Protecting Texas by Reducing and Preventing Pollution

Dear Senator Flores:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-97.317222,31.055833&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Pete Flores

Temple Generation I, LLC

(Air Account BF-A003-C, CN603272352, RN105380216)**

Dear Mr. Chacon:

Temple Generation I, LLC (Temple I), an affiliate of BKV-BPP Power LLC, is submitting this application to the Texas Commission on Environmental Quality (TCEQ) for renewal and revision of Title V Federal Operating Permit (FOP) Number O3544 for Temple I located on the southeast side of the city of Temple in Bell County, Texas.

Temple I is submitting this renewal application in accordance with 30 TAC Chapter 122, more specifically with §122.241. TCEQ last renewed/revised the FOP on April 19, 2021. It has a five-year term, and therefore expires April 19, 2026. This renewal application is being submitted within the required timeframe of six to eighteen months prior to expiration date.

The FOP includes Acid Rain Permit and Cross-State Air Pollution Rule (CSAPR) requirements/conditions.

This application includes the following attachments that have been uploaded into STEERS:

- **Attachment 1 Site Information** - Summary of Unit-Specific Regulatory Applicability, Process Description, Area Map, Plot Plan, and Process Flow Diagram
- **Attachment 2 Administrative Forms** - TCEQ Forms OP-CRO2, OP-1, OP-2, OP-ACPS, OP-AR1, OP-SUMR, and Acid Rain/CSAPR Certificate of Representation

According to the TCEQ instructions for Form OP-CRO1, it is not necessary to submit this form if the certifying FOP Duly-Authorized Representative (DAR) and the Acid Rain Designated Representative (DR) submit the application in STEERS.

The included Form OP-CRO2 is to notify TCEQ of a new Acid Rain DR effective.

- **Attachment 3 Unit Attribute Forms** - TCEQ Forms OP-UA2 (Emergency Engines), OP-UA6 (Auxiliary Boiler), OP-UA11 (Combined-Cycle Units), and OP-UA15 (Combined-Cycle Unit Stacks)

As part of this application, for the sake of providing an all-inclusive application Temple I is submitting the current versions of all the UA forms reflecting unit-specific, positive applicability.

- **Attachment 4 Applicability Determination Form** - TCEQ Form OP-REQ1 (Area-Wide)
- **Attachment 5 Permits by Rule Supplemental Table** - TCEQ Form OP-PBRSUP table that provides specific information on Permits by Rule (PBR) previously claimed by Temple I for New Source Review authorization of emissions from various ancillary sources and activities.

To facilitate your review, please note the following:

1. **Requested Changes with this Renewal** - The only change requested via this application are:
 - a. Update of TCEQ's records to reflect the new Acid Rain DR.
 - b. Update of the New Source Review Authorization References to reflect Standard Permit Registration No. 172658 issued May 22, 2023.
2. **FOP Actions Since Last Renewal** - Changes since the last FOP renewal were administrative changes to assign company representatives and an Off-Permit Change. On May 24, 2023, TCEQ acknowledged an Off-Permit Change to reflect our May 24, 2023 notification for wet compression upgrades to the combined-cycle units (FOP Emission Units CTG-1 and CTG-2).
3. **No Changes to Major NSR Summary Table** - Changes are not required to the Major New Source Review (NSR) Summary Table. The only New Source Review (NSR) permitting action since the FOP was last renewed/revised was TCEQ's May 22, 2023 issuance of Registration No. 172658 under the Electric Generating Units Air Quality Standard Permit to authorize wet compression upgrades to the combined-cycle units. This Standard Permit Registration has not yet been incorporated into NSR Permit No. 83503/PSDTX1111 and will not affect the NSR permit when it is incorporated.
4. **No New Positive Regulatory Applicability Determinations** - There is no new positive regulatory applicability reflected in this application. The current versions of the unit attribute (OP-UA) forms summarized below have been completed and included in Attachment 3 to confirm/update unit-specific attributes used to define positive regulatory applicability. Form OP-REQ3 is not included as we understand that TCEQ generates specific regulatory requirements to be incorporated into the FOP based on specific applicability information provided via the application OP-UA forms.
 - a. Form OP-UA2 for the Diesel Firewater Engine (ENG-1), Diesel Emergency Engine (ENG-2), and Diesel Air Compressor Engine (ENG-4) - for defining 40 CFR Part 63 (MACT) Subpart ZZZZ and 40 CFR Part 60 (NSPS) Subpart IIII applicability
 - b. Form OP-UA6 for the Auxiliary Boiler (AUX-1) – for defining 40 CFR Part 60 Subpart Dc applicability
 - c. Form OP-UA11 for the Combined Cycle Units (CTG-1 and CTG-2) – for defining 40 CFR Part 60 Subpart KKKK applicability. Because Temple I is not a major source of hazardous air pollutants (HAP), Form OP-UA11 Table 5 was not included and the turbines are not subject to 40 CFR Part 63 Subpart YYYY
 - d. Form OP-UA15 for the Combined Cycle Unit Stacks (CTG-1 and CTG-2) – for defining 30 TAC Chapter 111 Subchapter A applicability

We would like to thank you in advance for your review of this FOP Renewal/Revision application. FEDERAL OPERATING PERMIT NO. O3544 RENEWAL AND REVISION APPLICATION

TEMPLE I

TEMPLE GENERATION I, LLC

The Temple I power plant (the Plant) is located 2892 Panda Drive on the southeast side of the city of Temple, Texas in Bell County. Temple I is the application area for the renewal of Title V Federal Operating Permit (SOP) Number O3544. The Plant is owned and operated by Temple Generation I, LLC.

The Temple Power Station (the Station) is comprised of two adjacent areas that are owned and operated by two separate entities as summarized below. Air emissions for the entire Station were initially authorized under New Source Review/ Prevention of Significant Deterioration (NSR/PSD) Permit Numbers 83503 and PSDTX1111. That air permit was split in May 2015 to reflect two separate owner/operator entities as follows:

1. Temple I (the Plant) is the portion of the Station owned/operated by Temple Generation I, LLC (CN603272352). It consists of combined-cycle units 1 and 2, and ancillary equipment. Associated air emissions are authorized under NSR/PSD Permit Nos. 83503 and PSDTX1111, NSR Permit No. 154740, and FOP No. O3544. On February 12, 2019, TCEQ altered NSR Permit No. 83503 and issued NSR Permit No 154740 to transfer several emission points from Permit No. 83503 to the new Permit No. 154740. These emission points consist of NSR permit Emission Point Numbers (EPN's) ENG-1, TK-1, TK-2, TK-ENG1, WO-LOAD, Maintenance Painting, Maintenance Sandblasting, and Degreasers. EPN's ENG-1, TK-1, TK-2, and TK-ENG1 have corresponding Unit ID Numbers in SOP No. O3544.
2. Temple II is the portion of the plant owned/operated by Temple Generation II, LLC (CN606040673). It consists of combined-cycle units 3 and 4, and ancillary equipment. Associated air emissions are authorized under NSR/PSD Permit Numbers 131621 and PSDTX1458, and Federal Operating Permit (SOP) Number O3851.

The overall process for this facility has not changed since the FOP was last renewed/revised in 2021. For reference only, this application includes the following figures. Figure 1-1 is an Area Map showing the location of the Station, with the surrounding areas. Figure 1-2 is a Site Map indicating the location of the Station within the combined property boundary. Figure 1-3 is a plot plan showing the layout of major equipment and permitted facilities. Figure 1-4 is a process flow diagram that illustrates the air emission sources. A process description is provided below.

SOP Number O3544 was last renewed/revised April 19, 2021 and is subject to a five-year renewal. Temple I requests the permit be renewed and revised in accordance with this application submittal.

Unit-Specific Regulatory Applicability Summary

The applicable regulatory requirements, that are not area-wide, are summarized as follows for the emissions units and vents/stacks represented in the FOP and FOP Applicable Requirements Summary:

- The Combined Cycle Unit Stacks (CTG-1 and CTG-2) are subject to 30 TAC Chapter 111 §111.111(a)(1)(C) visible emissions. They are grouped (Group ID No. GRP-STACK). They are

also subject to the §111.151(a) particulate matter emissions requirements which are addressed via the area-wide FOP conditions. Periodic Monitoring is stipulated for visible emissions/opacity to demonstrate compliance with Chapter 111.

- The Combined Cycle Units (CTG-1 and CTG-2) are subject 40 CFR Part 60 (NSPS) Subpart KKKK Standards of Performance for Stationary Gas Turbines. The associated Heat Recovery Steam Generator (HRSG's)/duct burners are not subject to 40 CFR Part 60 Subparts Dc because they are subject to Subpart KKKK instead. The associated combustion turbines are not subject to 40 CFR Part 63 (MACT) Subpart YYYYY because they are not located at a major source of hazardous air pollutant (HAP) emissions. The combined-cycle units are not subject to 40 CFR Part 60 Subpart TTTT because associated construction did not commence after January 8, 2012.
- The Auxiliary Boiler (AUX-1) is subject to 40 CFR Part 60 Subpart Dc Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units.
- The Diesel Firewater Engine (ENG-1), Diesel Emergency Engine (ENG-2), and Diesel Air Compressor Engine (ENG-4) are subject to 40 CFR Part 63 Subpart ZZZZ requirements. The Diesel Firewater Engine drives the fire water pump for use should a fire event occur. The Diesel Emergency Engine drives a back-up, diesel-fired generator that provides electricity in the event of a power failure. The Diesel Air Compressor Engine drives a back-up, diesel-fired air compressor in the event the electric primary air compressor fails. They comply with 40 CFR Part 63 Subpart ZZZZ by complying with 40 CFR Part 60 Subpart IIII because the engines commenced construction after July 11, 2005 and were manufactured after April 1, 2006.

Process Description

The Plant is designed to generate nominally 750 megawatts (MW) of power and utilizes two Siemens SGT6-5000F combustion turbine generators (CTGs) in combined cycle mode (CTG-1 and CTG-2) that are fueled by natural gas only. Each CTG exhausts into a heat recovery steam generator (HRSG) and the steam produced by the HRSGs is fed to a back-pressure steam turbine generator (STG). Natural gas-fired duct burners located within each HRSG are used for supplementary firing to increase steam production and STG output. A natural gas-fired auxiliary boiler (AUX-1) is used to supplement steam flow through the HRSGs and reduce the startup time for the STGs. Exhaust gas leaving the HRSGs passes through Selective Catalytic Reduction (SCR) systems for the control of nitrogen oxide (NO_x) emissions from the CTGs and duct burners. Electricity generated from the CTGs and STGs is sent to an on-site switchyard and transmitted onto the electrical grid.

Pipeline quality natural gas is delivered to the plant boundary at a pressure sufficient for use without additional compression. The natural gas fuel is sent through a knockout drum for removal of any liquid which may have been carried through from the pipeline. The gas then passes through a filter/separator to remove particulate matter and entrained liquid. Liquid in the gas stream is separated and drains to a sump. Hydrocarbon liquids in the sump are periodically removed by truck for off-site disposal.

The natural gas can then be routed through two natural gas-fired in-line heaters where the gas is heated and split into individual inlet streams to supply each CTG, HRSG duct burner, or the auxiliary boiler. Alternatively, the natural gas can bypass the heaters and can be routed directly to the fired equipment.

The combustion turbine is the main component of the combined cycle power system. Ambient air is filtered, cooled, and compressed in a multiple-stage axial flow compressor. Compressed air and fuel (heated natural gas) are mixed and combusted in the turbine dry, low-nitrogen oxide (NO_x), i.e., DLN, combustion chamber. Exhaust gas from the combustion chamber is expanded through a multi-stage power turbine that drives both the air compressor and electric power generator. Exhaust gas exiting the power turbine is ducted to a HRSG where steam is produced to generate additional electricity in a STG. Steam production in the HRSG is augmented with supplementary fired duct burners.

The high-pressure portion of the steam turbine receives high-pressure superheated steam from the HRSG and exhausts the spent steam to the reheat section of the HRSG. The steam from the reheat section of the HRSG is supplied to the intermediate-pressure section of the turbine, which expands to the low-pressure section. The low-pressure turbine also receives excess low-pressure superheated steam from the HRSG and exhausts the spent steam to the surface condenser. The steam turbine set is designed to produce electrical power without additional fuel consumption other than that produced by the duct burners.

For exhaust gases exiting the HRSGs, the Plant incorporates SCR systems for the control of NO_x emissions from the CTGs and the duct burners (i.e., in addition to utilizing low-NO_x burners). The SCR systems consist of a modular foil catalyst bed and support structure, and an aqueous ammonia injection grid. The catalyst bed is located within the HRSG at the point where the flue gas temperature is optimized for SCR conversion of NO_x. The ammonia injection grid is located within the HRSG upstream of the catalyst. SCR reduces NO_x through a catalyzed chemical reaction of NO_x by ammonia that is introduced as a reactant in the flue gas, in the presence of excess oxygen. The reaction generates nitrogen gas and water as the reduced end products that are ultimately emitted from the stack to the atmosphere. These discharge constituents are in addition to the products of combustion and the residual unconsumed ammonia reagent (i.e., ammonia slip) emissions.

Spent steam exiting the HRSGs is condensed using a surface condenser that uses cooling water from the wet main cooling tower, the Plant Cooling Tower. As the steam is condensed, the condensate flows to the surface condenser hot well where the condensate is then recycled back to the HRSGs as makeup for the steam process. Water from the cooling tower is commonly referred to as “circulating” cooling water. A dedicated set of cooling water pumps is provided for this service.

Additional cooling water is required for auxiliary plant cooling. Cooling water for plant auxiliary purposes is not used for direct cooling of plant auxiliaries; rather a closed loop auxiliary cooling system consisting of pumps, expansion tank, and heat exchangers is provided for this purpose. Cooling water is circulated through a set of plate and frame heat exchangers to cool the closed loop coolant, a glycol/water mixture.

A diesel-fired, water pump engine (ENG-1) is available to the Plant for fire suppression. A diesel-fired, emergency power generator engine (ENG-2) provides power to the Plant during power and maintenance outages. A diesel-fired, portable standby air compressor engine (ENG-4) provides compressor air for instrumentation, etc should the electric primary air compressor fail. Small diesel fuel storage tanks (< 2,500 gallon [gal]) are associated with the engines.

Other equipment supporting plant operations include:

- Cooling water treatment system;
- Station sumps, sump pumps, and oil/water separator;
- Feed water treatment system including:
 - Demineralizer regeneration tank, storing sulfuric acid or equivalent;
 - Neutralization tank, storing a water/sodium sulfate or similar solution; and
 - Demineralizer regeneration tank, storing sodium hydroxide solution or equivalent
- Aqueous ammonia tanks for supply to the SCR NO_x emissions control systems,
- Plant and instrument air compressors and auxiliary equipment;
- Steam and water sampling system;
- Deaerator vents;
- Station maintenance activities, including painting, sandblasting, and solvent degreasers;
- Small (< 5,000 gal) natural gas condensate tanks, small (< 12,000 gal) lubrication oil tanks, and small (< 300 gal) hydraulic oil tanks.
