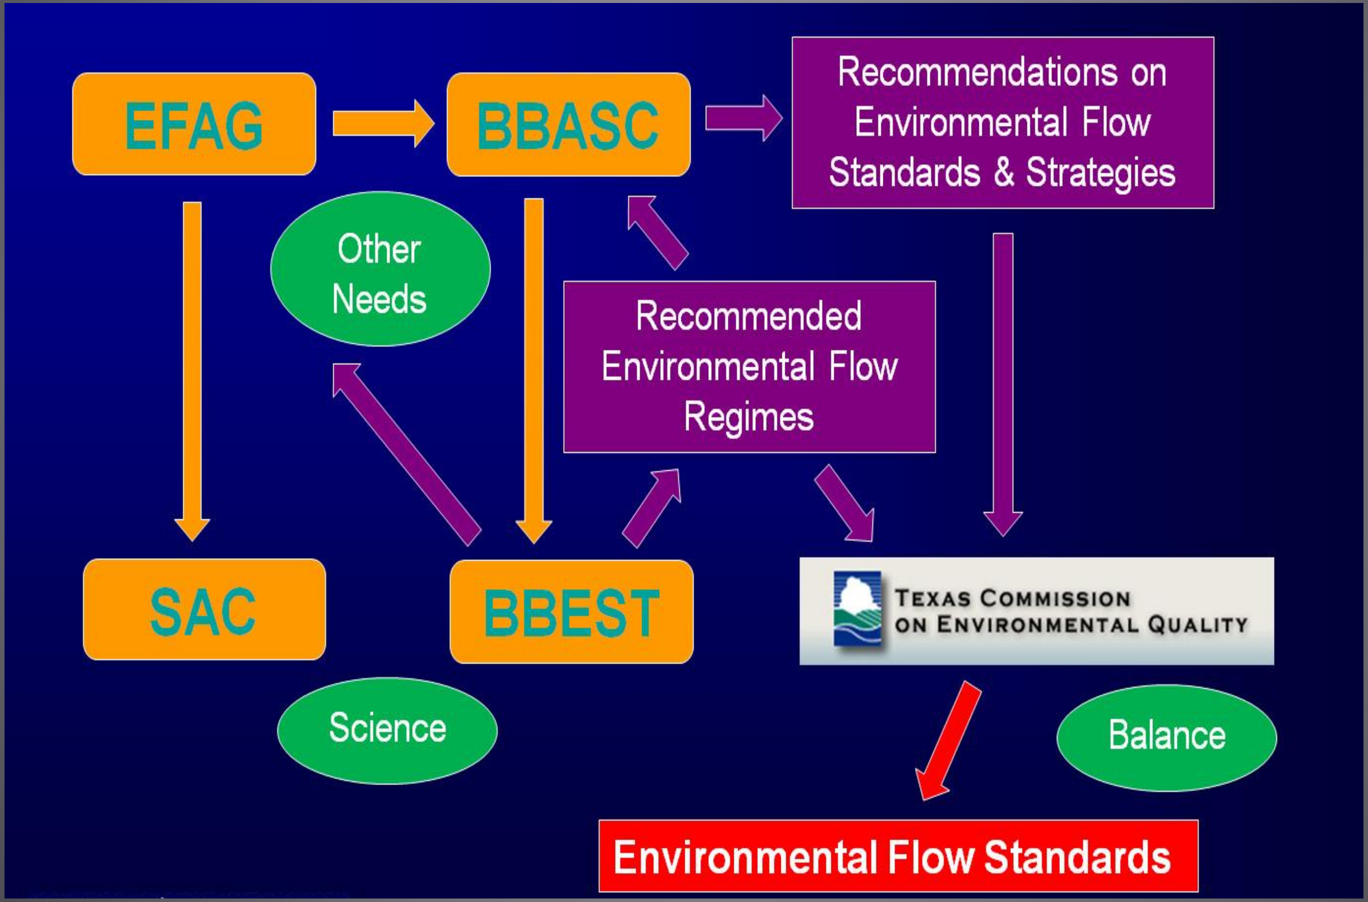
Lower Rio Grande and Lower Laguna Madre BBEST Report

Summary
July 2012

BBEST members: Hudson DeYoe (chair), Jude Benavides, Robert Edwards, Warren Pulich, Carlos Marin, David Buzan

The Process



Flow chart by Sam Vaugh, Nueces BBEST

Basin & Bay Expert Science Team (BBEST)

1) **Comprised of technical experts with knowledge of the river basin and bay system and of methods for developing environmental flow regimes.**
2) **LRG-LLM BBEST performs freshwater inflow analyses based on best available science/data and recommends environmental flow regimes through a consensus process.**
3) **Provide environmental flows recommendations by June, 2012.**
4) **Provide technical support to the LRG BBASC in its development of recommendations on environmental flow standards & strategies, and their work plan.**

BBEST Profile

Hudson DeYoe	Chair, Lower Laguna Madre Co-lead	University of Texas - Pan American, Edinburg, TX
Dave Buzan	Vice-chair, Resaca and Arroyo Colorado Lead	Atkins Global, Inc., Austin, TX
Jude Benavides	Hydrology Co-lead	University of Texas at Brownsville, Brownsville, TX
Carlos Marin	Hydrology Co-lead	Ambiotec, Inc., Brownsville, TX
Robert Edwards	Rio Grande Lead	University of Texas, Pan American, Edinburg, TX
Warren Pulich	Lower Laguna Madre Co-lead	Texas State University, San Marcos, TX

BBEST Charge and Goal

Each basin and bay expert science team shall develop environmental flow analyses and a recommended environmental flow regime for the river basin and bay system for which the team is established through a collaborative process designed to achieve a consensus.

In developing the analyses and recommendations, the science team must consider all reasonably available science, without regard to the need for the water for other uses, and the science team's recommendations must be based solely on the best science available.

Goal: Develop an Environmental Flows Recommendations Report for consideration by BBASC and TCEQ

BBEST Project Area

- Six geographically regions:
  - Lower Laguna Madre Estuary (LLM)
  - Tidal portion of the Rio Grande
  - Above-tidal portion of the Rio Grande up to Anzalduas Dam
  - Arroyo Colorado
  - Resacas
  - Coastal basins between the LLM and the Rio Grande tidal.

LRG/LLM BBEST Analyses & Recommendations

1) Overview of Lower Laguna Madre
2) Sound Ecological Environment ?
3) Hydrology Analyses
4) Inflow Regime Analyses of Focal Species/Habitats
5) Environmental Flow Regime Recommendations
6) Adaptive Management Plan

Report Organization

- Section 1 Preamble
- Section 2 Hydrology
- Section 3 Lower Laguna Madre
- Section 4 Rio Grande Estuary
- Section 5 Ecological and hydrological characteristics above-tidal segment of the Rio Grande from above Anzalduas dam to El Jardin weir
- Section 6 Bahia Grande and San Martin Lake Complex
- Section 7 Resacas and Brownsville resaca watershed
- Section 8 Arroyo Colorado
- Section 9 Freshwater Inflow Analysis
- Section 10 Freshwater Inflow Recommendations
- Section 11 Adaptive Management
- Section 12 References
- Section 13 Appendices

Sound Ecological Environment

- The BBEST charge is to develop flow regimes “adequate to support a ‘sound ecological environment’ and to maintain the productivity, extent and persistence of key aquatic habitats in and along the affected water bodies.”
- A sound ecological environment (modified from SAC definition):
  - Maintains native species,
  - Is sustainable, and
  - Is a current condition. Current condition represents the condition from some year to present identified by the BBEST. The period of current condition may be defined differently for each body of water.

Bahia Grande/San Martin Lake

- The Bahia Grande is not a sound ecological environment due to anthropogenic alterations, but may become more so with the construction of a new wider channel.
- Because there is little data available, we offer no opinion about whether San Martin Lake is a sound ecological environment.

Resacas

•232 miles, covering 130 square miles – old Rio Grande channel
•113 miles of oxbows – cutoff bends in the Rio Grande and Arroyo Colorado

Ecology
Rare fish and salamanders
Riparian vegetation – roosting, nesting, and feeding for wildlife and migratory songbirds

Resacas

- Resacas should not be considered sound ecological environments when compared to their historical condition before the early 1800s. Their hydrology has been substantially altered since dams and flood control structures have eliminated flooding from the Rio Grande which historically was one of their primary sources of water.
- BBEST recommendation: Maintain depth, water, and riparian vegetation of existing resacas and oxbows

Arroyo Colorado

Freshwater

- 63 miles
- Wastewater and ag return flows dominate in dry weather
- Limited quality aquatic habitat, inadequate habitat and water quality

Saltwater

- 26 miles: Harlingen to Lower Laguna Madre
- Estuary for fish, shrimps, and crabs
- Poor water quality in upper end (low dissolved oxygen)

Habitat change and wastewater dominated flow degrade the above tidal and in upper reaches of the tidal Arroyo.

Arroyo Colorado

- BBEST does not consider the Arroyo Colorado a sound environment in regard to flow because the current flow does not support a healthy, diverse, sustainable community of native fish and shellfish along its entire length and because the sources of flow degrade water quality in the upper 15 river miles of the Arroyo.

BBEST recommendation:

Continue reducing waste loading to the Arroyo and explore ways to improve habitat

Lower Laguna Madre

- Several lines of evidence support the BBEST’s determination that the Lower Laguna Madre Estuary environment has been “sound” from the early 1960s, but that it appears to be undergoing detrimental changes over the last 15-20 years.

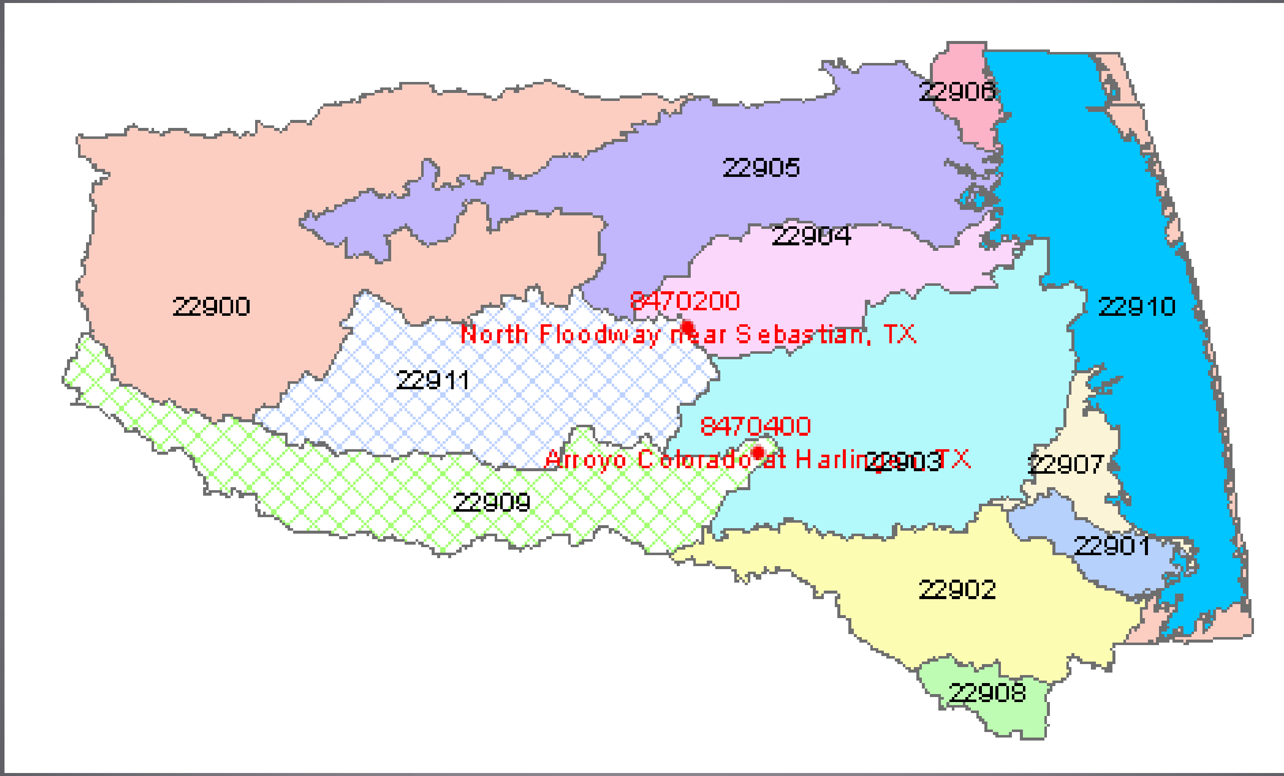
The Evidence

- The LLM is famous for its lush seagrass beds. LLM seagrass has decreased from its peak of 59,153 ha in the 1960s, to 46,558 ha in mid-1970s, and then to 46,624 ha in 1988. Other losses to follow.
- Long-term maintenance of normal estuarine fishery populations would appear to be possible only within the context of a generally sound estuarine environment.
- There has undeniably been a fundamental change in hydrology of LLM since the late 1950s due to the dredging of the GIWW (1952) and the opening of Mansfield Pass (1958).
- Above changes have been accompanied by increased freshwater drainage from the Arroyo Colorado and other sources.

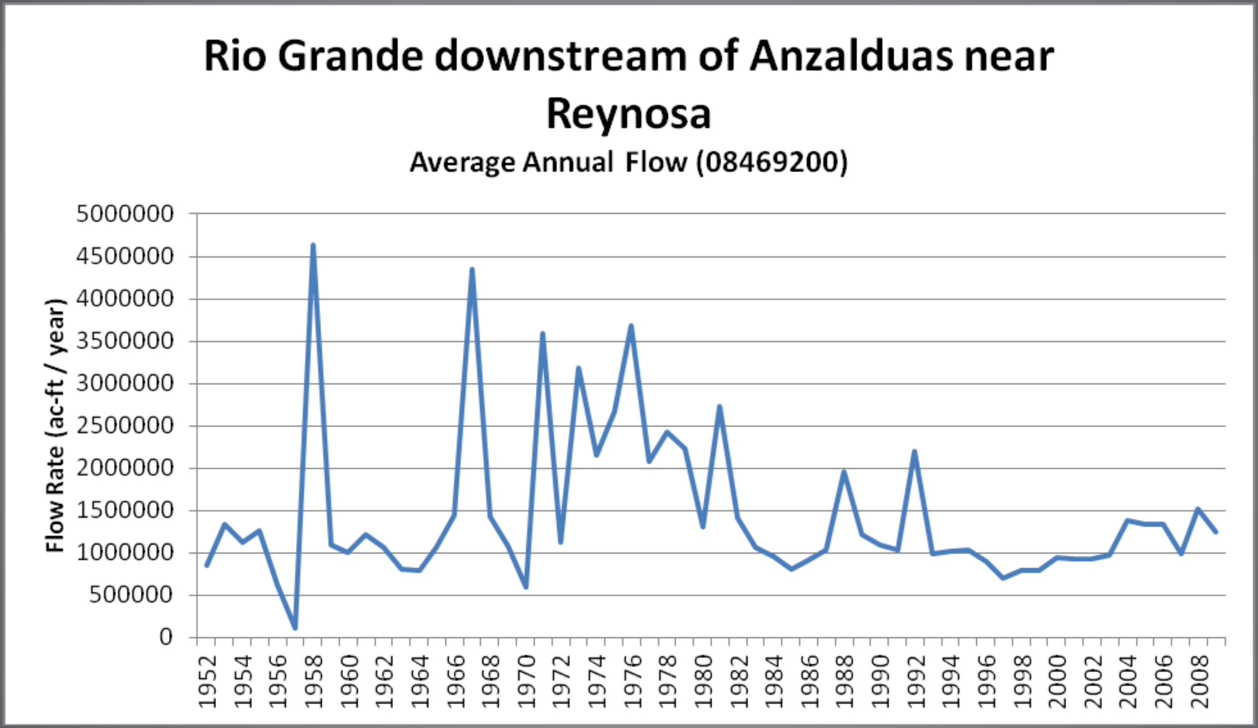
Hydrologic Considerations

Major Watersheds in Study Area

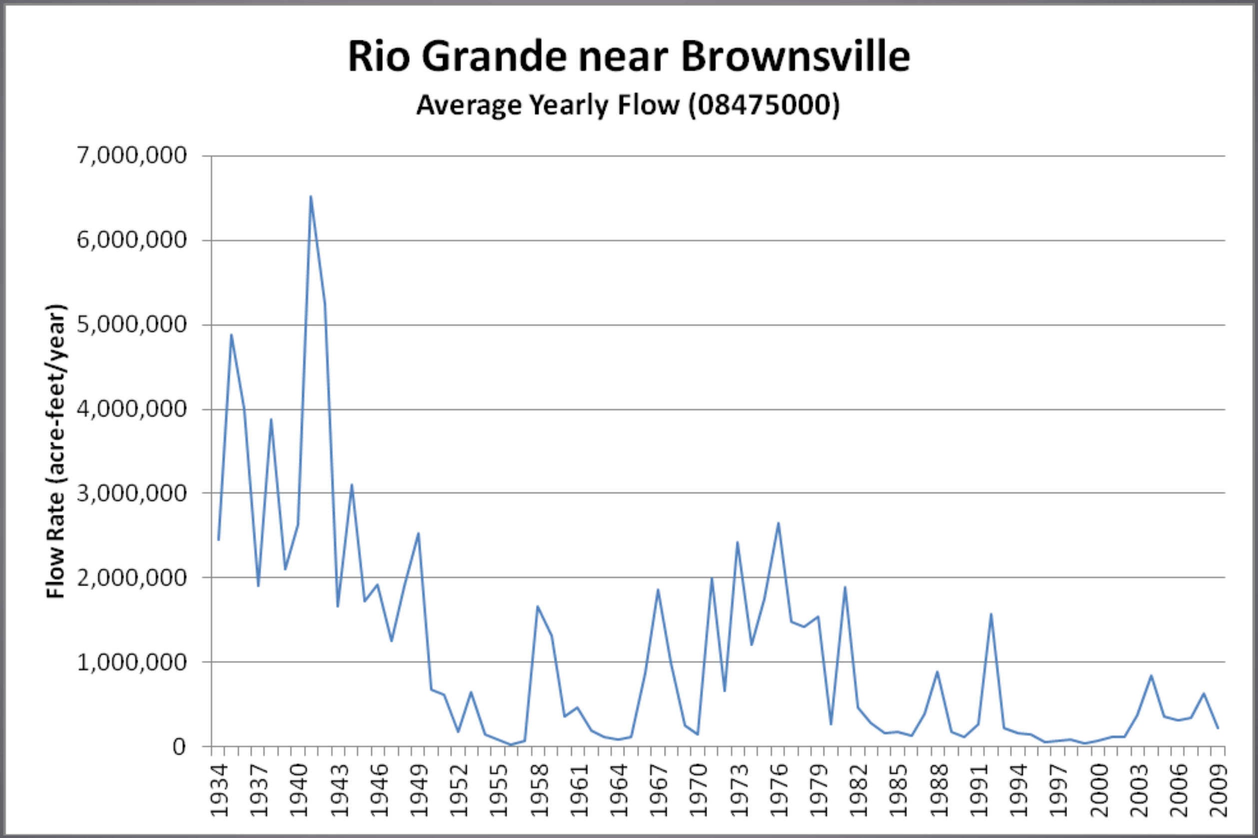
TWDB Coastal Hydrology Technical Report – Subwatersheds in Study Area



Rio Grande – Anzalduas
Average Annual Flows for POR (1952-2009)



Rio Grande – Brownsville
Average Annual Flows for POR (1934 – 2009)



Historic Flows in the Rio Grande					
	Description	Units	Anzalduas Gage (1952-2009)	Brownsville Gage (1934-2009)	Brownsville Gage (1952-2009)
Daily Values	Average Daily Flow	(ac-ft/day)	3,992	3,058	1,692
	Max. Daily Flow	(ac-ft/day)	240,272	61,084	32,153
	Min. Daily Flow	(ac-ft/day)	0	0	0

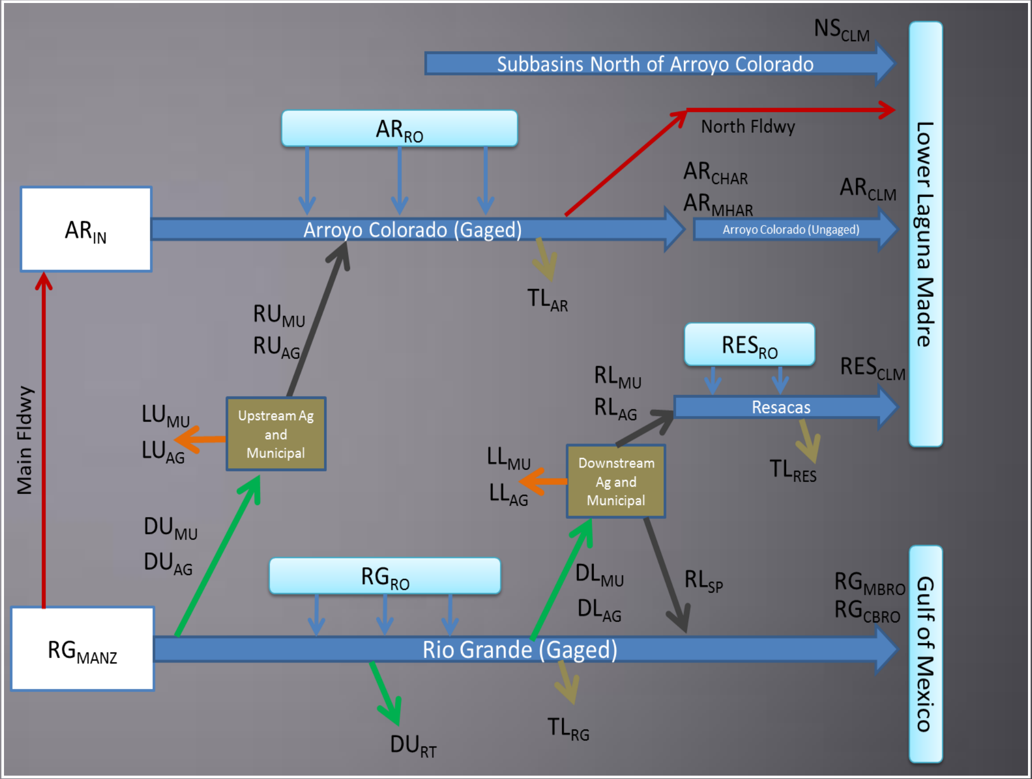
25th	12,018	51,569	7,131
50th	13,942	81,368	14,533
75th	17,628	129,801	25,550
90th	24,766	191,280	90,403
95th	30,866	283,721	209,117

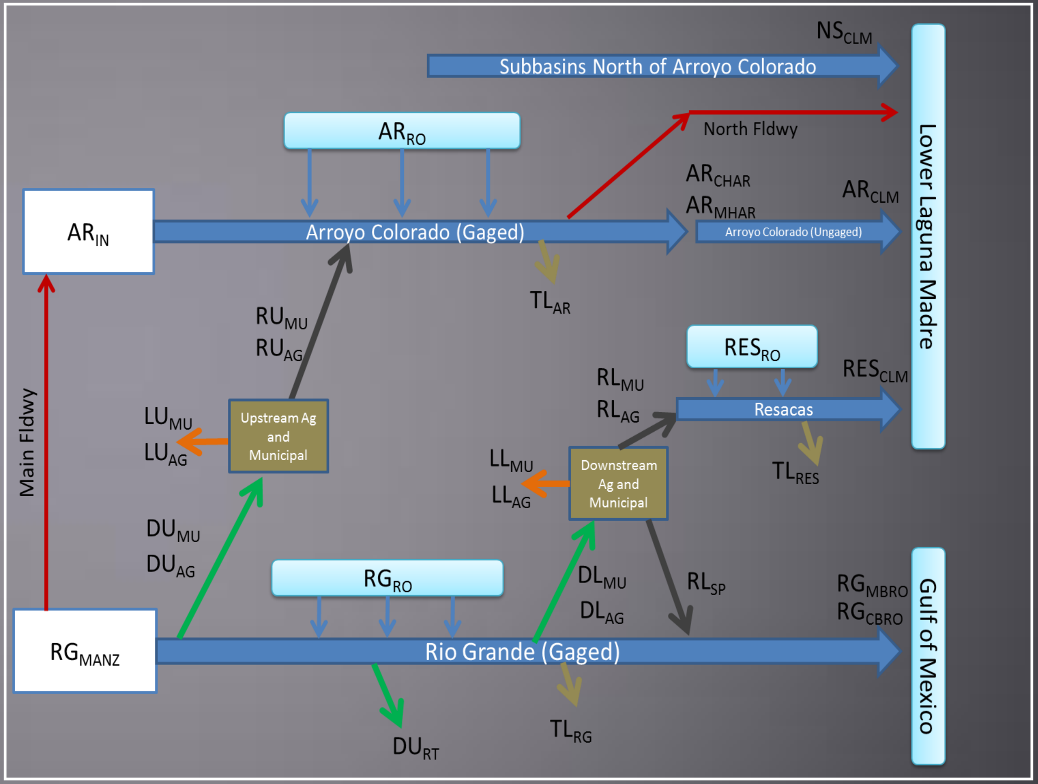
Water Balance and Flow Analysis: Period of Record and Existing Work

- POR was 1999 – 2008
  - Limited by return data
  - SWAT model for Arroyo tremendous aid
- Reliance on TWDB hydrologic study for ungaged basins
  - North Subbasins
  - AC downstream of Harlingen
  - Brownsville / Resacas



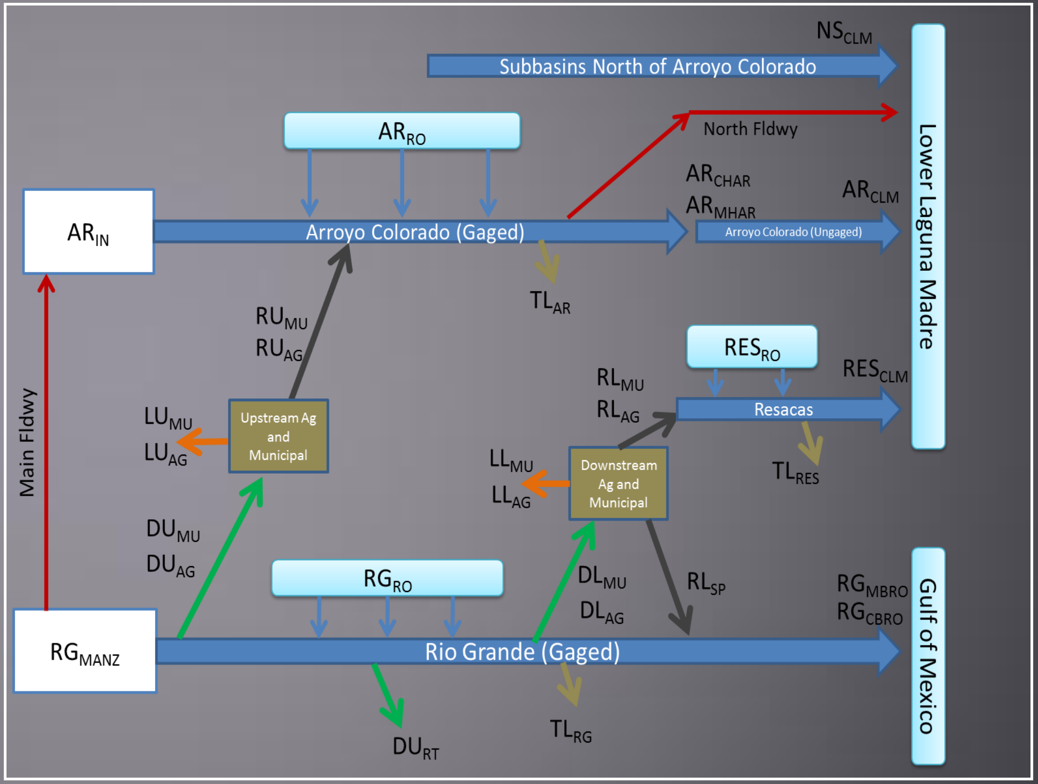
Water Balance and Flow Analysis: Primary Goals

- Primary goals
  - To estimate "natural flow" condition
    - Specific definition
    - Flows without returns and/or diversions
    - Approximated by runoff and losses in stream
  - To estimate component flow at important locations
    - % of flow due to:
      - Agriculture
      - Municipal
      - Runoff



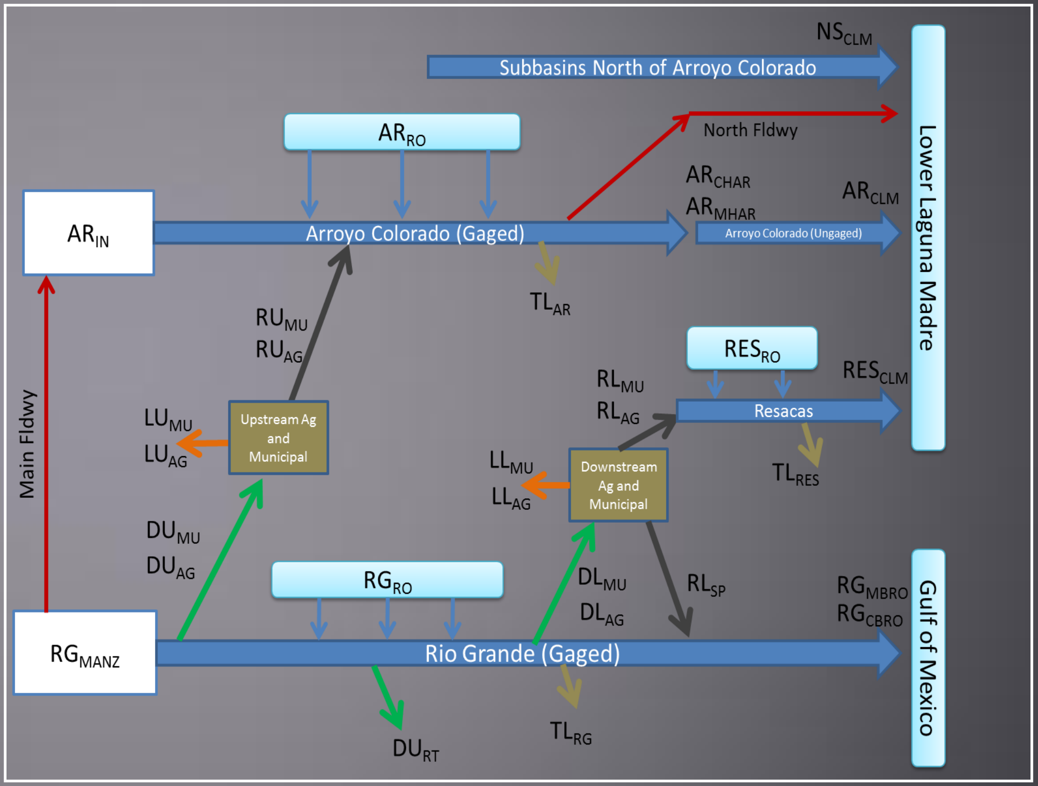
Water Balance and Flow Analysis: Primary Goals (Cont'd)

- Primary goals
  - To provide dataset for development of cumulative distribution function
    - Percentile flow distributions for existing and natural conditions
- Forms the hydrologic basis of flow recommendations



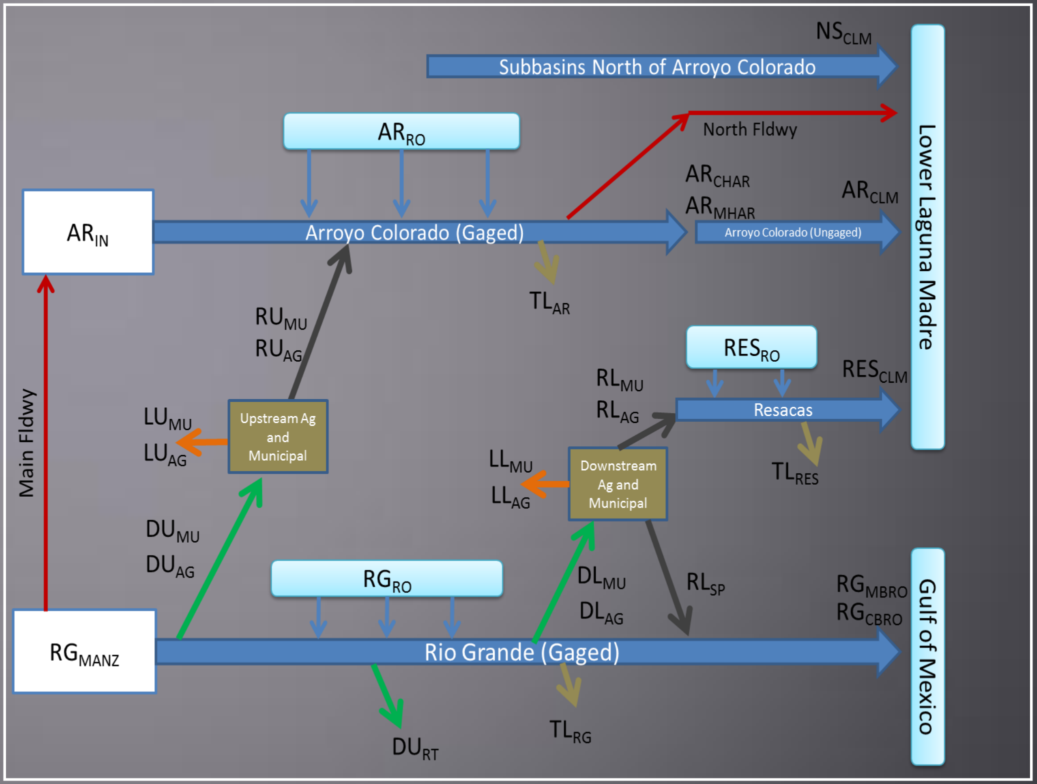
Water Balance and Flow Analysis: Limitations and Caveats

- General balance of:
  - Runoff
  - Agricultural and municipal withdrawals / returns
  - Losses where available
- Specific parameters not investigated:
  - evapotranspiration
  - infiltration
  - groundwater / interflow

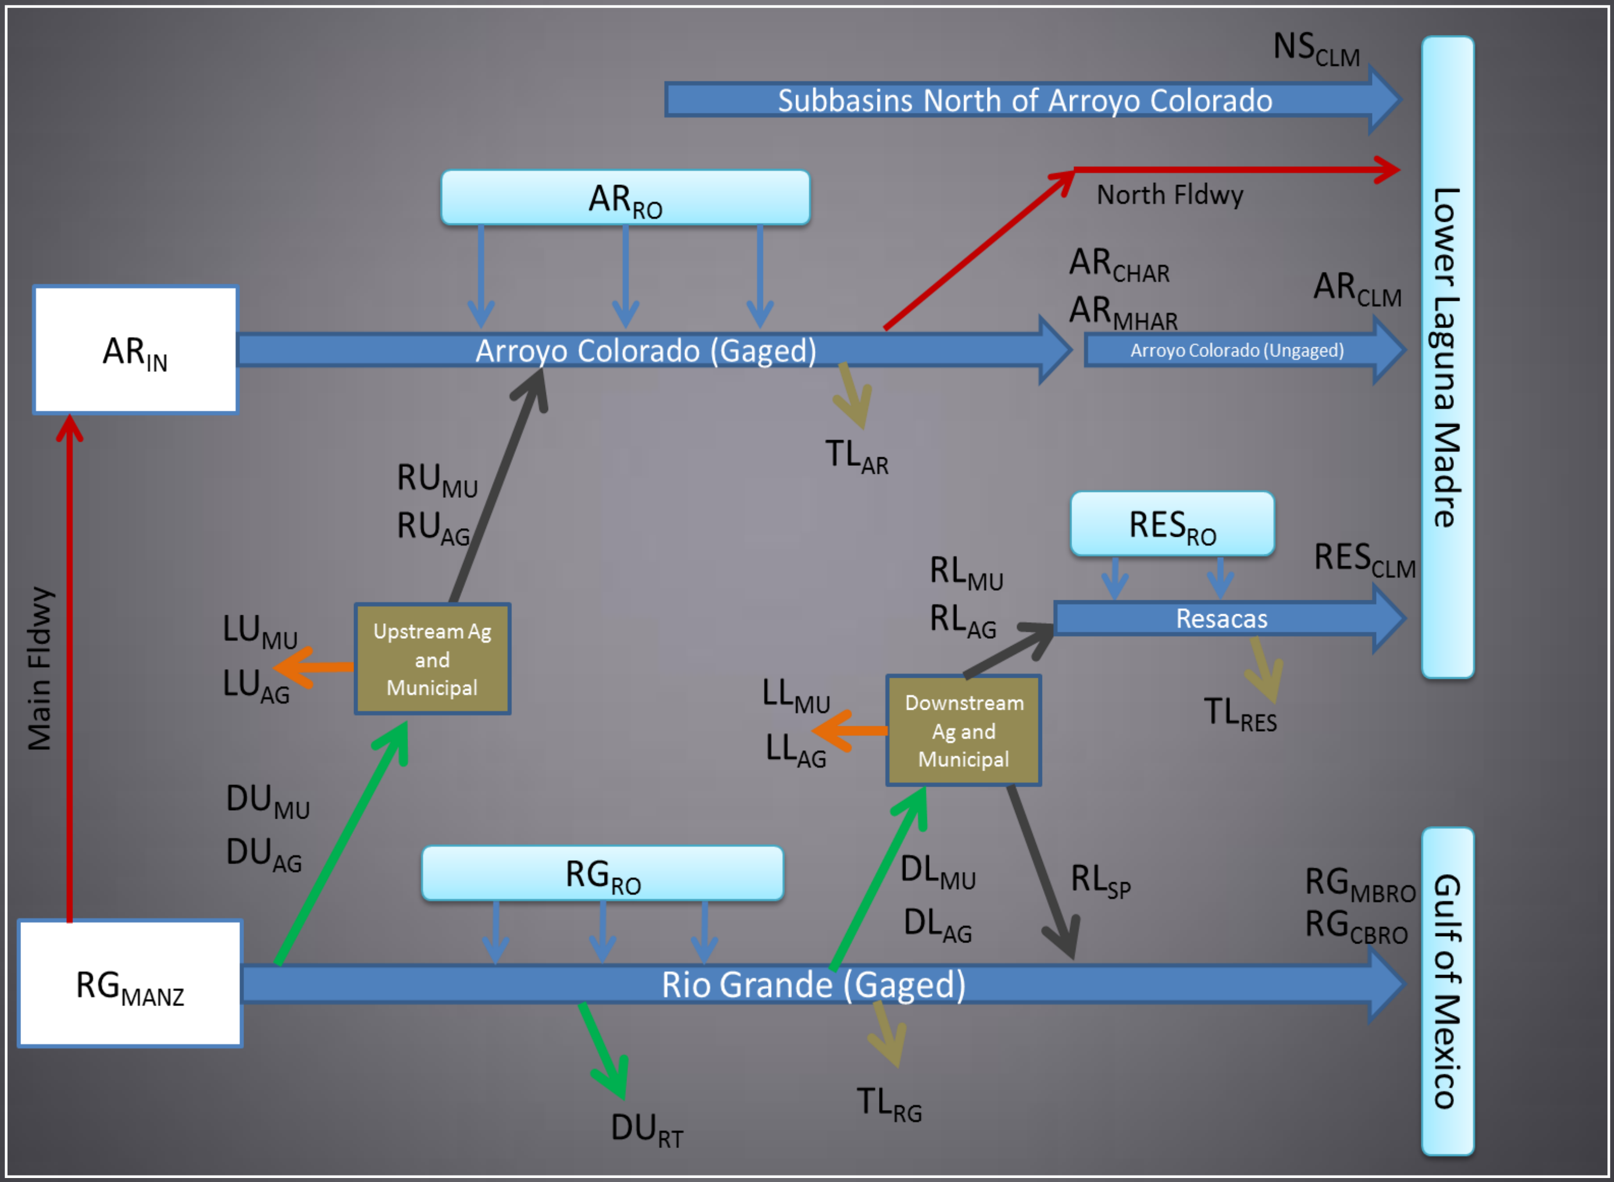


Water Balance and Flow Analysis: Limitations and Caveats

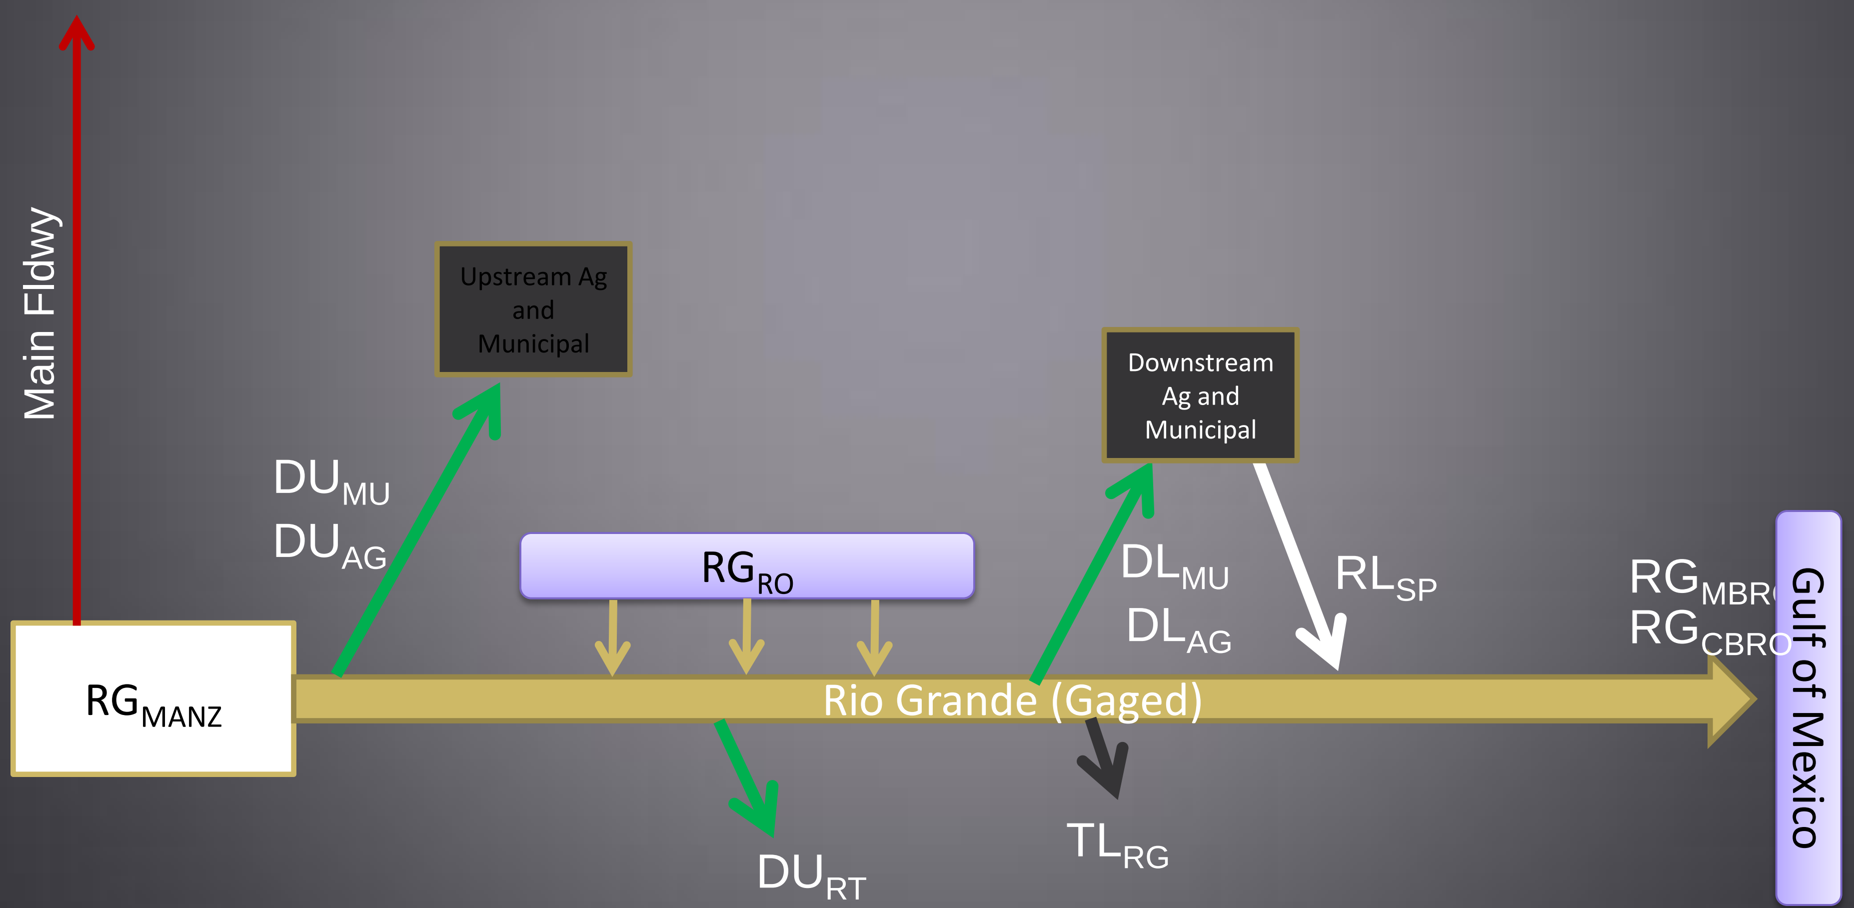
- Additional limitations:
  - No diversion or return data to Mexico
  - POR limited by withdrawal and return data
  - Volumetric flow comparison at monthly time step
  - Not location specific within subwatersheds unless noted
  - Lower Rio Grande Flood Control Project Operations considered outlier events

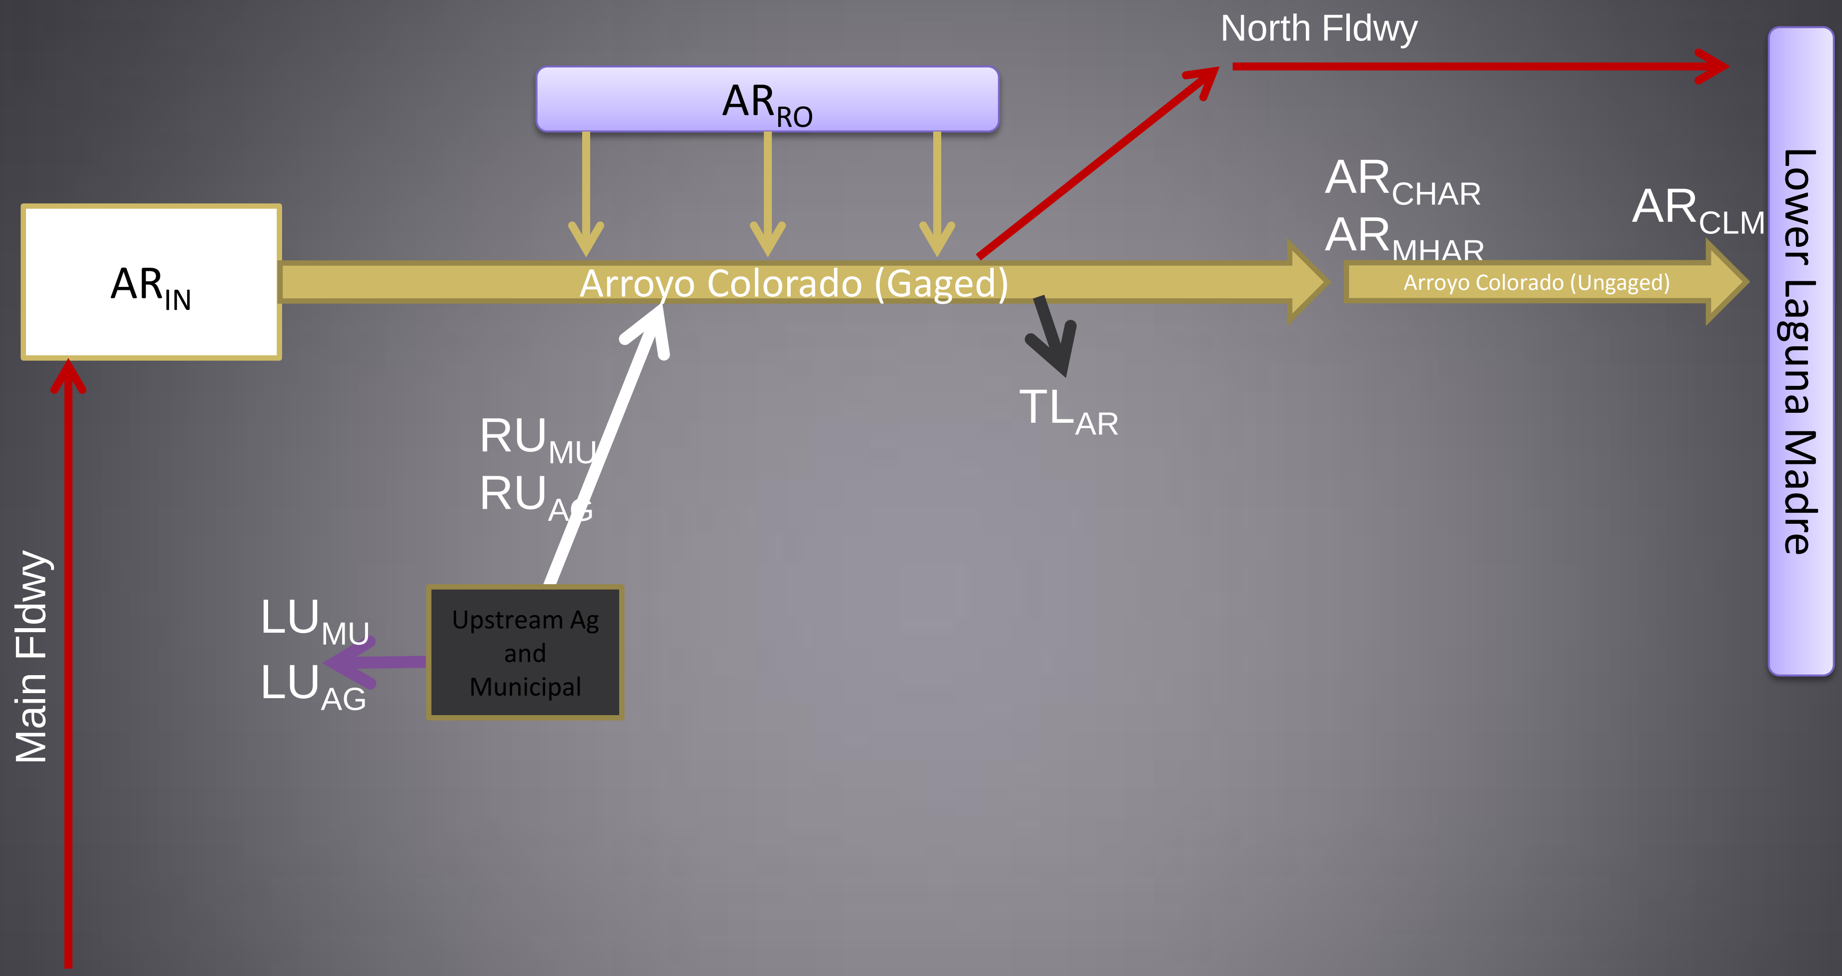


Water Balance Schematic with Variables

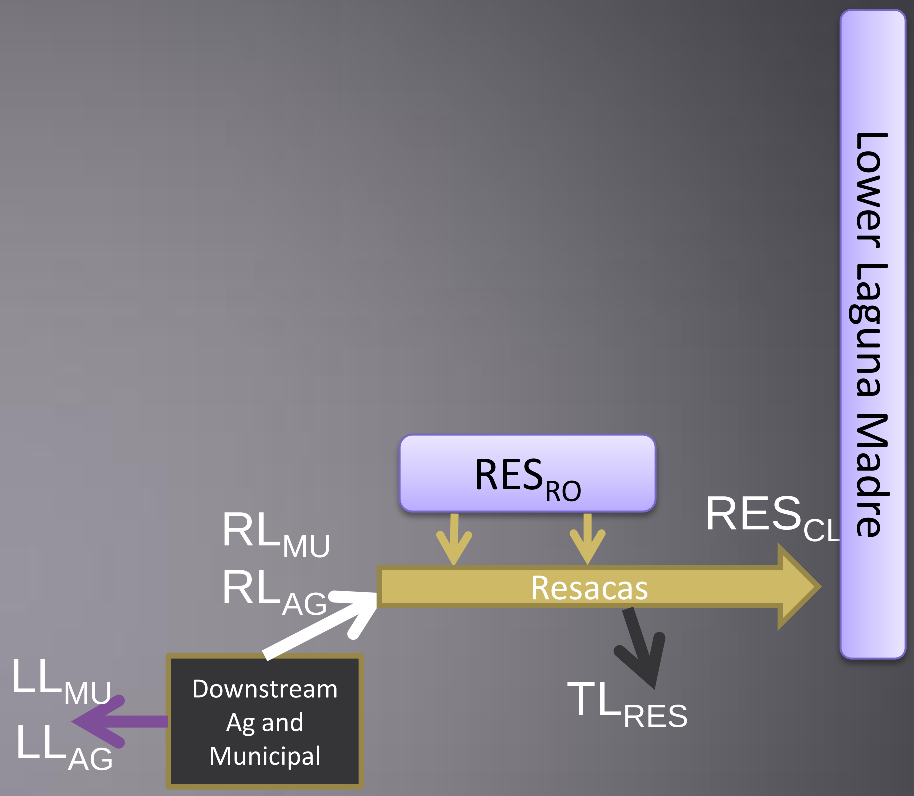


Rio Grande: Inflows and Outflows

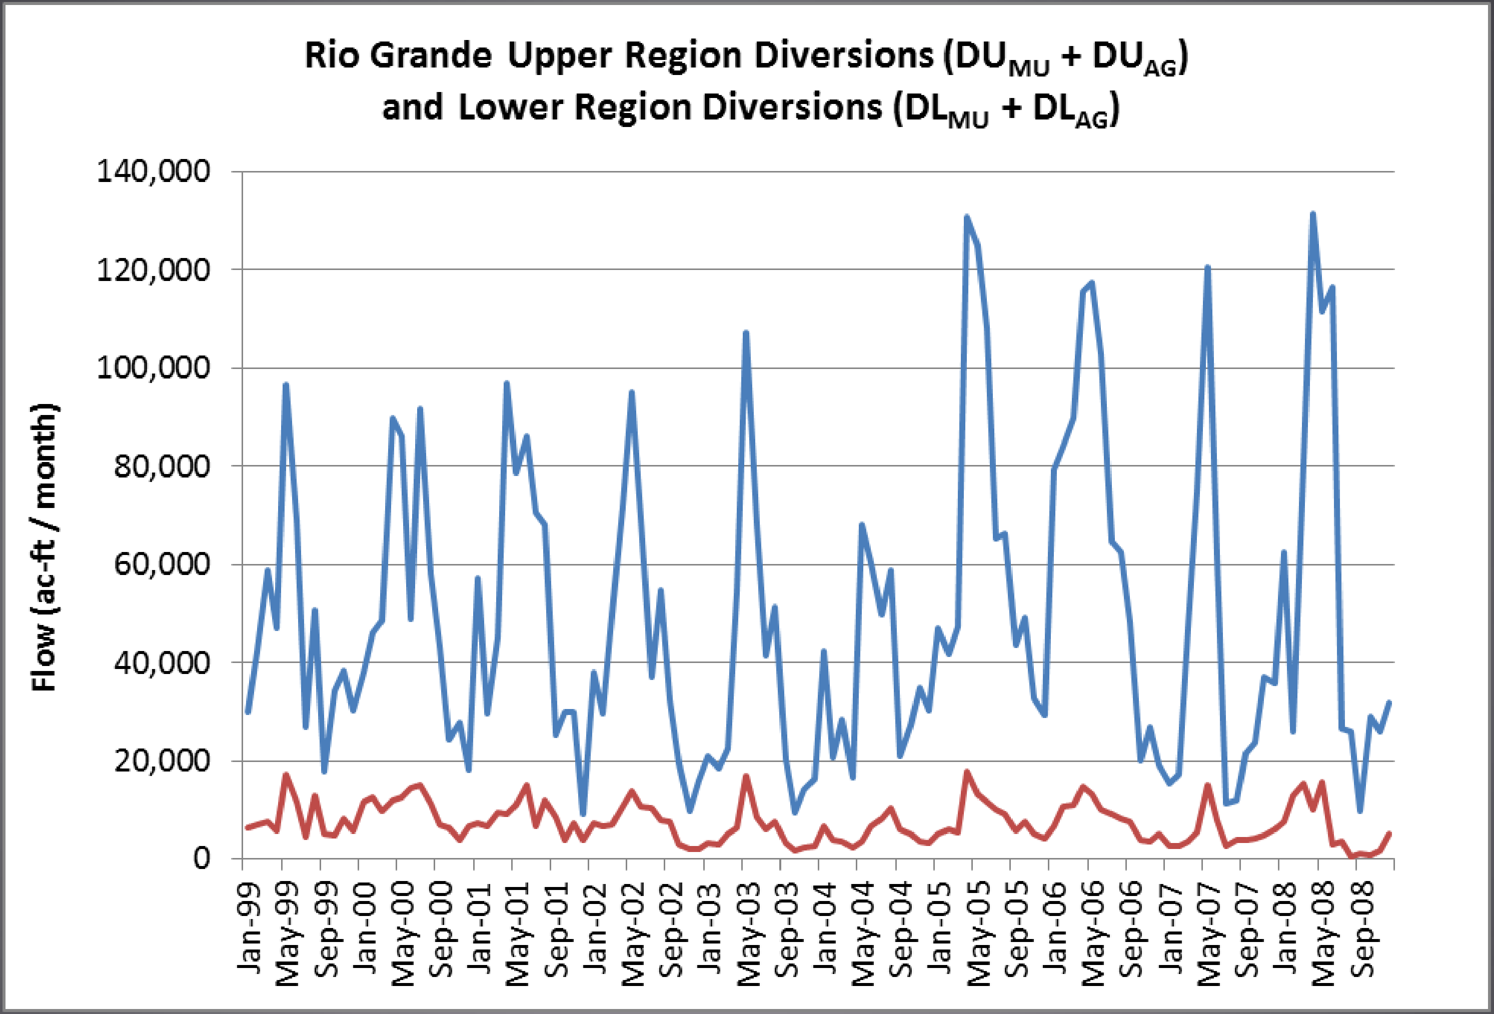




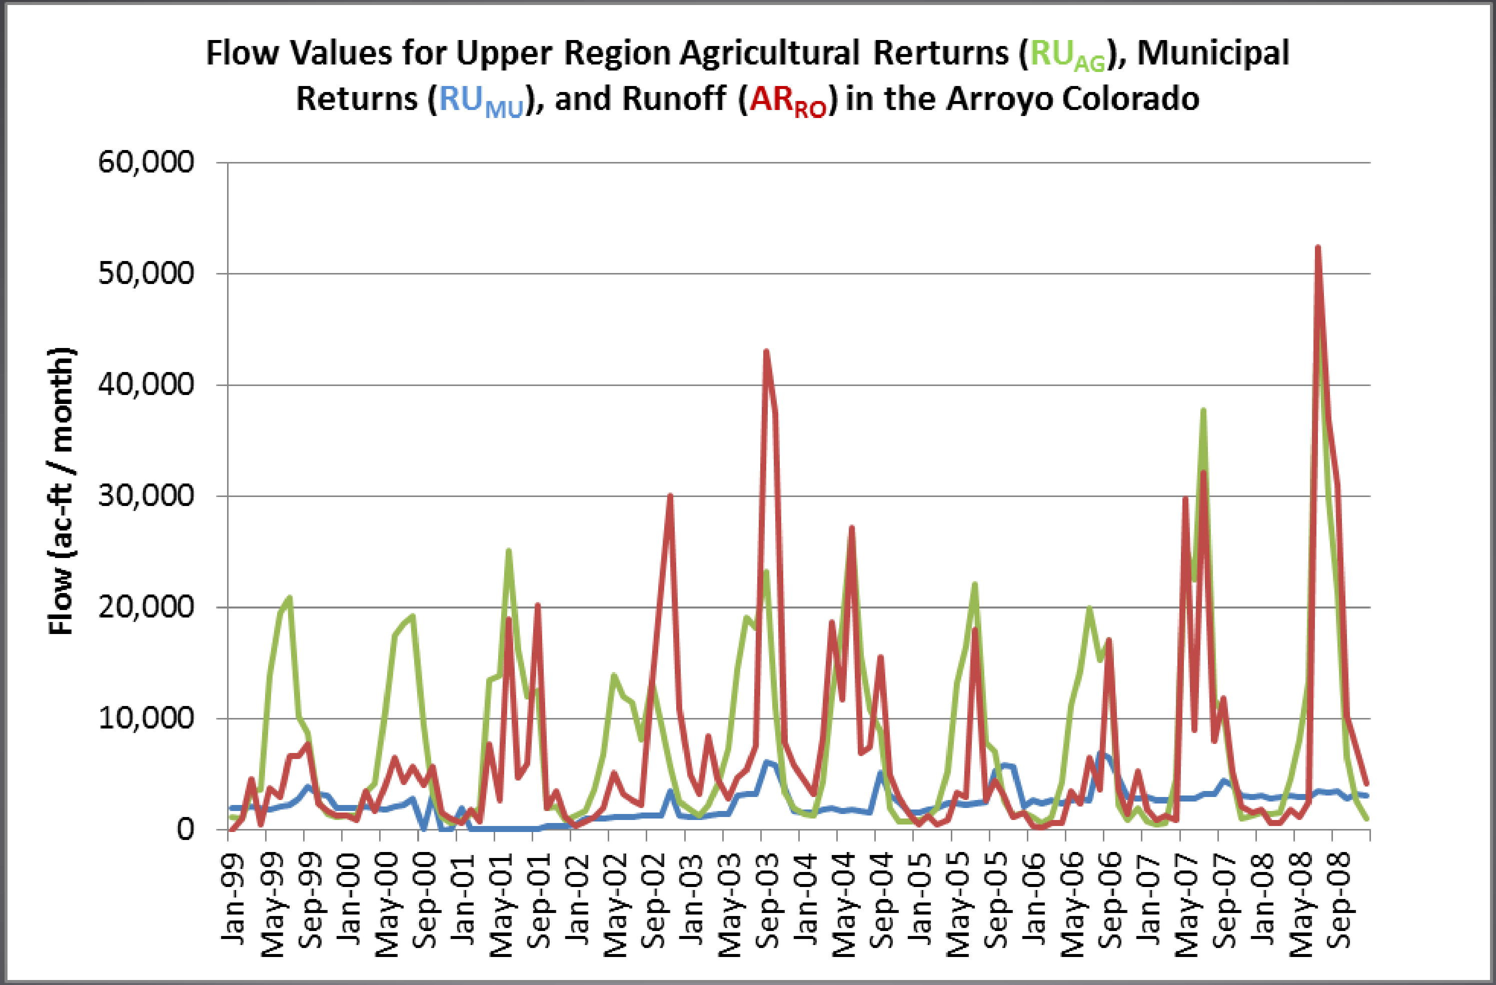
Arroyo Colorado: Inflows and Outflows



Brownsville / Resaca Watersheds: Inflows and Outflows



Units: ac-ft / month	DU_{MU} + DU_{AG}	DL_{MU} + DL_{AG}
Average	49,955	7,422
Median	43,002	6,766
Standard Deviation	30,871	4,053



Units: ac-ft / month	RU_{MU}	RU_{AG}	AR_{RO}
Average	2,350	8,464	6,946

Recommendations for future work on water balance

- Update analysis to include longer period of record
  - Particular emphasis on withdrawal and return data
- Estimate uncertainty in the current deterministic flow values

Tidal Rio Grande

Plant Nutrients:
From the Arroyo to the LLM

- Include mostly inorganic molecules needed by primary producers (algae and plants) to grow and reproduce
  - Micronutrients such as iron, potassium, manganese, zinc
  - Macronutrients such as carbon, nitrogen and phosphorus
  - If one nutrient is lacking, organism will be stunted

Arroyo Nutrients

Table 8.3.2. Water quality averages for select parameters for the Arroyo Colorado at the Port of Harlingen for the period March 1977 to August 2010.

	Sp Cond	Total NH4	Total NO3	Total Kjeldahl	Total PO4	Ortho PO4	Chl a
	uS/cm	mg N/L	mg N/L	mg N/L	mg PO4/L	mg PO4/L	ug/L
Avg	4436	0.56	2.64	1.53	2.33	1.40	33.71
SD	1465	1.39	1.33	0.44	1.34	0.56	21.74
N	185	161	76	98	36	34	136

- Arroyo nutrient levels are high compared to other Texas waterways.

Nutrient loading rates are high but vary seasonally

Table 8.3.3. Seasonal nitrogen (DIN) and phosphate loading rates for the Arroyo Colorado. Loading rate estimates are based on TCEQ water quality data from the Port of Harlingen and flow values from the Harlingen IBWC gage for the period 1978-2009.

	Avg 5-day flow	DIN	TPO4	Avg DIN Load	SD DIN Load	Avg PO4 Load	SD PO4 Load	Avg Load N/P ratio
	acre-ft/day	n	n	kg/day	kg/day	kg/day	kg/day	molar
Winter	427.5	38	11	1379.8	1961.7	496.0	347.2	6.4
Spring	569.4	46	7	1319.0	1578.9	923.9	1093.9	3.3
Summer	446.8	46	10	990.0	1935.3	344.5	77.6	6.6
Fall	548.3	31	8	957.0	1045.0	715.5	736.5	3.1

Nutrients encourage the growth of LLM primary producers

Seagrass epiphytes

Texas brown tide

Excessive seaweed growth

Seagrasses can be affected indirectly by high nutrient levels

Combined Inflow Percentiles to Lower Laguna Madre Dry Season Months (November – April) for years 1999-2008

		Existing Dry Season Inflows to Lower Laguna Madre	Natural Dry Season Inflows to Lower Laguna Madre	% of Nat Flows / Existing flows
	Units	**(ac-ft/month)**	**(ac-ft/month)**	**%**
Percentile	**Min**	12,446	1,426	11.5%
	0.05	13,537	1,895	14.0%
	0.1	14,109	2,381	16.9%
	0.2	16,270	3,428	21.1%
	0.25	16,872	3,613	21.4%
	0.5	19,610	5,695	29.0%
	0.75	25,504	12,901	50.6%
	0.8	29,900	15,215	50.9%
	0.9	40,833	28,023	68.6%
	0.95	42,559	30,077	70.7%
	Max	205,357	170,970	83.3%
	Average	26,342	12,669	N/A
	Median	19,610	5,695	N/A
	St. Dev.	25,596	23,087	N/A

Combined Inflow Percentiles to Lower Laguna Madre Wet Season Months (May – October) for years 1999-2008

		Existing Wet Season Inflows to Lower Laguna Madre	Natural Wet Season Inflows to Lower Laguna Madre	% of Nat Flows / Existing flows
	Units	**(ac-ft/month)**	**(ac-ft/month)**	**%**
Percentile	**Min**	12,313	3,613	29.3%
	0.05	16,386	5,007	30.6%
	0.1	17,743	5,531	31.2%
	0.2	20,909	6,908	33.0%
	0.25	21,214	7,888	37.2%
	0.5	31,213	14,445	46.3%
	0.75	51,620	38,152	73.9%
	0.8	66,072	52,894	80.1%
	0.9	107,042	92,771	86.7%
	0.95	156,861	151,407	96.5%
	Max	393,204	338,325	86.0%
	Average	50,988	36,715	N/A
	Median	31,213	14,445	N/A
	St. Dev.	59,004	55,327	N/A

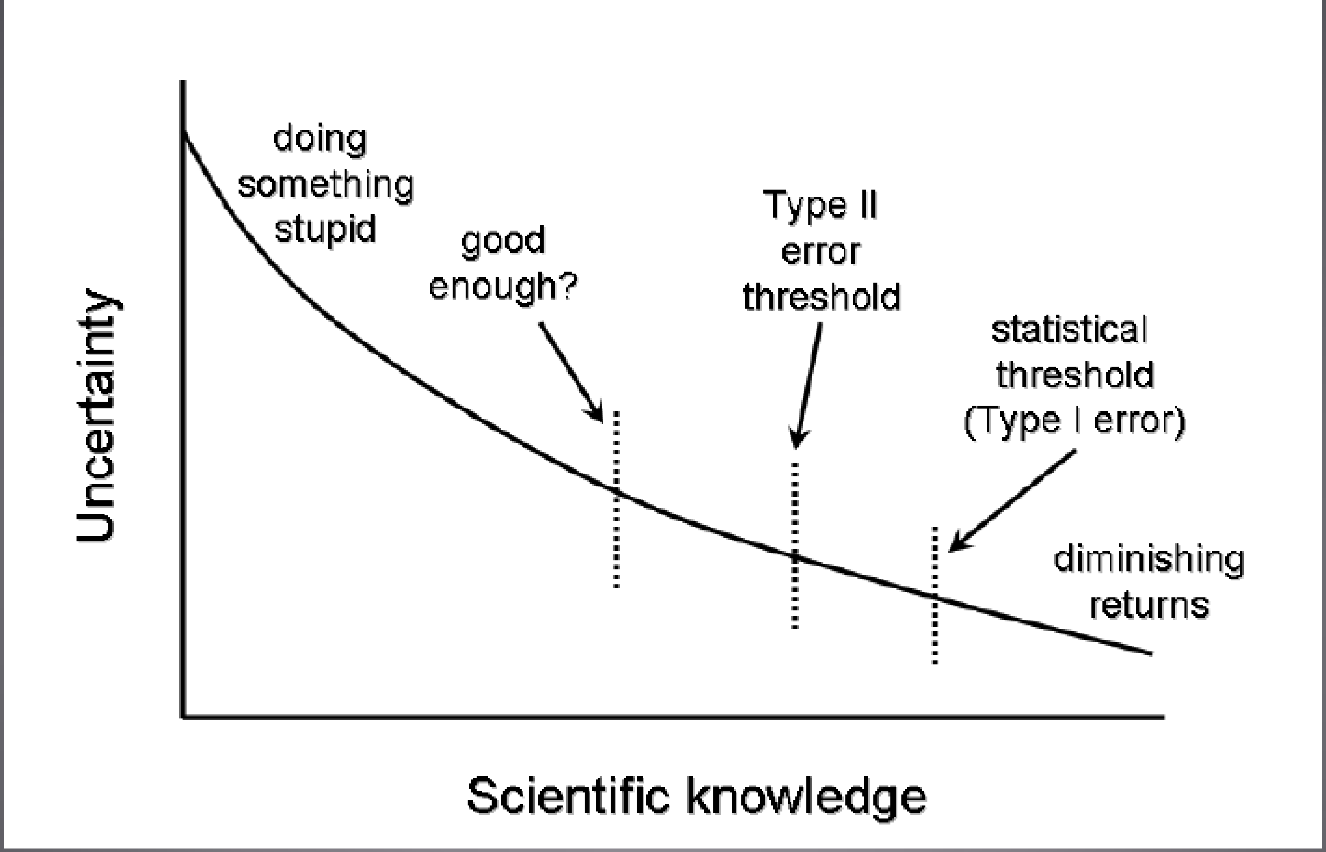
Summary of Recommendations

- Freshwater inflow during the dry season (Nov-Apr) is between 3,613 and 12,901 acre-feet per month (daily avg flows of 61 to 217 cfs)
  - During at least 3 months
  - Does not exceed 217 cfs for more than 45 days during the season
  - Is not less than 61 cfs for more then 45 days during the season

Summary of Recommendations

- Freshwater inflow during the wet season (Mar-Oct) is between 7,888 and 38,152 acre-feet per month (daily avg flows of 133 to 641 cfs)
  - During at least 3 months
  - Does not exceed 641 cfs for more than 45 days during the season
  - Is not less than 133 cfs for more then 45 days during the season

Uncertainty



Uncertainty decreases as some function of increasing scientific knowledge. The statistical thresholds that define Type I errors (the likelihood of incorrectly inferring a relationship between variables when none exists) and Type II errors (the likelihood of incorrectly concluding no relationship when in fact one exists) are generally well established. The location of the “good enough” threshold is more nebulous, and shifts toward the right as the costs of making a mistake become greater.
