FLOWERS BAKING COMPANY OF TYLER, LLC PROCESS DESCRIPTION

Bread baking at this facility is a highly mechanized process. This particular bakery consists of two highspeed production lines, one to produce breads and one to produce buns. The bun production process is nearly identical to that of bread production, with the only differences being in make-up equipment and shorter baking times. Bulk quantities of flour are shipped to the facility in trucks where the flour is conveyed into one of four storage silos. These silos utilize fabric filters and a silo enclosure to control emissions during loading. These flour silos are only subject to the area wide applicable requirements in TAC Chapter 111. The flour is then air conveyed into the building where it is weighed and mixed with sugar, yeast, and water.

The mixing of the various ingredients produces a "brew" which is pumped into a fermentation tank. This initiates a long series of complex biochemical changes that end in the oven where the bread is baked. From the fermentation tank, the brew is mixed with additional flour and the remaining ingredients. It emerges as dough and is transferred to the make-up equipment where it is kneaded, cut to the proper size, and deposited into a pan.

There are four basic types of dough mixing processes: sponge and dough, straight dough, liquid ferments, and no time dough. These processes vary in the manner in which the various dough ingredients are mixed, which determines the amount of fermentation time available. Fermentation time can vary from five hours or more to 20 minutes or less, usually averaging 2 to 2.5 hours. The baking process actually occurs in the oven itself, which causes expansion of the loaf to final volume, crust formation, yeast and enzymatic activity inactivation, coagulation of the dough proteins, partial gelatinization of the starch, and reduction of loaf moisture, all of which are necessary to produce high quality, saleable bread products. To accomplish all of these products and process effects in the proper sequence, the ovens typically have from three to eight temperature gradient zones, which are maintained in critical balance.

Before entering the oven, the dough is allowed to rise in a "proof box." Steam for this high temperature, high humidity proof box environment is supplied by two boilers (1EF and 2EF). These boilers are potentially subject to 40 CFR 60, Subpart Dc Standards of Performance for Small Industrial Commercial Institutional Steam Generating. However, since the units were installed before 1989 and both are less than 10 MMBtu/hr, a negative applicability determination was made for both units. The boilers are authorized under New Source Review (NSR) permit number 22041. The ovens themselves are direct fired, conveyorized, units with operating temperatures of 400 to 450 degrees Fahrenheit. Emissions are generated in the oven by two processes: the combustion of natural gas and off gassing from the bread itself (discussed below). These emissions exit the ovens through stacks on the ovens.

The off gassing of ethanol (VOC) from the bread is generated as a result of the fermentation process which causes the sugars and starches to be converted to ethanol, carbon dioxide, and water. Fermentation begins immediately following the initial mixing of ingredients and continues until the yeast is killed in the oven. During the initial fermentation period, a skin forms on the top of the dough. The skin keeps the ethanol and carbon dioxide inside the dough, thereby allowing the dough to rise and minimizing fugitive emissions. As a result, most of the ethanol generated by fermentation is released in the oven during baking when the skin breaks. The baking of the bread usually requires 15 to 20 minutes. Once the bread exits the oven, it is allowed to cool while it is transferred via conveyor to the slicing and packaging area. Once sliced and packaged, the product is shipped to customers by truck.

2.2 PROCESS DESCRIPTION

Bread baking at this facility is a highly mechanized process. This particular bakery consists of two high-speed production lines, one to produce breads and one to produce buns. The bun production process is nearly identical to that of bread production, with the only differences being in make-up equipment and shorter baking times. Facility Information

Before entering the oven, the dough is allowed to rise in a "proof box." Steam for this high temperature, high humidity proof box environment is supplied by two boilers (1EF and 2EF). These boilers are potentially subject to 40 CFR 60, Subpart Dc Standards of Performance for Small Industrial Commercial Institutional Steam Generating. However, since the units were installed before 1989 and both are less than 10 MMBtu/hr, a negative applicability determination was made for both units. The boilers are authorized under New Source Review (NSR) permit number 22041. The ovens themselves are direct fired, conveyorized, units with operating temperatures of 400 to 450 degrees Fahrenheit. Emissions are generated in the oven by two processes: the combustion of natural gas and off gassing from the bread itself (discussed below). These emissions exit the ovens through stacks on the ovens.

The off gassing of ethanol (VOC) from the bread is generated as a result of the fermentation process which causes the sugars and starches to be converted to ethanol, carbon dioxide, and water. Fermentation begins immediately following the initial mixing of ingredients and continues until the yeast is killed in the oven. During the initial fermentation period, a skin forms on the top of the dough. Once the bread exits the oven, it is allowed to cool while it is transferred via conveyor to the slicing and packaging area. Once sliced and packaged, the product is shipped to customers by truck.

2.3 REVISIONS TO THE PERMIT AND COMPLIANCE SUMMARY

There have been no changes to significant emission sources at the bakery nor have any new applicable air regulations related to operations been promulgated since issuance of the current permit. Two boilers; however, have permit shield entries for 40 CFR Part 60 (NSPS), Subpart Dc. The boilers are authorized under New Source Review (NSR) permit number 22041. There are no changes to the Permit Shield in the FOP.

There are currently no outstanding violations of state or federal environmental laws or regulations at the Bakery. Since its issuance, Flowers has complied with the terms and conditions of the existing FOP. Please note that the current renewal application is outside of the required due date of six (6) months before the date of permit expiration (pursuant to Title 30 Chapter 122.133 of the Texas Administrative Code (TAC). Upon notification from TCEQ on May 15, 2025 regarding the missed renewal application deadline, Flowers immediately engaged their air consultant at Stantec to prepare the application.

FLOWERS BAKING COMPANY OF TYLER, LLC FOP PERMIT RENEWAL APPLICATION JUNE 2025 Regulatory Applicability Summary

3.0 REGULATORY APPLICABILITY SUMMARY

This section summarizes the federal air quality regulation applicability for the Bakery.

3.1 NEW SOURCE PERFORMANCE STANDARDS (NSPS)

NSPS contained in 40 CFR 60 require new, modified, or reconstructed sources to control emissions to the level achievable by the best demonstrated technology as specified in the relevant regulations. These NSPS regulations were reviewed to determine their applicability to the Flowers San Antonio Bakery equipment or to confirm non-applicability as appropriate. The results of this review are summarized below by regulatory citation.

3.1.1 40 CFR 60 Subpart Dc - Standards of Performance for Small Industrial-Commercial- Institutional Steam Generating Units

Subpart Dc (Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units) applies to steam generating units with a maximum design heat input capacity of greater than or equal to 10 MMBtu/hr, but less than or equal to 100 MMBtu/hr, which are constructed, modified or reconstructed after June 9, 1989 (per 40 CFR §60.40c(a)). Steam generating units are defined in 40 CFR §60.41c as devices that combust fuel and heat water or any heat transfer medium. There are no steam generating units at this facility greater than 10 MMBtu/hr. Therefore, this regulation is not applicable.

3.2 NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS (NESHAP)

Federal NESHAP regulations promulgated pursuant to Section 112 of the CAA are found in 40 CFR Parts 61 and 63. In general, NESHAP, or Maximum Achievable Control Technology (MACT) standards apply to major stationary sources of HAP emissions, defined as potential-to-emit of 10 tons or more per year of any single HAP or 25 tons or more per year of any combination of HAP and area stationary sources of HAP emissions (thresholds less than a major source). The Flowers San Antonio Bakery is not considered a major source of HAPs. Potentially applicable NESHAPs are discussed below.

3.2.1 40 CFR 63 Subpart A – General Provisions

This regulation has general provisions that are referenced by other more specific NESHAP regulations.

5

FLOWERS BAKING COMPANY OF TYLER, LLC FOP PERMIT RENEWAL APPLICATION JUNE 2025

Regulatory Applicability Summary

3.2.2 40 CFR 63 Subpart DDDDD – NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters

The Industrial/Commercial/Institutional Boilers and Process Heaters MACT for major sources was promulgated on March 21, 2011, and regulates HAP emissions from new and existing industrial, commercial, or institutional boilers and process heaters located at major sources of HAP emissions. This rule is not applicable to the Bakery since it is not a major source of HAP.

3.2.3 40 CFR 63 Subpart JJJJJJ - NESHAP for Industrial, Commercial and Institutional Boilers Area Sources

The Industrial/Commercial/Institutional Boilers for area sources was promulgated on March 21, 2011, and regulates HAP emissions from industrial, commercial, or institutional boilers located at area sources of HAP emissions. The Bakery is an area source, but the sources are gas-fired; therefore, the facility is not subject to this subpart.

Dear Senator Hughes:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) initial issuance application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. https://gisweb.tceq.texas.gov/LocationMapper/?marker=95.313611,32.35&level=13.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Bryan Hughes Page 2 July 18, 2025
