To Whom It May Concern:

Formosa Plastics Corporation, Texas (FPC TX) is submitting the enclosed Title V Site Operating Permit (SOP) renewal application for the Caustic/Chlorine and EDC Plants located in Point Comfort, Calhoun County, Texas.

This submittal constitutes a timely renewal application as it is being submitted at least six months and no earlier than 18 months before the current authorization to operate (ATO) expires on February 3, 2026.

The enclosed renewal application for Permit No. O1953 meets the requirements for a SOP renewal application per 30 TAC Chapter 122. The enclosed application includes the following TCEQ forms: OP-CRO1, OP-1, OP-2, OP-SUMR, OP-PBR SUP, OP-ACPS, OP-REQ1, OP-REQ2, OP-MON, and OP-UA forms.

Should you have any questions, please contact Ms. LeAnn Usoff at [leannu@ftpc.fpcusa.com](mailto:leannu@ftpc.fpcusa.com) or by telephone at (361) 920-9401.

## 1.0 Introduction

Formosa Plastics Corporation Texas (Formosa) owns and operates the Caustic/Chlorine and Ethylene Dichloride (EDC) Plants facility in Point Comfort, Calhoun County under the authorization of Title V Site Operating Permit (SOP) Number O1953. In the Caustic/Chlorine Plant, ion exchange membrane technology (IEM) is used to electrolytically separate brine into hydrogen, sodium hydroxide, and chlorine, which are processed to produce hydrogen chloride (HCl) and 50% (w/w) caustic solution. In the Ethylene Dichloride (EDC) Plant, EDC is produced by direct chlorination, where ethylene is reacted with chlorine in the presence of a catalyst to produce EDC.

Formosa submitted its previous SOP renewal application on March 6, 2020, and received its effective SOP from the Texas Commission on Environmental Quality (TCEQ) on February 3, 2021.

Formosa is submitting this Title V SOP renewal application to request permit renewal prior to expiration. This renewal application does include changes to the existing SOP, including adding annual visible emissions monitoring to the cooling towers EDC-CT, EC-C1, and EC-C2 and incorporating into the permit claimed but not registered 30 TAC Chapter 106 preconstruction authorizations under which the unit or process is operating.

This application is being submitted according to the timeline required for SOP renewals specified in 30 TAC §122.133(4), and it contains the following information required by the SOP application procedures specified in 30 TAC §122.132:

- Site location map and plot plan with emission units designated;
- Description of the processes and associated process flow diagrams;
- General and administrative forms OP-CRO1, OP-1, OP-2, OP-SUMR, OP-PBRSUP, and OP-ACPS (Appendix A);
- Area-wide applicable requirements form OP-REQ1 (Appendix B);
- Monitoring Form OP-MON (Appendix C);
- Unit attribute forms OP-UA3, OP-UA4, OP-UA6, OP-UA12, OP-UA14, OP-UA15, and OP-UA60 (Appendix D); and
- Alternative Methods of Compliance (Appendix E).

Sections 2.0, 3.0, and 4.0 of this application include site descriptive information such as the site location map, plot plan, and process information. Section 5.0 and the related appendices include the necessary TCEQ application forms.

## 4.0 Process Description and Flow Diagrams

The Caustic/Chlorine Plant produces HCl, bleach and 50% (w/w) caustic solution and the Ethylene Dichloride Plant produces EDC by direct chlorination. Processes and equipment at the two plants include chemical loading, chemical storage tanks and vessels, cooling towers, incinerators, emergency scrubbers, and miscellaneous activities and equipment that support these operations.

The following narrative describes the flow of materials through the Caustic/Chlorine Plant and the EDC Plant as shown on the process flow diagrams (Figures 4-1 and 4-2) included at the end of this section.

### 4.1 Caustic/Chlorine Plant

The Caustic/Chlorine Plant utilizes ion exchange membrane (IEM) technology to electrolytically decompose brine to produce sodium hydroxide and chlorine. Additionally, the process generates gaseous hydrogen at the cathode.

Treated well brine (1) from Markham Salt Dome, located 30 miles from the plant site, is continuously transferred to two Formosa well brine storage tanks (T-101S1 and T-101S2) via underground pipeline. The brine is concentrated to approximately 310 grams of sodium chloride per liter of water using a salt evaporation system before being treated for purification.

Although most of the naturally occurring impurities in the well brine such as calcium, magnesium, and sulfates are removed and reintroduced to the brine producing well at the Markham treatment facility, the transferred brine is further purified at the Formosa brine treatment process to minimize the potential for membrane clogging, decreasing the overall production efficiency, and inefficient energy consumption.

The purified brine (2) is introduced into the electrolytic cells for the production of sodium hydroxide, hydrogen and chlorine. Each cell contains an activated titanium anode, an activated nickel cathode, and a selective sodium ion exchange membrane separating the anolyte from the catholyte.

Electric current passes between the cells separating the brine into chlorine and sodium ion at the anode, and hydrogen and caustic at the cathode. The positive charge of the sodium ion enables the selective nature of the component towards the cathode; the ion passes through the selective membrane to the cathode to form caustic with the negatively charged hydroxide ion resulting from the release of hydrogen at the cathode. After complete electrolysis, chlorine gas, 32% by weight caustic, and hydrogen gas are generated and sent out to other areas within the Caustic/Chlorine plant for further processing.

#### **4.1.1 Caustic**

The hot 32% by weight caustic solution (3) generated at the membrane cells is transferred to the caustic evaporation area. Excess water is evaporated in a three-stage evaporator system, thereby increasing the caustic concentration to 50%. The water boiled off is condensed and recycled back to the plant for further use. Salt precipitated during the caustic concentration step is recycled back to the brine treatment area.

The 50% by weight caustic solution (4) is sent to product storage. A small portion of the caustic is consumed internally for neutralization purposes; however, the majority of the product is exported to various customers.

#### **4.1.2 Chlorine**

The chlorine gas (7) is washed, dried, then compressed. The compressed chlorine (14) is consumed internally as a reactant in the EDC Plant to produce ethylene dichloride (EDC). Additionally, a side stream of chlorine is thermally reacted with hydrogen to produce 35% Hydrochloric acid (HCl).

The hot chlorine gas at the cell outlet (7) is saturated with moisture and salt mist. During Chlorine Treatment, the chlorine gas is washed and cooled by exchange with cooling water. The condensate is sent to a scrubber to remove residual chlorine. The chilled chlorine gas is further treated in drying towers to remove excess water. Sulfuric acid (15) is contacted directly with the gas to absorb the remaining water. The spent acid is then consumed internally by Formosa. The dry chlorine gas (8) is sent downstream for the manufacture of either EDC, 15.5% Sodium Hypochlorite, or 35% HCl.

#### **4.1.3 Hydrogen**

Hydrogen is purified, dried, and compressed for use as a fuel in the Utilities Plant. If the Utilities Plant can not take the hydrogen, it is vented.

The hot hydrogen gas from the membrane cell (9) is saturated with moisture and sodium hydroxide mist. The water and mist are removed by direct contact of the hydrogen gas with water. The cooled hydrogen gas is compressed (10) and sent downstream to be used as fuel or in the manufacture of HCl. Any excess hydrogen gas is vented.

#### **4.1.4 HCl**

Chlorine (8) and hydrogen (10) gases are reacted in a synthesis reactor to form HCl. The HCl gas is absorbed by water to form a 35% HCl solution. The remaining HCl tail gas is sent to the tail gas absorber where more than 99% HCl fume is absorbed with pure water and routed back to the gas absorber for acid manufacture. Residual HCl gas (11) is routed to gas scrubber. The scrubber overheads vent to atmosphere (EPNs 2C403A/B). The HCl solution (13) is used in the plant for pH adjustment of brine and pure water production at the complex utilities' processing unit.

#### **4.1.5 Sodium Hypochlorite Production**

A side stream of dry chlorine gas is routed to the bleach production system and mixed with 20% caustic solution in a Powell bleach titanium reactor. The produced 15.5% NaOCl is transferred to the loading area and stored in FRP/CPVC tanks for outside sales. The bleach loading system has the capability to dilute the high concentration bleach into the trucks being loaded using pure water. In addition to the high concentration product, bleach concentrations of 10% and 12.5% get loaded into trucks for outside sales.

#### **4.1.6 Chlorine Scrubbing System**

Within the Caustic/Chlorine Plant there are two separate emergency vent scrubbing systems and one routine vent scrubbing system that remove waste chlorine from the vent stream. The chlorine treatment transport lines and handling equipment are connected (16) to the waste chlorine scrubbing system. The system handles any over pressuring of chlorine lines and the chlorine purge when an electrolysis cell is taken offline. This system is maintained at a slight vacuum to ensure that any chlorine leaks in the chlorine transport lines, and handling area are minimized.

The normal chlorine vent scrubber handles all normal process vents from the Caustic/Chlorine Plant while the plant is in normal operation. The normal chlorine scrubbing system consists of three scrubbing sets in series. The tail gas exiting the last scrubber is vented to the atmosphere.

The emergency vent scrubber systems process emissions generated during start-ups, shutdowns, and emergencies. This scrubbing system consists of two separate packed bed caustic scrubbers connected and operating in series. One system handles emissions from Chlorine Production Trains A, B, and E, while the other system handles emissions generated from Chlorine Production Trains C and D.

The plant also has a continuously supervised HCl and Cl<sub>2</sub> ambient air monitoring system, with field monitors distributed throughout the plant. The system alarms when the HCl and Cl<sub>2</sub> concentrations exceed a baseline.

### **4.2 Ethylene Dichloride Plant**

In the Ethylene Dichloride (EDC) Plant, EDC is produced by direct chlorination. In the direct chlorination process, ethylene is reacted with chlorine in the presence of a catalyst to produce EDC. The crude EDC produced is then distilled into the final EDC product. Wet crude EDC is pumped to the Vinyl Plant where it is distilled and thermally cracked into VCM. The EDC product is exported to various customers.

The Stauffer process is utilized to produce liquid ethylene dichloride by the liquid phase chlorination of ethylene in the presence of a ferric chloride catalyst. There are three reactor trains in the EDC Plant, two parallel wash trains containing a water wash and caustic wash section, and a fractional distillation section.

#### **4.2.1 Reactor Section**

Ethylene (40) and chlorine (41) are added to the LTDC EDC Reactor through spargers and completely mixed. The chlorine concentration in the crude EDC overflow is maintained at 0.03% to 0.05% by weight. Ferric chloride is present within the reactor due to the reaction between the chlorine and the sacrificial carbon steel tubes of the reactor and acts as a catalyst for the process.

The reactor product (42) overflows to the Dry Crude EDC Buffer Vessel (DV-101) (not shown) and is subsequently pumped to the Water Wash Decanter in the Water Wash and Caustic Wash Section. Non-condensable vent gases (44) flow to the gas incinerator by pressure.

#### **4.2.2 Water Wash and Caustic Wash**

The reactor product (crude EDC) is washed with the acidic water from the HCl Stripper in the Water Wash Decanter. Acid water recycle from the Water Wash Decanter bottoms is returned to the inlet of the vessel. The water washed EDC (43), which contains traces of HCl and Cl<sub>2</sub>, is fed to the Caustic Wash Decanter, mixed with caustic and separated into phases. A portion of the caustic phase from the Caustic Wash Decanter is recycled to optimize the caustic utilization. Make up NaOH solution (45) is fed to the inlet end of the caustic wash decanter. Wash water containing the reactor catalyst scrubbed from the crude EDC (46) overflows the Water Wash Decanter to the wastewater treatment system.

The neutral EDC is stored in the Wet Crude EDC Storage Tanks (DT-402 or DT-402B/C) or sent to the VCM plant for distillation. The spent caustic solution (47) overflows the Caustic Wash Decanter and gravity flows to the wastewater treatment system. Vent gases (44) from the decanters are combined, scrubbed, and sent to the gas incinerator.

#### **4.2.3 Fractional Distillation**

The wet, neutral crude EDC (48) is pumped from the Wet Crude EDC Storage Tank to the Light Ends (LE) Column. The preheated feed enters near the top of the column. A small quantity of 10% caustic solution (49) is added to hold the aqueous overhead condensate within an alkaline range of 12.0 - 14.0 pH.

The overhead condensate flows by gravity to the LE Column Reflux Accumulator where phase separation takes place. The organic (lower) phase is returned to the column and the aqueous (upper) phase is recirculated and added to the overhead condensate. The excess wastewater (50) flows from the accumulator to the Wastewater Storage Tank. Uncondensed vapor (51) from the LE Column accumulator is demisted and sent to the gas incinerator.

The dry underflow from the light ends column (52) is pumped to the heavy ends column. The feed enters near the bottom of the column. The overhead vapor is condensed and flows by gravity to the HE Column Reflux Accumulator. A portion of the condensate (53) is returned to

the column as reflux. The remaining portion of the overhead condensate (54) is pumped from the accumulator to the HCl Stripper.

The bottoms from the Heavy Ends Column (55) are stored in the Heavy Ends Hold Tank (not shown) and then sent to the EDC recovery column. Product from the EDC Recovery Column (56) is returned to the Heavy Ends Column. The underflow material (57) from the EDC Recovery Column is a by-product of the EDC Process Tanks. This material is transported by tank truck to an end user (customer) for reprocessing.

Condensate from the Heavy Ends Column (54) is stripped in the HCl Stripper to purge the residual HCl in the EDC to 2 ppm. Bottoms product from the HCl Stripper (58) is pumped out through a product cooler to product storage. The overhead condensate from the HCl Stripper (59) is collected in a receiver and fed by gravity back to the Water Wash Decanter. Non-condensable gases from the stripper (60) are sent to the gas incinerator system.

#### **4.2.4 Waste Water**

All process wastewater streams within the EDC Unit are collected in a totally enclosed system, then pretreated prior to discharge to the Combined Wastewater Treatment Plant (CWTP).

Wastewater streams are combined, neutralized and sent to the Wastewater Storage Tank. EDC contained in the wastewater settles to the bottom of the storage tank, is separated from the water in the tank and returned (61) to the Caustic Wash Decanter. The wastewater in the storage tank is heated and then sent (62) to the Steam Stripper. Steam (63) is sparged into the bottom of the column, and strips EDC from the wastewater. The condensate from the Steam Stripper Condenser (64) flows by gravity to the Caustic Wash Decanter. Wastewater from the bottom of the stripper (65) is pumped to the CWTP.

#### **4.2.5 Gas Incinerator**

Dry waste gases and wet waste gases from process equipment and tanks are fed to the gas incinerator system.

The incinerator system handles all waste gas from the unit. The wet and dry waste gas streams will be fed individually to a horizontal incinerator designed to provide sufficient residence time to reduce VOC emissions by 99.95%. The combustion products from the incinerator enter the waste heat boiler to produce 100 psig steam. The gases then enter the absorber, where HCl is removed. The exit gas from the absorber passes into a caustic scrubber where HCl and Cl<sub>2</sub> are reduced before discharge (66) to the atmosphere.

## 5.0 General and Administrative Forms

Appendix A of this application includes the general and administrative forms and supporting information required by the SOP application renewal process, 30 TAC §122.132. These forms and other data include the following:

- OP-CRO1 (Certification by Responsible Official);
- OP-1 (Site Information Summary);
- OP-2 (Application for Permit Revision/Renewal);
- OP-SUMR (Individual Unit Summary for Revisions);
- OP-PBRSUP (Supplemental PBR Form); and
- OP-ACPS (Application Compliance Plan and Schedule).

### 5.1 Applicability Determination Forms

The emission units at the Caustic/Chlorine and EDC plants are subject to site-wide applicable requirements as well as unit specific non-applicability determinations. A completed OP-REQ1 detailing these requirements is included in Appendix B.

### 5.2 Monitoring Updates

With this renewal Formosa is requesting annual visible emissions monitoring for the cooling towers (EPN EDC-CT, EC-C1, and EC-C2). OP-MON forms for this request are included in Appendix C.

### 5.3 Unit Attribute Forms

Appendix D includes the following unit attribute forms:

- OP-UA3 (Storage Tank Unit Attributes);
- OP-UA4 (Loading and Unloading Unit Attributes);
- OP-UA6 (Boiler Unit Attributes);
- OP-UA12 (Fugitive Emission Unit Attributes);
- OP-UA14 (Water Separator Unit Attributes);
- OP-UA15 (Emission Point/Stationary Vent/ Distillation Operation/ Process Vents Unit Attributes); and
- OP-UA60 (Chemical Manufacturing Unit Attributes).

### 5.4 Alternative Method of Compliance Memo

Appendix E includes the Alternative Method of Compliance Correspondence to establish Alternative Monitoring for all cooling towers at the Formosa Point Comfort Plant.

- Part 1 of this form must be submitted with all initial FOP applications and renewal applications.
- The Responsible Official must use Form OP-CRO1 (Certification by Responsible Official) to certify information contained in this form in accordance with 30 TAC § 122.132(d)(8).

**Part 1**

<b>A. Compliance Plan — Future Activity Committal Statement</b>	
<p>The <i>Responsible Official</i> commits, utilizing reasonable effort, to the following:  As the responsible official it is my intent that all emission units shall continue to be in compliance with all applicable requirements they are currently in compliance with, and all emission units shall be in compliance by the compliance dates with any applicable requirements that become effective during the permit term.</p>	
<b>B. Compliance Certification - Statement for Units in Compliance*</b> (Indicate response by entering an "X" in the appropriate column)	
1. With the exception of those emission units listed in the Compliance Schedule section of this form (Part 2, below), and based, at minimum, on the compliance method specified in the associated applicable requirements, are all emission units addressed in this application in compliance with all their respective applicable requirements as identified in this application?	<input checked="" type="checkbox"/> YES <input type="checkbox"/> NO
2. Are there any non-compliance situations addressed in the Compliance Schedule Section of this form (Part 2)?	<input type="checkbox"/> YES <input checked="" type="checkbox"/> NO
3. If the response to Item B.2, above, is "Yes," indicate the total number of Part 2 attachments included in this submittal. <i>(For reference only)</i>	
<p>* For Site Operating Permits (SOPs), the complete application should be consulted for applicable requirements and their corresponding emission units when assessing compliance status. For General Operating Permits (GOPs), the application documentation, particularly Form OP-REQ1 should be consulted as well as the requirements contained in the appropriate General Permits portion of 30 TAC Chapter 122.</p> <p>Compliance should be assessed based, at a minimum, on the required monitoring, testing, record keeping, and/or reporting requirements, as appropriate, associated with the applicable requirement in question.</p>

VIII. Title 40 Code of Federal Regulations Part 63 - National Emission Standards for Hazardous Air Pollutants for Source Categories (continued)		
I. Subpart T - National Emission Standards for Halogenated Solvent Cleaning		
1.	The application area includes an individual batch vapor, in-line vapor, in-line cold, and/or batch cold solvent cleaning machine that uses a hazardous air pollutant (HAP) solvent, or any combination of halogenated HAP solvents, in a total concentration greater than 5% by weight, as a cleaning and/or drying agent.	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
2.	The application area is located at a major source and includes solvent cleaning machines, qualifying as affected facilities, that use perchloroethylene, trichloroethylene or methylene chloride.	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
3.	The application area is located at an area source and includes solvent cleaning machines, other than cold batch cleaning machines, that use perchloroethylene, trichloroethylene or methylene chloride.	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
J. Subpart U - National Emission Standards for Hazardous Air Pollutant Emissions: Group 1 Polymers and Resins		
1.	The application area includes elastomer product process units and/or wastewater streams and wastewater operations that are associated with elastomer product process units. <i>If the response to Question VIII.J.1 is "No," go to Section VIII.K.</i>	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
2.	Elastomer product process units and/or wastewater streams and wastewater operations located in the application area are subject to 40 CFR Part 63, Subpart U. <i>If the response to Question VIII.J.2 is "No," go to Section VIII.K.</i>	<input type="checkbox"/> Yes <input type="checkbox"/> No
3.	The application area includes process wastewater streams that are designated as Group 1 or are determined to be Group 1 for organic HAPs as defined in 40 CFR § 63.482.	<input type="checkbox"/> Yes <input type="checkbox"/> No
4.	The application area includes process wastewater streams that are Group 2 for organic HAPs as defined in 40 CFR § 63.482.	<input type="checkbox"/> Yes <input type="checkbox"/> No

Dear Mr. Crabtree:

This correspondence is in response to Formosa Plastics Corporation, Texas's (Formosa's) request for Alternative Monitoring for all cooling towers (CT) at the Formosa Point Comfort Plant. The AMOC is used to comply with requirements for sampling and analysis of VOCs in cooling tower feed water and makeup water.

We understand that Formosa is requesting clarification and confirmation of the alternative VOC sampling procedure for all authorized CT at the site installed on similar product processes (see Attachment 1). This alternative method was previously approved for Formosa on December 2, 1992, January 11, 1996, and August 1997.

The alternative VOC sampling (referenced in historical correspondence as FPC TX VOC IN WATER AND WASTEWATER) is equivalent to Test Method 8020A. The method is detailed in Attachment 2 and should provide representative concentrations of non-methane hydrocarbons to comply with the above-referenced permits. This alternative method does not apply to any requirements that may in 40 Code of Federal Regulations Part 60, New Source Performance Standards (NSPS), 40 Code of Federal Regulations Part 61, National Emission Standards for Hazardous Air Pollutants (NESHAP), or 40 Code of Federal Regulations Part 63, Maximum Achievable Control Technology (MACT) Standards for Hazardous Air Pollutants.

Re: AMOC #66

The Texas Commission on Environmental Quality (TCEQ) Executive Director has made a final decision to approve your AMOC request. You are reminded that approval of any AMOC shall not abrogate the Executive Director or Administrator's authority under the Act or in any way prohibit later canceling the AMOC.

This AMOC approval may supersede certain requirements or representations in Permit Nos. 7699, 19166, 19167, 19168, 19198, 19199, 19200, 19201, 20203, 40157, 76044, 76305, 91780, 107518, 107520, 127838, 128752, HAP10, PSDTX1053, PSDTX1058, PSDTX1222, PSDTX1224, PSDTX1226, PSDTX1232, PSDTX1234, PSDTX1237, PSDTX1238, PSDTX1240, PSDTX1383, PSDTX1384, PSDTX226M7, and PSDTX760M9. To ensure effective and consistent enforceability, we request that Formosa incorporate this AMOC into the permit(s) through submittal of alteration(s) no later than 90 days after this approval, if not already included.

This approval may also change applicable requirements for the site, which are identified in the site operating permits (SOP) O1484, O1951, O1953, O1954, O1956, O1957, O1958, O3409, and O3421. The TCEQ recommends the submittal of a SOP administrative revision if any changes are necessary. Changes meeting the criteria for an administrative revision can be operated before issuance of the revision if a complete application is submitted to the TCEQ and this information is maintained with the SOP records at the site.

If you need further information or have any questions, please contact Ms. Anne Inman, P.E. at (512) 239-1276 or write to the Texas Commission on Environmental Quality, Office of Air, Air Permits Division, MC-163, P.O. Box 13087, Austin, Texas 78711-3087.

This action is taken under authority delegated by the Executive Director of the TCEQ.

Sincerely,

Michael Wilson, P.E., Director  
Air Permits Division  
Office of Air  
Texas Commission on Environmental Quality

VOC in Water and Wastewater by TACB-VOC Method Procedure

## LABORATORY STANDARD OPERATING PROCEDURES

### VOC IN WATER AND WASTEWATER BY TACB-VOC METHOD

Revision Number 5

#### 1.0 PURPOSE \*

In an effort to maintain Quality, Efficiency, Safety, and Environmental Responsibility, this procedure has been developed for L.S. & Q.A. Department Operation.

#### 2.0 SCOPE \*

This method is for the analysis of water and wastewater samples containing volatile organic compounds (VOC) and non-methane hydrocarbons (NMHC). It is intended for analyzing treated and un-treated water and wastewater streams permitted in FPC expansion complex.  
This method can be used to quantitate volatile organic compounds that have boiling points less than 200°C and are insoluble or slightly soluble in water.

#### 3.0 ORGANIZATIONS AFFECTED

This procedure affects operation within the L.S. & Q.A. Department and any other department that may request this analysis.

#### 4.0 RESPONSIBILITIES

Personnel	Responsibility
Management/Supervision	Responsible for development and implementation of the procedure, training material, and training of subordinates
QA/QC	Responsible for auditing the performance of the procedure.
Lab Technician	Responsible for knowing and performing analysis per procedure.

#### 5.0 DEFINITIONS

**VOC**                      *Volatile Organic Compounds (VOC)* are organic compounds that have boiling points approximately less than 200°C.

#### 6.0 KEY POINTS

Not applicable

## LABORATORY STANDARD OPERATING PROCEDURES

### VOC IN WATER AND WASTEWATER BY TACB-VOC METHOD

Revision Number 5

#### 7.0 POLICIES \*

This procedure has been developed to insure adherence to FPC Quality, Environmental, Health, and Safety Policies, FPC Corporate Total Quality Management Policies, L.S. & Q.A. Department Quality Management Plan and L.S. & Q.A. Department Quality Assurance Project Plan.

#### 8.0 GUIDELINES

- Summary** Volatile organic compounds (VOC) are extracted from sample by purge and trap techniques. Stripped sample components are swept to the gas chromatograph inlet where the individual components are detected using a flame ionization detector. The resultant peaks are summed and quantitated against external calibration curve constructed using benzene as a standard.
- Interferences** Major contaminate peaks are volatile materials in the laboratory and impurities in the inert purging or carrier gas. A trip blank prepared from organic-free reagent water and carried through the sampling and handling protocol can serve as a check for any possible contamination of sample.
- Safety Considerations** The use of proper gloves, safety glasses, and FRC should be exercised when using reagents. Exercise caution when working with glassware. Wipe any spills, clean area immediately and dispose of properly. Avoid skin or eye contact, inhalation or ingestion. Do not operate instrument without all protective equipment in place.
- Sample Collection and Storage**
- Water sample are collected in 40mL vial with a Teflon-lined septum and an open top screw-cap. Two vials per sampling event must be collected at a minimum per sample point. The containers must be filled in such manner that no air bubbles pass through the sample as the container is being filled. Should bubbling occur, the sample must be poured out and the vial refilled. Seal the vial so that no air bubbles are entrapped in it.
  - Due to differing solubility and diffusion properties of gases in liquid matrices at different temperatures, it is possible for the sample to generate some headspace during storage. This headspace will appear in the form of micro-bubbles, and should not invalidate a sample for volatile analysis.
  - The presence of a macro-bubble, generally indicates either improper sampling technique or a source of gas evolution within the sample. Studies conducted by the USEPA (EMSL-Ci, unpublished data) indicate that "pea-sized" bubbles (i.e. diameter < ¼ in.) did not adversely affect volatiles data. These bubbles were generally encountered in wastewater samples, which are more susceptible to variations in gas solubility than are groundwater samples.

***Apparatus and Equipment***

1. Gas Chromatograph/Detector/Data System
  - a. Gas Chromatograph - Agilent model 6890 or model 5890 (as back up)
  - b. The GC must be equipped with a Agilent flame ionization detector (FID) or equivalent
  - c. The recommended data system is a Agilent Chemstation (or equivalent)
  - d. The GC column used for this determination is a J&W DB-5 column. The dimensions of the column are 30 m x 0.53 mm ID x 1.50 um film thickness.
2. Purge-and-Trap - An OI Analytical 4560 purge-and-trap or equivalent is recommended. The trap will be constructed of stainless tubing and filled with 2,6-diphenylene oxide polymer (Tenax GC or equivalent), methyl silicon packing, silica gel, and coconut charcoal. Alternatively, hydrophobic carbon molecular sieve and graphitized carbon black materials may be substituted if equivalent or increased method sensitivity can be demonstrated.  
An OI 4551A autosampler is configured to the purge-and-trap to allow for automated analysis.
4. Gas-Tight Microsyringes; 10, 25, 100, 250, 1000 uL sizes
5. 40 mL VOA (volatile organic analysis) vials with Teflon faced septa

***Reagents***

1. Organic-free reagent water (18.2 ohm-cm Millipore water)
2. Certified 2.0 mg/ml benzene standard in methanol solvent for initial calibration verification.  
Accustandard stock number M502-01-10X
3. Methanol, Pesticide quality or equivalent
4. Certified 1.0 mg/ml Benzene Standard in methanol solvent for calibration. Accustandard stock number AS-E0004

***QC Requirements***

QC	DESCRIPTION	FREQUENCY	CRITERIA	CORRECTIVE ACTION
MB	Method blank; Organic-free reagent water	1/10 sample	< 20 ppb Which is the amount of the lowest std.	Investigate system contamination; correct the problem and reanalyze the samples.
ICV	Initial Calibration verification, Benzene: 100 ppb.	1/10 sample	20% deviation from actual value. (80 ppb-120 ppb)	Check instrument malfunction. Correct the instrument problem and reanalyze. Perform initial calibration after the third failure.

***Calculations***Deviation(%)

$$D = \frac{|X - T|}{T} \times 100$$

Where, D = percent deviation  
 X = the observed value for the measurement  
 T = "actual" value for the measurement

***Precision and Accuracy***

None

***Reporting***

1. Analytical reporting limit is 20 ppb (ug/L).
2. All verified results must be entered in LIMS and/or the appropriate non-routine log sheet upon completion.
3. For the purpose of reporting to applicable agencies, preliminary results from LIMS may be used to prevent greater than 48hr delay in reporting time.

#### 9.0 PROCEDURES\*

#### 9.1 *Standard Preparation*

##### 9.1.2 Calibration Standards

Fill 40 mL VOA vials with reagent water, taking care not to trap any air in the vial. Add the Calibration Standard (AS-E0004) to the vial using a clean microsyringe basing on following list to prepare the calibration standards:

	Stock solution
Blank	0.0 uL
20 ppb	0.8 uL
50 ppb	2.0 uL
100 ppb	4.0 uL
250 ppb	10.0 uL
500 ppb	20.0 uL
1000 ppb	40.0 uL

9.1.3 Initial Calibration Verification Standard: Upon opening the certified benzene standard (e.g. M502-01-10X ), transfer to a 1 mL reaction vial and cap with a syringe valve. This standard may be good up to 6 months, but should be replaced if ICV fails. Fill a 40 mL VOA vial with Reagent water, taking care not to trap any air in the vial. Add 2.0 uL to the vial using a clean microsyringe for a 100 ppb std.

9.1.4 All standard preparation activities must be logged in the standards logbook.

#### 9.2 *Instrument Setup*

9.2.1 GC/FID is configured as follows:

##### Inlet

Mode: split                      Gas: Helium  
 Heater:                        250 °C  
 Preaature:                    6.9 psi  
 Total Flow:                   102 mL/min  
 Split ratio:                    9:1  
 Split Flow:                    90 mL/min

##### Column

Mode:                            Const Pressure  
 Pressure:                      6.9 psi  
 Flow:                            10.0 mL/min  
 Average Velocity:            66 cm/sec.

Initial		50	2.00	2.00
Ramp 1	20.00	250	9.00	16.00
Post Run		50	0	16.00

**Detector:**

Heater: 280 °C

H2 flow 40.0 mL/min

Air Flow 450 ml/min

Makeup Flow (He): 25.0 mL/min

Flame: On

## 9.2.2 Purge-and-Trap (OI 4560):

Purge flow	35 mL/min
Purge	11 min at 25 °C
Desorb	2 min at 180 °C
Bake	10 min at 185 °C
Transfer line	100 °C
Valve	100 °C
Sample size	5 mL
Drypurge	1 min

9.3 **Re- Calibration**

9.3.1 Recalibration is recommended once a year or when new ICV fails 20% recovery. Prior to re-calibration, GC and samplers must be baked out. Raise the GC oven temp to 250°C and bake for at least 30 min. It is also necessary to cycle the purge-and-trap through one bake cycle to ensure that there are no contaminants present in the trap. After 30 min lower GC temp to 50°C.

9.3.2 Prepare the calibration standards as outlined in 9.1.2 just prior to analysis. Load the standard vials in the correct slots of the autosampler and prepare following re-calibration sequence in the **Method and Run control window** of the Chemstation Software. Start the sequence by following steps from 9.4.4 to 9.4.9.

## LABORATORY STANDARD OPERATING PROCEDURES

### VOC IN WATER AND WASTEWATER BY TACB-VOC METHOD

Revision Number 5

Re-calibration sequence:

Line	Vial	Sample Name	Method Name	Inj/Vial	Sample Type	Cal Level	Update RF	Update RT
1	1	MB (Blank)	TACB-VOC	1	Sample			
2	1	20 ppb	TACB-VOC	1	Calibration	1	Replace	No Update
3	1	50 ppb	TACB-VOC	1	Calibration	2	Replace	No Update
4	1	100 ppb	TACB-VOC	1	Calibration	3	Replace	Replace
5	1	250 ppb	TACB-VOC	1	Calibration	4	Replace	No Update
6	1	500 ppb	TACB-VOC	1	Calibration	5	Replace	No Update
6	1	1000 ppb	TACB-VOC	1	Calibration	6	Replace	No Update

- 9.3.3 In the **data analysis window** of the Chemstation Software, load the chromatogram for the blank (reagent water). Check to see that there are no contamination peaks. For some low level analysis, a small peak will show at the beginning of the run. This is due to a pressure change on column when the sampler injects. If a calibration exists, the run should read less than two times the lower analytical limit for the analysis.
- 9.3.4 Open the calibration file and check to see that there are only two significant peaks. The first peak will be the solvent or methanol peak. The peaks should be sharp with minimum tailing. If there are more than two peaks, the calibration stock or reagent water is contaminated. Correct this condition and begin the calibration again.
- 9.3.5 Once the calibration files are integrated, the results must be assembled in a linear calibration curve. Display the calibration curve and check that the fit is at least  $R^2 > 0.990$ . Calculate a new area reject from the Calibration curve plot "AREA= number value x amount + 0" (the number value is the slope of the calibration curve. The amount is 20). Enter this new area into the integration events table in the value line for area reject.
- 9.3.6 Calibration should be set to calculate uncalibrated peaks using compound benzene. The parameters should sum all the individual peak areas of chromatogram.

#### 9.4 **Sample Analysis**

- 9.4.1 Composite sample: A volumetric composite is performed by combining the chilled (4°C) samples collected during a weeklong sampling event in a chilled jar that is surrounded by ice. This must be performed quickly to prevent loss of volatile component. The sample is mixed and transferred to 40mL VOA.

## LABORATORY STANDARD OPERATING PROCEDURES

### VOC IN WATER AND WASTEWATER BY TACB-VOC METHOD

Revision Number 5

Note: The volumetric composite may not reflect the true emissions over a week long period due to fluctuations in flow rate of the stream to be tested.

- 9.4.2 For grab samples, directly use the vial that the sample was received in.
- 9.4.3 Load the samples in the autosampler racks noting their positions.
- 9.4.4 Bring up the window **P & T 6890C (online): Method & Run control** by Click **Start / Program/HP Chemstation /instrument online** if it is not opened on the computer monitor.
- 9.4.5 Click **Sequence/Load Sequence** to load an existing sequence.
- 9.4.6 Click **Sequence/Sequence Parameter** to change the **Subdirectory** to today's date.
- 9.4.7 Click **Sequence/Sequence Table** to edit the sequence at the data station.  
Enter the sample information in a sequence file located in the data station. Be sure that the vial positions correspond with vial locations and the correct method is chosen for the analysis

Following sequence table is an example:

Line	Vial	Sample Name	Method Name	Inj/Vial	Sample Type
1	1	MB(Blank)	TACB-VOC	1	Sample
2	1	ICV	TACB-VOC	1	Sample

16	1	Sample B	TACB-VOC	1	Sample

Note: Method blank and calibration verification need be run every 10 samples.

- 9.4.8 Press **Run Sequence** button. Now system is ready and waiting for Purge-and-trap device to start.
- 9.4.9 Purge-and-trap device preparation:
  - (1) Push **SPL** Button on the front panel, the window will show: **L551** start:            end:
  - (2) Set the start and end positions that need match with actual sample position and run sequence, use arrow **ON** button and **OFF** button to switch between start and end, then use keypad to key in position number.

RE: Revisions to the Testing Techniques for Sampling Wastewater and Polyolefin Powder  
Required by the Texas Natural Resource Conservation Commission (TNRCC)  
Permit Nos.: 19167, 19168, 19198, 19199, 19200, 19201, 20203  
PSD-TX Permit No. 760M3

Dear Mr. Brittan:

This is in response to your letter dated November 7, 1995, which was related to the proposed procedures for analyzing the volatile organic compound (VOC) content in wastewater and polyolefin powder.

On June 6, 1995, Formosa Plastics, Corporation (Formosa) proposed revisions to a TNRCC approved procedure for analyzing the VOC content in wastewater and polyolefin powder. In a letter dated August 29, 1995, the TNRCC stated multiple concerns related to the proposed analytical revisions. These concerns centered around the operational parameters of the gas chromatograph which was proposed for the required analysis. In the letter dated November 7, 1995, Formosa supplied additional information and comments addressing these issues. After reviewing the information, the TNRCC has determined that Formosa Plastics adequately addressed the concerns and hereby accepts the proposed VOC sampling and analysis plan as written.

If you have questions, please contact me at (512) 239-1740.

RE: Sampling Procedures for Determination of Volatile Organic Compounds (VOC) in Polyolefin Powder/Pellets, Process Wastewater, and Cooling Tower Water Supplemental Measurement Procedure for Continuous Emission Monitoring Systems (CEMS) Failures Under Texas Air Control Board (TACB) Permits 19166, 19199, and 20203.

Dear Mr. Hyak:

Your letter dated November 2, 1992, in which you requested a review of the sampling methods and supplemental measurements listed above, has been given to me for review and reply.

The method proposed for determining VOC content in polyolefin powder and pellets parallels the "Beverage Can Method" that is currently accepted for use in Texas. There are several minor substitutions in analytical equipment but, after reviewing these substitutions with Mr. Jim Lindgren of the TACB Organic Analysis Laboratory, it was determined that the substitutions should not have a significant bias on the reported data.

The method proposed for determining VOC content in cooling tower water parallels the U. S. Environmental Protection Agency Method 8020A. After comparing the two methods, there were no major deviations identified that would significantly bias the reported data.

In a letter dated October 1, 1992, addressed to Matt Brittain of your staff, I requested several procedure modifications to the supplemental measurement procedure for CEMS failures. After reviewing the revised procedures submitted by Mr. Brittain, I find the revised procedures to be acceptable as written.

As long as these methods are performed correctly, they should produce reliable and accurate data. Permission is hereby granted to use these methods as proposed. The TACB reserves the right to direct Formosa Plastics Corporation, Texas to revise and/or change any or all of these methods if the TACB deems necessary. There are new, more reliable methods and advances in technology constantly being developed, and these methods may, someday, become obsolete in comparison.

Sincerely,

## TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

*Protecting Texas by Reducing and Preventing Pollution*

July 28, 2025

THE HONORABLE LOIS KOLKHORST  
TEXAS SENATE  
PO BOX 12068  
AUSTIN TX 78711-2068

Re: Accepted Federal Operating Permit Renewal Application  
Project Number: 38605  
Permit Number: O1953  
Formosa Plastics Corporation, Texas Caustic/  
Chlorine and EDC Plants  
Point Comfort, Calhoun County  
Regulated Entity Number: RN100218973  
Customer Reference Number: CN600130017

Dear Senator Kolkhorst:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-96.547222,28.688888&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Lois Kolkhorst
