## TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

*Protecting Texas by Reducing and Preventing Pollution*

August 25, 2025

THE HONORABLE ADAM HINOJOSA  
TEXAS SENATE  
PO BOX 12068  
AUSTIN TX 78711-2068

Re: Accepted Federal Operating Permit Renewal Application  
Project Number: 38754  
Permit Number: O3580  
Corpus Christi Liquefaction, LLC  
Corpus Christi Liquefaction  
Gregory, San Patricio County  
Regulated Entity Number: RN104104716  
Customer Reference Number: CN604136374

Dear Senator Hinojosa:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-97.270555,27.9&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

### 3. PROCESS DESCRIPTION

---

#### **An updated process description is provided below:**

Corpus Christi Liquefaction, LLC (CCL) is authorized to construct and operate a natural gas liquefaction and export terminal "The Terminal". Liquefied natural gas (LNG) is exported via LNG carriers from the marine terminal.

The Terminal operates three trains continuously (8,760 hours per year) using eighteen GE LM2500+G4 DLE natural gas-fueled refrigeration compressor turbines, six on each train (EPN: TRB1 through TRB18). There are two propane, two ethylene, and two methane refrigeration turbines per train. Because these gas turbines are used for compression, they have variable operating characteristics with hotter and cooler exhaust temperatures, and therefore cannot be compared to turbines used in electric generation.

Each of the three trains in the liquefaction process is equipped with an Acid Gas Removal Unit (AGRU). To reduce emissions from the acid gas vent stack, sulfur emissions are controlled with sulfur removal equipment. There are no vents directly to the atmosphere associated with the sulfur removal system. After sulfur removal, the acid gas is controlled using thermal oxidizers (TO) (EPNs: TO-1, TO-2 and TO-3), one per train. Acid gas can also be vented to the wet and dry gas flares (EPNs: WTDYFLR1, WTDYFLR2) when the TOs are out of service. A fixed roof tank for storage of amine is authorized (EPN: AMNTK1), which supplies amine to amine surge tanks (EPNs: AMNSRG1 through AMNSRG3) as needed in the AGRU process. Wastewater from the acid gas removal process and the dehydration process is routed to the wastewater tank (EPN: WWTK1) which is equipped with carbon control and the wastewater is then loaded into trucks (EPN: WWLD) for offsite treatment and/or disposal. A scavenger is utilized in the removal of the final amount of H<sub>2</sub>S in the AGRU. Spent scavenger is stored in a storage tank (EPN: TK1902) and loaded into tank trucks for disposal off-site (EPN: SCAVLD).

Heavier compounds in the natural gas are removed as condensate. The condensate is stored in an internal roof floating roof tank (EPNs: IFRTK1) and is routed to a pipeline for delivery to market. However, in the event of a pipeline outage, the condensate can be loaded into trucks (EPNs: TRKLD and TRKVCU) for delivery to market.

Emissions related to marine loading and various maintenance activities are controlled by the marine ground flare (EPN: MRNFLR).

Two sets of flares, with each set comprised of one wet flare and one dry flare (EPNs: WTDYFLR1, WTDYFLR2) control emissions from the liquefaction process.

The Terminal includes several engines and diesel storage tanks utilized for the engines and plant vehicles. Additionally, one gasoline storage tank is used to fuel plant vehicles.

Planned maintenance and shutdown activities occur at each LNG train when necessary to ensure safety and reliability of equipment.
