# 1.0 Introduction

DCP Operating Company, LP (DCP) (CN601229917) submits this application to renew Federal Operating Permit (FOP) Number (No.) O2521 for the Southwest Ozona Gas Plant (the Plant) (RN102552726). The Plant is located in Crockett County, which is classified as an attainment county for all criteria pollutants.

Per Title 30 of the Texas Administrative Code (30 TAC) §122.133(2), DCP is required to submit a permit renewal application at least six (6) months, but no earlier than 18 months, prior to the July 21, 2026 expiration date of the existing FOP. Therefore, to avoid expiration of the existing permit and maintain compliance at the site, DCP is submitting this FOP renewal application before the renewal deadline of January 21, 2026.

The following revisions are included as part of the renewal application:

- Add a new fugitive component emission unit and associated applicable requirements,
- Add a generator engine and associated applicable requirements,
- Delete a generator engine and associated applicable requirements,
- Delete two (2) storage tanks from the permit,
- Correct the unit ID for C3516-1B to C3516-1A,
- Correct the descriptions for several existing units in the permit, and
- Add periodic monitoring requirements for several existing units in the permit to use the periodic monitoring option number PM-P-030 listed in the TCEQ Periodic Monitoring Options Table (APDG 5241 v10).

Section 2.0 includes a discussion of Compliance Assurance Monitoring (CAM) and Periodic Monitoring (PM) applicability. Section 3.0 of this document contains a list of all forms included in this revision application.

## 1.3 Facility Overview and Process Description

The Southwest Ozona Gas Plant is a cryogenic gas processing plant. The plant receives incoming gas from two streams; one low-pressure stream and a high-pressure stream. Gas from the low-pressure stream is sent to an inlet separator where entrained liquids, including condensate and water, are separated from the gas. The liquids are piped to storage tanks (GB-601(R), TK-620, PWTK-1, PWTK-2, PWTK-3, PWTK-4, PWTK-5, and PWTK-6). The gas is then routed to the inlet compressor engines (WAUK-1B, WAUK-2B, WAUK-3A, and WAUK-4). After compression, the low-pressure gas joins the high-pressure gas stream.

The combined low and high-pressure streams are routed to inlet slug catchers to further remove liquids from the stream. Liquids separated from the stream are piped to storage tanks. Liquids from the condensate tanks are routed through the condensate stabilizer, which separates the light ends, mostly methane, ethane and propane. The light end vapors are then routed back to the low-pressure inlet stream for recompression and processing. The liquids from the stabilizer are sent to the Ozona Gas Processing Plant via pipeline.

After removal of condensate from the inlet streams, the gas is routed to the mole sieve dehydration system to further remove any entrained water. The media in the mole sieve dehydrators is regenerated by a heat medium heater (SRB-3A) and waste heat recovery from engine exhaust at the site.

The remaining gas contains some acid gases, mostly carbon dioxide (CO<sub>2</sub>) and traces of hydrogen sulfide (H<sub>2</sub>S). The acid gases are removed in the amine treaters (AMINE and AMINERR). The gas comes into contact with the amine, which removes the CO<sub>2</sub> and small amounts of H<sub>2</sub>S from the stream. The amine is regenerated by the amine reboilers (SRB-1 and SRB-4). Overheads from the amine vent are routed to either the flare (FLARE) or heat medium heater for destruction of small amounts of H<sub>2</sub>S and volatile organic compounds (VOC).

The sweet gas is then piped to the cryogenic system, which cools the gas through a series of heat exchangers and the expander. The expander rapidly cools the gas by reducing the pressure of the gas through expansion. The cooled gas is routed to the demethanizer tower which separates the inlet streams into gas and liquid products. The natural gas product from the demethanizer, which consists of mostly methane, exits from the top of the tower and is called residue gas. This

gas flows through a series of heat exchangers which cool the incoming inlet gas. The residue gas is then piped to the residue compressors (16SGTB-1, 16SGTB-2A, and 16SGTB-3). Portions of the gas are used by the fuel burning equipment at the site, such as compressor engines, heaters and the flare pilot. The remaining residue gas is routed offsite to sales via pipeline.

The NGLs from the bottom of the demethanizer tower are routed to a product surge tank. The tank provides capacity to allow for a constant flow of NGL from the system to the pipeline. The sweet NGLs are then delivered to the product pipeline for delivery to the Ozona Gas Processing Plant for further separation.

The refrigeration (propane) system is used to cool the inlet gas which helps liquefy gases heavier than methane. The system is closed and never contacts the process streams. Refrigerant grade propane from a surge tank is routed to a propane chiller, which holds a liquid level. The inlet gas flows through a tube bundle in the chiller and is cooled by the propane. The resulting hot propane vapors are cooled and returned to the surge tank.

Several additional above ground storage tanks, used for the storage of materials such as lube oil, diesel, methanol, amine, antifreeze, water and remediation condensate are located onsite (DIESEL-TK1, DIESELTK2, METH-TK1, METH-TK2, METH-TK3, TANK-1, TANK-2, TANK-3, TANK-4, TANK-5, TANK-6, TANK-7, TK19, TK-20, TK-21, TK-25, TK-30, TK-38, TK-41, and TK-REM).

In addition to the compressor engines, tanks, amine units, and flare, the Southwest Ozona Gas Plant consists of other auxiliary operations which include:

- Fire-water pump engines (FIRE-1 and FIRE-2)
- Generator engine (G3512-1)
- Condensate truck loading emissions (LO-1)
- Produced water truck loading emissions (LOAD)
- Facility fugitive emissions (FUGITIVE)

Figure 1-1 shows the plot plan for the Plant. Figure 1-2 shows the process flow diagram for the Plant.

## 1.4 Current Authorizations

Emissions resulting from the Plant's operations are currently authorized by the Texas Commission on Environmental Quality (TCEQ) with 30 TAC §116.620 standard permit (SP) Registration No. 78352, Permit by Rule (PBR) Registration No. 44707, and unregistered PBRs 106.359 and 106.492.

## 2.0 Compliance Assurance Monitoring and Periodic Monitoring Applicability

### 2.1 Compliance Assurance Monitoring Applicability

Compliance Assurance Monitoring (CAM) is required for any air emission source operating under an FOP if the source meets all of the following criteria, as described in 30 TAC 122.604:

- 30 TAC §122.604(b)(1) – The emission unit is subject to an emission limitation or standard for an air pollutant (or surrogate thereof) in an applicable requirement.
- 30 TAC §122.604(b)(2) – The emission unit uses a control device to achieve compliance with the emission limitation or standard.
- 30 TAC §122.604(b)(3) – The emission unit has pre-control device potential to emit greater than or equal to the amount in tons per year required for a site to be classified as a major source.

Even if the three (3) criteria above are met, CAM does not apply to the following:

- 30 TAC §122.604(c)(1) – Emission limitations or standards proposed by the US EPA after November 15, 1990 under Federal Clean Air Act (FCAA), 111 (Standards of Performance for New Stationary Sources) or 112 (Hazardous Air Pollutants).
- 30 TAC §122.604(c)(2) – Emission limitations or standards under FCAA, Title VI (Stratospheric Ozone Protection).
- 30 TAC §122.604(c)(3) – Emission limitations or standards under FCAA, Title IV (the Acid Rain Program).
- 30 TAC §122.604(c)(4) – Emission limitations or standards that apply solely under an emissions trading program approved or promulgated by the US EPA under the FCAA that allows for trading emissions.
- 30 TAC §122.604(c)(5) – Emission caps that meet the requirements specified in Title 40 Code of Federal Regulations (“40 CFR”) 70.4(b)(12) (State Program Submittals and Transition).
- 30 TAC §122.604(c)(6) – Emission limitations or standards for which an applicable requirement specifies a continuous compliance determination method, unless the

applicable compliance method includes an assumed control device emission reduction factor that could be affected by the actual operation and maintenance of the control device.

- 30 TAC §122.604(c)(7) – Other emission limitations or standards specified as exempt by the US EPA.

Based on the above applicability, no changes to CAM in the existing permit are proposed in this renewal application.

## 2.2 Periodic Monitoring Applicability

Periodic Monitoring (PM) applies to an emission unit at a site provided the unit is subject to an emission limitation or standard in an applicable requirement, as described in 30 TAC 122.604.

PM does not apply to emission limitations or standards where the applicable requirement includes sufficient monitoring that will provide reliable data for the relevant time period associated with compliance with the applicable requirement, as described in Title 30 TAC 122.602(b). Emissions limitations or standards that do not require PM include, but are not limited to, the following:

- 30 TAC §122.602(b)(1) – Emission limitations or standards proposed by the US EPA after November 15, 1990 under FCAA, 111 (Standards of Performance for New Stationary Sources) or 112 (Hazardous Air Pollutants).
- 30 TAC §122.602(b)(2) – Emission limitations or standards under FCAA, Title IV (the Acid Rain Program).
- 30 TAC §122.602(b)(3) – Emission limitations or standards for which an applicable requirement specifies a continuous compliance determination method, unless the applicable compliance method includes an assumed control device emission reduction factor that could be affected by the actual operation and maintenance of the control device.
- 30 TAC §122.602(b)(4) – Other emission limitations or standards specified as exempt by the US EPA.

All applicable requirements for emission units at the site include sufficient monitoring, as described in 30 TAC §122.602(b). However, specific periodic monitoring is being added as part of this renewal application for the TCEQ Chapter 111 Visible Emissions regulation for emissions units that combust only natural gas.

## TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

*Protecting Texas by Reducing and Preventing Pollution*

January 21, 2026

THE HONORABLE ROLAND GUTIERREZ  
TEXAS SENATE  
PO BOX 12068  
AUSTIN TX 78711-2068

Re: Accepted Federal Operating Permit Renewal Application  
Project Number: 39709  
Permit Number: O2521  
DCP Operating Company, LP  
Southwest Ozona Gas Plant  
Ozona, Crockett County  
Regulated Entity Number: RN102552726  
Customer Reference Number: CN601229917

Dear Senator Gutierrez:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-101.466666,30.445833&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Roland Gutierrez
