TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

April 23, 2026

THE HONORABLE BRIAN BIRDWELL
TEXAS SENATE
PO BOX 12068
AUSTIN TX 78711-2068

Re: Accepted Federal Operating Permit Renewal Application

Permit Number: O2945

Ranger, Eastland County
Regulated Entity Number: RN100219534
Customer Reference Number: CN600130348

Dear Senator Birdwell:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-98.716944,32.503888&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Brian Birdwell

1.0 Introduction

Ranger Gas Gathering, LLC (Ranger) (CN600130348) is submitting a site operating permit (SOP) application for the Ranger Gas Plant (RN100219534) to renew Title V SOP Number (No.) O2945. The Ranger Gas Plant is located in Eastland County, which is classified as an attainment county for all criteria pollutants.

Per Title 30 of the Texas Administrative Code (30 TAC) §122.133(2), Ranger is required to submit a permit renewal application at least six (6) months, but no earlier than 18 months, prior to the October 27, 2026, expiration date of the existing SOP. Therefore, to avoid expiration of the existing permit and maintain compliance at the site, Ranger is submitting this SOP renewal application before the renewal deadline of April 27, 2026.

Section 2.0 contains a process description for the facility, Section 3.0 contains a summary of the revisions request, and Section 4.0 contains all required Texas Commission on Environmental Quality (TCEQ) forms for the renewal application.

1.3 Current Authorizations

Presently, emissions resulting from the site's operations are authorized by TCEQ Standard Exemption (SE) Numbers (Nos.) 6, 58, 63, and 105, Permit By Rule (PBR) Nos. §106.512 and §106.352 under PBR Registration No. 95544. Forms OP-REQ1 and OP-PBRSUP in this application contain a detailed listing of these authorizations.

2.0 Process Description

Natural gas from multiple field wells enters the facility via several pipelines into five pig catchers. The gas from the five pig catchers is routed to a single inlet gas separator that catches water and condensate present in the inlet gas. The water and condensate from the inlet gas separator are pumped into either a 300-barrel aboveground storage tank or a 200-barrel aboveground storage tank. Both tank vents are equipped with a system to recycle the vent gas from each tank back to the natural gas inlet stream at the front end of the facility. Each of the tank vents is also equipped with a bypass to the atmosphere that only vents to atmosphere in the unlikely event that the recycle is not operating. Each of the tanks is equipped with an overflow line that empties into the other tank. The water is transferred from each tank to a tank truck for shipment off-site, until only condensate remains in the tank. The condensate from each tank is then transferred to a tank truck for shipment off-site.

The natural gas from the inlet gas separator passes through the first stage inlet gas scrubber to the first compression stage and then through the first stage gas cooler. The natural gas from the first stage gas cooler passes through the second stage scrubber to the second compression stage and then through the second stage gas cooler. The natural gas from the second stage gas cooler passes through the third stage scrubber to the third compression stage and then through the third stage gas cooler to one final scrubber prior to entering the refrigeration portion of the facility. Water and condensate that are separated from the compressed and cooled gas in each scrubber are routed back to the inlet gas separator.

The gas compression at the facility is achieved via four natural gas compressors. These compressors operate as necessary to achieve the desired compression pressure. The compressors are powered by one (1) 1,200-horsepower, two (2) 600-horsepower, and one (1) 215-horsepower reciprocal internal combustion engines. All the engines are fueled using a portion of the compressed outlet natural gas from the facility.

The compressed and cooled gas from the last gas scrubber enters a heat exchanger to further cool the gas prior to the propane refrigeration unit. The gas from the heat exchanger then enters a propane refrigeration unit where it is cooled to a temperature of -10°F to remove NGL from the gas stream. The propane in the refrigeration unit is compressed by a gas compressor powered by a 400-horsepower reciprocal internal combustion engine. This engine is fueled using a portion

of the compressed outlet natural gas from the facility. A lean glycol solution is injected into the gas stream at two locations in the refrigeration area of the facility (prior to the heat exchanger and prior to the propane refrigeration unit) to dehydrate the compressed gas. The facility is also equipped with a completely enclosed methanol injection system which is used to inject methanol into the refrigeration system, as necessary, to prevent freezing.

After cooling in the heat exchanger and propane refrigeration unit, the gas enters a three-phase separator. In this vessel, the NGL and rich glycol are separated from the dehydrated natural gas. The NGL goes through a flash drum and recovery tower before temporary storage in a 33,000-gallon pressurized product surge tank until it is sent off-site via pipeline. The light ends from the flash drum are recycled to the propane refrigeration unit. A portion of the dehydrated natural gas is used to fuel the compressor engines and the glycol dehydrator reboiler heater, with the remaining portion of gas sent off-site via pipeline. The rich glycol is recycled to the on-site glycol dehydration unit.

The glycol dehydration unit regenerates the rich glycol by heating the solution of ethylene glycol and water in a reboiler heated by a 2.0 million British thermal units per hour (MMBtu/hr) natural gas fired heater. This process removes the excess water from the ethylene glycol solution to generate lean glycol (80% ethylene glycol/20% water) that is recycled back to the refrigeration area of the facility for injection into the gas stream. The vent gas from the reboiler is recycled back to the natural gas inlet stream at the front end of the facility. The vent from the reboiler is also equipped with a bypass to the atmosphere that only vents to atmosphere in the unlikely event the recycle is not operating.

Fugitive emissions from process areas of the plant are emitted from various equipment components such as valves, flanges, connectors, etc.

There are also two fuel storage tanks near the maintenance area that store fuel for use in plant vehicles and maintenance equipment. One of the tanks stores gasoline and the other tank stores diesel fuel. The plant operates the following emission sources at the site.

- One (1) Cooper-Bessemer GMVA4 400 horsepower (HP) internal combustion compressor engine (Unit ID: ENG1)
