- *When completing Tables 1a through 2d for a revision to a site-operating permit (SOP) use the information contained in the Applicable Requirements Summary of the SOP to complete this form.*
- *The owner or operator shall be in compliance with the CAM and /or PM requirements no later than the date of issuance of the SOP. If the CAM additions proposed by the owner or operator require installation, testing, or final verification of the operational status of the monitoring equipment, after the date of SOP issuance, the owner or operator shall include an implementation plan and schedule as an attachment to this form [40 CFR § 64.4(e)]. The details of the CAM implementation plan and schedule will be included in the SOP as an enforceable plan and schedule including milestones such as installation, testing, or final verification of the monitoring equipment [40 CFR § 64.6(d)]. However, in no case shall the CAM schedule for completing the installation, testing, or final verification exceed 180 days after issuance of the SOP.*

- *The owner or operator shall be in compliance with the CAM or PM requirements contained in a general operating permit (GOP) no later than 180 days from the date the GOP containing the CAM or PM requirements is effective.*

The TCEQ also requires that a Core Data Form be submitted with all incoming registrations unless **all** of the following are met: the Regulated Entity Reference Number (RN) and Customer Reference Numbers (CN) have been issued by the TCEQ and no core data information has changed. The Central Registry is a common record area of the TCEQ, which maintains information about TCEQ customers and regulated activities, such as company names, addresses, and telephone numbers. This information is commonly referred as, "core data." The Central Registry provides the regulated community with a central access point within the agency to check core data and make changes when necessary. When core data about a facility is moved to the Central Registry, two new identification numbers are assigned: the CN and the RN. The Core Data Form is required if facility records are not yet part of the Central Registry or if core data for a facility has changed. If this is the initial registration, permit, or license for a facility site, then the Core Data Form must be completed and submitted with application or registration forms. If amending, modifying, or otherwise updating an existing record for a facility site, the Core Data Form is not required, unless any core data information has changed. To review additional information regarding the Central Registry, go to the TCEQ Web site at, www.tceq.texas.gov/nav/permitting/central_registry/guidance.html.

Process Description

Transcontinental Gas Pipe Line Company, LLC ("Transco") is a subsidiary of The Williams Companies, with offices located in Houston, Texas. Transco owns and operates a bidirectional natural gas pipeline transmission system extending from Texas to New York. Transco's system is regulated at the federal level by the Federal Energy Regulatory Commission under the Natural Gas Act, and by the U. S. Department of Transportation under the Natural Gas Pipeline Safety Act. Compressor Station 40 is located near Sour Lake, Hardin County, Texas. The station (SIC Code 4922 / NAICS Code 486210) is part of Transco's interstate natural gas pipeline transmission system.

Compressor Station 40 is a major source of VOC, NO_x, CO and HAPs (Formaldehyde) and operates under VERP 49008 and several Permits-By-Rule (PBRs). Sources of air pollutant emissions are the natural gas-fired reciprocating IC engines, an auxiliary generator, a natural gas (NG) condensate storage tank, glycol tank, lube oil storage tanks, wastewater tank, a jacket water surge vessel, NG condensate truck loading, and piping component fugitive VOC emissions.

The facility's primary function is to compress natural gas for transmission along the pipeline system. It maintains six (6) Cooper-Bessemer GMW-10 reciprocating IC engines. The rating of each engine is 2,500 HP. The engines are fueled by pipeline quality natural gas supplied from Transco's mainline transmission system. Fuel is metered upstream of the engines. Dry scrubbers are upstream of the compressors to remove particulate. Any condensate, which is very little, is sent to a small fixed roof condensate tank. This is trucked offsite about once per year. The engines are equipped with an Altronic Ignition System and are water-cooled. The Jacket Water Cooling system consists of five (5) 25 HP electric pumps. The Jacket Water Cooling system utilizes a surge tank to prevent an air lock in the water system. Each engine drives a compressor. The purpose of the compressor is to move the natural gas further downstream by increasing the pressure. This process is repeated about every 40 miles along the pipeline system.

An emergency generator is maintained onsite in case of loss of purchase power. Small storage tanks are used to hold glycol, oil and water for engine lubricating and cooling. Pipes and engines are blown down or purged of gas before maintenance is conducted as a safety precaution.

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

July 3, 2025

THE HONORABLE ROBERT NICHOLS
TEXAS SENATE
PO BOX 12068
AUSTIN TX 78711-2068

Re: Accepted Federal Operating Permit Renewal Application
Project Number: 38307
Permit Number: O3168
Transcontinental Gas Pipe Line Company, LLC
Compressor Station 40
Sour Lake, Hardin County
Regulated Entity Number: RN100211838
Customer Reference Number: CN603452400

Dear Senator Nichols:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-94.504444,30.176666&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Robert Nichols
