note:

Plant equipment and processes are unchanged from the 2020 Title V Renewal. A flow diagram is included with the 2025 renewal submittal.

PROCESS DESCRIPTION

The process begins at the rubber mixer (generically referred to as the “Banbury”), an internal mixing device typically handling 500 LB batches. Rubber, process oils, and dry chemicals are blended into a homogeneous rubber batch within the internal mixer. Any dust generated in this process is captured by the Torit cartridge dust collector. Collected dusts are recycled into future rubber batches. Oil is added to the dry chemicals in a pre-blender to control dust. The rubber can be blocks of “masterbatch” received from companies that produce synthetic rubber polymers from petroleum-based chemicals, or, “dry-mix” rubber that has received the initial mixing at another Bridgestone Bandag or Bridgestone plant.

After mixing for a specified time, the rubber batch drops onto a rubber mill consisting of two counter-rotating steel rolls that continue the blending process. The rubber is pulled into sheets, then conveyed from the mill, and routed through a process dip tank. The tank cools and coats the rubber sheet with a soapy film to prevent sticking. The rubber is fan-folded on pallets and held for further processing. Tests are run on each batch to ensure proper curing characteristics. There are minor levels of HAP and VOC emissions from the milling process.

Approved pallets of rubber are subsequently delivered to a series of mills that eventually feed into one of two rubber extruders. A series of two mills is used for each extruder. The first mill is called the “breakdown” mill and the second is referred to as the “blend” mill. These terms are not important and other names are often used. Customer demands relating to tread performance results in rubber compound changes. Some compounds are difficult to process with only two mills in series, so the 5th mill was added between “A” and “B” lines to provide needed blending capacity. Rubber milling generates minor levels of VOCs and HAPs

Once the rubber is properly blended, a strip is fed from the mill to the extruder. There is an “A” extruder and “B” extruder. The purpose of the extruder is to produce a rubber strip with a profile tailored to the specific tread mold for which it is destined. The continuous strip of rubber from the extruder enters a cooling conveyor. Cooling is necessary because the uncured rubber received curing chemicals at the mixer, and continued heat build-up through the process will cause premature curing. The extruders will also produce minor amounts of VOCs and HAPs.

TITLE V PERMIT RENEWAL – O-01074

March 2025

After exiting the long cooling conveyor, the rubber strip goes through the dip tank of a kensil solution to prevent sticking, then cut to proper length, rolled up, and stored in a rack system until needed at the curing presses. The extrusions are fed to the steam-heated rubber presses, which consist of a stack of molds. The press is closed and removed following the curing cycle, which lasts between 12 and 20 minutes. They are then cooled and fed to trimmers where mold flash is removed. Trimmed tread is rolled up and stored until cool, at which time it is sent to the tread finishing system. The presses, “A” and “B”, produce VOCs in the range of about 5 -7 tons/yr, HAPs at lower rates.

In the tread finishing process, the underside of the tread passes through high-speed wire brush heads called “buffers”. Rubber particles removed in this step are collected in a cyclone collector for reuse in the process. The cyclone collector discharges to a baghouse. The collected rubber buffings are used as an ingredient in subsequent rubber batches. The buffers produce a small amount of VOC and HAPs. The buffed tread continues down a conveyor line and is fed through a roller coater which applies rubber cement to the buffed surface. After cement application, the tread is packaged for delivery to the retreading dealers. There are three (3) tread finishing lines.

The plant is a major source of VOC due to the rubber cement application. The cement application accounts for about 90 – 110 tons per year of VOC. HAPs are insignificant.

The rubber cement is manufactured in the cement house and is produced with low aromatic commercial heptane and contains approximately 5.0 lb VOC/gallon. The cement house also produces rubber cement and packages heptane in 5-gallon containers for use in the franchised dealer retread shops.

End of process description
