TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Protecting Texas by Reducing and Preventing Pollution

August 3, 2026

THE HONORABLE ADAM HINOJOSA
TEXAS SENATE
PO BOX 12068
AUSTIN TX 78711-2068

Re: Accepted Federal Operating Permit Initial Issuance Application
Project Number: 40766
Permit Number: O4947
Valley Co-op Oil Mill
Harlingen Facility
Harlingen, Cameron County
Regulated Entity Number: RN102261021
Customer Reference Number: CN600129738

Dear Senator Hinojosa:

This letter notifies you that the Texas Commission on Environmental Quality has received a federal operating permit (FOP) initial issuance application for a site located in your district. This application is being processed in an expedited manner, as allowed by the commission's rules in 30 Texas Administrative Code, Chapter 101, Subchapter J. As part of this permitting process, the applicant is required to publish a formal newspaper public notice. The notice will inform the public of their right to make comments or request a public hearing. This link to an electronic map of the site or facility's general location is provided as a public courtesy and not part of the application or notice. For exact location, refer to application. <https://gisweb.tceq.texas.gov/LocationMapper/?marker=-97.718333,26.209722&level=13>.

The FOP program regulates both new and existing major sources of emissions. The goal of the program is to improve air quality in Texas through increased compliance by codifying existing applicable regulatory requirements into the FOP. The FOP provides the applicant authorization to operate the equipment at the site. The FOP identifies and codifies air emission requirements (known as applicable requirements) that apply to the emission units at the site. The FOP does not authorize construction of emission units or emissions from those units. The New Source Review (NSR) permit is the mechanism for these authorizations.

The Honorable Adam Hinojosa

1. EXECUTIVE SUMMARY

Valley Co-op Oil Mill (Valley Co-op) owns and operates a cottonseed oil processing mill located at 1901 N. Expressway 77 in Harlingen, Cameron County, Texas (Harlingen Facility). Valley Co-op has been assigned Texas Commission on Environmental Quality (TCEQ) Customer Reference Number (CN) 600129738, and the Harlingen Facility is identified as TCEQ Regulated Entity Reference Number (RN) 102261021. Cameron County is currently classified as an attainment area for all criteria pollutants. The Harlingen Facility is classified as a major source with respect to the Title V operating permit program. Additionally, the Harlingen Facility is a major source of Hazardous Air Pollutants (HAPs).

This application is being submitted and expedited as an initial Title V operating permit application for the Harlingen Facility. The site does not have an existing Title V operating permit number.

The enclosed initial Site Operating Permit (SOP) application for the Harlingen Facility includes all required TCEQ forms and supporting information.

3. PROCESS DESCRIPTION

The manufacture of vegetable oil from cottonseed generally involves seed preparation and conditioning, oil extraction, solvent/oil separation, desolventization and treatment of desolventized flakes, and finally oil refining. Short-cut lint is removed from the clean seeds in a delinting process. The clean seed (now termed black seed) is then hulled to remove the outer seed hulls from the inner seed meats. Solvent extraction is then used to separate the cottonseed oil from the seed meats. Solvent extraction is the most efficient method of recovering oil from most oil-bearing seeds. Valley Co-op uses n-hexane-based solvent, which is the most common solvent used in commercial continuous edible oil extraction systems. The general process descriptions for the operations at the Harlingen Facility are provided in the following paragraphs.

3.1 Seed Receiving and Storage

The Harlingen Facility receives cottonseed by truck. Each truck is weighed by existing on-site scales before being sent to one of two seed dumps. The trucks are unloaded at the seed dumps by being elevated to a 45-degree angle. The cottonseed is released from the rear of the truck and dumped into a hopper. The cottonseed is then distributed to storage houses. Mechanical conveying is used to transfer cottonseed at this point in the process since pneumatic conveying could result in cottonseed damage. At Dump No. 1, a cyclone (Emission Point Number [EPN] AA) is periodically used to transfer a pneumatic stream from the seed houses.

3.2 Seed Cleaning

Once ready for processing, the cottonseed is mechanically conveyed to the cleaning room and is then processed through the cottonseed cleaners. The cottonseed cleaners separate leaves, twigs, grabbots, and fly lint from seed. Clean seed then passes to a rock and shale trap. Lint and trash are collected by cyclones F1-F5, while grabbots are sent to the Hammermill. From the rock and shale trap, clean seed passes to the 1st Cut Lint Cleaners.

3.3 Delinting and Lint Cleaning

The 1st Cut Linters remove the longest lint from the cottonseed. During the process of removing lint from cottonseed, some cottonseed parts and foreign material remain caught in the lint. The 1st Cut Lint Cleaners are used to clean the lint. These machines beat, stir, and convey the lint over perforated metal, which is sized to remove the various sizes of foreign material. Motes are combined with the motes from the separation room and cleaned in the motes cleaner. Motes are transferred from the motes cleaner to the motes baling press and baled.

The partially delinted cottonseed from the 1st Cut Linters is conveyed to the 2nd Cut Linters. As with the 1st Cut Linters, some cottonseed parts and foreign matter remain caught in the lint. The lint from the 2nd Cut Linters, with recycle lint from the cleaners, is cleaned in the 2nd Cut Lint Cleaners. Shale and pepper from the 2nd Cut Linters is treated in the Hammermill. The clean first-cut and second-cut lint is conveyed to the baling room and baled. Finished bales of lint are sent to storage for shipment. The shale, pepper, and trash stream from each lint cleaner and the motes cleaner is combined and sent to the Hammermill. Product from the Hammermill is transferred to the separation room and then to the meal room.

3.4 Hulling and Separating

After the cottonseed is delinted through the 2nd Cut Linters, the black seed is transferred to a black seed storage tank for holding prior to hulling and separating. The black seed is then conveyed for processing to the safety shaker in the hulling and separating area. The safety shaker removes loose lint and any miscellaneous material from the black seed and directs the lint to the lint room. The safety shaker also screens and separates fine hulls and meats from the black seed and directs them to the huller room.

The black seed is then processed through the huller and shaker, which cut the black seed open to release the meats. Meats are then directed to the meats stream. Hulls and uncut seed are sent to the hull and seed separator. Uncut seed is separated out and recycled to the huller and shaker. Any remaining meat is separated from the hulls in the purifier, single-drum, and double-drum beaters. Meats from these three machines are directed to the meat stream while the hulls are sent to hull storage.

3.5 Oil Extraction

Solvent extraction is the most efficient method of recovering oil from most oil-bearing vegetable seeds. Extraction is accomplished through a procedure in which oil-bearing cottonseed meats are contacted with a suitable solvent. The most common solvent used in commercial continuous edible oil extraction systems, and the solvent used at the Harlingen Facility, is n-hexane-based solvent.

Before being directed to the oil extraction unit, the cottonseed meats are processed by a cooker located in the prep room. The cooker is steam-heated by a natural gas-fired boiler and heats the meats with added moisture so that they may be “flaked” into flaking rolls. The flaking is necessary to improve oil extraction.

In the Solvent Extraction Plant, cottonseed meats are fed to a counter-current solvent extractor where oil is extracted by percolating solvent through cottonseed flakes. The extractor is operated under slight negative pressure to aid in the feeding of meats and to prevent escape of solvent vapors. During oil extraction, two streams of material are produced. The first stream consists of solvent and oil, and the second consists of meal saturated with solvent.

3.6 Solvent/Oil Separation

After extraction, the miscella (mixture of solvent and oil) is separated by distillation. During distillation, the first stage Evaporator increases the oil concentration in the miscella to 60 percent. The miscella is then pumped to storage tanks where it is temporarily kept until further refinement. The miscella is next treated in the Miscella Refiner where it is acidified with a caustic solution (typically sodium hydroxide). This action begins the separation of the heavy soaps from the light oil. The heavy soaps are removed from the miscella by centrifuge. At this point, the miscella is processed through the second stage Evaporator which removes the remaining solvent. The Refiner is hermetically sealed with the solvent vapors processed through the condenser-vent scrubber system. Centrifuge seal water and backwash is treated in a separate sump before treatment in the main sump. The oil, now stripped of solvent, is pumped to an oil dryer to remove the moisture and is then pumped to finished oil tanks prior to shipment.

3.7 Solvent/Meal Separation

The cottonseed flakes that are processed through the extractor become saturated with solvent. In order to reclaim the solvent and make the meal edible for animals, the flakes are fed to the Desolventizer/Toaster (D/T) unit. This device is similar to a stack cooler in which steam is used to vaporize and strip out occluded solvent from the meal. In addition to vaporizing most of the solvent, the steam also adds to the moisture

content of the meal, thus minimizing fugitive dust emissions as the meal is conveyed to the meal dryer. The meal is then processed through a rotary drum meal dryer. Dry, heated air is fed to the dryer section, counter-current to the flow of meal, to dry the meal and remove residual solvent. The meal is then cooled and sent to the meal warehouse for further processing. The cool air stream is processed in a cyclone and discharged to the atmosphere.

3.8 Hexane Recovery and Control

The solvent-laden vapors from the D/T unit and the first and second stage Evaporators are collected, condensed, and sent to a solvent/water separator. This cooled condensate containing recovered solvent and solvent vapors is separated into solvent and water phases by gravity. The solvent layer is returned to solvent storage for re-use. The water layer is sent through a waste-heat reboiler to recover heat energy and is then clarified in the main sump. The solvent remaining in the exhaust gas from the condensers is controlled with a mineral oil scrubbing system. Mineral oil is first used to remove solvent from the exhaust gases prior to release to the atmosphere. The solvent-laden mineral oil is stripped of solvent by steam in the stripping column. The solvent vapors are recycled to the solvent condenser. Cooling water is discharged to the main sump and steam condensate is returned to the boiler feed.
