3. Non-compliance Situation Description		
Failure to stay within oxygen operational limit. TSAR submitted thirty-four deviations for their heater (EPN: H-501) exceeded the oxygen operational limit. The limit for H-501 is 3.66% oxygen and the highest exceedance occurred between December 7 and 14, 2023, with a 12% oxygen limit. This was discovered during biennial stack testing. During the testing it was determined that H-501 had an oxygen limit of 3.6%. However, after TSAR reviewed the Stack Test Report, TSAR found an error on the report and found that H-501 had an oxygen limit of 2.6%. It was determined that		

Part 2

A. Compliance Schedule

H-501 could not safely operate at this oxygen limit. Operations decided to continuously monitor the fuel gas and adjust air flow to give higher oxygen percentage. Another stack test will be conducted once TSAR finds a solution to get a higher oxygen percentage.

4. Corrective Action Plan Description

A Notice of Violation dated June 19, 2024 was issued to TSAR for failure to stay within oxygen operational limit for H-501.

5. List of Activities/Milestones to Implement the Corrective Action Plan

1. August of 2024, TSAR retained Great Southern Technologies to help develop a path forward towards resolving the Heater H-501 O2 operational limit.
2. On September 24, 2024, Great Southern Technologies traveled to TSAR to evaluate Heater H-501. Montrose Environmental Group (stack testing company) was also present to monitor the NOx emissions and O2% while Great Southern Technologies collected operating data and observed the heater in operation. Great South Technologies recommended modifying the burner circle and replacing the existing conventional burners in H-501 with Ultra Low NOx Burners (ULNB). The ULNB will guarantee a reduction in NOx emissions down to 0.0459 lbs/MMBTU and maintain a strong flame stability. The modified burner cycle would address the adverse flue gas currents, while significantly reducing flame/hot flue gas impingement.
3. In September 2025, TSAR plans to install the ULNB.
4. After installation, and the refinery starts up and gets back to operating at normal conditions, TSAR will schedule to perform a NOx performance test on Heater H-501 and determine a new oxygen operational limit. TSAR will submit a 45-day notification to the TCEQ San Antonio Region of the NOx Performance Test date and submit the NOx Performance Test report to TCEQ within 60 days after completion of the Performance Test.

Process Description of TSAR's Operations

The San Antonio Refinery, LLC (TSAR) facility specializes in producing refined petroleum products. The process begins with crude oil being transported to the refinery via pipeline, where it is stored in floating roof storage tanks (T-401 and T-404) before entering the refining process. The stored crude oil undergoes preheating through various energy recovery heat exchangers. It is then further heated by the crude charge heater and the auxiliary crude heater before being fed into the atmospheric distillation unit (crude tower). The refinery uses a hot oil heater to provide indirect heat to several processing units.

The Ultra-Low-Sulfur Diesel (ULSD) area encompasses the reformer, naphtha hydrotreater, and diesel hydrotreater units, which further refine intermediates received from the crude tower and hot oil heater using additional heaters. Steam from Boiler No. 4 supports various refinery operations. The Isomerization Unit (ISOM), authorized under Permit No. 6113, enhances the production quality of premium gasoline. Cooling Tower No. 2 (EPN CT-2) circulates and cools non-contact cooling water used in the refining process.

The refinery produces a range of products, including gasoline, reformate, LSR/HSR (naphtha), mineral spirits, solvents, kerosene, and jet fuel. These products are cooled and stored in various tanks. A diesel cut is further processed and stored for immediate sale or blending. The atmospheric tower bottoms (ATM), such as No. 4 fuel oil (Oil-4), are cooled and routed to storage tanks. Product distribution occurs through several loading racks, including rail car loading racks (EPNs RL-1, RL-ATB), truck loading racks (EPN L-2, L-3, L-5), an uncontrolled ATB rail car loading rack (EPN RL-ATB), and an uncontrolled jet loading rack (EPN FL-1). Additives are mixed into the product streams from additive storage tanks.

The vapor combustion unit (EPN VCU-1) is interlocked with the rail car loading rack (RL-1) and uses electronic ignition to ignite displaced vapors during loading operations. The process flare (EPN FL-2) controls air emissions from plant upsets, maintenance activities, and various process vessels, including V-38, V-506, 900V20, 901V48, 901V43, and Pump 56 A/B seals. It also manages excess fuel gas associated with the periodic accumulation of light crude during refining.

Dear Senator Gutierrez:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. This application is being processed in an expedited manner, as allowed by the commission's rules in 30 Texas Administrative Code, Chapter 101, Subchapter J. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-98.46,29.348333&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.
