Kyle,

Attached are the requested files. For MEOHMT9802, it was authorized as an amendment to NSR Permit 103626. It does not have the same PSD/Nonattainment/GHG applicability that the original unit had. MEOHMT9802 is the only emission source in the Title V permit that is like this as the other sources in the project had pervious applicability to the PSD/NA permit numbers. So, while all the permit numbers are combined into one document, I just want to make sure that we have it listed correctly whether it is just 103626 or all the permit numbers.

Thank you,

Good afternoon Jim,

We are on track to issue the PNAP as early as tomorrow afternoon. My team leader completed her review of your application today and pointed out a few minor issues that require updates from you. Please provide a response for the following by **noon tomorrow, 07/08.** Thank you!

- **Form OP-1 – Page 4 – Question X.I. –** This was answered "Yes" indicating there are units not in compliance with their respective applicable requirements, but I did not see a compliance plan filled out in the application. Form OP-ACPS dated 06/17/2026 indicates all units are in compliance. Please update the question to "No" and provide me with an updated page.
- **NSR Permit GHGPSDTX25 –** Please update the issuance date on Page 88 of the OP-REQ1 to 10/11/2024. I have updated this date in the Major NSR Summary Table and in the NSR Authorizations Table of your permit.
- **Unit ID MEOHMT9802 –** I added N164, PSDTX1296, and GHGPSDTX25 as Preconstruction Authorizations for this unit. No updates are required from you, but I wanted to let you know.

Let me know if you have any questions. Thank you!

Sincerely,

Kyle,

For my comments on the working draft permit, they are covered by the changes I made in the OP-REQ1. It appears that I copied over incorrect information from a previous application. I have attached the updated OP-REQ1 and tracked changes. The changes should also address the registered PBR in Section XII.I.

For OP-PBRSUP, we previously claimed PBRs that we could potentially use, but have not actually used. These were all listed in the permit and why we used N/A for the Unit ID. Since there is only currently the one registered PBR being used, I removed all the excess PBRs and have included the updated form. Since there is no periodic monitoring for fugitive components in the PM guidance document, I indicated the mentoring program (28LAER) that these components are currently following according to the PBR registration.

I can confirm that the Major NSR Summary Table is correct and I have no changes to make.

I will add these files into STEERS tomorrow for certification.

Subject: [EXT]WDP -- FOP O3678/Project 40439, Fairway Methanol LLC, Clear Lake Plant Methanol Unit

Good afternoon Jim,

I have conducted a technical review of the renewal/minor revision application for Fairway Methanol LLC, Clear Lake Plant Methanol Unit. An electronic copy of the Working Draft Permit (WDP) is attached for your review. This WDP contains the TCEQ determination of applicable requirements based on the information submitted in your application, and any updates provided. Please review the WDP and submit to me any comments you have on the working draft permit by **COB Wednesday, July 1st.** Please also provide a response for the following:

- **Form OP-PBRSUP**
    - **Table B –** The OP-PBRSUP should be a comprehensive list of all PBR authorizations used in the permit area, even if the unit/source does not appear in the permit. We understand that some sources have no other potentially applicable requirements besides the PBR and will only appear on the OP-PBRSUP, so if those sources do not normally have a unit ID, you will need to create one just for use on the OP-PBRSUP. Please update each "N/A" throughout each table with a Unit ID to give some idea of what the PBR is authorizing.
    - **Table C –** PBR 106.511/09/04/2000 should not be listed on Table C according to the form instructions. Please add to either Table A/B and then to Table D as well. Please also associate a Unit ID with this PBR according to the instructions above.
    - **Table D –** Please be sure to update the Unit ID on this Table as well. In addition, "N/A" is not acceptable to be listed in the Monitoring Requirement column. The statement should be specific enough to indicate what is being monitored and/or recorded in order to satisfy periodic monitoring for compliance with the PBR and 106.4 general limits. Please add more detail.
        - **Unit ID MEOHFUG –** 106.261/11/01/2003 [175830] should be listed on Table D as well, with an appropriate Monitoring Requirement description.
- **Form OP-REQ1 –** Each PBR listed on the OP-PBRSUP should be listed on Page 89, Section XII.I of the OP-REQ1 (and vice versa). Please update and provide a copy.
- **Major NSR Summary Table –** Please review the attached Tables in Appendix B for accuracy and make any necessary changes utilizing "Tracked Changes Mode" so I can review them.

Let me know if you have any questions. Thank you!

Sincerely,

Kyle J. Murray

Hey Jim,

I missed that while glancing over the latest version of the draft permit (I was only looking for units subject to 61). Yes, you should keep that checked yes. Thanks for reaching out.

Kyle,

I'll have these updates done pretty quickly, but I did have one quick question for Question VII.A.1 – Page 25.

As a site, we are subject to Subpart FF (Benzene Waste), but meet the 1 megagram exception. We have had the term in the special terms and conditions of the permit.

Should I keep that checked yes, even though we do not have any specific units subject the a Subpart 61, or uncheck even though we have sitewide Subpart FF applicability?

Thank you,

In addition, I wanted to let you know that EPA has, on occasion, objected to Title V permits based on the following:
a. NSR permit and PBR monitoring sufficiency –please refer to our periodic monitoring guidance for reference of monitoring that EPA has, so far, considered sufficient.
b. Reference to confidential business information (CBI) in NSR permits and PBR submittals.
c. High level terms in the SOP Applicable Requirement Summary Table. The high level terms are sometimes used in SOPs when unit attribute forms have not yet been updated due to regulatory amendments.
d. Accuracy of PBR information provided on the supplemental table and in the permit – please refer to Forms OP-PBRSUP and OP-REQ1 Instructions.
If you have any questions or concerns on any of these items or think you need to do any additional updates, let me know and we can discuss further.

Application updates may now be submitted through Title V STEERS. Any application updates that are submitted by the RO/DAR through STEERS are certified and do not require the submittal of an original signature OP-CRO1. Application updates that are provided through email or physical mail require certification using an original signature OP-CRO1.

Please notify me when these updates have been submitted.

As required on Form OP-1, question IV.D, please remember the FOP application and all application updates must be submitted to EPA Region 6 at R6AirPermitsTX@epa.gov and to the TCEQ regional office having jurisdiction. This submittal information can be found on our website at Where to Submit FOP Applications and Permit-Related Documents.

Please review the "SOP Technical Review Fact Sheet" located at http://www.tceq.texas.gov/assets/public/permitting/air/Guidance/Title_V/sop_wdp_factsheet.pdf. This guidance contains important information regarding the review process and application update procedures. Contact me if you have any questions regarding the guidelines, the project schedule, or any other details regarding your application or permit.

Let me know if you have any questions. Thank you!

Dear Senator Middleton:

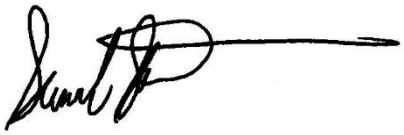

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) renewal application for a site located in your district. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. https://gisweb.tceq.texas.gov/LocationMapper/?marker=-95.063888,29.621388&level=13.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

SECTION 4
SUPPLEMENTAL INFORMATION

4.1 Process Description

In general, methanol is synthesized from a mixture of carbon monoxide (CO), carbon dioxide (CO_2) and hydrogen (H_2) (otherwise known as synthesis gas) over a catalyst at elevated pressures and temperatures. Methanol and water products are separated out from any unreacted components. The water and methanol are then separated and the final product sent to storage.

The synthesis gas used in this process is produced by steam reforming and oxygen reforming of natural gas. In this process, pipeline natural gas is compressed, preheated, treated to remove sulfur, saturated with process water, mixed with steam, and reheated. The natural gas/steam mixture is fed to the Primary reformer where a portion of the methane is converted to synthesis gas by reaction with steam inside of externally-heated, catalyst-filled tubes. Heat input to the Primary reformer is provided by the combustion of natural gas and a purge stream taken from the converter loop to remove inert gases (nitrogen, argon and methane) and excess H_2. Heat is recovered from the flue gases from the Primary reformer prior to venting the flue gases to atmosphere by super-heating steam, reheating the natural gas/steam mixture fed to the primary reformer, preheating the natural gas feed to the sulfur removal system and preheating combustion air.

The partially reformed gas stream from the Primary reformer is sent to the Secondary reformer where it is reacted with oxygen and the remaining methane converted to synthesis gas. Combustion emissions from the Primary reformer are routed to a single stack (EPN: REFORM). The process synthesis gas leaving the Secondary reformer is cooled, compressed and sent to the converter loop where CO, CO_2, and H_2 are reacted to produce crude methanol, a mixture of methanol and water. Process streams including the synthesis gas and converted methanol will be monitored using process analyzers. Most of the steam that is required to operate the Methanol plant is produced by heat recovery from the synthesis gas leaving the secondary reformer; the remainder is produced by heat recovery from the Methanol converters.

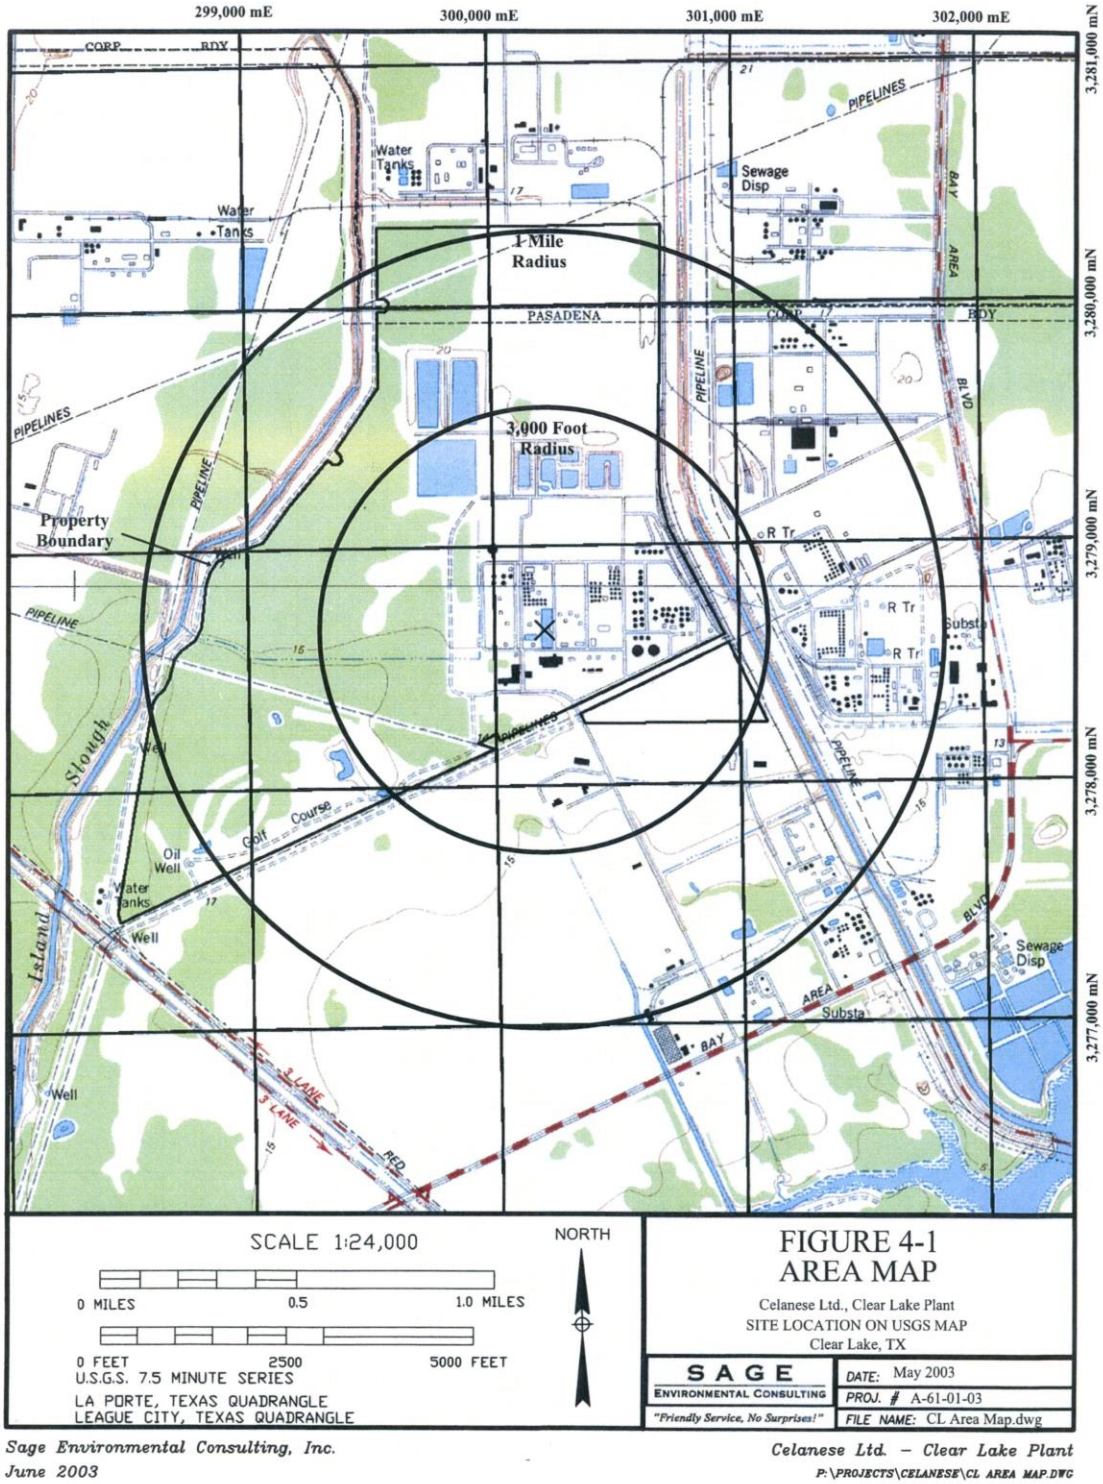

The crude methanol is sent to a three-column distillation train. Light ends are taken overhead in the first column and combined with the purge stream from the converter loop. About 60% of the finished methanol is taken overhead in the second column. The residue from the second column feeds a third column. The remainder of the finished methanol is taken overhead in the third column. A side stream from the third column is recycled to the Saturation system. The process water stream from the bottom of the third column is also recycled to the Saturation system. Finished methanol will be sent to the storage area. The storage area consists of five existing fixed-roof storage tanks and a proposed new storage tank. All of the tank vents will be routed to the Tank Farm Vent Scrubber (EPN: T9801ST).

Finished methanol is fed to the on-site Acetic Acid plant or shipped off-site by existing truck, railcar and/or pipeline facilities. Celanese currently has truck and railcar

loading facilities to ship methanol. The loading emissions are controlled by thermal oxidizers owned and operated by a 3rd Party. The additional methanol produced will be shipped off-site via pipeline; therefore, throughputs through the railcar and truck facilities are not expected to increase as a result of this project.

There are several other sources that will be associated with the operation of the Methanol Plant. A flare (EPN: MEOHFLR) will be available to control emissions as appropriate from Maintenance, Start-up, or Shutdown (MSS) activities or emergency vents. A back-up diesel emergency generator (EPN: MEOHENG) will be located in the Methanol Unit and will be used for back-up power. The cooling tower will be subject to 40 CFR 63 Subpart F monitoring.

Good morning,

As we discussed, this renewal application will be processed as an untimely renewal application. Since the project is in untimely status, failure to issue the renewal prior to permit expiration on October 6, 2026, will result in permit expiration according to 30 TAC § 122.241(g). Upon expiration, the site will lose authorization to operate until a new Title V Permit is issued.

This application will need to be expedited using the expedited air permitting program according to the instructions in our STEERS application submittal guidance (TCEQ RG-531c - A Guide to Obtaining Title V Permits in STEERS ePermits beginning on Pg. 35). We will notify you once a project has been created so that you can submit the renewal application and expedited request in STEERS.

In the event we determine that the permit cannot be renewed prior to permit expiration, we will direct you to submit a new initial issuance application for the site. This initial issuance application will not provide an application shield, and the site would not be authorized to operate after expiration of the current permit/prior to issuance of the new permit.

I recommend reaching out to the regional office to make them aware of the situation. Let them know that you are working with Air Permits to issue the permit.

Please let me know if you have any questions.

Thank you,
Rhyan

Good afternoon, James,

I am Jennifer's team leader. She sent your message to me to ask how we should respond. Looking at our database, you are now outside of the 6–18-month window to submit a timely renewal. You are under 6 months, which would make your renewal untimely. You will need to call my section manager, Rhyan Stone, to discuss the path forward with keeping this permit active. Please call him tomorrow, as time is critical.

Thank you.

Jennifer,

I just tried to access STEERS for this application and received an error message. "A timely renewal application has not been submitted for this permit. Please contact the Air Permits Division at AIRPERM@tceq.texas.gov to discuss how to proceed."

It looks like we should have been processing this as a renewal as well. Is that still possible. Is there a way to resolve this with this application cycle? Or will I need to submit a renewal application separately.

Subject: Technical Review -- FOP O3678/Project 39247, Fairway Methanol LLC/Clear Lake Plant Methanol Unit

Good Morning,

I have been assigned to the Federal Operating Permit (FOP) revision application of Permit No. O3678 for Fairway Methanol LLC, Clear Lake Plant Methanol Unit. This application has been assigned Project No. 39247. Please address all correspondence pertaining to this permit application, including any updates, to me at the address below, and use both the Permit and Project reference numbers above to facilitate tracking.

In addition, I wanted to let you know that EPA has, on occasion, objected to Title V permits based on the following:
a. NSR permit and PBR monitoring sufficiency –please refer to our periodic monitoring guidance for reference of monitoring that EPA has, so far, considered sufficient.
b. Reference to confidential business information (CBI) in NSR permits and PBR submittals.
c. High level terms in the SOP Applicable Requirement Summary Table. The high level terms are sometimes used in SOPs when unit attribute forms have not yet been updated due to regulatory amendments.
d. Accuracy of PBR information provided on the supplemental table and in the permit – please refer to Forms OP-PBRSUP and OP-REQ1 Instructions.
If you have any questions or concerns on any of these items or think you need to do any additional updates, let me know and we can discuss further.

Application updates may now be submitted through Title V STEERS. SECTION 4
SUPPLEMENTAL INFORMATION

4.1 Process Description

In general, methanol is synthesized from a mixture of carbon monoxide (CO), carbon dioxide (CO_2) and hydrogen (H_2) (otherwise known as synthesis gas) over a catalyst at elevated pressures and temperatures. Methanol and water products are separated out from any unreacted components. The water and methanol are then separated and the final product sent to storage.

The synthesis gas used in this process is produced by steam reforming and oxygen reforming of natural gas. In this process, pipeline natural gas is compressed, preheated, treated to remove sulfur, saturated with process water, mixed with steam, and reheated. The natural gas/steam mixture is fed to the Primary reformer where a portion of the methane is converted to synthesis gas by reaction with steam inside of externally-heated, catalyst-filled tubes. Heat input to the Primary reformer is provided by the combustion of natural gas and a purge stream taken from the converter loop to remove inert gases (nitrogen, argon and methane) and excess H_2. Heat is recovered from the flue gases from the Primary reformer prior to venting the flue gases to atmosphere by super-heating steam, reheating the natural gas/steam mixture fed to the primary reformer, preheating the natural gas feed to the sulfur removal system and preheating combustion air.

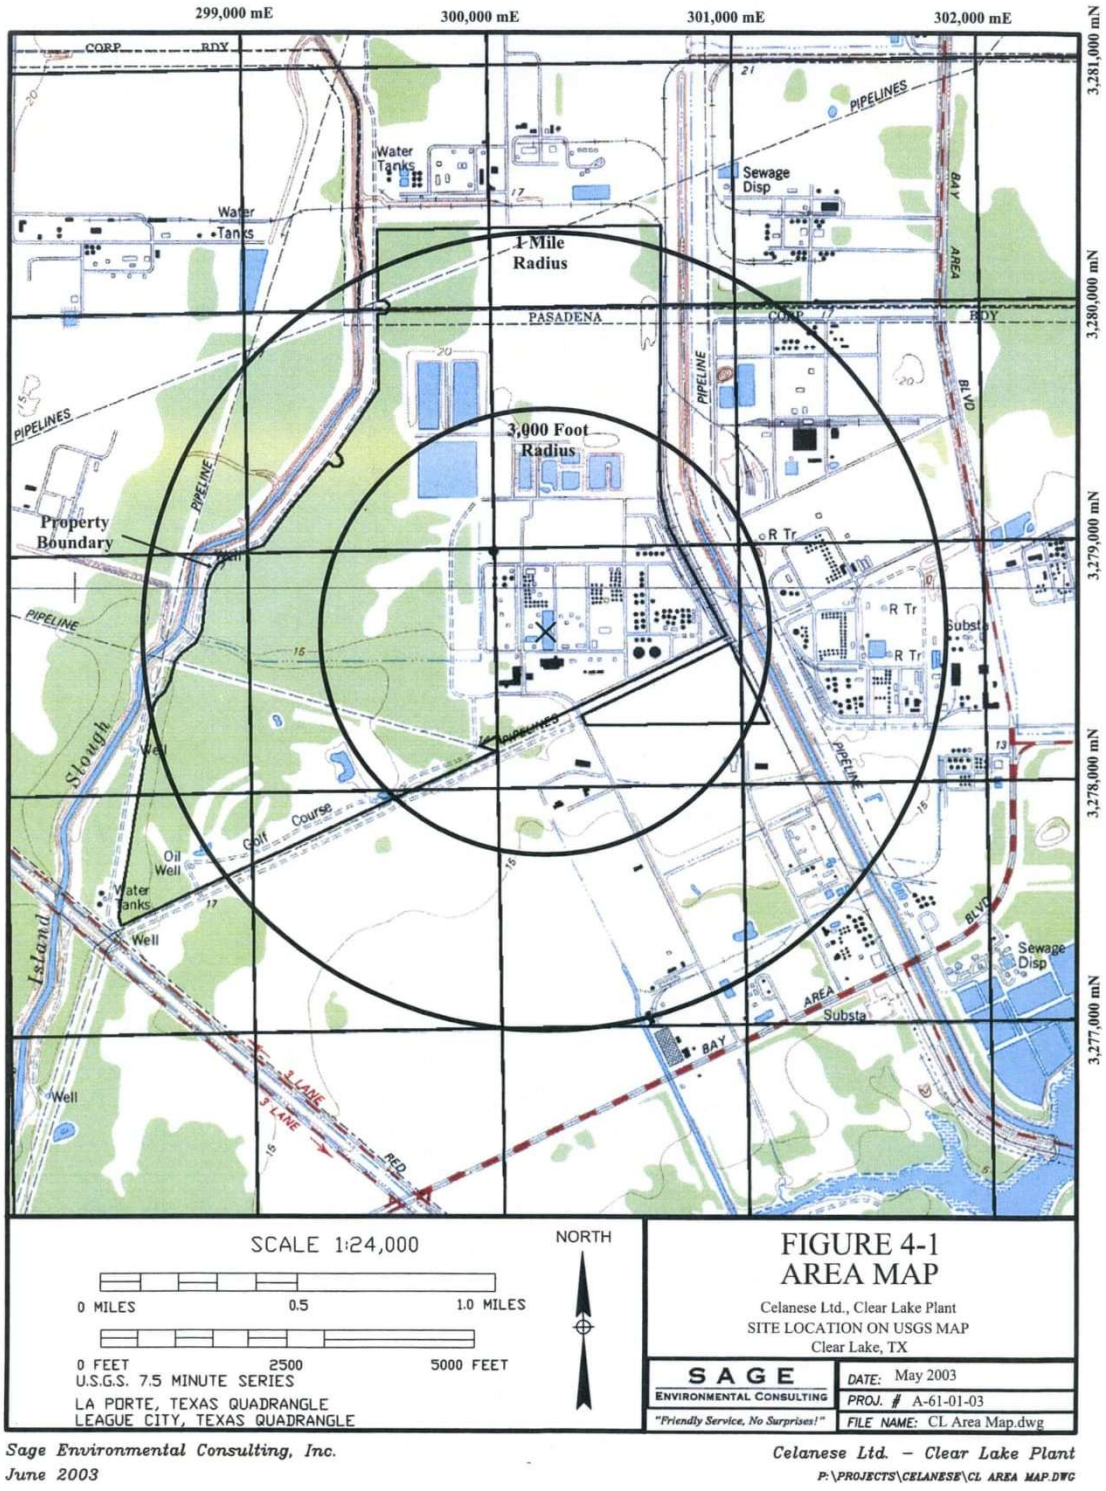

The partially reformed gas stream from the Primary reformer is sent to the Secondary reformer where it is reacted with oxygen and the remaining methane converted to synthesis gas. Combustion emissions from the Primary reformer are routed to a single stack (EPN: REFORM). The process synthesis gas leaving the Secondary reformer is cooled, compressed and combined with additional Hydrogen and Carbon Dioxide from the CO2 Purification Unit. The CO2 Purification Unit receives waste CO2 and removes impurities that may foul catalyst in this reaction section. This mixture is sent to the converter loop where CO, CO_2, and H_2 are reacted to produce crude methanol, a mixture of methanol and water. Process streams including the synthesis gas and converted methanol is monitored using process analyzers. Most of the steam that is required to operate the Methanol plant is produced by heat recovery from the synthesis gas leaving the secondary reformer; the remainder is produced by heat recovery from the Methanol converters.

The crude methanol is sent to a three-column distillation train. Light ends are taken overhead in the first column and combined with the purge stream from the converter loop. About 60% of the finished methanol is taken overhead in the second column. The residue from the second column feeds a third column. The remainder of the finished methanol is taken overhead in the third column. A side stream from the third column is recycled to the Saturation system. The process water stream from the bottom of the third column is also recycled to the Saturation system. Finished methanol is sent to the storage area. The storage area consists of five existing fixed-roof storage tanks and a proposed new storage tank. All of the tank vents are routed to the Tank Farm Vent Scrubber (EPN: T9801ST).

Finished methanol is fed to the on-site Acetic Acid Units or shipped off-site by existing truck, railcar and/or pipeline facilities. Celanese currently has truck and railcar loading facilities to ship methanol. The loading emissions are controlled by thermal oxidizers owned and operated by a 3rd Party. Additional methanol produced is shipped off-site via pipeline.

There are several other sources that are associated with the operation of the Methanol Plant. A flare (EPN: MEOHFLR) is used control emissions as appropriate from Maintenance, Start-up, or Shutdown (MSS) activities or emergency vents. A back-up diesel emergency generator (EPN: MEOHENG) is located in the Methanol Unit and is used for back-up power. The Methanol cooling tower (EPN: MEOHMT) is subject to 40 CFR 63 Subpart F. The CO2 Cooling Tower (EPN: MEOHMT9802) is subject to 30 TAC Chapter 115 Subpart H.
