State of the Current Knowledge of the Angelina-Neches River Basin

Brief Summary of Objectives

The objective of this study is to review existing information located in reports and referenced literature related to the water quality, hydrology, physical habitat, biology, and physical processes (geomorphology) of the Angelina-Neches River Basin. All the available literature on the subject will be abridged to create an annotated bibliography. This annotated bibliography will be migrated to an electronic database. This database will be set up so literature pertinent to a researcher’s interest can be queried. The database will also include a field to contain the geographic coordinates of where the study took place. This will link each study to a tab located on a map at the study site. In addition to the database, a report will be produced on the state of current knowledge of the Angelina-Neches River Basin.
