

# Geomorphic Overlay

How Geomorphology Can Inform  
HEFR Parameters

# Sabine River Near HW 12

# The Real Answer

---

- Determine the Desired Bathymetry or Geometry
- Determine Hydrology That Created the Desired Bathymetry
- Allow a Natural - Variable Hydrology That Will Created or Maintain the Desired Bathymetry
- Diversion or Return Flows May Change Fluvial Geometry

# Typical Geomorphic Study

---

- ◉ Define Existing Hydrology, Hydraulics and Geomorphic Parameters
- ◉ Define Future Hydrologic and Hydraulic Conditions
- ◉ Geomorphic – Sediment Analysis Shows How Proposed Future Conditions Effect Hydraulic, Sedimentation, and Channel Stability

# Existing Conditions

---

- ◉ Existing Hydrology
- ◉ How Has the Hydrology Changed
- ◉ How Has the Channel Responded to Hydrologic Changes
- ◉ Determine Which Changes are Natural and Which are a Result of Man's Activities

# Future Conditions

---

It Remains Unclear How to Adjust Observed or WAM Outputs to Reflect a Future Condition Flow with a HEFR Flow Regime Implemented

# Future Conditions

---

It Remains Unclear How to Adjust Observed or WAM Discharges to Reflect a Future Condition Flow with a HEFR Flow Regime Implemented

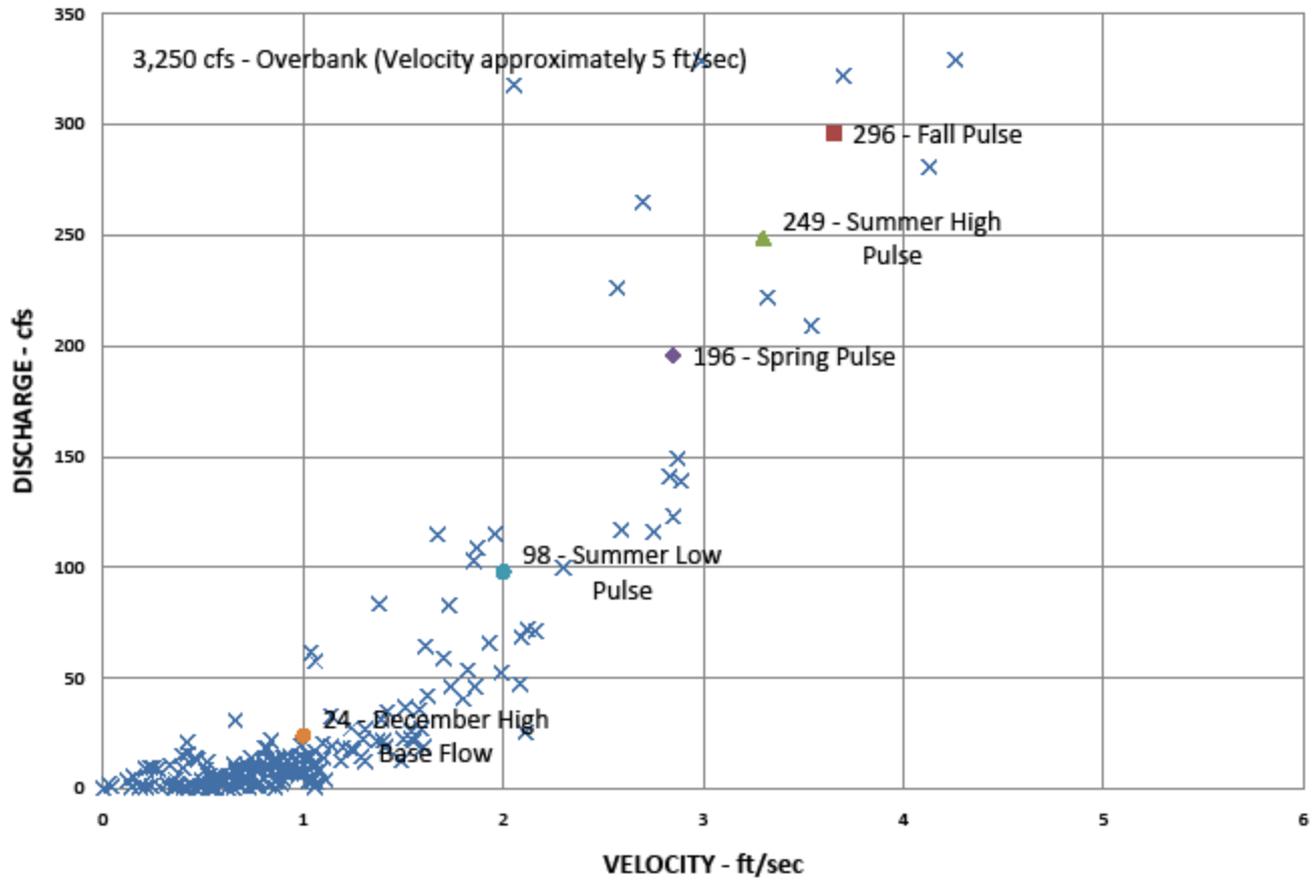

# How CAN Geomorphology Inform HEFR Parameters?

---

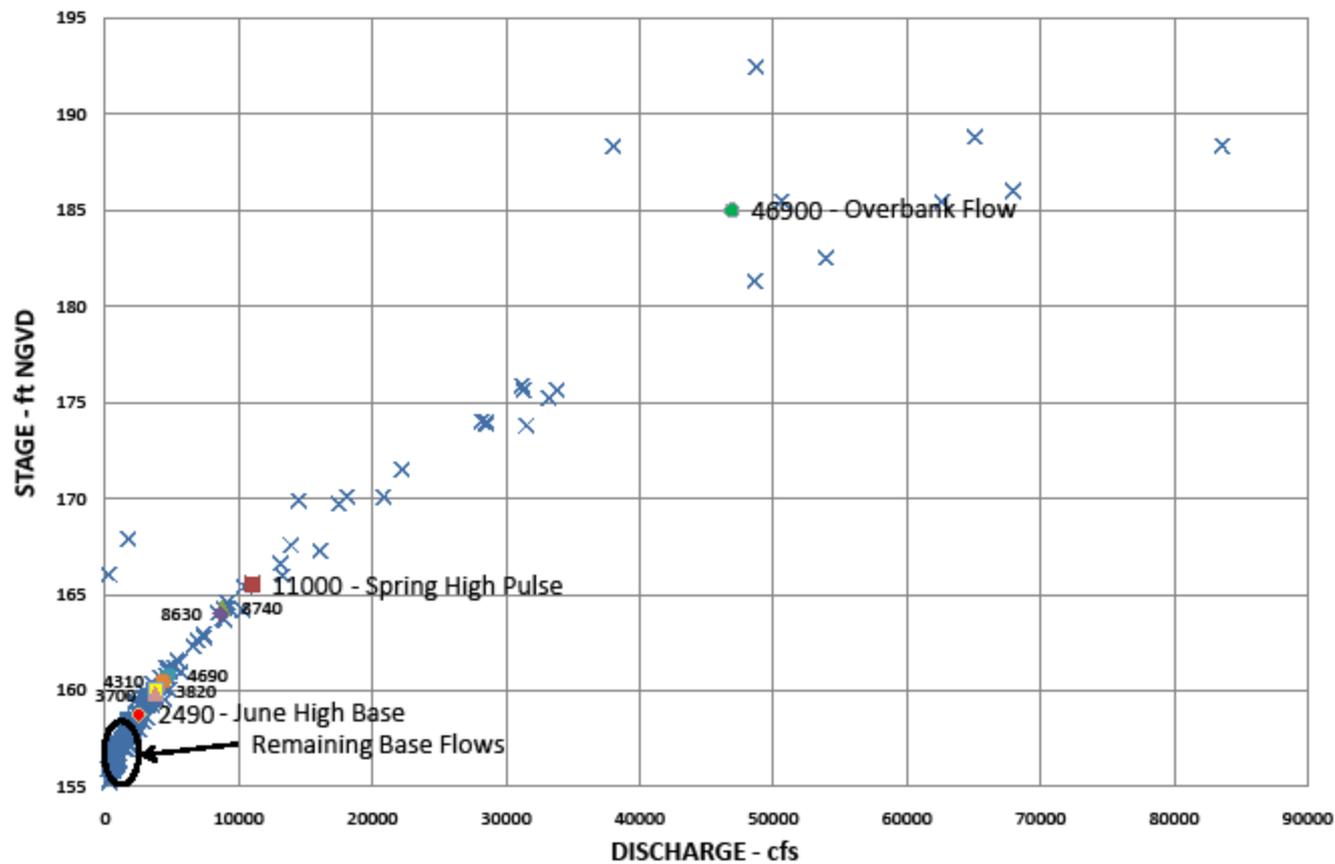

- ◉ Determine if the Channel is Stable at USGS Gage Station
- ◉ Use Effective Discharge Calculation
- ◉ Develop and Understanding How Base, Pulse, and Overbank Flows Fit the Hydraulics of the Stream at the Gage Station

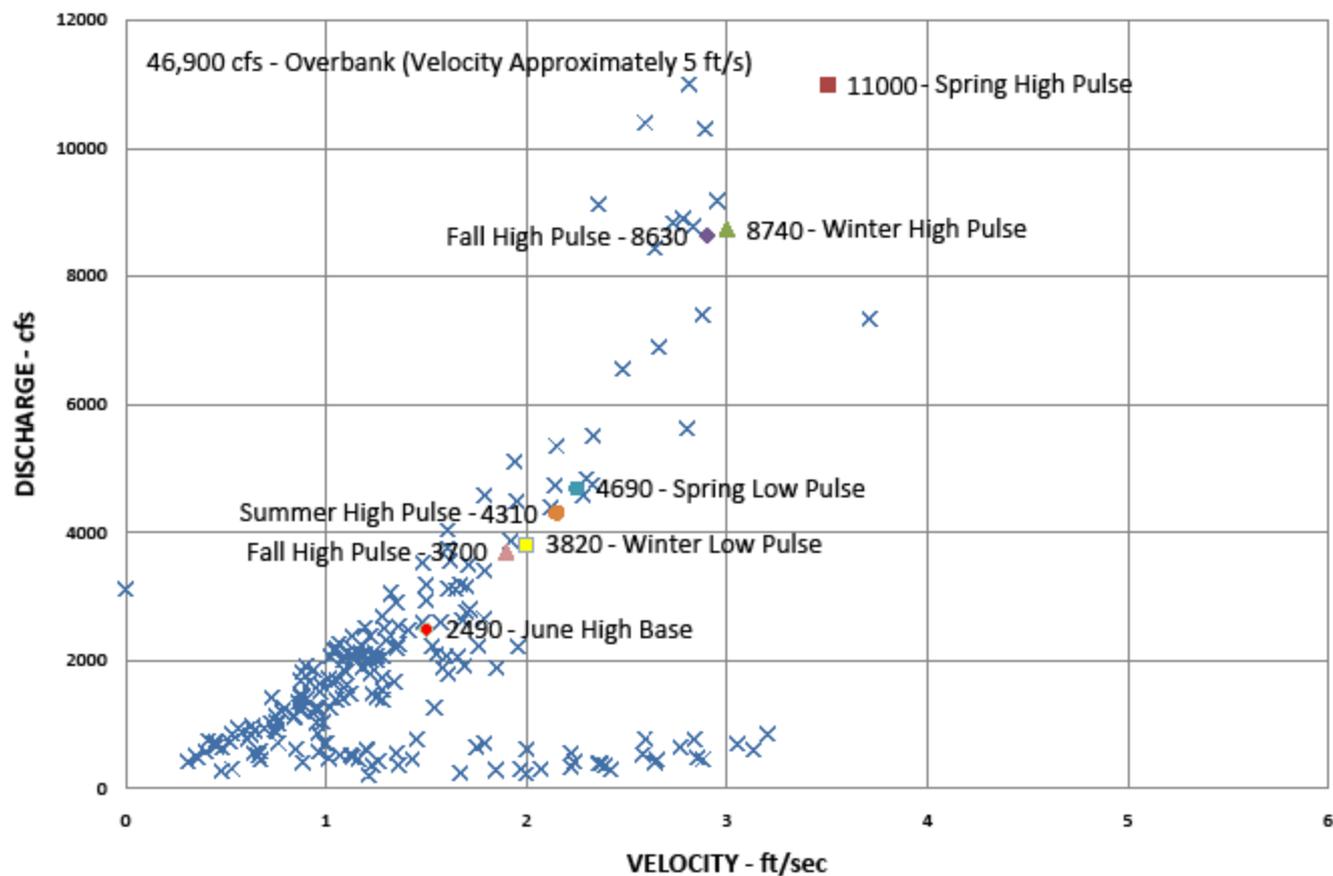

# Colorado River - Ballinger

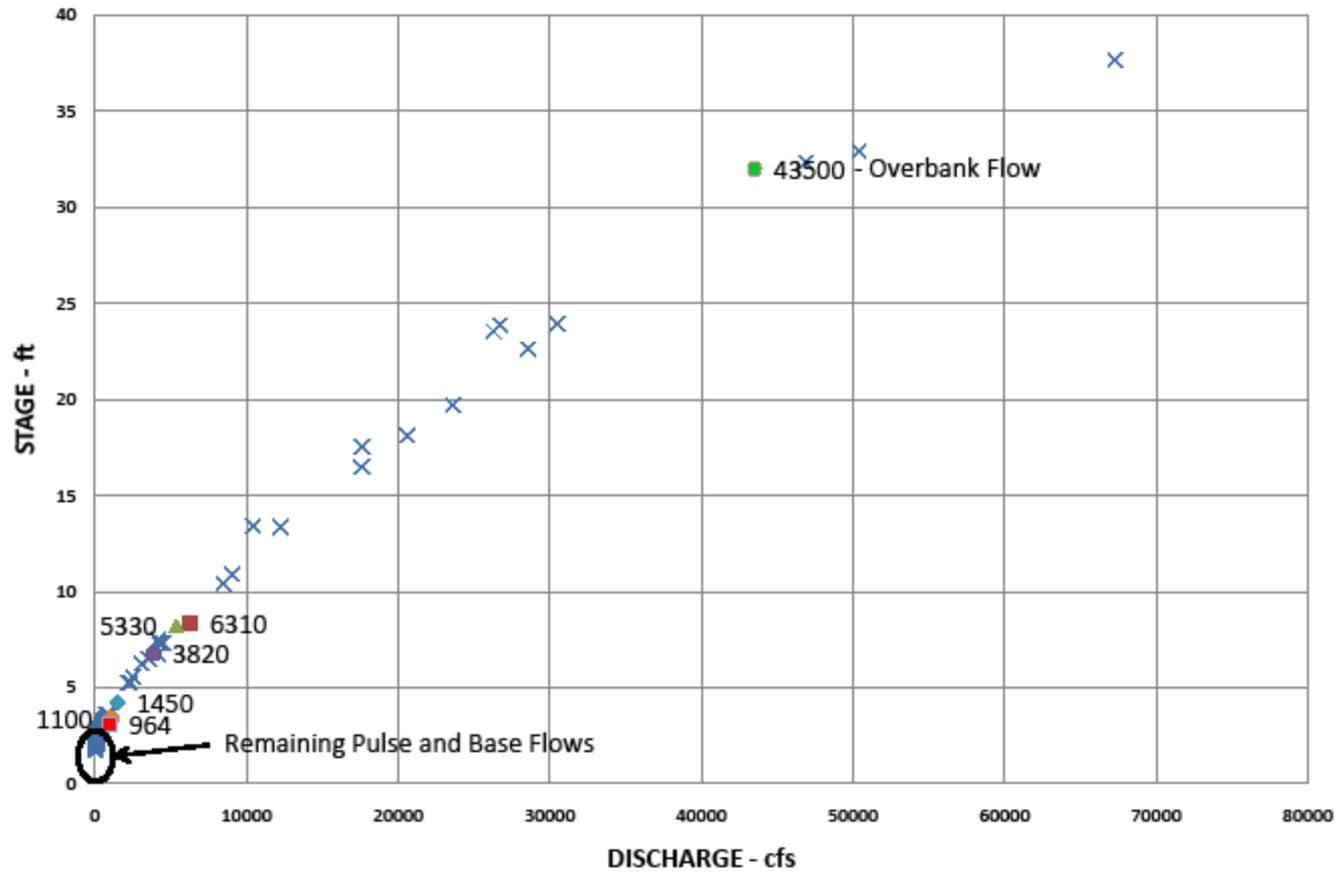

# Colorado River - Columbus

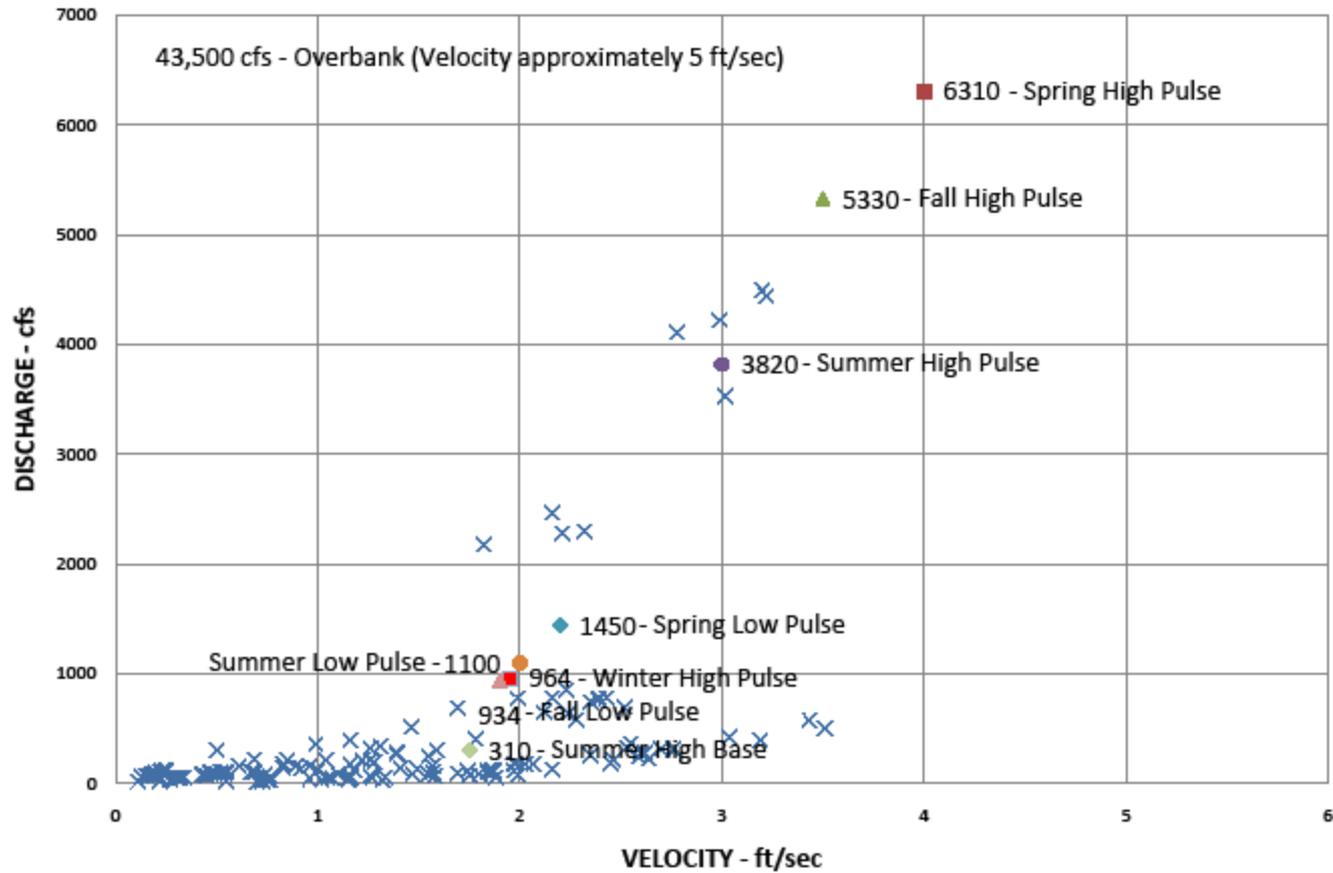

## Colorado River - Columbus

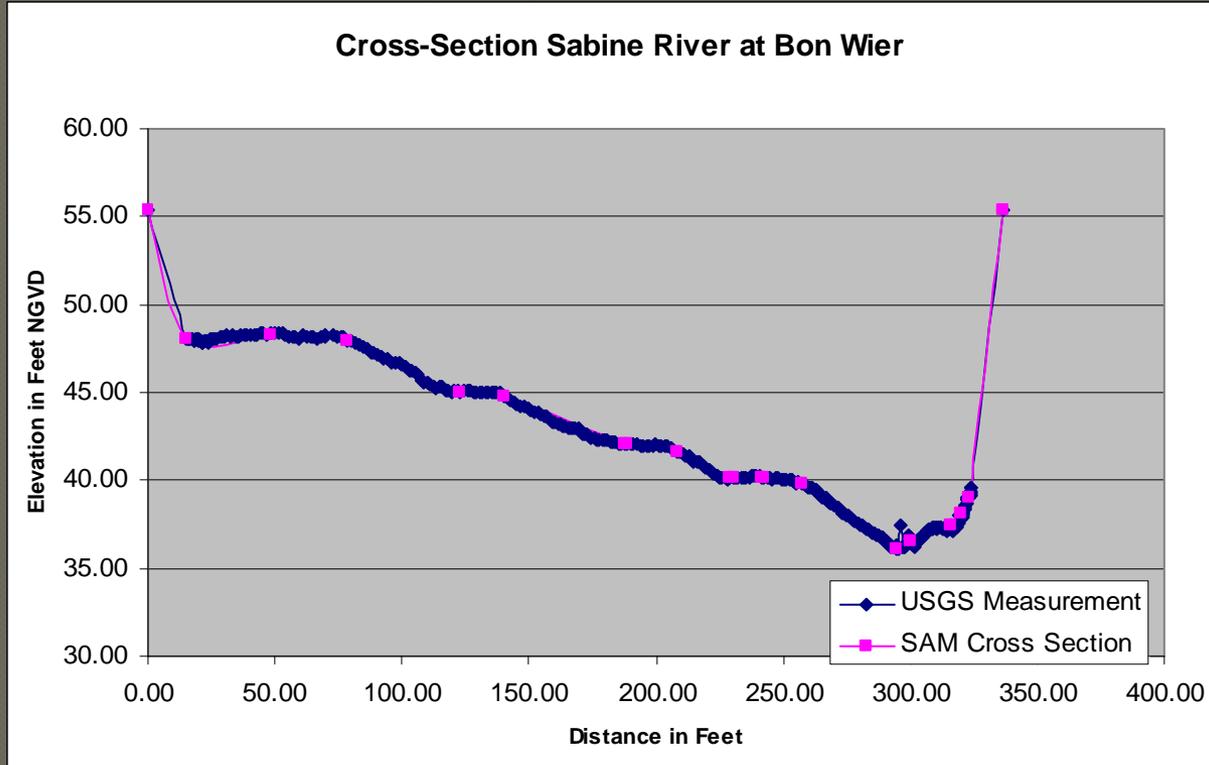

# Colorado River - San Saba

## Colorado River - San Saba

## Hydraulics

# Sediment Rating Curve

# Sediment Histograms

# How Geomorphology Can Inform HEFR Parameters

---

- ◉ Identify Hydraulic Characteristics of the stream at gage location
- ◉ Identify critical values for sediment transport
