Regulated Entity Number: RN101061927
Customer Reference Number: CN601678568

Dear Senator Hughes:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-94.436111,32.393888&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Bryan Hughes

2.0 PROCESS DESCRIPTION

The Harrison County Power Project is a natural gas-fired combined cycle power generation facility located in Harrison County. The plant consists of two natural gas-fired combustion turbines, two heat recovery steam generators (HRSG) with duct burners, one steam turbine, a cooling tower, and ancillary equipment. The two units are each capable of producing a nominal 570 megawatts (MW) of electricity.

The combustion turbines are fired exclusively with pipeline-quality natural gas which minimizes emissions of volatile organic compounds (VOC_s), particulate matter, and sulfur dioxide. Emission control systems include dry low NO_x burners and selective catalytic reduction. Each turbine/HRSG power train has its own stack and CEMS.
