Public Involvement Plan Form for Permit and Registration Applications

The Public Involvement Plan is intended to provide applicants and the agency with information about how public outreach will be accomplished for certain types of applications in certain geographical areas of the state. It is intended to apply to new activities; major changes at existing plants, facilities, and processes; and to activities which are likely to have significant interest from the public. This preliminary screening is designed to identify applications that will benefit from an initial assessment of the need for enhanced public outreach.

All applicable sections of this form should be completed and submitted with the permit or registration application. For instructions on how to complete this form, see TCEQ-20960-inst.

Section 1. Preliminary Screening

- New Permit or Registration Application
 New Activity - modification, registration, amendment, facility, etc. (see instructions)

If neither of the above boxes are checked, completion of the form is not required and does not need to be submitted.

Section 2. Secondary Screening

- Requires public notice,
 Considered to have significant public interest, **and**
 Located within any of the following geographical locations:

- Austin
- Dallas
- Fort Worth
- Houston
- San Antonio
- West Texas
- Texas Panhandle
- Along the Texas/Mexico Border
- Other geographical locations should be decided on a case-by-case basis

**If all the above boxes are not checked, a Public Involvement Plan is not necessary.
Stop after Section 2 and submit the form.**

- Public Involvement Plan not applicable to this application. Provide **brief** explanation.

Not expected to have significant public interest.

3. PROCESS DESCRIPTION

The plant is comprised of a Linear Alpha Olefins (LAO) train and a Poly Alpha Olefins (PAO) train. The LAO train includes ethylene displacement, ethylene chain growth, pressure separation, vacuum separation, butene displacement, light olefins separation, crude pretreatment, distillation, product storage, and loading.

In the Ethylene Displacement section, ethylene is fed via pipeline and contacted with high molecular weight aluminum alkyls (grown alkyls, fed from the Vacuum Separation Section) at high temperature and moderate pressure to displace the alkyls from the aluminum catalyst with ethylene, resulting in the release of higher molecular weight olefins. The heavy olefins are separated from the product stream and routed to the Crude Pretreatment Section. The product stream (light to mid-range olefins and catalyst) is routed to the Ethylene Chain Growth section. Prior to entering the Chain Growth section, the product stream receives makeup catalyst from a totally enclosed stationary vessel which is not open to the atmosphere.

In the Ethylene Chain Growth section, the catalyst and product olefins from the ethylene displacement are contacted with additional ethylene (recycled ethylene from light olefins separation) at moderate temperature and high pressure to allow a reaction between ethylene and the catalyst to produce grown alkyls. The product stream from this section is routed to the Pressure Separation section, where light olefins are separated from the product. These light olefins are routed to the Light Olefins Separation section and the grown alkyls and remaining olefins are routed to the Vacuum Separation section, where the grown alkyls are further concentrated by separating the mid-range olefins through vacuum flash and vacuum distillation. The mid-range olefins stream is routed to the Crude Pretreatment section. The grown alkyls stream is recycled to the beginning of the process: one portion to the Ethylene Displacement section and the other portion to the Butene Displacement section of the Peaking Loop. In the Butene Displacement section, a portion of recycled grown alkyls is contacted with recycled butene to displace the alkyls from the aluminum catalyst and release higher molecular weight olefins. Light olefins are separated and routed to the Light Olefins Separation, where ethylene is separated and routed back to the Ethylene and Butene Chain Growth Sections (ethane is separated and routed to offsite users via pipeline; butene is separated and routed back to Butene Displacement; butane and butene isomers are separated (mixed C4) and routed to offsite users via pipeline, and the product is routed to the Crude Pretreatment section).

In the Crude Pretreatment section, trace amounts of catalyst remaining in the product streams are deactivated by injecting small amounts of oxygen and alcohol. The alcohol used is a C8 alcohol. The treated product stream (Crude Olefins) is routed to the Product Distillation section, where the Crude Olefins stream from the Crude Pretreatment section is fractionated into product olefins by distillation. Product olefins include, but are not limited to, the following type of compounds or mixtures: hexene, octene, decene, dodecane, tetradecane, hexadecene/octadecene (blend) and byproducts: eicosene/docosene/tetracosene (blend), and hexacosene+. The C6 through C26 products (hexene through hexacosene+) are routed to the Product Storage and Loading facilities. In addition, C6 isomers are separated and sent to offsite users via pipeline. The Butene Displacement product stream is sent to the Butene Chain Growth section, where the catalyst and product olefins stream is contacted with ethylene. The purpose of the butene chain growth section is to allow reaction between ethylene and the catalyst to produce grown alkyls. The product stream from this Butene Chain Growth is routed to the Pressure Separation Section.

The Product Storage and Loading section consists of API storage tanks (both floating roof and fixed roof), load out pumps, two (2) truck and six (6) railcar loading stations and a vapor recovery system with a thermal oxidizer (EPN: THOX). In addition, a marine loading dock will loadout products to barges, and utilize a marine vapor combustor unit (MVCU) to control higher vapor pressure product barge loading (EPN:

MVCU). Most of the storage tanks are equipped with recirculating lines, which provide hydraulic mixing of products. Storage tanks containing C10 or lighter have internal floating roofs, and tanks with products C20 and higher have bayonet heaters used primarily for startup and shutdown of the tanks (when hot product is not already occupying the tank). Products can be routed to a single Product Rework tank (EPN: T-7802, internal floating roof) for temporary storage until the material can be returned to the process.

The T-7962 Alcohol Storage Tank stores the C8 alcohol used for Crude Pretreatment (as previously described). Aqueous ammonia tank will store approximately 30% aqueous ammonia for use in the hot oil heater selective catalyst reduction (SCR) system. This tank is designed to maintain pressure sufficient at all times to prevent tank emissions to the atmosphere. Alternatively, INEOS Oligomers may receive ammonia via pipeline from adjacent facilities. The truck and railcar loading stations are equipped with vapor recovery systems to capture vapors from the loading of higher vapor pressure products (hexene and octene), and route them to THOX for VOC emission control. Uncollected loading emissions are emitted as fugitives to the atmosphere (EPN: L-1). The marine loading dock is designed to utilize a vacuum collection system to capture vapors of higher vapor pressure products during barge loading; vapors are routed to the MVCU for VOC emission control. For lower vapor pressure barge loading, uncaptured loading vapors are emitted as fugitives (EPN: BARGELOAD).

The Poly Alpha Olefins (PAO) train includes a group of reactors, catalyst recovery, caustic wash, monomer separation, hydrogenation, distillation, product storage, and loading. Both trains will utilize the site thermal oxidizer, flare system, hot oil system, and cooling tower.

In the Reaction Section, 1-decene is fed into a series of four stirred reactions and one plug flow reactor. The 1-decene feed is fed to the Reaction Section of the process via pipeline. In the presence of a catalyst complex, an exothermic reaction occurs which begins to oligomerize the 1-decene monomer. The reaction is assisted by a gaseous co-catalyst mixture, boron trifluoride (BF₃), which is supplied from the Catalyst Recovery Section. The heat of reaction will be removed by a propane refrigeration system. Crude PAO products leave the Reaction Section and are fed to the Catalyst Recovery Section. In the Catalyst Recovery Section, unused co-catalysts and catalyst complex are recovered using flash gas and liquid separation. BF₃ is fed via pressurized truck-based cylinders; propanol is fed via a storage tank. Crude PAO exits the Catalyst Recovery Section for the Caustic Wash Section, while the BF₃ gas stream is recycled to the Reaction Section. In the Caustic Wash Section, any remaining catalyst dissolved in the crude PAO or off gas from the PAO reactors is removed by a caustic solution in the caustic wash drum. Make-up caustic supplied by the caustic tank ensures that there is an excess of caustic soda in the water phase. When contacted with the caustic solution, the catalyst and caustic react to form a solution of salt, water, and propanol called the sodium fluoroborate solution. The sodium fluoroborate solution is sent to storage tanks. The caustic scrubber off-gas is routed to THOX. The crude PAO is then sent to a water wash drum to dissolve and remove any remaining salts, and then the crude PAO is piped to the Crude PAO Intermediate Storage Tank before being routed to the Monomer Separation Section.

In the Monomer Separation Section, the crude PAO stream is heated in the monomer distillation column to flash any unreacted 1-decene monomer from the product; this 1-decene is sent to the Fuel Decene Tank (EPN: T-7721). Crude PAO from the column bottoms is then routed to the Hydrogenation Section, where the PAO product is hydrogenated using hydrogen gas to remove the unsaturated bonds and stabilize the product. Crude PAO product from the hydrogenation section is sent to a series of columns for product refinement and purification; the 2cST, 4cST, 6cST and 8cST PAO products are routed to the tank farm for storage. The PAO product storage and loading section consists of API storage tanks (both floating roof and fixed roof), load out pumps, two (2) truck loading stations, two (2) railcar loading stations, and barge loading. Storage tanks containing crude PAO products are fixed roof tanks storing low vapor pressure

materials. Part of the product storage and loading section consist of a product rework tank, specifically a single vertical fixed roof API tank (EPN: T-7729); products can be routed to the product rework tank for temporary storage until the material can be returned to the process. A vertical fixed roof API tank (T-7531) stores sodium hydroxide solution (for use in the caustic scrubber) and two internal floating roof API tanks (FINs: T-7532) store sodium fluoroborate solution before being trucked off site. The alcohol storage tank is an internal floating roof API Tank (FIN: T-7712) used to store the propanol used in the Catalyst Recovery Section (as previously described). The vapors from the floating roofs are routed to THOX. The truck loading stations are not equipped with vapor capture and recovery for PAO product loading, as the products loaded are low vapor pressure materials; loading losses are emitted as fugitives to the atmosphere (EPN: L-2). Vapor recovery, which returns vapors to the storage tanks, will be employed for the truck loading of sodium fluoroborate solution.

FLR-1 is used for MSS activities at the PAO Plant as well as the PAO plant's flare header. The PAO plant routine waste gas streams to the flare are sweep gas and relief valve leaks. The hot oil heater and hot oil system (EPN: HTR-1) is utilized for heat transfer fluid throughout the process in the PAO Plant. THOX controls waste gas streams from the PAO plant and may also be utilized for MSS activities at the PAO Plant. Cooling water is supplied from a new cell installed in the LAO Cooling Tower System (EPN: CT-1). The new cell consists of counterflow cooling tower cells with mechanical draft. Water treatment chemicals are metered into the basin of the cooling towers to control corrosion of steel equipment and piping. Gaseous chlorine or chlorinated compounds may be used as a biocide.

Dear Senator Huffman:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) initial issuance application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-95.199511,29.231403&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.
