

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY
AGENDA ITEM REQUEST
for State Implementation Plan Revision Adoption

AGENDA REQUESTED: February 23, 2022

DATE OF REQUEST: February 4, 2022

INDIVIDUAL TO CONTACT REGARDING CHANGES TO THIS REQUEST, IF NEEDED: Jamie Zech, Agenda Coordinator, (512) 239-3935

CAPTION: Docket No. 2021-0594-SIP. Consideration for the adoption of the Redesignation Request and Maintenance Plan State Implementation Plan (SIP) Revision for the Freestone-Anderson and the Titus 2010 Sulfur Dioxide (SO₂) National Ambient Air Quality Standard (NAAQS) Nonattainment Areas.

The SIP revision includes a request that the United States Environmental Protection Agency redesignate the Freestone-Anderson and Titus nonattainment areas to attainment for the 2010 SO₂ NAAQS and provides 10-year maintenance plans for both areas consistent with federal Clean Air Act (FCAA), §175A requirements. The SIP revision also addresses the comprehensive emissions inventory and nonattainment new source review certification statement SIP requirements provided under Part D of the FCAA. Office of Air

Docket No.: 2021-0594-SIP

Subject: Commission Approval for Adoption of the Redesignation Request and Maintenance Plan State Implementation Plan (SIP) Revision for the Freestone-Anderson and Titus 2010 Sulfur Dioxide (SO₂) National Ambient Air Quality Standard (NAAQS) Nonattainment Areas

Redesignation Request and Maintenance Plan for the Freestone-Anderson and Titus SO₂ NAAQS Nonattainment Areas
Rule Project No. 2021-007-SIP-NR

Background and reason(s) for the SIP revision:

The United States Environmental Protection Agency (EPA) revised the SO₂ NAAQS on June 22, 2010, adding the 75 parts per billion (ppb) one-hour primary standard (75 *Federal Register* (FR) 35520). The EPA designated several areas in Texas as nonattainment for the 2010 SO₂ NAAQS, effective January 12, 2017 (81 FR 89870), including portions of Freestone and Anderson Counties (Freestone-Anderson) and a portion of Titus County (Titus). Areas designated as nonattainment for the SO₂ NAAQS are subject to the general nonattainment area planning requirements in §172 of the federal Clean Air Act (FCAA) and to the SO₂-specific planning requirements in FCAA, §191 and §192. These planning requirements include an emissions inventory, attainment demonstration (AD), reasonably available control measures (RACT) including reasonably available control technology (RACT), enforceable emission limitations and control measures, reasonable further progress (RFP) plan, nonattainment new source review (NNSR), and contingency measures.

SIP revisions for the Texas 2010 SO₂ nonattainment areas were due to the EPA on July 13, 2018. On August 22, 2019, the EPA proposed an error correction to modify designations to unclassifiable for the Freestone-Anderson and Titus nonattainment areas (84 FR 43757). On June 29, 2021, the EPA published a notice withdrawing the proposed error correction (86 FR 34187). Primarily due to ongoing litigation and the expectation for designation revisions, Texas did not submit SIP revisions for the nonattainment areas by the July 13, 2018 due date. On August 10, 2020, the EPA published a final notice of finding of failure to submit, effective September 9, 2020 (85 FR 48111). Under FCAA, §110(c), EPA has an obligation to promulgate a federal implementation plan (FIP) within two years if the SIP planning requirements are not met. Further, under FCAA, §179(a) and (b) and 40 Code of Federal Regulations §52.31, if the EPA does not make a completeness determination by March 9, 2022 (18 months after the finding of failure to submit) of a Texas SIP submittal to address the deficiencies, then the emissions offset sanction identified in FCAA, §179(b)(2) will apply for the affected nonattainment areas. If the EPA does not determine that the state's submittals are complete within six months after imposing the offset sanction, then the highway funding sanction will apply. However, if Texas submits the required SIP revisions and the EPA approves those submittals by September 9, 2022 (two years after the finding of failure to submit), then the EPA will not be required to promulgate a FIP.

The Monticello Steam Electric Station in Titus County was the primary SO₂ emissions source in the Titus SO₂ NAAQS nonattainment area, and it was shut down in late 2017. The Big Brown Steam Electric Station in Anderson County, the primary SO₂ emissions source in the Freestone-Anderson SO₂ NAAQS nonattainment area, ceased operations in early 2018 and was demolished in April of

Re: Docket No. 2021-0594-SIP

2021. On May 14, 2021, the EPA published final clean data determinations (CDD) for the Freestone-Anderson and Titus nonattainment areas, effective June 14, 2021 (86 FR 26388). The EPA made these determinations based on the shutdown of the primary emissions sources in both nonattainment areas, and the determinations were supported by monitoring data from within or near those areas along with an evaluation of previous modeling. The final CDDs suspend the following SIP planning requirements for the 2010 SO₂ NAAQS related to attainment: the AD and RFP plans, RACT, RACM, contingency measures, and enforceable emission limitations and control measures. These requirements are suspended for as long as the areas continue to attain the standard. However, the emissions inventory and NNSR SIP requirements are not suspended by a CDD and must be addressed in a SIP submittal by March 9, 2022 to avoid sanctions and a potential FIP. Furthermore, a final CDD is not a redesignation to attainment under FCAA, §107(d)(3), but it does provide support for a redesignation request.

Scope of the SIP revision:

The Redesignation Request and Maintenance Plan SIP Revision for the Freestone-Anderson and Titus SO₂ NAAQS Nonattainment Areas includes the state's request that the EPA redesignate both areas to attainment for the 2010 SO₂ and provides the required 10-year maintenance plan for each area.

The SIP revision also includes a comprehensive, detailed inventory of current SO₂ emissions for both nonattainment areas and the state's certification that current regulations provide the means to satisfy NNSR requirements for the Freestone-Anderson and the Titus SO₂ NAAQS nonattainment areas.

A.) Summary of what the SIP revision will do:

The SIP revision for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas requests that the EPA redesignate both areas to attainment for the 2010 SO₂ NAAQS, provides a 10-year maintenance plan for each area consistent with FCAA, §175A requirements, and addresses, by the EPA's March 9, 2022 deadline, the outstanding NNSR and emissions inventory requirements that were not suspended by the May 14, 2021 CDDs.

B.) Scope required by federal regulations or state statutes:

The FCAA, §175A(a) indicates that states that submit a request for redesignation to attainment are required to submit a revision to the SIP providing for a maintenance plan for the area for at least 10 years after the effective date of redesignation. In addition, this SIP revision includes a comprehensive emissions inventories and NNSR certification statements since those requirements are not suspended by the CDD.

C.) Additional staff recommendations that are not required by federal rule or state statute:

None.

Statutory authority:

The authority to propose and adopt a SIP revision is derived from FCAA, §110, which requires states to submit implementation plans that contain enforceable measures to achieve the NAAQS; FCAA, §175A, regarding maintenance plans; and other general and specific authority in Texas Water Code, Chapters 5 and 7, and Texas Health and Safety Code, Chapter 382.

Effect on the:

A.) Regulated community:

The regulated community will benefit by receiving relief from sanctions, FIP, and additional nonattainment permitting requirements.

Re: Docket No. 2021-0594-SIP

B.) Public:

People in and around the Freestone-Anderson and Titus nonattainment areas have already benefitted from improved air quality due to the closures of the Big Brown Steam Electric Station and the Monticello Steam Electric Station. The public will benefit from the redesignation and continued maintenance of the Freestone-Anderson and Titus areas.

C.) Agency programs:

No impact on agency programs is anticipated.

Stakeholder meetings:

The proposed SIP revision went through a public review and comment period and one public hearing was offered. Since there are no associated new rules, stakeholder meetings were not held.

Public comment:

The commission offered a virtual public hearing for this SIP revision on September 28, 2021 at 2:00 p.m. Notice of the public hearing was published in the *Texas Register* as well as the *Dallas Morning News*, *Freestone County Times*, and *Mount Pleasant Tribune*. TCEQ staff were present and ready to open the hearing for public comment; however, no attendees arrived to make comments on the record. Therefore, the public hearing was not formally opened for comment and a transcript was not prepared.

The public comment period opened on August 27, 2021 and closed on September 29, 2021. During the comment period, TCEQ staff received comments from the EPA. Comments primarily concerned monitoring, verification of continued attainment, contingency measures, and conformity. A summary of the comments and TCEQ responses are included as a part of this SIP revision in the Response to Comments.

Significant changes from proposal:

The following significant changes were made in response to comments made by the EPA:

- Section 2.3.2.2 *Conformity Requirements* was added to include discussions on both general and transportation conformity in the Freestone-Anderson and Titus County 2010 SO₂ NAAQS nonattainment areas.
- Chapter 3: *Maintenance Demonstration* was updated to clarify that verification of continued attainment will not rely on monitoring data due to the TCEQ's plan to decommission the Fairfield Farm to Market 2570 Ward Ranch monitor.
- Chapter 4: *Contingency Plan* was updated to clarify how the TCEQ will verify continued attainment and contingency measure triggers in the Freestone-Anderson and Titus County areas in the absence of monitoring data.

Potential controversial concerns and legislative interest:

None.

Will this SIP revision affect any current policies or require development of new policies?

No.

What are the consequences if this SIP revision does not go forward? Are there alternatives to SIP revision?

The state could choose to not submit the redesignation request and maintenance plan portions of this SIP revision, as it is not a required submittal, but if not submitted and approved by the EPA, the Freestone-Anderson and Titus nonattainment areas will remain in nonattainment status.

Commissioners

Re: Docket No. 2021-0594-SIP

While final CDDs do suspend attainment-related SIP planning requirements, the TCEQ must still address those nonattainment area requirements that are not suspended by the CDDs. If the portions of this SIP revision that specifically address the emissions inventory and NNSR requirements for both nonattainment areas are not submitted, those SIP requirements would remain outstanding. If those SIP requirements for the Freestone-Anderson and/or the Titus SO₂ NAAQS nonattainment areas remain outstanding on March 9, 2022, the EPA will be required to implement a FIP for each applicable area.

Key points in the adoption SIP revision schedule:

Anticipated adoption date: February 23, 2022

Adoption
February 23, 2022

This page intentionally left blank

EXECUTIVE SUMMARY

On June 22, 2010, the United States Environmental Protection Agency (EPA) revised the sulfur dioxide (SO₂) National Ambient Air Quality Standards (NAAQS) to add the 75 parts per billion (ppb) one-hour primary standard, effective August 23, 2010 (75 *Federal Register* (FR) 35520). Portions of Freestone and Anderson Counties (Freestone-Anderson) and a portion of Titus County (Titus) are designated nonattainment for this standard. The Freestone-Anderson 2010 SO₂ NAAQS nonattainment area was designated nonattainment due to emissions from the Big Brown Steam Electric Station, the primary SO₂ emissions source in that area. The Titus 2010 SO₂ NAAQS nonattainment area was designated nonattainment due to emissions from the Monticello Steam Electric Station, the primary SO₂ emissions source in that area. As of early 2018, both facilities had permanently ceased operations.

State implementation plan (SIP) submittals for the Texas 2010 SO₂ nonattainment areas were due to the United States Environmental Protection Agency (EPA) by July 13, 2018. On August 22, 2019, the EPA proposed an error correction to modify designations to unclassifiable for Texas SO₂ nonattainment areas, including the Freestone-Anderson and Titus nonattainment areas (84 FR 43757). On June 29, 2021, the EPA published a notice withdrawing the proposed error correction (86 FR 34187). Primarily due to ongoing litigation and the expectation for designation revisions, Texas did not submit SIP revisions for the nonattainment areas by the July 13, 2018 due date. On August 10, 2020, the EPA published a final notice of finding of failure to submit, effective September 9, 2020 (85 FR 48111). This action triggered an EPA obligation under federal Clean Air Act (FCAA), §110(c) to promulgate a federal implementation plan (FIP) anytime within two years if the SIP planning requirements are not met. If the EPA does not make a completeness determination by March 9, 2022 (18 months after the finding of failure to submit) of a Texas SIP submittal to address the deficiencies, then pursuant to FCAA, §179(a) and (b) and 40 Code of Federal Regulations §52.31, the emissions offset sanction identified in FCAA, §179(b)(2) will apply for the affected nonattainment areas. If the EPA does not determine that the state's submittals are complete within six months after imposing the offset sanction, then the highway funding sanction will apply. If Texas submits the required SIP revisions and the EPA approves those submittals by September 9, 2022 (two years after the finding of failure to submit), then the EPA will not be required to promulgate a FIP.

On June 30, 2020 the Texas Commission on Environmental Quality (TCEQ) sent a letter to the EPA requesting clean data determinations (CDD) for the Freestone-Anderson and the Titus nonattainment areas. In support of this request, the TCEQ cited the retirements of the Big Brown Steam Electric Station and the Monticello Steam Electric Station, and preliminary SO₂ design values below the NAAQS in each of these two nonattainment areas. On May 14, 2021, the EPA published final CDDs for the Freestone-Anderson and Titus nonattainment areas (86 FR 26401) concluding that, effective June 14, 2021, both areas are currently in attainment of the 2010 SO₂ NAAQS per the EPA's Clean Data Policy. The CDDs were based on an analysis of available monitoring and modeling data. While a CDD is not a redesignation to attainment under FCAA, §107(d)(3)(E), it does provide support for redesignation of each of these nonattainment areas.

The FCAA, §107(d)(3)(E) states that the EPA can redesignate an area to attainment if the following conditions are met:

- the EPA has determined that the NAAQS has been attained;
- the applicable implementation plan has been fully approved by the EPA under FCAA, §110(k);
- the EPA has determined that the improvement in air quality is due to permanent and enforceable reductions in emissions;
- the state has met all applicable requirements for the area under §110 and Part D of the FCAA; and
- the EPA has fully approved a maintenance plan, including a contingency plan, for the area under FCAA, §175A.

A final CDD suspends some of the SIP requirements of FCAA, Part D, such as attainment demonstrations, reasonable further progress demonstrations, implementation of reasonably available control measures (including reasonable available control technology), and contingency measures, for as long as the area continues to attain the standard. A CDD does not suspend the comprehensive emissions inventories (EI) and nonattainment new source review (NNSR) certification statement SIP requirements for nonattainment areas. These requirements must be addressed in a SIP revision submitted to the EPA by March 9, 2022 to avoid sanctions and a potential FIP.

This SIP revision includes the state's request that the EPA redesignate the Freestone-Anderson and Titus nonattainment areas to attainment for the 2010 SO₂ NAAQS. This SIP revision also includes maintenance plans for the areas, in accordance with FCAA, §175A, to ensure continued attainment of the 2010 SO₂ NAAQS for at least 10 years after the effective date of a redesignation. Finally, this SIP revision includes the outstanding comprehensive EIs and NNSR certification statements required for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas.

SECTION V-A: LEGAL AUTHORITY

General

The Texas Commission on Environmental Quality (TCEQ) has the legal authority to implement, maintain, and enforce the National Ambient Air Quality Standards (NAAQS) and to control the quality of the state's air, including maintaining adequate visibility.

The first air pollution control act, known as the Clean Air Act of Texas, was passed by the Texas Legislature in 1965. In 1967, the Clean Air Act of Texas was superseded by a more comprehensive statute, the Texas Clean Air Act (TCAA), found in Article 4477-5, Vernon's Texas Civil Statutes. The legislature amended the TCAA in 1969, 1971, 1973, 1979, 1985, 1987, 1989, 1991, 1993, 1995, 1997, 1999, 2001, 2003, 2005, 2007, 2009, 2011, 2013, 2015, 2017, and 2019. In 1989, the TCAA was codified as Chapter 382 of the Texas Health and Safety Code.

Originally, the TCAA stated that the Texas Air Control Board (TACB) was the state air pollution control agency and was the principal authority in the state on matters relating to the quality of air resources. In 1991, the legislature abolished the TACB effective September 1, 1993, and its powers, duties, responsibilities, and functions were transferred to the Texas Natural Resource Conservation Commission (TNRCC). In 2001, the 77th Texas Legislature continued the existence of the TNRCC until September 1, 2013 and changed the name of the TNRCC to the TCEQ. In 2009, the 81st Texas Legislature, during a special session, amended section 5.014 of the Texas Water Code, changing the expiration date of the TCEQ to September 1, 2011, unless continued in existence by the Texas Sunset Act. In 2011, the 82nd Texas Legislature continued the existence of the TCEQ until 2023. With the creation of the TNRCC (and its successor the TCEQ), the authority over air quality is found in both the Texas Water Code and the TCAA. Specifically, the authority of the TCEQ is found in Chapters 5 and 7. Chapter 5, Subchapters A - F, H - J, and L, include the general provisions, organization, and general powers and duties of the TCEQ, and the responsibilities and authority of the executive director. Chapter 5 also authorizes the TCEQ to implement action when emergency conditions arise and to conduct hearings. Chapter 7 gives the TCEQ enforcement authority.

The TCAA specifically authorizes the TCEQ to establish the level of quality to be maintained in the state's air and to control the quality of the state's air by preparing and developing a general, comprehensive plan. The TCAA, Subchapters A - D, also authorize the TCEQ to collect information to enable the commission to develop an inventory of emissions; to conduct research and investigations; to enter property and examine records; to prescribe monitoring requirements; to institute enforcement proceedings; to enter into contracts and execute instruments; to formulate rules; to issue orders taking into consideration factors bearing upon health, welfare, social and economic factors, and practicability and reasonableness; to conduct hearings; to establish air quality control regions; to encourage cooperation with citizens' groups and other agencies and political subdivisions of the state as well as with industries and the federal government; and to establish and operate a system of permits for construction or modification of facilities.

Local government authority is found in Subchapter E of the TCAA. Local governments have the same power as the TCEQ to enter property and make inspections. They also

may make recommendations to the commission concerning any action of the TCEQ that affects their territorial jurisdiction, may bring enforcement actions, and may execute cooperative agreements with the TCEQ or other local governments. In addition, a city or town may enact and enforce ordinances for the control and abatement of air pollution not inconsistent with the provisions of the TCAA and the rules or orders of the commission.

In addition, Subchapters G and H of the TCAA authorize the TCEQ to establish vehicle inspection and maintenance programs in certain areas of the state, consistent with the requirements of the federal Clean Air Act; coordinate with federal, state, and local transportation planning agencies to develop and implement transportation programs and measures necessary to attain and maintain the NAAQS; establish gasoline volatility and low emission diesel standards; and fund and authorize participating counties to implement vehicle repair assistance, retrofit, and accelerated vehicle retirement programs.

Applicable Law

The following statutes and rules provide necessary authority to adopt and implement the state implementation plan (SIP). The rules listed below have previously been submitted as part of the SIP.

Statutes

All sections of each subchapter are included, unless otherwise noted.

TEXAS HEALTH & SAFETY CODE, Chapter 382 September 1, 2019

TEXAS WATER CODE September 1, 2019

Chapter 5: Texas Natural Resource Conservation Commission

Subchapter A: General Provisions

Subchapter B: Organization of the Texas Natural Resource Conservation Commission

Subchapter C: Texas Natural Resource Conservation Commission

Subchapter D: General Powers and Duties of the Commission

Subchapter E: Administrative Provisions for Commission

Subchapter F: Executive Director (except §§5.225, 5.226, 5.227, 5.2275, 5.231, 5.232, and 5.236)

Subchapter H: Delegation of Hearings

Subchapter I: Judicial Review

Subchapter J: Consolidated Permit Processing

Subchapter L: Emergency and Temporary Orders (§§5.514, 5.5145, and 5.515 only)

Subchapter M: Environmental Permitting Procedures (§5.558 only)

Chapter 7: Enforcement

Subchapter A: General Provisions (§§7.001, 7.002, 7.0025, 7.004, and 7.005 only)

Subchapter B: Corrective Action and Injunctive Relief (§7.032 only)

Subchapter C: Administrative Penalties

Subchapter D: Civil Penalties (except §7.109)

Subchapter E: Criminal Offenses and Penalties: §§7.177, 7.179-7.183

Rules

CHAPTER 1: GENERAL

1.1 BACKGROUND

Information on the Texas State Implementation Plan (SIP) and a list of SIP revisions and other air quality plans adopted by the commission can be found on the [Texas State Implementation Plan](http://www.tceq.texas.gov/airquality/sip) webpage (<http://www.tceq.texas.gov/airquality/sip>) and on the [Texas Commission on Environmental Quality's](http://www.tceq.texas.gov/) (TCEQ) website (<http://www.tceq.texas.gov/>).

1.2 PURPOSE

The TCEQ seeks redesignations of the Freestone-Anderson and Titus nonattainment areas to attainment for the 2010 sulfur dioxide (SO₂) National Ambient Air Quality Standard (NAAQS) under federal Clean Air Act (FCAA), §107(d)(3)(E), which states that the United States Environmental Protection Agency (EPA) can redesignate an area to attainment if all of the following conditions are met:

- the EPA has determined that the NAAQS has been attained;
- the applicable implementation plan has been fully approved by the EPA under FCAA, §110(k);
- the EPA has determined that the improvement in air quality is due to permanent and enforceable reductions in emissions;
- the state has met all applicable requirements for the area under §110 and Part D of the FCAA; and
- the EPA has fully approved a maintenance plan, including a contingency plan, for the area under FCAA, §175A.

The purpose of this SIP revision is to address all of the above requirements, including the comprehensive emissions inventory and nonattainment new source review certification statement requirements under Part D of the FCAA. This SIP also includes maintenance plans that will fulfill the requirements under FCAA, §107(d)(3)(E) and ensure that the Freestone-Anderson and Titus nonattainment areas continue to attain the 2010 SO₂ NAAQS through 2034.

1.3 HISTORY OF THE 2010 SO₂ NAAQS IN RELATION TO FREESTONE, ANDERSON, AND TITUS COUNTIES

On June 22, 2010, the EPA revised the SO₂ NAAQS, adding the 75 parts per billion one-hour primary standard (75 *Federal Register* (FR) 35520). On June 2, 2011, Texas submitted a letter to the EPA recommending designations for nine counties, including unclassifiable designations for Anderson, Freestone, and Titus Counties. On April 20, 2012, TCEQ submitted a revised recommendation but did not change the state's initial recommendation for Anderson, Freestone, or Titus County designations.

On August 5, 2013, the EPA published final nonattainment area designations for areas that had monitored data indicating violations of the 2010 SO₂ NAAQS within the period from 2009 through 2011 (78 FR 47191). The EPA announced nonattainment designations for 29 areas in 16 states but was not prepared to issue designations for the remaining areas, including all of Texas. Following those initial designations, several entities sued the EPA for failing to complete all area designations by a June 2013 deadline.

On March 2, 2015, to resolve outstanding litigation, the United States District Court for the Northern District of California approved and entered a consent decree setting deadlines for the EPA to complete three additional rounds of designations. By July 2, 2016 (for Round 2 designations), the EPA was required to designate areas with newly monitored violations as well as areas with large emissions sources not announced for retirement as of March 2015.¹

In a letter to the TCEQ dated March 20, 2015, the EPA identified 12 electric power plants with emissions meeting the court-ordered criteria for required designation by July 2016. These included the Big Brown Steam Electric Station in Freestone County and the Monticello Steam Electric Station in Titus County. The EPA's letter provided an opportunity for Texas to submit updated recommendations and supporting information for the EPA to consider for area designations by September 18, 2015.

On August 21, 2015, the EPA published the Data Requirements Rule (DRR) for the 2010 SO₂ NAAQS (80 FR 51052). The DRR required states to identify sources with 2014 emissions greater than 2,000 tpy, and to inform the EPA of plans to characterize air quality at the identified sources, either through modeling or monitoring.

On September 18, 2015, Texas submitted revised recommendations in response to the EPA's March 2015 letter, recommending unclassifiable/attainment designations for areas of the state that did not have monitors at that time, including Anderson, Freestone, and Titus Counties.

On January 15, 2016, in compliance with the DRR, Texas submitted to the EPA a list with final identification of 24 sources in the state with 2014 emissions greater than 2,000 tpy. This list included the Big Brown Steam Electric Station in Freestone County and the Monticello Steam Electric Station in Titus County. The state submitted the DRR-required air quality characterization plans for all identified sources by the July 1, 2016 deadline. In its air quality characterization plans, the TCEQ indicated that monitoring would be used to characterize air quality for both the Big Brown Steam Electric Station in Freestone County and the Monticello Steam Electric Station in Titus County. However, the March 2015 consent decree designation deadline for areas where these facilities were located would not allow for sufficient time to collect monitoring data from source-oriented monitors in accordance with the DRR. The DRR required that all source-oriented monitors to be used to characterize air quality to inform designations were to be installed and operating by January 1, 2017, which further limited the state's ability to obtain sufficient qualified monitoring data before the EPA's designations needed to be finalized.

On February 11, 2016, the EPA issued a 120-day notice to Texas with proposed designations for areas surrounding the 12 sources identified in its March 2015 letter. The notice included intended nonattainment area designations for portions of Anderson, Freestone, and Titus Counties, with the portions of Anderson and Freestone Counties in a single nonattainment area (the Freestone-Anderson nonattainment area).

¹ Large emissions sources were defined as those sources with 2011 SO₂ emissions either greater than 16,000 tons per year or greater than 2,600 tons per year with an emission rate over 0.45 pounds per million British thermal units (lbs/MMBtu).

On April 19, 2016, Texas responded to the 120-day notice, restating the position that Anderson, Freestone, and Titus Counties should each be designated unclassifiable/attainment.

On July 12, 2016, the EPA published final Round 2 designations but delayed those for Anderson, Freestone, Titus, and four other counties (81 FR 45039). On December 13, 2016, the EPA published final nonattainment designations for the Freestone-Anderson 2010 SO₂ NAAQS nonattainment area and the Titus 2010 SO₂ NAAQS nonattainment area (81 FR 89870). In making nonattainment designations for the two areas, the EPA considered data available at the time of those designations, including modeling submitted by Luminant Generation Company, LLC (owner of the two facilities) as well as modeling that the Sierra Club had submitted to the EPA in 2016. The EPA's analysis determined that the Big Brown Steam Electric Station and the Monticello Steam Electric Station were responsible for almost 100% of the SO₂ impacts on the maximum modeled concentrations in their respective areas. TCEQ was required to submit SIP revisions for the nonattainment areas by July 13, 2018. However, due to ongoing litigation challenging these designations as well as an EPA proposed error correction that would have revised the designations if finalized (86 FR 34187, June 29, 2021), Texas did not submit the SIP elements required for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas to the EPA by the submittal deadline.

On October 6, 2017, Luminant, a subsidiary of Vistra Energy, announced plans to retire the Monticello Steam Electric Station in Titus County. Shortly after, on October 13, 2017, Luminant announced plans to retire the Big Brown Steam Electric Station in Freestone County, and to close both facilities at the beginning of 2018. Permits for Big Brown Steam Electric Station were voided on December 1, 2020. Monticello Steam Electric Station changed ownership from Luminant to Golden Eagle Development on June 22, 2020. Golden Eagle voided the permits for the Monticello Steam Electric Station on July 14, 2020. These facilities were the major SO₂ emissions sources in their respective nonattainment areas.

On June 30, 2020, the TCEQ sent a letter to the EPA requesting clean data determinations (CDD) for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas. In support of this request, the TCEQ cited the retirements of both the Big Brown Steam Electric Station and the Monticello Steam Electric Station and preliminary SO₂ design values below the NAAQS in each nonattainment area. Monitoring data used to determine those preliminary design values were obtained from a source-oriented monitor in Freestone County (the Fairfield Farm to Market (FM) 2570 Ward Rand monitor located approximately three miles southwest of the Big Brown Steam Electric Station), and a monitor in Titus County source-oriented to the Welsh Power Plant (the Cookville FM 4855 monitor located approximately 12 miles east of the Monticello Steam Electric Station).

On August 10, 2020, in response to a notice of intent to sue by the Sierra Club, the EPA published a final action finding that Texas failed to submit the required nonattainment area SIP revisions for the 2010 SO₂ NAAQS (85 FR 48111). This action triggered an EPA obligation under FCAA, §110(c) to promulgate a federal implementation plan (FIP) anytime within two years of the finding of failure to submit if the state fails to meet the SIP planning requirements. If the EPA does not make a completeness determination by March 9, 2022 (18 months after the finding of failure to submit) of a Texas SIP

submission to address the deficiencies, then pursuant to FCAA, §179(a) and (b) and 40 Code of Federal Regulations §52.31, the emissions offset sanction identified in FCAA, §179(b)(2) will apply for the affected nonattainment areas. If the EPA does not determine that the state's submittals are complete within six months after imposing the offset sanction, then the highway funding sanction will apply. If Texas submits the required SIP submittals and the EPA approves those submittals by September 9, 2022 (two years after the finding of failure to submit), then the EPA will not be required to promulgate a FIP.

On May 14, 2021, the EPA published final CDDs for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas, suspending the following SIP planning requirements for the 2010 SO₂ NAAQS related to attainment: attainment demonstration, reasonable further progress plan, reasonably available control measures, reasonably available control technology, and contingency measures (86 FR 26401). These requirements are suspended for as long as the areas continue to attain the standard. The CDDs do not suspend the comprehensive emissions inventories and nonattainment new source review SIP requirements for 2010 SO₂ NAAQS nonattainment areas, which are addressed for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas in this SIP revision. A final CDD is not a redesignation to attainment under FCAA, §107(d)(3). However, the final CDDs support the request for redesignations and the maintenance plans included in this SIP revision.

1.4 PUBLIC HEARING AND COMMENT INFORMATION

The public comment period opened on August 27, 2021 and closed on September 29, 2021. The commission offered a virtual public hearing for this SIP revision on September 28, 2021 at 2:00 p.m. Notice of the public hearing was published in the *Texas Register* as well as the *Dallas Morning News*, *Freestone County Times*, and *Mount Pleasant Tribune*. TCEQ staff were present and ready to open the hearing for public comment; however, no attendees arrived to make comments on the record. Therefore, the public hearing was not formally opened for comment and a transcript was not prepared.

Written comments were accepted via mail, fax, or through the eComments (<https://www6.tceq.texas.gov/rules/comments/>) system. During the comment period, TCEQ staff received comments from the EPA. The comments received are summarized and addressed in the Response to Comments for this SIP revision.

1.5 SOCIAL AND ECONOMIC CONSIDERATIONS

Because rulemaking is not a part of this SIP revision, there are no changes that would impact society or the economy.

1.6 FISCAL AND MANPOWER RESOURCES

The TCEQ determined that its fiscal and manpower resources are adequate and will not be adversely affected through the implementation of this plan.

CHAPTER 2: REDESIGNATION REQUIREMENTS

2.1 INTRODUCTION

Section 107(d)(3)(E) of the federal Clean Air Act (FCAA) states that the United States Environmental Protection Agency (EPA) can redesignate a nonattainment area to attainment if the following conditions are met:

- the EPA has determined that the National Ambient Air Quality Standard (NAAQS) has been attained;
- the applicable implementation plan has been fully approved by the EPA under FCAA, §110(k);
- the EPA has determined that the improvement in air quality is due to permanent and enforceable reductions in emissions;
- the state has met all applicable requirements for the area under §110 and Part D of the FCAA; and
- the EPA has fully approved a maintenance plan, including a contingency plan, for the area under FCAA, §175A.

This chapter describes how the Freestone-Anderson and Titus nonattainment areas meet the FCAA redesignation requirements for the 2010 sulfur dioxide (SO₂) NAAQS.

2.2 ATTAINMENT OF THE 2010 SO₂ NAAQS

On June 30, 2020, the Texas Commission on Environmental Quality (TCEQ) sent a letter to the EPA requesting clean data determinations (CDD) for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas designated nonattainment in Round 2. The letter asked the EPA to consider the permanent retirement of the Big Brown Steam Electric Station in Freestone County and the Monticello Steam Electric Station in Titus County in its determinations. These shutdowns eliminated the only significant SO₂ emissions sources in each nonattainment area.

The letter also asked the EPA to consider quality-assured and certified ambient air monitoring data from 2017 through 2019 that showed decreases from previous years in the ambient SO₂ concentrations that resulted from the closures of the Big Brown Steam Electric Station in Freestone County and the Monticello Steam Electric Station in Titus County. At the time the CDD request was submitted, the Fairfield Farm to Market (FM) 2570 Ward Ranch monitor, located approximately three miles southwest of the Big Brown Steam Electric Station, had a preliminary design value of 41 parts per billion (ppb) for 2019—the first full year after the facility shut down. The Cookville FM 4855 monitor, located approximately 12 miles east of the Monticello Steam Electric Station and source-oriented to the still-operational Welsh power plant in Titus County, had a preliminary 2019 design value of 28 ppb. Both preliminary design values were below the 2010 SO₂ NAAQS of 75 ppb.

On September 25, 2020, the EPA proposed CDDs for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas (85 *Federal Register* (FR) 60407). The EPA's 2014 SO₂ nonattainment area state implementation plan (SIP) guidance states that in order for a nonattainment area that was designated based on modeling data to be

determined as attaining the NAAQS, additional dispersion modeling may be required.² However, the EPA has implemented a different analysis for areas designated based on modeling where the primary cause of the NAAQS violation has been permanently shut down, as is the case in both the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas. In these cases, the EPA stated that “the permanent cessation of SO₂ emissions from primary sources may be sufficient to determine that the area is attaining the NAAQS, if available monitoring, emissions and modeling data for the area also support the finding of attainment” (85 FR 60410).

On May 14, 2021, the EPA published final CDDs for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas (86 FR 26401). The EPA concluded that each area is currently in attainment of the 2010 SO₂ NAAQS per the EPA’s Clean Data Policy. The EPA stated that Texas had submitted sufficient monitoring data in each area to support a determination of clean data. The EPA based its final decision on the permanent shutdown of both Big Brown Steam Electric Station and Monticello Steam Electric Station, a detailed analysis of monitoring data, consideration of available modeling data, and emission inventory data. The final CDDs affirm that the Freestone-Anderson and Titus County areas are attaining the 2010 SO₂ NAAQS.

2.3 SIP APPROVABILITY UNDER SECTION 110(K) OF THE FCAA

The SIP revision for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas must be fully approved under FCAA, §110(k). This section of the FCAA contains the requirements for SIP completeness; deadlines; full, partial, and conditional approval; and disapproval. Approval action on SIP elements and the redesignation request may occur simultaneously.³ For the nonattainment areas to be redesignated to attainment, Texas must meet all applicable requirements of the FCAA, §110 and Part D.

2.3.1 Section 110 General SIP Requirements

Section 110(a) of the FCAA contains general SIP requirements for the NAAQS. Within three years of the promulgation of a new NAAQS, states are required to submit an infrastructure SIP that provides for implementation, maintenance, and enforcement of the NAAQS. On April 23, 2013, the TCEQ adopted an infrastructure and transport SIP revision for the 2010 SO₂ NAAQS. This SIP revision was submitted to the EPA on May 9, 2013.

On January 11, 2016, the EPA approved portions of the SIP revision that address the requirements of FCAA, §110(a)(1) and (2) as they apply to the 2010 SO₂ NAAQS (81 FR 1127). This action did not address portions of the SIP revision pertaining to FCAA, §110(a)(2)(D)(i)(I) concerning interstate pollution transport affecting attainment and maintenance of the NAAQS, or §110(a)(2)(D)(i)(II) concerning interstate visibility transport. The portions of the SIP revision pertaining to FCAA, §110(a)(2)(D)(i)(I) were

² USEPA: “Guidance for 1-hour SO₂ Nonattainment Area SIP Submissions” Memorandum from Steve Page, Director, EPA Office of Air Quality Planning and Standards to the EPA Air Division Directors, April 23, 2014. Provides guidance for the application of the clean data policy to the 2010 1-hour primary SO₂ NAAQS.

³ USEPA: “Procedures for Processing Requests to Redesignated Areas to Attainment” Memorandum from John Calcagni, Director, Air Quality Management Division, September 4, 1992.

deemed complete by operation of law on November 9, 2013. On October 17, 2017, the EPA published a final determination that the Regional Haze and Interstate Visibility Transport Federal Implementation Plan (FIP) satisfied the FCAA, §110(a)(2)(D)(i)(II) requirement (82 FR 48324). On August 12, 2020, the EPA finalized amended versions of an intrastate SO₂ trading program as an alternative to best available retrofit technology (BART) requirements for certain sources in Texas (85 FR 49170).

Texas meets all requirements of FCAA, §110 that were applicable prior to submittal of this redesignation request, as identified in Table 2-1: *Status of Texas FCAA, §110(a)(2) 2010 SO₂ NAAQS Infrastructure Requirements*.

2.3.2 Part D Requirements

Subpart 1 of Part D of the FCAA consists of general requirements applicable to all areas designated nonattainment for any NAAQS. Subpart 5 of Part D contains more specific requirements applicable to the SO₂ NAAQS. FCAA, §172 general SIP requirements and the SO₂-specific planning requirements of FCAA, §191 and §192 include an emissions inventory, attainment demonstration, reasonably available control technology (RACT), reasonably available control measures (RACM), enforceable emission limitations and control measures, reasonable further progress (RFP) demonstration, nonattainment new source review (NNSR), and contingency measures. Texas did not submit any SIP elements required under Part D by the July 13, 2018 submittal deadline.

The EPA's "Clean Data Policy for the Fine Particle NAAQS" describes the SIP planning requirements for nonattainment areas that attain the NAAQS but have not yet been redesignated to attainment.⁴ Additional EPA rulemakings codify the Clean Data Policy for ozone in the final 1997 eight-hour ozone NAAQS implementation rule (70 FR 71612, November 29, 2005) and for fine particulate matter (PM_{2.5}) in the final 2012 PM_{2.5} NAAQS SIP requirements rule (81 FR 58009, August 24, 2016). On April 23, 2014, the EPA issued a memorandum extending the Clean Data Policy to the 2010 SO₂ NAAQS.⁵ Under the Clean Data Policy, the SIP requirements relating to attainment demonstrations, implementation of RACT and RACM, RFP demonstrations, and contingency measures are suspended as long as air quality in the area continues to meet the relevant NAAQS. The NNSR and emissions inventory requirements are not suspended under a CDD and are both addressed in this SIP revision.

On May 14, 2021, the EPA published CDDs for both the Freestone-Anderson and the Titus 2010 SO₂ NAAQS nonattainment areas (86 FR 26401). As a result of these CDDs, Texas is not required to submit attainment demonstrations and associated RACT and

⁴ USEPA: "Clean Data Policy for the Fine Particle National Ambient Air Quality Standards" Memorandum from Steve Page, Director, EPA Office of Air Quality Planning and Standards to the EPA Air Division Directors, December 14, 2004.

⁵ Guidance for 1-Hour SO₂ Nonattainment Area SIP Submissions, April 23, 2014.

RACM, RFP demonstrations, or contingency plans for these areas. This redesignation request and maintenance plan SIP revision addresses the Part D SIP requirements not suspended by the CDDs, being the NNSR and emissions inventory requirements. The NNSR requirements are addressed in Section 2.3.2.1: *NNSR Certification Statement*, and comprehensive emissions inventory information is provided in Chapter 3: *Maintenance Demonstration*.

2.3.2.1 NNSR Certification Statement

SO₂ NAAQS nonattainment area SIPs must include provisions to require permits for the construction and operation of new or modified stationary sources. Major stationary sources in SO₂ nonattainment areas are those sources emitting at least 100 tons per year (tpy) of SO₂. An NSR permitting program for nonattainment areas is required by FCAA, §172(c)(5) and §173, and further defined in 40 Code of Federal Regulations (CFR) 51, Subpart I (Review of New Sources and Modifications). Under these requirements, new major sources or major modifications at existing sources in an SO₂ nonattainment area must comply with the lowest achievable emissions rate and obtain sufficient emissions offsets. NNSR permits for SO₂ authorize construction of new major sources or major modifications of existing sources of SO₂ in an area that is designated nonattainment for the SO₂ NAAQS. The NSR offset ratio for SO₂ nonattainment areas is 1.00:1. The EPA initially approved Texas' NNSR regulation for SO₂ on September 27, 1995 (60 FR 49781). The TCEQ determined that because the Texas SIP already includes 30 Texas Administrative Code (TAC) §116.12 (Nonattainment and Prevention of Significant Deterioration Review Definitions) (79 FR 66625) and 30 TAC §116.151 (New Major Source or Major Modification in Nonattainment Area Other Than Ozone) (77 FR 65119), the NNSR SIP requirements are met for Texas for the 2010 SO₂ NAAQS for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas. Further, the TCEQ already certified that Texas has EPA-approved rules that cover NNSR requirements with the timely-submitted 2010 SO₂ NAAQS Infrastructure and Transport SIP Revision.

2.3.2.2 Conformity Requirements

Section 176(c) of the FCAA establishes that no federal institution may support or approve an action in a NAAQS nonattainment or maintenance area that does not conform to the approved SIP. According to FCAA, §176(c)(1)(B)(i-iii), federal actions may not cause or contribute to any new violation of any standard in any area; increase the frequency or severity of any existing violation of any standard in any area; or delay timely attainment of any standard or any required interim emission reductions or other milestones in any area. Requirements for complying with FCAA, §176(c) and conforming to the SIP fall under two categories, general conformity requirements (40 CFR Part 93, Subpart B) and transportation conformity requirements (40 CFR Part 93, Subpart A).

General Conformity

General conformity regulations apply in all NAAQS nonattainment and maintenance areas (ozone, carbon monoxide (CO), nitrogen dioxide (NO₂), particulate matter (PM₁₀ and PM_{2.5}), SO₂, and lead) for all federal actions except those related to transportation plans, programs, and projects developed, funded, or approved under Title 23 United States Code or the Federal Transit Act, namely transportation-related actions by the Federal Highway Administration or the Federal Transit Administration. Federal actions

in the Freestone-Anderson and Titus County 2010 SO₂ NAAQS nonattainment areas became subject to general conformity requirements one year after the effective date of designation as nonattainment, or January 12, 2018, and will remain subject to general conformity requirements when redesignated to attainment with a maintenance plan. Federal actions with SO₂ emissions that are expected to meet or exceed 100 tpy will be required to demonstrate general conformity according to the criteria and procedures established in 40 CFR Part 93, Subpart B. In consultation with federal agencies that are required to approve general conformity determinations for federal actions in the affected areas, the TCEQ will ensure that those actions conform to the SIP according to the criteria established in 40 CFR §93.158.

Transportation Conformity

Federal transportation conformity regulations are only applicable for the transportation-related NAAQS: ozone, CO, NO₂, PM₁₀ and PM_{2.5}, and certain precursor pollutants in applicable NAAQS nonattainment and maintenance areas (40 CFR §93.102(b)(1)). SO₂ is not considered a transportation-related NAAQS, and the Freestone-Anderson and Titus County 2010 SO₂ NAAQS nonattainment areas are not subject to transportation conformity requirements. Title 40 CFR §93.102(b)(2)(v) stipulates that transportation-related emissions of SO₂ in certain PM_{2.5} nonattainment and maintenance areas may be considered significant enough to subject the areas to transportation conformity requirements for SO₂ as a precursor pollutant. Freestone, Anderson, and Titus Counties have never been designated nonattainment for another NAAQS, including PM_{2.5}, so only the SO₂ NAAQS is applicable. Based on the EPA's transportation conformity regulations, the Freestone-Anderson and Titus County 2010 SO₂ NAAQS nonattainment areas have no transportation conformity obligations; therefore, this SIP revision does not include motor vehicle emissions budgets for the maintenance horizon year, and 30 TAC §114.270 is not applicable.

2.4 PERMANENT AND ENFORCEABLE EMISSIONS REDUCTIONS

In the Freestone-Anderson 2010 SO₂ NAAQS nonattainment area, the Big Brown Steam Electric Station coal-fired steam electric generating Units 1 and 2 were permanently retired on February 12, 2018. By letter dated May 24, 2018, Luminant Generation Company, LLC asked the TCEQ to void the Title V permit, Federal Operating Permit (FOP) 065, and it was voided by the TCEQ on August 29, 2018. A letter was submitted by Luminant to the TCEQ to void Big Brown Steam Electric Station's individual NSR permits (17891, 18744, 45420, 53205, 54810, 56445, 56447, 72206, 83646, 83647, 85296, 94619, 95214, 96276, 99047, 99050, 106862, 108990, 112207, and 148918). On March 28, 2018, the TCEQ voided all NSR authorizations for Big Brown Steam Electric Station's coal-fired steam electric generating Units 1 and 2 and certain other facilities, as requested by Luminant Generation Company, LLC. On December 20, 2019, the Big Brown Steam Electric Station came under new ownership. Falcon Development, LLC acquired the site from Luminant Generation Company, LLC on December 20, 2019. On June 30, 2020, Falcon Development, LLC requested that the TCEQ void the remaining NSR permit authorizations (17891, 18744, 56447, 106862, and 112207) that were maintained while closure activities were completed. On June 30, 2020, these remaining

NSR authorizations were voided. On April 18, 2021, the facility was permanently demolished by the current owners.⁶

In the Titus 2010 SO₂ NAAQS nonattainment area, Luminant Generation Company, LLC permanently retired the Monticello Steam Electric Station coal-fired steam electric generating Units 1, 2, and 3 on December 31, 2017. Luminant Generation Company, LLC filed to void the Monticello Steam Electric Station Title V permit, FOP 64, on May 23, 2018, and it was voided by the TCEQ on August 3, 2018. Luminant Generation Company, LLC submitted a letter on February 9, 2018, asking the TCEQ to void individual NSR permits (2401, 26740, 45432, 54808, 56384, 71238, 85294, 95215, 104897, 105738, 146220, 83645, and 83640). On February 14, 2018, the TCEQ voided all NSR authorizations for Monticello Steam Electric Station Units 1, 2, and 3 and certain other facilities, as requested by Luminant Generation Company, LLC. Golden Eagle Development, LLC acquired the site from Luminant Generation Company, LLC on December 20, 2019. On July 14, 2020, Golden Eagle Development, LLC asked the TCEQ to void the remaining NSR permit authorizations (146278, 2399, 140265, 137864, 56387, 54408, 112334, and 104210) that were maintained while closure activities were completed. On July 14, 2020, these remaining NSR authorizations were voided.

2.5 SECTION 175A REQUIREMENTS FOR MAINTENANCE PLANS

Section 107(d)(3)(E)(iv) of the FCAA stipulates that for an area to be redesignated to attainment from nonattainment, the EPA must fully approve a maintenance plan meeting the requirements of FCAA, §175(A). Section 175A of the FCAA outlines the requirements of a plan to provide for the maintenance of the relevant NAAQS in the area or areas for at least 10 years after redesignation. The remainder of this SIP revision fulfills those maintenance plan requirements of FCAA, §175A and contains the following elements for both the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas:

- attainment emissions inventory;
- maintenance demonstration;
- verification of continued attainment;
- monitoring network; and
- contingency plan.

Section 175A(b) of the FCAA requires that eight years after an area is redesignated to attainment, the state submit an additional SIP revision including a maintenance plan for the 10 years after the expiration of the original maintenance plan. The TCEQ plans to meet this future requirement for a second 10-year maintenance plan.

⁶ “Boom heard Sunday morning demolition of Big Brown Power Plant” *Palestine Herald-Press*, April 18, 2021.

CHAPTER 3: MAINTENANCE DEMONSTRATION

3.1 INTRODUCTION

This state implementation plan (SIP) revision demonstrates that both the Freestone-Anderson and the Titus nonattainment areas will remain in attainment of the 2010 sulfur dioxide (SO₂) National Ambient Air Quality Standard (NAAQS) for the 10-year period following the date that the areas are redesignated to attainment by the United States Environmental Protection Agency (EPA), as required by the federal Clean Air Act (FCAA), §175A. The maintenance demonstration is satisfied if the state demonstrates that future SO₂ emissions levels are not expected to result in exceedances of the 2010 SO₂ NAAQS.

Since redesignation is contingent upon the EPA's approval of this maintenance plan, the Texas Commission on Environmental Quality (TCEQ) projected SO₂ emissions to a future year of 2034, referred to as the horizon year. Setting the horizon year at 2034 satisfies the 10-year FCAA requirement for maintenance plans. It also allows adequate time for EPA review and approval of the maintenance plan and redesignation of the area to attainment.

The most current periodic emissions inventories (EIs) data were analyzed as part of this maintenance demonstration. TCEQ chose the year 2017 as the base year for the analyses presented in this chapter because it was the most recent periodic inventory year available to develop the EIs for this SIP revision. At the time of preparation of this SIP revision, the 2020 periodic EIs were still under development by TCEQ in accordance with the EPA's Air Emissions Reporting Requirements (AERR) (40 Code of Federal Regulations Part 51, Subpart A). Section 3.3: *General Emissions Inventory Development and 2017 Base Year* provides details on the base year EI development.

3.2 HISTORICAL EMISSIONS INVENTORY TRENDS

For the historical period 2011 through 2019, beginning prior to and including the 2017 base year, the overall anthropogenic SO₂ emissions in both the Freestone-Anderson and the Titus 2010 SO₂ NAAQS nonattainment areas declined substantially. As demonstrated in Figure 3-1: *Freestone-Anderson Nonattainment Area Historical SO₂ Emissions Trends* and Figure 3-2: *Titus Nonattainment Area Historical SO₂ Emissions Trends*, SO₂ emissions have decreased by over 99% in each of the nonattainment areas. These reductions are due to the shutdown of the coal-fired electric generating units in the nonattainment areas. Details of the shutdowns of the Big Brown Steam Electric Station and the Monticello Steam Electric Station are provided in Section 2.4: *Permanent and Enforceable Emissions Reductions*.

Area, non-road mobile, and on-road mobile emissions are less than 0.01% of the base year point source emissions, and display decreasing emissions trends similar to the point source emissions in Figure 3-3: *Freestone-Anderson Nonattainment Area Historical SO₂ Nonpoint Emissions Trends* and Figure 3-4: *Titus Nonattainment Area Historical SO₂ Nonpoint Emissions Trends*. For the historical period 2011 through 2017, area, on-road mobile, and non-road mobile emissions decreased 56% in the Freestone-Anderson nonattainment area and decreased 75% in the Titus nonattainment area. These emissions decreases were primarily due to the EPA-mandated phase-in of ultra-low sulfur diesel fuel from 2006 to 2010 for on-road sources and from 2007 to 2014

for non-road sources. The emission inventories used in this section use different planning assumptions than the mobile source emissions developed specifically for this SIP revision, and therefore may differ slightly.

Figure 3-1: Freestone-Anderson Nonattainment Area Historical SO₂ Emissions Trends

Figure 3-2: Titus Nonattainment Area Historical SO₂ Emissions Trends

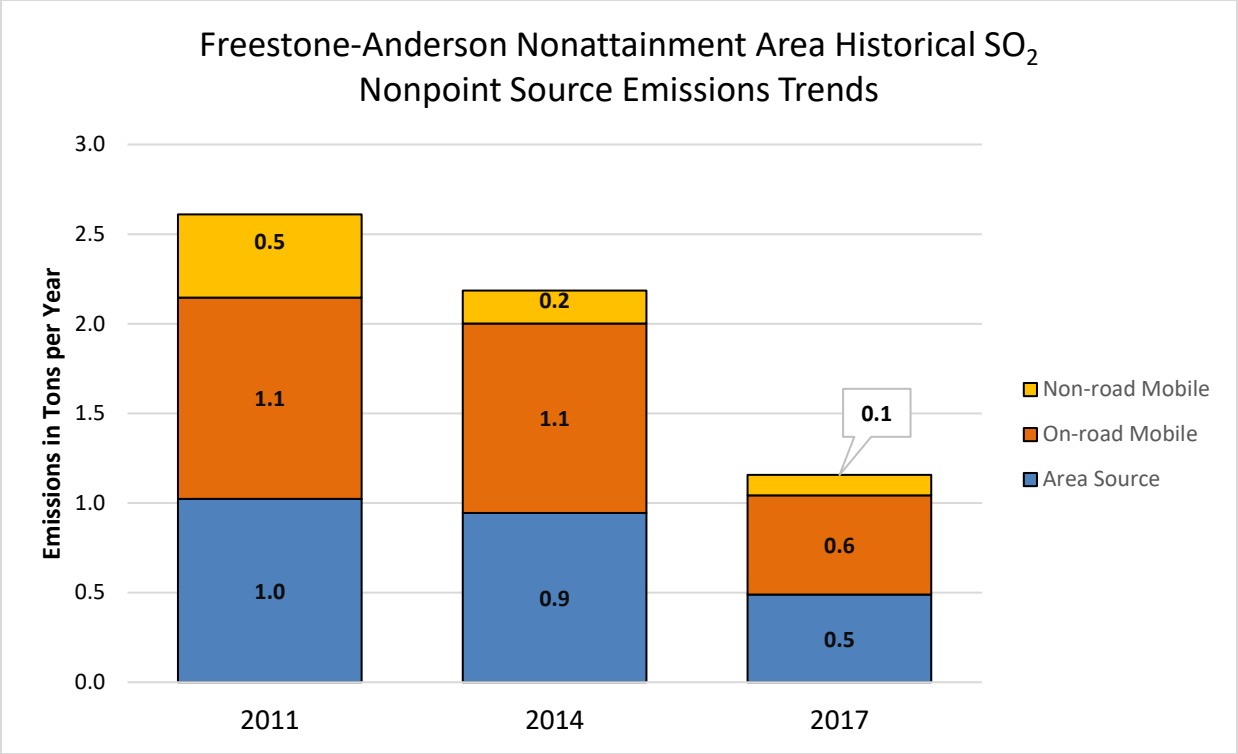

Figure 3-3: Freestone-Anderson Nonattainment Area Historical SO₂ Nonpoint Source Emissions Trends

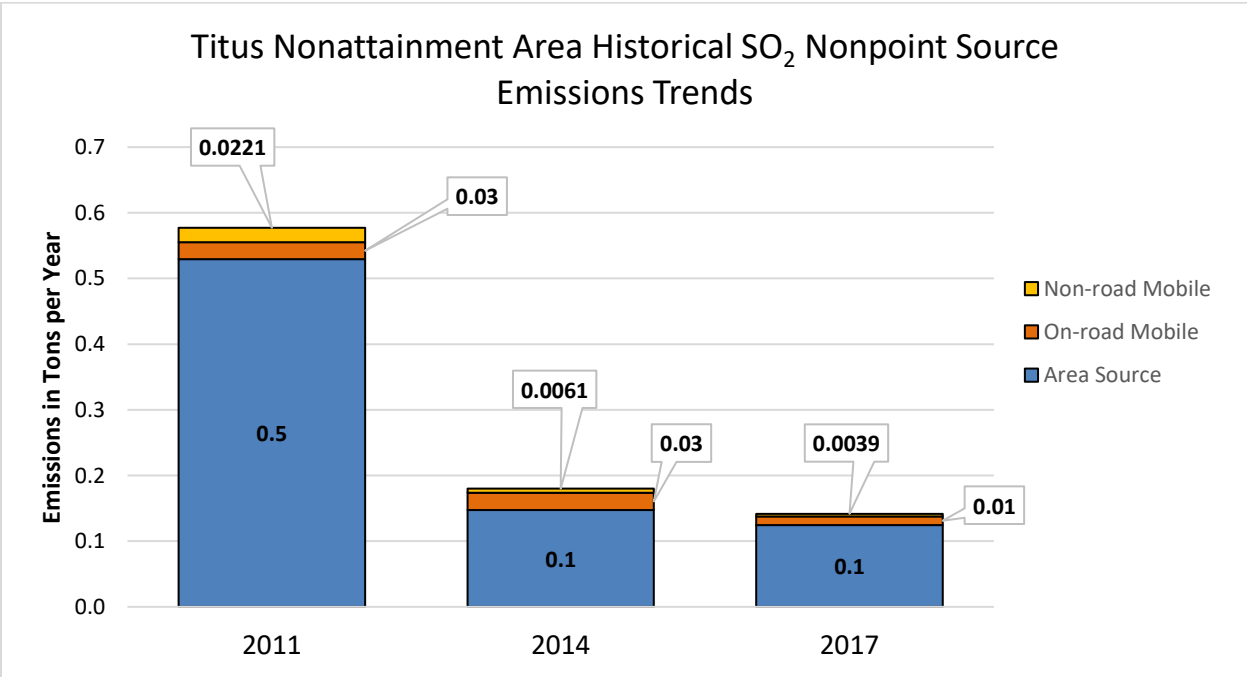

Figure 3-4: Titus Nonattainment Area Historical SO₂ Nonpoint Source Emissions Trends

3.3 GENERAL EMISSIONS INVENTORY DEVELOPMENT AND 2017 BASE YEAR EMISSIONS INVENTORY

The 1990 FCAA Amendments require that EIs be prepared for SO₂ nonattainment areas. An SO₂ EI must identify the emissions source types present in an area, the amount emitted, and the types of processes and control devices employed at stationary sources or other source categories. The TCEQ maintains an inventory of current information for sources of SO₂ emissions. This inventory identifies the types of emissions sources present in an area, the amount of each pollutant emitted, and the types of processes and control devices employed at each facility or source category. The total anthropogenic inventory of SO₂ emissions for an area is derived from estimates developed for three general categories of emissions sources: point, area, and mobile (both non-road and on-road). The EI also provides data for a variety of air quality planning tasks, including establishing baseline emissions levels, calculating reduction targets, control strategy development for achieving the required emissions reductions, the emissions inputs used in the air quality simulation models, and tracking the actual emissions reductions against the established emissions growth and control budgets.

The TCEQ SO₂ nonattainment area EIs provide the tons of SO₂ emitted annually from anthropogenic sources. Consistent with a September 4, 1992 EPA memorandum entitled *Procedures for Processing Requests to Redesignate Areas to Attainment*, the attainment EI base year may be any one of the three years used to determine the design value for the attainment year. On May 14, 2021, the EPA published clean data determinations for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas, concluding that each area attained the 2010 SO₂ NAAQS based on 2017 through 2019 certified ambient monitoring data (86 *Federal Register* 26401). The TCEQ selected 2017 as the attainment EI base year since it is one of the three years used to determine the design value for the 2019 attainment year. The 2017 EI is the most recent available periodic inventory year and is also the year of designation.

The total SO₂ EIs for the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas were developed for four general categories of anthropogenic emissions sources, which are detailed in Section 3.3.1: *Point Sources*, Section 3.3.2: *Area Sources*, Section 3.3.3: *Non-Road Mobile Sources*, and Section 3.3.4: *On-Road Mobile Sources*. Summaries of the 2017 SO₂ emissions by source type are provided in Section 3.5: *Emissions Summaries*.

3.3.1 Point Sources

Point source emissions data are collected annually from sites that meet the reporting requirements of 30 Texas Administrative Code (TAC) §101.10. The TCEQ provides detailed reporting instructions and tools for completing and submitting an EI. Companies submit EI data using a Web-based system called the Annual Emissions Inventory Report System. Companies are required to report emissions data and to provide sample calculations used to determine the emissions. Information characterizing the process equipment, the abatement units, and the emissions points is also required. Per the FCAA, §182(a)(3)(B), company representatives certify that reported emissions are true, accurate, and that they fully represent emissions that occurred during the calendar year to the best of the representative's knowledge.

All data submitted in the EI are reviewed for quality assurance purposes and then stored in the State of Texas Air Reporting System (STARS) database. The TCEQ's [Point Source Emissions Inventory](https://www.tceq.texas.gov/airquality/point-source-ei/psei.html) webpage (https://www.tceq.texas.gov/airquality/point-source-ei/psei.html) contains guidance documents and historical point source emissions data. Additional information is available upon request from the TCEQ's Air Quality Division.

3.3.1.1 2017 Base Year Emissions Inventory

The TCEQ extracted the 2017 point source inventory data from STARS on March 19, 2021. The extracted data include annual emissions of SO₂ reported for point sources located within the boundaries of the Freestone-Anderson and Titus nonattainment areas.

Stationary point sources comprised over 99% of the base year SO₂ emissions in the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas. The Freestone-Anderson 2010 SO₂ NAAQS nonattainment area boundaries encompass portions of Freestone and Anderson Counties, where the primary source of SO₂ emissions, Big Brown Steam Electric Station (Regulated Entity Reference Number [RN] RN101198059), was located. The Titus 2010 SO₂ NAAQS nonattainment area boundaries encompass portions of Titus County, where the primary source of SO₂ emissions, Monticello Steam Electric Station (RN102285921), was located. The Big Brown and Monticello Steam Electric Stations were both coal-fired power plants. The Freestone Energy Center (RN102333853), a natural gas-fired power plant, is the only other SO₂ point source located in the Freestone-Anderson nonattainment area, but it is not a major source of SO₂. No other SO₂ point sources are located in the Titus nonattainment area.

A summary of the base year point source SO₂ EIs is presented in Section 3.5 of this SIP revision.

3.3.2 Area Sources

Stationary emissions sources that do not meet the reporting requirements for point sources are classified as area sources. Area sources are small-scale stationary industrial, commercial, and residential sources that use materials or perform processes that generate emissions. Examples of typical SO₂ emissions sources include upstream oil and gas flares, compressor engines, and heaters; stationary source fossil fuel combustion at residences and businesses; outdoor refuse burning; and agricultural crop burning.

Per EPA rule and guidance, area source emissions are calculated as county-wide totals rather than as individual sources. Area source emissions are typically calculated by multiplying an EPA- or TCEQ-developed emissions factor (emissions per unit of activity) by the appropriate activity or activity surrogate responsible for generating emissions. Population is one of the more commonly used activity surrogates for area source calculations. Other activity data that are commonly used include the amount of gasoline sold in an area, employment by industry type, and crude oil and natural gas production.

The emissions data for the different area source categories are developed, quality assured, stored in the Texas Air Emissions Repository database system, and compiled to develop the statewide area source EI.

3.3.2.1 2017 Base Year Emissions Inventory

The 2017 area source EIs were developed in accordance with the requirements of the AERR rule. The 2017 EIs were developed using EPA-generated EIs; TCEQ-contracted projects to develop EIs; TCEQ staff projects to develop EIs; and projecting 2014 EIs by applying growth factors derived from Eastern Research Group (ERG) study data, the [Economy and Consumer Credit Analytics](http://www.economy.com/default.asp) website (<http://www.economy.com/default.asp>), and the United States Energy Information Administration's *Annual Energy Outlook* publication. The documentation for the development of the ERG study projection factors is provided in Appendix A: *Growth Factors for Area and Point Sources*.

The EPA developed EIs for states to use for many area source categories as part of the National Emissions Inventory (NEI). The states access these individual EIs through the EPA's [2017 National Emissions Inventory \(NEI\) Data](https://www.epa.gov/air-emissions-inventories/2017-national-emissions-inventory-nei-data) webpage (<https://www.epa.gov/air-emissions-inventories/2017-national-emissions-inventory-nei-data>). These source categories include but are not limited to industrial coatings; degreasing; residential, commercial/institutional, and industrial fuel use; commercial cooking; aviation fuel use; and consumer products. For some source categories, the TCEQ developed state-specific emissions estimates by acquiring current state-specific activity data and applying appropriate emissions factors. These source categories include, but are not limited to, gasoline storage tanks, structure fires, dry cleaners, and automobile fires.

The TCEQ committed significant resources to improve the oil and gas area source inventory categories for the 2017 base year EIs. The improvements included the development and refinement of a state-specific oil and gas area source emissions calculator. This oil and gas area source emissions calculator uses county-level production and local equipment activity data with local emissions requirements to estimate emissions from individual production categories, including compressor engines, condensate and oil storage tanks, loading operations, heaters, and dehydrators. The documentation for the development of the oil and gas emissions calculator can be found in Appendix B: *Characterization of Oil and Gas Production Equipment and Develop a Methodology to Estimate Statewide Emissions*. A significant improvement made to the oil and gas calculator for the 2017 base year inventories was the development of refined emissions factors for oil and gas wellhead flaring. County-level factors for the flared gases were developed using the amount of flared gas from each field and the hydrogen sulfide (H₂S) field concentrations from the [Railroad Commission of Texas \(RRC\)](https://www.rrc.state.tx.us/oil-and-gas/research-and-statistics/field-data/hydrogen-sulfide-h2s/) website (<https://www.rrc.state.tx.us/oil-and-gas/research-and-statistics/field-data/hydrogen-sulfide-h2s/>). This improved the resulting SO₂ emissions estimates from oil and gas wellhead flaring.

Another significant improvement made for the 2017 base year EIs was the development of a Texas-specific industrial, commercial, and institutional (ICI) combustion emissions calculator. This improved upon the default calculations and parameters provided by the EPA for these fuel combustion sources. The

documentation for the development of the ICI combustion emissions calculator is provided in Appendix C: *Industrial, Commercial, and Institutional (ICI) Fuel Use Study*.

Quality assurance of area source emissions involves ensuring that the activity data used for each category are current and valid. Data such as current population figures, fuel usage, and material usage were updated and the EPA guidance on emissions factors was used. Other routine efforts such as checking calculations for errors and conducting reasonableness and completeness checks were implemented.

A summary of the base year inventories for area source SO₂ emissions is presented in Section 3.5 of this SIP revision.

3.3.3 Non-Road Mobile Sources

Non-road vehicles do not normally operate on roads or highways and are often referred to as off-road or off-highway vehicles. Non-road emissions sources include agricultural equipment, commercial and industrial equipment, construction and mining equipment, lawn and garden equipment, aircraft and airport equipment, locomotives, and drilling rigs.

For this SIP revision, EIs for non-road sources were developed for the following subcategories: NONROAD model categories, airports, locomotives, and drilling rigs used in upstream oil and gas exploration activities. The airport subcategory includes estimates for total emissions from the aircraft, auxiliary power units (APU), and ground support equipment (GSE) subcategories. The following sections describe the emissions estimation methods used for the non-road mobile source subcategories.

A summary of the non-road mobile source inventories is presented in Section 3.5 of this SIP revision.

3.3.3.1 NONROAD Model Categories

The Motor Vehicle Emission Simulator 3 (MOVES3) model is the EPA's latest mobile source emissions model for estimating non-road source category emissions. However, the EPA did not make any significant non-road emissions calculations updates between the previous version of the model, MOVES2014b, and the new version, MOVES3; the two models generate essentially identical non-road emissions. Therefore, the TCEQ used the most recent Texas-specific utility for the non-road mobile component of MOVES2014b model, called Texas NONROAD version 2.1 (TexN2.1), to calculate emissions from all non-road mobile source equipment and recreational vehicles, except for airports, locomotives, and drilling rigs used in upstream oil and gas exploration activities.

Because emissions for airports and locomotives are not included in either the MOVES3 model or the TexN2.1 utility, the emissions for these categories are estimated using other EPA-approved methods and guidance.

In past years, equipment survey studies were conducted that focused on various equipment categories operating in different areas of Texas, including diesel construction equipment, liquid propane gas-powered forklifts, and agricultural equipment. The resulting survey data contributed to the updating of inputs to the

TexN utility to accurately estimate non-road emissions for the State of Texas instead of using the national default values in the EPA's MOVES model.

The TexN2.1 utility was recently updated for select non-road diesel equipment profiles, equipment populations, Texas-specific fuel data, and growth factors for the full range of non-road equipment categories contained within the utility for 2013 through 2050 to improve the accuracy of future activity and emissions estimates. More information regarding the updates and development for the TexN2.1 utility is provided in the ERG report in Appendix D: *TexN2.1 Utility Diesel Equipment Profile and Growth Factor Updates for Use with MOVES*.

2017 Base Year Emissions Inventory

TCEQ staff developed the base year 2017 non-road model category SO₂ emissions for this SIP revision using the TexN2.1 utility set for fully controlled run scenarios that used 2017 meteorological input data.

3.3.3.2 Drilling Rigs

Although emissions for drilling rig diesel engines used in upstream oil and gas exploration activities are included in the TexN2.1 utility, alternate emissions estimates were developed for this source category to develop more accurate county-level inventories. The equipment populations for drilling rigs were set to zero in the TexN2.1 utility to avoid duplicating emissions.

Due to significant growth in the oil and gas exploration and production industry, a 2015 TCEQ-commissioned survey of oil and gas exploration and production companies was used to develop updated drilling rig emissions characterization profiles. The drilling rig emissions characterization profiles from this study were combined with county-level drilling activity data obtained from the RRC to develop the EI. The documentation of procedures used in developing the drilling rigs EI is provided in the ERG report in Appendix E: *2014 Statewide Drilling Rig Emissions Inventory with Updated Trends Inventories*.

2017 Base Year Emissions Inventory

The 2017 base year EI for drilling rig diesel engines used in upstream oil and gas exploration activities was developed using the results of a 2015 statewide inventory improvement study combined with 2017 RRC drilling activity data.

3.3.3.3 Locomotives

The locomotive EIs were developed from a TCEQ-commissioned study using EPA-accepted EI development methods. The locomotive EIs include line haul and yard emissions activity data from all Class I, II, and III locomotive activity and emissions by rail segment. The method and procedures used to develop the locomotive EIs for this SIP revision are provided in the ERG report in Appendix F: *2014 Texas Statewide Locomotive Emissions Inventory and 2008 through 2040 Trend Inventories*.

2017 Base Year Emissions Inventory

The base year 2017 locomotive non-road mobile subcategory SO₂ emissions for this SIP revision were taken from the 2017 trend EI developed as part of the ERG report in Appendix F.

3.3.3.4 Airports

The airport EIs were developed from TCEQ-commissioned studies using the Federal Aviation Administration (FAA) Aviation Environmental Design Tool (AEDT). The AEDT is the most recent FAA model for estimating airport emissions, and it replaced the FAA's Emissions and Dispersion Modeling System. The airport emissions categories used for this SIP revision included aircraft (commercial air carriers, air taxis, general aviation, and military), APU, and GSE operations.

The method and procedures used to develop the airport EIs for this revision are provided in the ERG reports in Appendix G: *2017 Texas Statewide Aircraft Emissions Inventory* and Appendix H: *Development of Texas Statewide Aircraft Trend Emissions Inventories 2011 through 2045*.

2017 Base Year Emissions Inventory

The base year 2017 airport non-road mobile subcategory SO₂ emissions for this SIP revision were taken from the 2017 statewide airport EI developed as part of the ERG report in Appendix G.

To develop the base year 2017 statewide airport EIs, 2017 activity data provided by local airports were compiled and supplemented with publicly available 2017 activity data as the basis for estimating emissions.

3.3.4 On-Road Mobile Sources

On-road mobile emissions sources consist of automobiles, trucks, motorcycles, and other motor vehicles traveling on public roadways in conjunction with off-network emissions, occurring outside public roadways. On-road mobile source SO₂ emissions are usually categorized as combustion-related emissions. Combustion-related emissions are estimated for vehicle engine exhaust. To calculate emissions, both the rate of emissions per unit of activity (emissions factors) and the number of units of activity must be determined.

Updated on-road EIs for this SIP revision were developed using the EPA's mobile source emissions model, MOVES3, run in inventory mode. During a MOVES3 inventory mode run, emissions rates are first calculated and then applied to user supplied activity levels or EPA MOVES default activity levels. The MOVES3 model may be run using national default information or the default information may be modified to simulate specific data, such as the control programs, driving behavior, meteorological conditions, and vehicle characteristics. Because modifications to the national default values influence the emissions factors calculated internally by the MOVES3 model, parameters that are used in TCEQ EI development reflect local conditions to the extent that local values are available.

3.3.4.1 2017 Base Year Emissions Inventory

TCEQ staff developed the 2017 base year on-road mobile source category SO₂ emissions for this SIP revision using the MOVES3 model. Values to reflect local conditions as well as local activity levels were used where available. Detailed information on the inputs and data sources used in the on-road EI development is provided in Appendix I: *MOVES3 On-road Inventory Development*.

The Federal Motor Vehicle Control Program (FMVCP) provides on-going reductions of SO₂ emissions from mobile sources. The FMVCP includes vehicle emissions certification standards as well as corresponding limits on fuel sulfur content. The limits on sulfur content for diesel and gasoline fuels contribute to maintenance of reduced SO₂ emissions from mobile sources.

A summary of the on-road source inventories is presented in Section 3.5 of this SIP revision.

3.4 VERIFICATION OF CONTINUED ATTAINMENT AND HORIZON YEAR EMISSIONS INVENTORY

This SIP revision demonstrates continued attainment using available methods outlined in the EPA's redesignation guidance.⁷ Future emissions for the Freestone-Anderson and Titus nonattainment areas were projected or developed from the most recently available EIs for a source category to a horizon year of 2034. Details are provided in Section 3.4.1: *Point Sources*, Section 3.4.2: *Area Sources*, Section 3.4.3: *Non-Road Mobile Sources*, and Section 3.4.4: *On-Road Mobile Sources*. Summaries of the 2034 horizon year SO₂ emissions by source type are provided in Section 3.5.

Projecting emissions to 2034 aligns with the EPA's requirement of maintenance plans to demonstrate attainment for a 10-year period following the date of redesignation. The requirement for demonstration of continued attainment is satisfied when the state demonstrates that future SO₂ emissions levels are not expected to result in exceedances of the 2010 SO₂ NAAQS. To track progress of the Freestone-Anderson and Titus nonattainment areas toward continued attainment of the 2010 SO₂ NAAQS, the TCEQ will continue to develop and submit periodic EIs to the EPA every three years as required by the federal AERR rule.

In addition to the horizon year emissions projection and periodic EI submittals, the TCEQ plans to rely on EI data for point sources reported to the Commission and on the TCEQ's EPA-approved authority to issue air preconstruction permits for new major sources under the New Source Review (NSR) Prevention of Significant Deterioration (PSD) Program and air preconstruction permits for new or modified minor sources under the NSR air permitting program. The TCEQ will continue to rely on its EPA-approved authority to issue operating permits for sources subject to the Title V Federal Operating Permits Program. The Title V Program primarily applies to major sources as defined in 30 TAC §122.10(13). The program also covers some minor sources as specified by the EPA.

As discussed in Section 3.3.1: *Point Sources*, there are no major point sources of SO₂ emissions in the Titus 2010 SO₂ NAAQS nonattainment area, and there is one minor stationary source of SO₂ emissions in the Freestone-Anderson 2010 SO₂ NAAQS nonattainment area that reports to the TCEQ point source EI. Table 3-1: *Permit Allowable and Projected Actual SO₂ Emissions in Tons Per Year for the Freestone-Anderson Nonattainment Area* contains current permit allowable emissions and

⁷ Memorandum from John Calcagni, Director of Air Quality Management Division, September 4, 1992, *Procedures for Processing Requests to Redesignate Areas to Attainment*. EPA Office of Air Quality Planning and Standards.

projected future SO₂ emissions for the area, which are slightly less than 18 tons per year (tpy), well below major source thresholds. Table 3-2: *Permit Allowable and Projected Actual SO₂ Emissions in Tons Per Year for the Titus Nonattainment Area* illustrates that current permit allowable SO₂ emissions and projected future SO₂ emissions for the area are zero. The TCEQ expects these sources to be appropriately identified through the point and area source EI and addressed through the air permitting programs. Section 3.2: *Historical Emissions Inventory Trends* demonstrates significant SO₂ decreases from all source categories in the nonattainment area, and the TCEQ has forecasted these emissions decreases will be maintained in the horizon year of 2034 using EPA guidance. As demonstrated in Section 3.2 and discussed below, the anticipated emissions of SO₂ from these sources will be substantially lower relative to SO₂ emissions from a major point source.

Under 30 TAC §101.10, certain point sources including major sources of SO₂ emissions are required to submit EI annually. The TCEQ annually reviews its EI data, including data for the Freestone-Anderson and Titus nonattainment areas, to ensure compliance with the EPA's Data Requirements Rule for the 2010 SO₂ NAAQS. In accordance with this rule, the TCEQ will characterize the air quality in regard to the 2010 SO₂ NAAQS for any areas that have SO₂ emissions sources meeting the rule's criteria, including the Freestone-Anderson and Titus nonattainment areas.

TCEQ's air permitting program addresses both major and minor point source SO₂ emissions. If a new major point source of SO₂ emissions were to be constructed or an existing major point source were to be modified in either of the two areas, it would be required to undergo NSR PSD review, including a federal best available control technology (BACT) review and an air dispersion modeling analysis to demonstrate that the SO₂ emissions would not significantly contribute to deterioration of air quality in the area. For changes undergoing case-by-case review, the TCEQ's NSR Program would address the construction and operation of any change to an existing major source that did not constitute a major modification, certain potential new minor point sources, or changes to certain existing minor point sources by requiring the source to undergo NSR review, including a BACT review applicable to minor sources and a demonstration that there would be no violation of the 2010 SO₂ NAAQS.

To address other potential construction and operation of new sources and modification of existing sources of SO₂ emissions in either the Freestone-Anderson or Titus areas, the TCEQ implements a permit-by-rule program for certain types of facilities the commission has determined will not make a significant contribution of air contaminants to the atmosphere and standard permits for specific, well-characterized classes of facilities. Potential new sources qualifying for a permit-by-rule are limited to a maximum of 25 tpy of SO₂ pursuant to the requirements of 30 TAC §106.4(a)(1)(B). Depending on the type of potential new source qualifying for a standard permit, the standard permit will limit the total amount of sulfur that may be contained in the fuel used for the specific facility. It is expected that any potential new emissions of SO₂ will be relatively small and not cause a violation of the 2010 SO₂ NAAQS.

Projects for sources that constitute a new major source or major modification to an existing major source are prohibited from being authorized under standard permits pursuant to 30 TAC §116.610(b). Any new major source or major modification to an

existing major source in an area designated attainment for an air contaminant subject to a NAAQS is required to comply with the NSR PSD requirements for that same air contaminant. The source would not qualify for a standard permit or permit by rule under 30 TAC §116.610(b) and §106.4(a)(2) and (3).

As the EPA stated in the final Data Requirements Rule for the 2010 SO₂ NAAQS, “the EPA and the air quality management community have recognized over many years that peak concentrations of SO₂ are commonly caused by one or a few major point sources in an area, and that peak concentrations are typically observed relatively close to the source” (80 FR 51052). The permanent and enforceable shutdown of the major SO₂ point sources in the nonattainment areas, the reporting requirements for EI data for point sources, the periodic emissions inventory reporting for area and mobile sources, and the air permitting programs that address point and area sources are expected to provide verification of continued attainment, in lieu of relying on monitoring data, to track maintenance and attainment of the 2010 SO₂ NAAQS for both the Freestone-Anderson and Titus nonattainment areas after redesignation to attainment.

3.4.1 Point Sources

In the Freestone-Anderson 2010 SO₂ NAAQS nonattainment area, the Big Brown Steam Electric Station coal-fired steam electric generating units located in Freestone County were demolished and the TCEQ permits voided. As a result, the 2034 horizon year projected emissions are zero for the Big Brown Steam Electric Station site.

At the time this SIP revision was prepared, the Freestone Energy Center natural gas-fired electric generating plant was the only operational SO₂ point source within the Freestone-Anderson 2010 SO₂ NAAQS nonattainment area. The 2034 horizon year actual SO₂ emissions were projected and set equivalent to the Freestone Energy Center’s permit allowable emissions (17.92 tpy).

In the Titus 2010 SO₂ NAAQS nonattainment area, the Monticello Steam Electric Station coal-fired steam electric generating units were shut down and the TCEQ permits voided. There are no other SO₂ point sources located in the nonattainment portion of Titus County. Therefore, the 2034 horizon year projected emissions are zero for the Titus County 2010 SO₂ NAAQS nonattainment area.

The permit allowable and projected actual SO₂ emissions are summarized below in Table 3-1 and Table 3-2.

Table 3-1: Permit Allowable and Projected Actual SO₂ Emissions in Tons Per Year for the Freestone-Anderson Nonattainment Area

County	Company	Permit Allowable	2034 Projected Actuals
Freestone	Big Brown Steam Electric Station	0	0
Freestone	Freestone Energy	17.92	17.92
Anderson	Not applicable	0	0

Table 3-2: Permit Allowable and Projected Actual SO₂ Emissions in Tons Per Year for the Titus Nonattainment Area

County	Company	Permit Allowable	2034 Projected Actuals
Titus	Monticello Steam Electric Station	0	0

A summary of the horizon year point source SO₂ EIs is presented in Section 3.5 of this SIP revision.

3.4.2 Area Sources

Since 2017 is the most recently available periodic EI year, the TCEQ designated the 2017 EIs as the starting point for the 2034 horizon year EI projections for all area source categories except oil and gas sources. Since more recent activity data are available for oil and gas sources, the TCEQ updated the area source oil and gas EIs using 2019 RRC production data. These newer data reflect growth that has occurred since the 2017 base year and reflect more recent operations.

The updated 2034 horizon year EIs for the area source categories were developed using projection factors derived from Appendix A. The study in this appendix contains individual projection factors for each source category and for each forecasting year. This projection method is the EPA standard and accepted methodology for developing future year emissions inventories.

The 2034 area source EIs were developed by applying the selected emissions projection factor to the 2017 emissions for each area source category except oil and gas source categories; the 2034 area source EIs for oil and gas source categories were developed by applying the selected emissions projection factor to the 2019 emissions. No controls were incorporated into the horizon year inventories.

A summary of the horizon year SO₂ EIs for area sources is presented in Section 3.5 of this SIP revision.

3.4.3 Non-Road Mobile Sources

The 2034 horizon year EIs for non-road sources were developed based on the details provided in the following subsections.

A summary of the horizon year SO₂ EIs for non-road mobile sources is presented in Section 3.5 of this SIP revision.

3.4.3.1 NONROAD Model Categories

TCEQ staff developed the horizon year 2034 non-road model category SO₂ emissions for this SIP revision using the TexN2.1 utility set for fully controlled run scenarios that used 2017 meteorological input data.

3.4.3.2 Drilling Rigs

The horizon year 2034 diesel drilling rig non-road mobile subcategory SO₂ emissions were based on 2019 drilling activity data (the most recently available activity data)

combined with the 2034 year-specific emissions factors from the ERG report in Appendix E.

3.4.3.3 Locomotives

The horizon year 2034 locomotive non-road mobile subcategory SO₂ emissions were taken from the 2034 trend EI developed as part of the ERG report in Appendix F.

3.4.3.4 Airports

The horizon year 2034 airport non-road mobile subcategory SO₂ emissions were taken from the 2034 statewide airport trend EI developed as part of the ERG report in Appendix H. The 2017 statewide airport EI was used as the base year EI from which 2011 through 2045 trend EIs were projected, based on growth factors from the FAA's Terminal Area Forecast data.

3.4.4 On-Road Mobile Sources

TCEQ staff developed the 2034 horizon year on-road mobile source category SO₂ emissions for this SIP revision using the MOVES3 model. Values to reflect local conditions as well as local activity levels were used when available, excluding meteorology and fuel inputs, which were held constant at 2017 levels. For more detailed information on the inputs and data sources used in the on-road EI development, see Appendix I.

The FMVCP provides on-going reductions of SO₂ emissions from mobile sources. The FMVCP limits on sulfur content for diesel and gasoline fuels contribute to maintenance of reduced SO₂ emissions from mobile sources.

A summary of the horizon year SO₂ EIs for on-road mobile sources is presented in Section 3.5.

3.5 EMISSIONS SUMMARIES

For the Freestone-Anderson and Titus 2010 SO₂ NAAQS nonattainment areas, the 2017 base year, and the 2034 horizon year emissions by source category, are presented in Table 3-3: *Freestone-Anderson Nonattainment Area SO₂ Emissions by Source Category in Tons Per Year*, and Table 3-4: *Titus Nonattainment Area SO₂ Emissions by Source Category in Tons Per Year*. These tables illustrate that in the horizon year of 2034, point sources contributed almost entirely to the SO₂ emissions decreases. This conclusion is supported by Section 3.2, which demonstrates significant SO₂ decreases from all source categories in the nonattainment area, and the TCEQ has forecasted these decreases will be maintained in the horizon year of 2034 using EPA guidance.

Contributions from biogenic emissions are not included in the summaries because this analysis is limited to anthropogenic sources. Note: totals may differ by 0.01 tpy from the sum of the EI categories due to rounding.

Per EPA rule and guidance, the area, non-road mobile, and on-road mobile source emissions are calculated as county-wide totals for Freestone, Anderson, and Titus Counties. To obtain area, non-road mobile, and on-road mobile source emissions for the nonattainment areas, the county-level emissions were ratioed based on the 2010

population located within the portions of the nonattainment boundaries for each area. Details of the population ratios applied to the county-wide totals for the area, non-road mobile, and on-road mobile source categories are presented in Appendix J: *Population Ratios for Non-Point Sources*.

Table 3-3: Freestone-Anderson Nonattainment Area SO₂ Emissions by Source Category in Tons Per Year

Source Category	2017 Base Year	2034 Horizon Year
Point	47,644.21	17.92
Area	0.49	0.54
Non-road	0.06	0.05
On-road	0.94	0.90
Total	47,645.70	19.41

Table 3-4: Titus Nonattainment Area SO₂ Emissions by Source Category in Tons Per Year

Source Category	2017 Base Year	2034 Horizon Year
Point	29,412.15	0.00
Area	0.12	0.23
Non-road	0.003	0.003
On-road	0.02	0.02
Total	29,412.29	0.25

3.6 MAINTENANCE DEMONSTRATION CONCLUSION

Trend analysis using the 2017 base year and the 2034 horizon year emissions shows an overall decrease in SO₂ emissions of 47,626 tpy for the Freestone-Anderson 2010 SO₂ NAAQS nonattainment area, and an overall decrease in SO₂ emissions of 29,412 tpy for the Titus 2010 SO₂ NAAQS nonattainment area. For each of the nonattainment areas, this represents a 99.9% decrease in SO₂ emissions between the 2017 base year emissions and the 2034 horizon year emissions. Based on future emissions and historical trend emissions analysis, the Freestone-Anderson and Titus nonattainment areas are projected to show continued attainment of the 2010 SO₂ NAAQS through 2034.

CHAPTER 4: MONITORING NETWORK

4.1 MONITORING NETWORK AND REPORTING REQUIREMENTS

The Texas Commission on Environmental Quality (TCEQ) ambient air quality monitoring network provides monitoring data to characterize air quality based on the 2010 sulfur dioxide (SO₂) National Ambient Air Quality Standard (NAAQS). SO₂ monitors are managed in accordance with 40 Code of Federal Regulations (CFR) Part 58 to provide data to determine compliance or progress towards compliance with the 2010 SO₂ NAAQS. The SO₂ monitor site evaluation and selection process considers the SO₂ source's peak modeled impacts along with other monitor siting criteria, including power availability, site access, and 40 CFR Part 58, Appendix E siting criteria requirements.

The Freestone-Anderson area around the Big Brown Steam Electric Station facility and the Titus area around Monticello Steam Electric Station were designated nonattainment, effective January 12, 2017 (81 *Federal Register* (FR) 89870). The TCEQ deployed a special purpose SO₂ monitor near the Big Brown Steam Electric facility at the Fairfield Farm to Market (FM) 2570 Ward Ranch site (air quality system number 481611084) in Freestone County on October 30, 2017. No monitors were deployed in the area around Monticello Steam Electric Station in Titus County as the facility was shut down in late 2017. The Big Brown Steam Electric Station facility in the Freestone-Anderson area ceased operations in early 2018 and was subsequently demolished. The TCEQ submitted a request to the United States Environmental Protection Agency (EPA) to decommission the Fairfield FM 2570 Ward Ranch SO₂ monitor. This monitor is eligible for decommission based on the 2018 through 2020 design value of 17 parts per billion, which is 23% of the 2010 SO₂ NAAQS, as provided by 40 CFR Section 51.1203(c)(3).

The TCEQ also deployed a State or Local Air Monitoring Station SO₂ monitor near the Welsh Power Plant at the Cookville FM 4855 site (air quality system number 484491078) in Titus County on December 7, 2016. Based on the three-year design value for this SO₂ monitor, the area surrounding the Welsh Power Plant was designated attainment/unclassifiable in Round 4 of the air quality designations for the 2010 primary SO₂ NAAQS, March 26, 2021 (86 FR 16055). While this monitor is not located within the Titus nonattainment area, data from this monitor was used as supporting information for the EPA's clean data determination for the area.

The TCEQ commits to maintaining an air monitoring network that meets regulatory requirements. The TCEQ continues to work with the United States Environmental Protection Agency through the air monitoring network review process, as required by 40 CFR Part 58, to determine: the adequacy of the federal air monitoring network, additional monitoring needs, and recommended monitor decommissions. Air monitoring data from these SO₂ monitors are quality assured, reported, and certified according to 40 CFR Part 58.

CHAPTER 5: CONTINGENCY PLAN

5.1 INTRODUCTION

Section 175A(d) of the federal Clean Air Act (FCAA) requires that maintenance plans include contingency provisions to promptly correct any violation of the National Ambient Air Quality Standard (NAAQS).

The United States Environmental Protection Agency (EPA) indicates in both its 2014 sulfur dioxide (SO₂) nonattainment area state implementation plan (SIP) guidance and previous SIP guidance regarding SO₂ contingency measures that in many cases, attainment revolves around compliance of a single source or a small set of sources with emission limits shown to provide for attainment and that FCAA, §175A does not explicitly require that contingency measures take effect without further action by the air agency in order for the maintenance plan to be approved.^{8,9} The EPA's 2014 SO₂ nonattainment area SIP guidance further states that the EPA interprets the contingency measures requirement to mean that a state has a comprehensive program to identify sources of violations of the SO₂ NAAQS and will undertake an aggressive follow-up for compliance and enforcement, including expedited procedures for establishing enforceable consent agreements pending the adoption of a revised SIP.

5.1.1 Existing State Stationary Source Control Measures

The Texas Commission on Environmental Quality (TCEQ) has implemented rules that limit and minimize emissions from sources of SO₂ emissions. Existing 30 Texas Administrative Code (TAC) Chapter 112 contains control requirements for sources of SO₂ emissions in Texas that were developed for a previous SO₂ NAAQS. The SO₂ control measures in 30 TAC Chapter 112, Subchapter A establish emission limits, monitoring, reporting, and recordkeeping requirements for a variety of source types, including solid fossil fuel-fired steam generators.

Because both the Big Brown Steam Electric Station and the Monticello Steam Electric Station are shut down and the new source review (NSR) authorizations for both sites are voided, the TCEQ does not expect any violations of the 2010 SO₂ NAAQS to occur in either the Freestone-Anderson nonattainment area or the Titus nonattainment area. If a regulated entity were to start operations of a new electric power generating plant or any other SO₂ point source at either of the decommissioned sites or elsewhere within either of the nonattainment areas, the regulated entity would be subject to the TCEQ's NSR air permitting program, under 30 TAC Chapter 116, for the authorization of construction of a new stationary source of air contaminants. If these nonattainment areas are redesignated to attainment, any new major source of SO₂ emissions would be subject to Prevention of Significant Deterioration (PSD) permitting requirements in accordance with 30 TAC Chapter 116 and 40 CFR Part 51. The regulated entity may be

⁸ USEPA: "Guidance for 1-hr SO₂ Nonattainment Area SIP Submissions" Memorandum from Steve Page, Director, EPA Office of Air Quality Planning and Standards to the EPA Air Division Directors, April 23, 2014.

⁹ General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990 published on April 16, 1992 (57 FR 13498).

subject to either 30 TAC Chapters 106 or 116 preconstruction authorization for new minor facilities.

5.2 CONTINGENCY MEASURES AND TRIGGER LEVEL

The major source of SO₂ emissions in the Freestone-Anderson 2010 SO₂ NAAQS nonattainment area was the Big Brown Steam Electric Station, and the Monticello Steam Electric Station was the major SO₂ emissions source in the Titus 2010 SO₂ NAAQS nonattainment area. The owner of both electric generating stations surrendered the air permit authorizations for each of these facilities, eliminating the only major SO₂ emissions source in either of the areas. The resulting decrease of ambient SO₂ concentrations and SO₂ emissions demonstrates that the Freestone-Anderson and Titus nonattainment areas are attaining the 2010 SO₂ NAAQS and will continue to do so.

The TCEQ's EPA-approved NSR and PSD air permitting programs, as well as emissions inventory (EI) program data, will also assist with ensuring maintenance of the 2010 SO₂ NAAQS. Because the TCEQ plans to decommission the Fairfield Farm to Market (FM) 2570 Ward Rand monitor located in the Freestone-Anderson nonattainment area, and because the EPA commented that sole reliance on the Cookville FM 4855 monitor located in Titus County may not be sufficient to verify continued attainment, the TCEQ plans to rely on EI data for point sources reported to the commission and on the TCEQ's EPA-approved authority to issue air preconstruction permits for new or modified major sources under the NSR PSD Program and permits for new and modified minor sources under the NSR air permitting program, as described in Section 3.4: *Verification of continued Attainment and Horizon Year Emissions Inventory*. The TCEQ will continue to rely on its EPA-approved authority to issue operating permits for sources subject to the Title V Federal Operating Permits Program. The Title V Program primarily applies to major sources as defined in 30 TAC §122.10(13). The program also covers some minor sources as specified by the EPA.

As discussed in Section 3.3.1: *Point Sources*, there are no major sources of SO₂ emissions in the Titus 2010 SO₂ NAAQS nonattainment area, and there is one minor stationary source of SO₂ emissions in the Freestone-Anderson 2010 SO₂ NAAQS nonattainment area that reports to the TCEQ point source EI. Table 3-1: *Permit Allowable and Projected Actual SO₂ Emissions in Tons Per Year for the Freestone-Anderson Nonattainment Area* contains current permit allowable emissions and projected future SO₂ emissions for the area, which are slightly less than 18 tons per year (tpy), well below major source thresholds. Table 3-2: *Permit Allowable and Projected Actual SO₂ Emissions in Tons Per Year for the Titus Nonattainment Area* illustrates that current permit allowable SO₂ emissions and projected future SO₂ emissions for the area are zero. Section 3.2: *Historical Emissions Inventory Trends* demonstrates significant SO₂ decreases from all source categories in the nonattainment area, and the TCEQ has forecasted these emissions decreases will be maintained in the horizon year of 2034 using EPA guidance. As demonstrated in Section 3.2 and discussed below, the anticipated emissions of SO₂ from these sources will be substantially lower relative to SO₂ emissions from a major point source.

Under 30 TAC §101.10, certain point sources including major sources of SO₂ emissions are required to submit EI annually. The TCEQ develops and submits SO₂ emissions data for nonpoint sources periodically and submits it to the EPA in accordance with the Air Emissions Reporting Rule.

TCEQ's air permitting program addresses both major and minor point source SO₂ emissions. If a new major point source of SO₂ emissions were to be constructed or an existing major point source were to be modified in either of the two areas, it would be required to undergo NSR PSD review, including a federal best available control technology (BACT) review and air dispersion modeling analysis to demonstrate that the SO₂ emissions would not significantly contribute to deterioration of air quality in the area. For changes undergoing case-by-case review, the TCEQ's NSR Program would address the construction and operation of any change to an existing major source that did not constitute a major modification, certain potential new minor point sources, or changes to certain existing minor point sources by requiring the source to undergo NSR review, including a BACT review applicable to minor sources and a demonstration that there would be no violation of the SO₂ NAAQS.

To address other potential construction and operation of new sources and modification of existing sources of SO₂ emissions in either the Freestone-Anderson or Titus areas, the TCEQ implements a permit-by-rule program for certain types of facilities the commission has determined will not make a significant contribution of air contaminants to the atmosphere and standard permits for specific, well-characterized classes of facilities. Potential new sources qualifying for a permit-by-rule are limited to a maximum of 25 tpy of SO₂ pursuant to the requirements of 30 TAC §106.4(a)(1)(B). Depending on the type of potential new source qualifying for a standard permit, the standard permit will limit the total amount of sulfur that may be contained in the fuel used for the specific facility. It is expected that any potential new emissions of SO₂ will be relatively small and never result in a violation of the SO₂ NAAQS.

Projects for sources that constitute a new major source or major modification to an existing major source are prohibited from being authorized under standard permits pursuant to 30 TAC §116.610(b). Any new major source in an area designated attainment for an air contaminant subject to a NAAQS is required to comply with the NSR PSD requirements for that same air contaminant. That source would not qualify for a standard permit or permit by rule under 30 TAC §116.610(b) or §106.4(a)(2) and (3).

Potential violations of the 2010 SO₂ NAAQS in the Freestone-Anderson and Titus nonattainment areas will be assessed using the trigger level in the EPA's final Data Requirements Rule (DRR) (80 FR 51052). As EPA states in the DRR, "The EPA and the air quality management community have recognized over many years that peak concentrations of SO₂ are commonly caused by one or a few major point sources in an area, and that peak concentrations are typically observed relatively close to the source." Since the major sources of SO₂ emissions have permanently and enforceably shutdown in the Freestone-Anderson and Titus nonattainment areas, the TCEQ will continue to annually review its EI data to ensure compliance with the EPA's DRR. In accordance with this rule, the TCEQ will characterize the air quality in regard to the 2010 SO₂ NAAQS for any areas that have SO₂ emissions sources meeting the rule's criteria, including the Freestone-Anderson and Titus nonattainment areas.

Since the sources responsible for almost 100% of the impacts on the ambient concentrations in the nonattainment areas have been decommissioned or shut down, it is not possible to develop specific contingency measures until the cause of elevated ambient SO₂ concentrations is known.

The TCEQ has the authority to enforce accurate EI reporting and compliance with permitted allowable emissions rates. The TCEQ's follow-up for compliance and enforcement is satisfied through the TCEQ's enforcement programs authorized under the Texas Water Code (TWC) and Texas Health and Safety Code (THSC). See the Legal Authority (Section V-A) of this SIP narrative for more information on the TCEQ's enforcement authority.

The contingency requirement for the maintenance plan for each of the nonattainment areas is met through the TCEQ's comprehensive EPA-approved air permitting program and emissions inventory program to identify potential violations of the 2010 SO₂ NAAQS and ensure continued maintenance of the 2010 SO₂ NAAQS.

**RESPONSE TO COMMENTS RECEIVED CONCERNING THE
REDESIGNATION REQUEST AND MAINTENANCE PLAN
FOR THE FREESTONE-ANDERSON AND TITUS 2010
SULFUR DIOXIDE (SO₂) NATIONAL AMBIENT AIR
QUALITY STANDARD (NAAQS) NONATTAINMENT AREAS**

The Texas Commission on Environmental Quality (TCEQ or commission) conducted a virtual public hearing on September 28, 2021 at 2:00 p.m. During the comment period, which closed on September 29, 2021, the commission received comments from the United States Environmental Protection Agency (EPA).

TABLE OF CONTENTS

General Comments
Emissions Inventory
Redesignation Requirements
Monitoring
Contingency Plan

GENERAL COMMENTS

The EPA recommended that the TCEQ include a statement in the SIP revision that the commission will submit supplemental maintenance plans for the Freestone-Anderson and Titus County areas to the EPA at least two years before expiration of the first 10-year maintenance period, as required by federal Clean Air Act (FCAA), §175A(b).

In response to this comment, the TCEQ added a statement in Chapter 2: *Redesignation Requirements* of this SIP revision, acknowledging the requirements of FCAA, §175A(b).

EMISSIONS INVENTORY

The EPA commented in support of the use of 2017 comprehensive emissions inventory (EI) SO₂ data as the base year EI.

The commission appreciates the support. No changes were made in response to this comment.

REDESIGNATION REQUIREMENTS

The EPA commented that Section 3.4: *Verification of Continued Attainment and Horizon Year Emissions Inventory* of this SIP revision is in line with the EPA's Redesignation Guidance, as it describes an option of using EIs to track progress of the maintenance demonstration.

The commission appreciates the support of its use of EIs in the maintenance demonstration. No changes were made in response to this comment.

The EPA recommended including a discussion of how general conformity requirements are addressed in the SIP revision. The EPA also recommended that the TCEQ include a

discussion on how transportation conformity does not apply in the Freestone-Anderson and Titus County areas.

In response to this comment, the TCEQ added Section 2.3.2.2: *Conformity Requirements* to the SIP revision to discuss both general and transportation conformity.

MONITORING

The EPA recommended removing references to the Fairfield Farm to Market (FM) 2570 Ward Ranch monitor from the SIP revision if the TCEQ plans to decommission the monitor.

The TCEQ submitted a request to the EPA to decommission the Fairfield monitor. Chapter 4: *Monitoring Network* of the SIP revision has been revised in response to this comment.

CONTINGENCY PLAN

The EPA commented that the TCEQ's approach in Section 5.2: *Contingency Measures and Trigger Level* of the proposed SIP revision, which defers development of specific contingency measures until the cause of any future potential elevated concentrations is known, is consistent with EPA guidance.

The commission appreciates the support for the approach used in this SIP revision. No changes were made in response to this comment.

The EPA commented that if the TCEQ plans to decommission the Fairfield monitor for the Freestone-Anderson nonattainment area, the data from the monitor will not be available for use for purposes of the proposed redesignation request and maintenance plan for the area. The EPA also commented that because the Cookville FM 4855 monitor is not properly sited to fully characterize the ambient air in the area near the Monticello facility, sole reliance on this monitor may not be sufficient to verify continued attainment for the Titus County nonattainment area. The EPA requested clarification of whether verification of continued attainment and potential triggering of contingency measures would include monitoring data. The EPA said that in the absence of monitoring data, the TCEQ should identify and clearly describe how continued attainment and contingency measure triggers in the Freestone-Anderson and Titus County areas will be verified. Lastly, the EPA commented that if the TCEQ plans to use EI data to track maintenance and attainment of the NAAQS, the TCEQ should identify an action level of emission and include a discussion of permitting requirements for new sources that would ensure continued attainment.

The TCEQ updated the contingency plan in response to this comment. Specifically, the TCEQ removed reliance on monitoring data from the maintenance demonstration and contingency plan since there are no major SO₂ emissions sources in either nonattainment area. The updated maintenance demonstration and contingency plan include discussions of how the TCEQ's EPA-approved permitting and emissions inventory programs will assist with ensuring continued maintenance of the 2010 SO₂ NAAQS.

Texas Commission on Environmental Quality

ORDER ADOPTING REVISIONS TO THE STATE IMPLEMENTATION PLAN

Docket No. 2021-0594-SIP
Project No. 2021-007-SIP-NR

On February 23, 2022, the Texas Commission on Environmental Quality (Commission), during a public meeting, considered adoption of Redesignation and Maintenance Plans for the Freestone and Anderson Counties (Freestone-Anderson) and a portion of Titus County (Titus) 2010 Sulfur Dioxide (SO₂) National Ambient Air Quality Standard (NAAQS) Nonattainment Areas and revisions to the State Implementation Plan (SIP). The Commission adopts the Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas; and corresponding revisions to the SIP. The adopted Redesignation and Maintenance Plans include the state's request that the EPA redesignate both areas to attainment for the 2010 SO₂ NAAQS, the required 10-year maintenance plan for each area, the required emission inventory, and the state's certification that current regulations provide the means to satisfy Nonattainment New Source Review requirements for the Freestone-Anderson and the Titus SO₂ NAAQS Nonattainment Areas. Under Tex. Health & Safety Code Ann. §§ 382.011, 382.012, and 382.023 (West 2016), the Commission has the authority to control the quality of the state's air and to issue orders consistent with the policies and purposes of the Texas Clean Air Act, Chapter 382 of the Tex. Health & Safety Code. Notice of the proposed Redesignation and Maintenance Plans was published for comment in the September 10, 2021, issue of the *Texas Register* (46 Tex. Reg. 5920).

Pursuant to 40 Code of Federal Regulations § 51.102 and after proper notice, the Commission conducted a virtual public hearing to consider the Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas and revisions to the SIP. Proper notice included prominent advertisement in the areas affected at least 30 days prior to the date of the hearing. A virtual public hearing was held in Austin on September 28, 2021.

The Commission circulated hearing notices of its intended action to the public, including interested persons, the Regional Administrator of the EPA, and all applicable local air pollution control agencies. The public was invited to submit data, views, and recommendations on the proposed Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas and SIP revisions, either orally or in writing, at the virtual hearing or during the comment period. Prior to the scheduled hearing, copies of the proposed Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas and SIP revisions were available for public inspection at the Commission's central office and on the Commission's website.

Data, views, and recommendations of interested persons regarding the proposed Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas and SIP revisions were submitted to the Commission during the comment period and were considered by the Commission as reflected in the analysis of testimony incorporated by reference to this Order. The Commission finds that the analysis of testimony includes the names

of all interested groups or associations offering comment on the proposed Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas and the SIP revisions and their position concerning the same.

IT IS THEREFORE ORDERED BY THE COMMISSION that the Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas and revisions to the SIP incorporated by reference to this Order are hereby adopted. The adopted Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas and the revisions to the SIP are incorporated by reference in this Order as if set forth at length verbatim in this Order.

IT IS FURTHER ORDERED BY THE COMMISSION that on behalf of the Commission, the Chairman should transmit a copy of this Order, together with the adopted Redesignation and Maintenance Plans for the Freestone-Anderson and Titus 2010 SO₂ NAAQS Nonattainment Areas and revisions to the SIP, to the Regional Administrator of EPA as proposed revisions to the Texas SIP pursuant to the federal Clean Air Act, codified at 42 U.S. Code Ann. §§ 7401 - 7671q, as amended.

If any portion of this Order is for any reason held to be invalid by a court of competent jurisdiction, the invalidity of any portion shall not affect the validity of the remaining portions.

TEXAS COMMISSION ON
ENVIRONMENTAL QUALITY

Jon Niermann, Chairman
