Form OP-DEL-Instructions
Delegation of Responsible Official Information
Texas Commission on Environmental Quality

General:

A Responsible Official (RO) representing a corporation may choose to delegate signature authority to a Duly Authorized Representative (DAR). Such delegation may be made to an individual that has responsibility for the overall operation of one or more manufacturing, production, or operating facilities applying for, or subject to, a federal operating permit. The DAR option is only available for corporations, not partnerships, military bases, or municipalities. [30 TAC Chapter 122.165(c) and 40 CFR 70.2 defining "responsible official"] Note that RO identifying information (name, address, title, etc.) must appear on Form OP-1 (Site Information Summary) even if the RO authority is being delegated to a DAR. Please refer to the Form OP-1 instructions for additional information.

This form also satisfies the requirements for notification of a change of DAR appointment, administrative information changes (e.g., address, phone and title) regarding the DAR, or the removal of a previously appointed DAR. During an application review, change notifications should be included in the next submittal to TCEQ regarding the permit. Please notify TCEQ in advance of changes.

After the initial permit application submittal, include a completed Form OP-CRO2 (Change of Responsible Official) with the next submittal to TCEQ if there is:

1. a new RO, Designated Representative (DR), or Alternate Designated Representative (ADR) appointment; or
2. administrative information changes regarding the RO, DR, or ADR.

For new delegations, this form must bear the signatures of the RO and the DAR. For administrative information changes, this form must bear the signature of either the RO or the DAR. For removal of a previously appointed DAR, this form must bear the signature of the RO. Signature stamps can be accepted in place of an original signature. Electronic signature stamps such as DocuSign will not be accepted. **The RO signature date will be used to validate the signature authority of the RO and must be on or after the effective date of the RO delegating to or removing a specific DAR via this action.** The effective date of the RO delegating to the DAR will be based on one of the following:

1. the date the initial application was submitted, if the name of the RO delegating to or removing the DAR was included in the initial application submittal on Form OP-1 (Site Information Summary); or
2. the Appointment Effective Date on Form OP-CRO2, if the RO delegating to or removing the DAR is not the original RO included in the initial Form OP-1 and the RO was changed via Form OP-CRO2.

If the "Action Type" in Section II of this form is designating an "Administrative Information Change," and the submittal is signed by the DAR, the DAR signature date will be used to validate the signature authority of the DAR and must be on or after the delegation effective date of the DAR certifying the submittal. A DAR cannot certify information unless the DAR has signature authority.

This form must be submitted to TCEQ through Title V STEERS. A copy of the form must also be submitted to the appropriate TCEQ Regional Office and EPA. Information on where to submit this form can be found on the TCEQ website at: www.tceq.texas.gov/permitting/air/titlev/submittal.

TCEQ also requires that a Core Data Form be submitted on all incoming applications unless all the following are met: the Regulated Entity Number (RN) and Customer Reference Number (CN) have been issued by TCEQ and no core data information has changed. The Central Registry is a common record area of TCEQ, which maintains information about TCEQ customers and regulated activities, such as company names, addresses, and telephone numbers. This information is commonly referred as, "core data." The Central Registry provides the regulated community with a central access point within the agency to check core data and make changes when necessary. When core data about a facility is moved to the Central Registry, two new identification numbers are assigned: the CN and the RN. The Core Data Form is required if facility records are not yet part of the Central Registry or if core data for a facility has changed.

If this is the initial permit for a site, then the Core Data Form must be completed and submitted with application forms. If amending, modifying, or otherwise updating an existing record for a site, the Core Data Form is not required, unless any core data information has changed. To review additional information regarding the Central Registry, go to the TCEQ website at: www.tceq.texas.gov/permitting/central_registry/guidance.

1.0 TECHNICAL SUPPORT DOCUMENTATION

1.1 PROJECT INFORMATION

South Bow Terminals, LLC (South Bow) owns and operates the Houston Tank Terminal located in Houston, Harris County, Texas. The Federal Operating Permit (FOP) No. O4253 for the Houston Tank Terminal expires on April 8, 2026. As required under 30 TAC §122.133, South Bow is submitting this permit renewal application no later than 6 months prior to expiration of the permit, or October 8, 2025. This is considered a timely renewal application, and the facility will be authorized to continue to operate until Texas Commission on Environmental Quality (TCEQ) takes final action on this application.

Twenty-two (22) storage tanks are currently authorized via Non-Rule Air Quality Standard Permit for Oil and Gas Handling and Production Facilities (Permit No: 156483). However, only four (4) storage tanks have been constructed. South Bow is requesting removal of tanks 5 through 22 (BO-TK-05 to BO-TK-22) from the FOP; however, keep the same emissions cap established for storage tanks during the initial FOP issuance. The pipeline throughput remains unchanged even though only four (4) storage tanks have been constructed. Leaving the emissions cap unchanged allows for future expansion and operational flexibility to respond to market changes and customer demands.

1.2 PROCESS DESCRIPTION

The Houston Tank Terminal is a bulk liquid petroleum storage terminal. Crude oils and/or crude oil condensates are transferred via pipeline to and from the terminal storage tanks.

A simplified process flow diagram is included in Appendix A (Figure 1). The plot plan is included in Appendix A (Figure 3)

1.3 LOCATION INFORMATION

The Houston Tank Terminal is located near Houston, Harris County. An Area Map indicating a 3,000 foot radius around the terminal is included in Appendix A (Figure 2).

1.4 APPLICATION ORGANIZATION

The renewal application forms included are as follows:

- OP-1 (Site Information Summary)
- OP-2 (Application for Permit Revision/Renewal)
- OP-ACPS (Application Compliance Plan and Schedule)
- OP-REQ 1(Application Area-Wide Applicability Determinations and General Information)
- OP-REQ 2 (Negative Applicable Requirement Determinations)

1.5 EMISSION CALCULATIONS

The following describes the calculations used to determine the emission rates associated with each emission source category included in this permit application. Detailed emission calculations are presented in Appendices C and D of this application.

The terminal will handle a wide range of crude oils and/or crude oil condensates. The Reid Vapor Pressure (RVP) of the crude and/or crude oil condensates managed at the terminal vary from month to month, however, a maximum TVP of 11 psia is the basis for the proposed emission limits. South Bow proposes to keep the current emission cap (91.60 tons per year (tpy) of volatile organic compounds (VOCs)) for storage tanks rather than individual throughput limits due to the varying nature of crude oils and crude oil condensates and customer markets at the proposed terminal. South Bow proposes to manage the storage tanks included in this application such that the permitted emission limits are not exceeded. Managing to the emissions cap allows South Bow the operational flexibility to respond to market changes and customer demands.

1.5.1 Routine Emissions

The following describes the emission calculations associated with each routine emission source category in this permit application.

1.5.1.1 Storage Tank Emissions

For storage tanks, the emission calculations for routine working and breathing emissions are estimated using the calculations methods in Compilation of Air Pollutant Emission Factors: Volume I Stationary Point and Area Sources (AP-42, Fifth Edition, US EPA, October 2024 (hereafter referred to in this application as AP-42) Section 7.1. Short-term emission rates are calculated using AP-42 Section 7 equations using maximum temperature and vapor pressure.

Detailed storage tank emission calculations are included in Appendix C, as Tables C-1 and C-2.

1.5.1.2 Emergency Firewater Pumps and Generator

Non-emergency emissions will occur from weekly testing of two (2) diesel-fired emergency firewater pumps and generator. Maximum hourly emissions were calculated based on testing at the maximum engine capacity. Annual emissions were based on 100 hours testing per year per engine.

TITLE V RENEWABLE OPERATING PERMIT APPLICATION
PERMIT NO.: O4253
SOUTH BOW TERMINALS LLC (HOUSTON TANK TERMINAL)
AUGUST 2025

Detailed emission calculations for the emergency firewater pumps and generator are included in Appendix C, as Tables C-3, C-4 and C-5.

1.5.1.3 Piping Equipment Fugitives

The fugitive emissions from piping components and ancillary equipment were estimated using methods outlined in the TCEQ's air permit technical guidance for chemical sources (APDG 6422). Each fugitive component was classified first by equipment type (valve, pump, relief valve, etc.) and then by material type (gas/vapor, light liquid, heavy liquid). Total emission rates were obtained by multiplying the number of fugitive components of a particular type by the appropriate Petroleum Marketing Terminal emission factor.

Detailed piping fugitive calculations are included in Appendix C as Table C-6.

1.5.2 Maintenance, Startup and Shutdown Emissions (MSS)

Maintenance, startup, and shutdown (MSS) activities and associated emissions will occur to support terminal operation. The following describes the calculations used to determine the MSS emissions associated with each emission source included in this permit application.

Detailed emission calculations are presented in Appendix D of this application.

1.5.2.1 Storage Tank Floating Roof Landing Losses

The roof-landing events occur for predictable maintenance events, periods of inventory control, and routine product changes. Floating roof landing emissions are estimated using the methods in Subsection 7.1.3.2.2 Roof Landings of Section 7.1 Organic Liquid Storage Tanks of AP-42. For a given roof-landing event, total landing loss emissions are therefore the sum of the filling losses and the daily standing idle losses over the entire period that the roof remained landed. Landing losses are inherently episodic in nature and must be determined each time a tank's floating roof is landed. Landing losses occur from floating roof tanks whenever the tank is drained to a level where its roof lands on its legs or other supports (including roof suspension cables). When a floating roof lands on its supports or legs while the tank is being drained, the floating roof remains at the same height while the product level continues to lower. This creates a vapor space underneath the roof. Liquid remaining in the bottom of the tank provides a continuous source of vapors to replace those expelled by breathing (in the case of internal floating roof tanks) or wind action (in the case of external floating roof tanks). These emissions, referred to as *standing idle losses (LSL)*, occur daily as long as the floating roof remains landed. Additional emissions occur when incoming stock liquid fills a tank with a landed roof. The incoming volume of liquid not only displaces an equivalent volume of vapors from below the floating roof but also generates its own set of product vapors that are displaced during the filling process. These two types of emissions are collectively referred to as *filling losses (LFL)*. The calculation methodology used of the standing loss and refilling emissions is discussed in further detail below.

Similar to breathing losses under normal operating conditions, standing idle losses occur during that period a roof is landed with product still in the tank. Emission calculation equations for these losses are from

TITLE V RENEWABLE OPERATING PERMIT APPLICATION
PERMIT NO.: O4253
SOUTH BOW TERMINALS LLC (HOUSTON TANK TERMINAL)
AUGUST 2025

Subsection 7.1.2.2.1 Standing Idle Losses in Section 7.1 of AP-42. The quantity of emissions is dependent upon the number of days idle, tank type (IFR/EFR), type of product stored, and the time of the year. Maximum hourly VOC emissions for tanks with idle standing losses were determined by calculating the losses for one day and then dividing by twelve hours/day. Twelve hours were used since the tanks breathe out for twelve hours/day and breathe in the other twelve hours.

Similar to loading losses, refilling losses occur while a tank is being filled with product during that period of time a roof is landed. Emission calculation equations for these losses are from Subsection 7.1.3.2.2.2 of AP- 42. The quantity of emissions is dependent upon the tank type (IFR/EFR), type of product stored, time of year, and fill rate. The maximum refilling loss is based on: (1) the tank re-fill rate; and (2) the month resulting in the highest emission as a function of vapor pressure (July). Maximum hourly VOC emissions were determined by dividing the filling emissions (LFL) by the maximum pumping rate. The calculation assumes that the product vapors within the vapor space under the tank roof are emitted from the tank at the same rate as the liquid coming into the tank. Once a tank is drained, tanks storing products with true vapor pressures greater than 0.5 psia are degassed and the vapors removed from the vapor space under the floating roof are routed to vapor combustor until the VOC concentration in the vapor space is less than 10,000 parts per million by volume (ppmv) after which the tank may vent to atmosphere. Blowers are used to ventilate the tank and force out any residual volatile organic compound (VOC) material. Emissions from the vapor combustion device have been estimated using the methods outlined in the TCEQ's *Air Permit Technical Guidance for Chemical Sources: Flares and Oxidizers, October 2002*. VOC, NO_x, SO₂, PM/PM₁₀/PM_{2.5} and CO emissions were estimated from the vapor combustion due to tank roof landing. VOC emissions are based on vendor guaranteed destruction efficiency of at least 99.8%. SO₂ emissions associated with crude oil and crude condensate vapor control were based on 100% conversion of any H₂S in the waste gas stream while SO₂ emissions associated with assist gas usage were based on AP-42, Section 3.2.7 emission factors. H₂S emissions were based on a max liquid concentration of 50 ppm and a corresponding DRE of 98%. PM/PM₁₀/PM_{2.5} emissions were based on emission factors from AP-42, Section 3.2-7.

Detailed floating roof storage tank roof landing MSS emissions are included in Appendix D as Tables D-2 through D-4.

1.5.2.2 Equipment Venting

Equipment venting includes, but is not limited to, liquid draining, venting to control, venting to atmosphere post control and refilling emissions during startup. The equipment venting emissions are calculated using the ideal gas law using the volume of the equipment and the material properties of the VOC material contained in the equipment. Short-term and annual emissions are based on an assumed number of simultaneous events and annual events per year, respectively. The equipment venting calculations are included to determine the contribution to the MSS cap purposes only. These emission calculations are not to be considered enforceable representations as to the magnitude, duration, and/or frequency of individual activities.

Equipment with isolated volumes equal to or less than 255 ft³ will be vented to the atmosphere uncontrolled while equipment with isolated volumes greater than 255 ft³ will first be degassed to a portable vapor control

device so to attain a VOC concentration below 10,000 ppmv. VOC, NO_x, SO₂, PM/PM₁₀/PM_{2.5} and CO emissions were estimated from the vapor combustion. VOC emissions are based on vendor guaranteed destruction efficiency of at least 99.8%. SO₂ emissions associated with crude oil and crude condensate vapor control were based on 100% conversion of any H₂S in the waste gas stream while SO₂ emissions associated with assist gas usage were based on AP-42, Section 3.2.7 emission factors. H₂S emissions were based on a max liquid concentration of 100 ppm and a corresponding DRE of 98%. PM/PM₁₀/PM_{2.5} emissions were based on emission factors from AP-42, Section 3.2-7.

Detailed equipment venting emission calculations are included in Appendix D as Table B-5.

1.5.2.3 Vacuum Truck and Frac Tank Loading

Emissions from the use of air movers and frac tanks are estimated using the loading loss equation from AP-42, Section 5.2.

Detailed vacuum truck and frac tank loading emissions are included in Appendix D as Table D-6.

1.6 REGULATORY APPLICABILITY SUMMARY

1.6.1 New Source Performance Standards (NSPS)

NSPS contained in 40 CFR 60 require new, modified, or reconstructed sources to control emissions to the level achievable by the best demonstrated technology as specified in the relevant regulations. These NSPS regulations were reviewed to determine their applicability to the Houston Tank Terminal equipment or to confirm non-applicability as appropriate. The results of this review are summarized below by regulatory citation.

1.6.1.1 40 CFR 60 Subpart A – General Provisions

This regulation has general provisions that are referenced by other more specific NSPS regulations.

1.6.1.2 40 CFR 60 Subpart Kb – Standards of Performance for Volatile Organic Liquid Storage Vessels for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984.

NSPS Subpart Kb applies to storage vessels with a capacity greater than or equal to 75 cubic meters (approximately 19,800 gallons) used to store volatile organic liquids with a maximum true vapor pressure greater than 15 kilopascals (kPa) that were constructed after July 23, 1984. The volatile organic liquid storage vessels at Houston Tank Terminal have capacity greater than 75 cubic meters (approximately 19,812 gallons). Therefore, this regulation is applicable.

1.6.1.3 40 CFR 60 Subpart IIII – Standards of Performance for Stationary Compression Ignition Internal Combustion Engines (CI ICE)

Subpart IIII (Standards of Performance for Stationary CI ICE) applies to manufacturers, owners, and operators of stationary CI ICE. The emergency generator and two (2) firewater pumps at the Houston Tank Terminal are subject to this regulation.

1.6.2 National Emission Standards for Hazardous Air Pollutants (NESHAP)

Federal NESHAP regulations promulgated pursuant to Section 112 of the CAA are found in 40 CFR Parts 61 and 63. In general, NESHAP, or Maximum Achievable Control Technology (MACT) standards apply to major stationary sources of HAP emissions, defined as potential-to-emit of 10 tons or more per year of any single HAP or 25 tons or more per year of any combination of HAP and minor stationary sources of HAP emissions (thresholds less than a major source). The Houston Tank Terminal is an area source of HAPs. Potentially applicable NESHAPs are discussed below.

1.6.2.1 40 CFR 63 Subpart ZZZZ – NESHAP for Stationary Reciprocating Internal Combustion Engines (RICE)

NESHAP Subpart ZZZZ regulates HAP emissions from existing, new, and reconstructed stationary compression ignition (CI) and spark ignition (SI), emergency and non-emergency, RICE located at major and area sources of HAP emissions. This standard is applicable to the Houston Tank Terminal. The emergency generator and fire water pumps meet the requirements of Subpart ZZZZ by meeting the requirements of 40 CFR part 60 (NSPS) Subpart IIII, for compression ignition engines. No further requirements apply for such engines under this part.

1.6.3 Texas State Air Regulations

1.6.3.1 Chapter 111 – Visible Emissions and Particulate Matter

Houston Tank Terminal is subject to and will operate in compliance with all requirements of 30 TAC Chapter 111.

1.6.3.2 10.1.2 Chapter 112 – Sulfur Compounds

Houston Tank Terminal is subject to and will operate in compliance with the requirements of 30 TAC Chapter 112.

1.6.3.3 10.1.3 Chapter 115 – Volatile Organic Compounds (VOC)

Houston Tank Terminal is subject to and will operate in compliance with the following subchapters of 30 TAC 115:

- 30 TAC §115.112 – Control Requirements for Storage of Volatile Organic Compounds;
- 30 TAC §115.542 – Control Requirements for Degassing of Storage Tanks, Transfer Vessels, and Marine Vessels.

Subject: Federal Operating Permit (Title V) Renewal Application
South Bow Terminals LLC
Houston Tank Terminal
Harris County, Texas
Customer Reference No.: CN605011642

Dear Permit Engineer:

South Bow Terminals LLC (South Bow) is submitting the enclosed application to renew the Federal Operating Permit (FOP) number O4253. The permit will expire on April 8, 2026. Twenty-two (22) storage tanks are currently authorized via Non-Rule Air Quality Standard Permit for Oil and Gas Handling and Production Facilities (Permit No: 156483). However, only four (4) storage tanks have been constructed. South Bow is requesting removal of tanks 5 through 22 (BO-TK-05 to BO-TK-22) from the FOP; however, keep the same emissions cap established for storage tanks during the initial FOP issuance. The pipeline throughput remains unchanged even though only four (4) storage tanks have been constructed. Leaving the emissions cap unchanged allows for future expansion and operational flexibility to respond to market changes and customer demands.
