TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

THE HONORABLE BRYAN HUGHES
TEXAS SENATE

Regulated Entity Number: RN100216555

Dear Senator Hughes:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-95.558333,33.693611&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Bryan Hughes

APPENDIX A – TITLE V FORMS

1.0 Introduction

Paris Generation, L.P. owns and operates the Paris Energy Center, a combined cycle electric power generation site in Paris, Lamar County, Texas. The site contains two General Electric (GE) Frame 7EA natural gas-fired combustion turbines, each equipped with a duct burner fired heat recovery steam generator (HRSG). The Paris Energy Center is authorized via Texas Commission on Environmental Quality (TCEQ) New Source Review (NSR) Air Permit No. 18394 and PSDTX739M5 (amended on February 28, 2023). NSR Permit No. 18394 authorizes the site's emission sources, including combined cycle combustion turbines, fuel oil and condensate storage tanks, an emergency-use generator engine, truck loading operations, a cooling tower, equipment leak fugitives, and maintenance, startup, and shutdown (MSS) activities. Per the requirements of 30 TAC §122.133 and §122.134, Paris Generation, L.P. submits the enclosed request to renew Title V Site Operating Permit (SOP) No. 094 for the Paris Energy Center. The permit is set to expire March 12, 2026, and this application is being submitted within the time frame to be considered a timely application in accordance with 30 TAC §122.241.

The following documentation is provided with this renewal application: required TCEQ Federal Operating Permit application forms, including forms addressing application certification, administrative information, site-wide applicability information, and unit attribute information. Appendix A includes the TCEQ Title V renewal application forms.

1.1 Key Items in Renewal Application

Paris Generation, L.P. is including the following key updates and requests to supplement the Title V renewal application:

1. A revised list of applicable standard exemptions (SEs) and permits by rule (PBRs) on forms OP-REQ1 and OP-PBRSUP.
 - a. See table in Section 2.3 which identifies the SE and PBR authorizations provided in the OP-PBRSUP.
 - b. Updated OP-REQ1, Section XII.I with current SE and PBR citations to align with OP-PBRSUP and removed SEs that are no longer applicable.
2. OP-REQ1, Section XI.F to demonstrate applicability with the Cross-State Air Pollution Rule (CSAPR) NO_x Ozone Season Group 2 Trading Program.
3. Form OP-UA6, Table 3 for demonstration of NSPS Subpart Db for Unit ID No. GRP-HRSG.
4. Form OP-MON for Unit ID No. GRP-TURB to provide periodic monitoring (PM) language in Section VI of the form for consistency with the turbines operation.
 - a. Table 1c is provided to revise the “minimum frequency” to clarify that visible emissions would only need to be observed if an alternate fuel is used for more than 24 consecutive hours to be consistent with the requirement in the “periodic monitoring text.” In addition, the periodic monitoring text is revised to clarify that a deviation is only confirmed if the result of a visible emissions observation shows a result over the “deviation limit,” or a visible emissions reading was not completed when fuel oil is used for more than 24 hours. For reference, the previous PM language is given on page 26 of the current SOP 094 (Revised 12/2023).
 - b. Table 2a is provided to show the proposed deletion of the current PM requirement.

2.0 Process Description

The Paris Energy Center (Paris) is an electric generating facility located in Paris, Lamar County, Texas. Paris consists of two (2) natural gas-fired combustion turbines, duct-fired heat recovery steam generators (HRSGs), and ancillary equipment. No. 2 fuel oil is authorized as a backup fuel for the combustion turbines. A process description of Paris' electric generating facility is provided in the following paragraphs.

2.1 Combined Cycle Combustion Turbines and Duct-Fired HRSGs

Two (2) natural gas-fired GE Frame 7EA combustion turbine (CT) units, each equipped with a duct burner fired HRSG are operated at the facility. Each CT is nominally rated at 84 megawatts (MW) with a maximum heat input of 1,080 million British thermal units per hour (MMBtu/hr). The duct-fired HRSGs each have a maximum heat input capacity of 225 MMBtu/hr. For each CT, ambient air is drawn from the air inlet filtration and cooling system to the compressor section of the CT. The air is then mixed with pre-filtered fuel and burned in the CT's combustor, which exhausts hot gases through rows of stationary vanes and rotating blades. The hot exhaust gases turn a drive shaft that drives a generator to produce electric power for distribution. The exhaust gases subsequently pass through a HRSG, where boiler feed water is converted into steam. The steam is routed to a steam turbine that drives a generator that produces additional electrical power. Each of the HRSGs is equipped with a duct burner that can combust natural gas to further heat the CT exhaust gas when additional power generation is required. Each CT/HRSG unit exhausts through a dedicated stack (Emission Point Numbers [EPNs]: 1 and 3). Emissions from EPNs 1 and 3 may alternatively be vented through the HRSG bypass stacks (EPNs 2 and 4, respectively). Fuel oil no. 2 is authorized as a backup fuel and can be fired a maximum of 2,160 hours per year (per CT).

Steam injection is employed in the CTs to minimize oxides of nitrogen (NO_x) emissions. Good combustion controls and the combustion of low-sulfur fuels are employed to reduce emissions of carbon monoxide (CO), volatile organic compounds (VOC), particulate matter (PM), particulate matter less than 10 microns (PM₁₀), and particulate matter less than 2.5 microns (PM_{2.5}), sulfur dioxide (SO₂), and sulfuric acid (H₂SO₄).

2.2 Maintenance, Startup, and Shutdown (MSS) Operations

Maintenance, startup, and shutdown (MSS) operations include planned startups (cold startups up to 8 hours, warm startups up to 3 hours) and shutdowns (up to 2 hours), during which NO_x, CO, and VOC emissions are higher due to incomplete combustion and delayed steam injection (starting at 480°F and 350 psi).

Combustion optimization activities, such as leak checks, tuning, and balancing, occur during seasonal tuning or after major repairs, with emissions not exceeding startup/shutdown rates. Full Speed No Load (FSNL) operation is used for testing, troubleshooting mechanical issues, and preventing equipment damage in cold conditions

2.3 Other Authorized Site Activities

Record the type of fuel used by the unit. If an alternate fuel is fired, either alone or in combination with the specified gas, for a period greater than or equal to 24 consecutive hours, the permit holder shall conduct an observation of the stationary vent for each such period to determine if visible emissions are observed. If the result of the visible emissions observation determines that the opacity is above the opacity limit, it will be reported as a deviation. Any time an alternate fuel is fired for a period of greater than 7 consecutive days, then visible emissions observations will be conducted no less than once per week. Documentation of all observations shall be maintained. If visible emissions are present during the firing of an alternate fuel, the permit holder shall either list this occurrence as a deviation, or the permit holder may determine the opacity consistent with Test Method 9. Any opacity readings that are above the opacity limit from the underlying applicable requirement shall be reported as a deviation.

- (1) Emission point identification - either specific equipment designation or emission point number from plot plan.
- (2) Specific point source name. For fugitive sources, use area name or fugitive source name.
- (3) NO_x -total oxides of nitrogen
CO - carbon monoxide
VOC - volatile organic compounds as defined in Title 30 Texas Administrative Code §101.1
PM - total particulate matter, suspended in the atmosphere, including PM₁₀ and PM_{2.5}
PM₁₀ - total particulate matter equal to or less than 10 microns in diameter, including PM_{2.5}

TCEQ-20648 (APD-ID164v1.0, Revised 09/22) Major NSR Summary Table

This form is for use by facilities subject to air quality permit requirements and may be revised periodically.

PM _{2.5}	- particulate matter equal to or less than 2.5 microns in diameter
SO ₂	- sulfur dioxide
H ₂ SO ₄	- sulfuric acid
H ₂ S	- hydrogen sulfide
Be	- beryllium
As	- arsenic
Pb	- lead
Hg	- mercury
F	- fluorine
MSS	- maintenance, startup, and shutdown.

- (4) Compliance with annual emission limits (tons per year) is based on a 12-month rolling period.
- (5) Maximum hourly emissions are based on peak load and 10 °F ambient temperature. Annual oil-fired emissions are also calculated on these conditions.
- (6) Annual emissions are based on base load and 59 °F ambient temperature.
- (7) Emissions from EPN: 1 may be vented through heat recovery steam generator bypass stack, EPN: 2.
- (8) Emissions from EPN: 3 may be vented through heat recovery steam generator bypass stack, EPN: 4.
- (9) Emission based on 110 tank turnovers per year.
- (10) The annual emission limit specified in MAERT for this facility includes emissions from the facility during both normal and planned MSS activities. The hourly emissions limit specified in the MAERT for this facility includes emissions from the facility during both normal operations and planned MSS, except for VOC and CO.
- (11) For each pollutant whose emissions during planned MSS activities are measured using a CEMS, the MSS lb/hr limits apply only during each clock hour that includes one or more minutes of MSS activities. During all other clock hours, the normal lb/hr limits apply.
- (12) Emission rate is an estimate and is enforceable through compliance with the applicable special condition(s) and permit application representations.
