Our Review of Your Application

The Edwards Aquifer Program staff conducts an administrative and technical review of all applications. The turnaround time for administrative review can be up to 30 days as outlined in 30 TAC 213.4(e). Generally administrative completeness is determined during the intake meeting or within a few days of receipt. The turnaround time for technical review of an administratively complete Edwards Aquifer application is 90 days as outlined in 30 TAC 213.4(e). Please know that the review and approval time is directly impacted by the quality and completeness of the initial application that is received. In order to conduct a timely review, it is imperative that the information provided in an Edwards Aquifer application include final plans, be accurate, complete, and in compliance with 30 TAC 213.

Administrative Review

1. Edwards Aquifer applications must be deemed administratively complete before a technical review can begin. To be considered administratively complete, the application must contain completed forms and attachments, provide the requested information, and meet all the site plan requirements. The submitted application and plan sheets should be final plans. Please submit one full-size set of plan sheets with the original application, and half-size sets with the additional copies.

   To ensure that all applicable documents are included in the application, the program has developed tools to guide you and web pages to provide all forms, checklists, and guidance. Please visit the below website for assistance: http://www.tceq.texas.gov/field/eapp.

2. This Edwards Aquifer Application Cover Page form (certified by the applicant or agent) must be included in the application and brought to the administrative review meeting.

3. Administrative reviews are scheduled with program staff who will conduct the review. Applicants or their authorized agent should call the appropriate regional office, according to the county in which the project is located, to schedule a review. The average meeting time is one hour.

4. In the meeting, the application is examined for administrative completeness. Deficiencies will be noted by staff and emailed or faxed to the applicant and authorized agent at the end of the meeting, or shortly after. Administrative deficiencies will cause the application to be deemed incomplete and returned.

   An appointment should be made to resubmit the application. The application is re-examined to ensure all deficiencies are resolved. The application will only be deemed administratively complete when all administrative deficiencies are addressed.

5. If an application is received by mail, courier service, or otherwise submitted without a review meeting, the administrative review will be conducted within 30 days. The applicant and agent will be contacted with the results of the administrative review. If the application is found to be administratively incomplete, it can be retrieved from the regional office or returned by regular mail. If returned by mail, the regional office may require arrangements for return shipping.

6. If the geologic assessment was completed before October 1, 2004 and the site contains “possibly sensitive” features, the assessment must be updated in accordance with the *Instructions to Geologists* (TCEQ-0585 Instructions).

Technical Review

1. When an application is deemed administratively complete, the technical review period begins. The regional office will distribute copies of the application to the identified affected city, county, and groundwater conservation district whose jurisdiction includes the subject site. These entities and the public have 30 days to provide comments on the application to the regional office. All comments received are reviewed by TCEQ.

2. A site assessment is usually conducted as part of the technical review, to evaluate the geologic assessment and observe existing site conditions. The site must be accessible to our staff. The site boundaries should be

clearly marked, features identified in the geologic assessment should be flagged, roadways marked and the alignment of the Sewage Collection System and manholes should be staked at the time the application is submitted. If the site is not marked the application may be returned.

3. We evaluate the application for technical completeness and contact the applicant and agent via Notice of Deficiency (NOD) to request additional information and identify technical deficiencies. There are two deficiency response periods available to the applicant. There are 14 days to resolve deficiencies noted in the first NOD. If a second NOD is issued, there is an additional 14 days to resolve deficiencies. If the response to the second notice is not received, is incomplete or inadequate, or provides new information that is incomplete or inadequate, the application must be withdrawn or will be denied. Please note that because the technical review is underway, whether the application is withdrawn or denied **the application fee will be forfeited**.

4. The program has 90 calendar days to complete the technical review of the application. If the application is technically adequate, such that it complies with the Edwards Aquifer rules, and is protective of the Edwards Aquifer during and after construction, an approval letter will be issued. Construction or other regulated activity may not begin until an approval is issued.

Mid-Review Modifications

It is important to have final site plans prior to beginning the permitting process with TCEQ to avoid delays.

Occasionally, circumstances arise where you may have significant design and/or site plan changes after your Edwards Aquifer application has been deemed administratively complete by TCEQ. This is considered a "Mid-Review Modification". Mid-Review Modifications may require redistribution of an application that includes the proposed modifications for public comment.

If you are proposing a Mid-Review Modification, two options are available:

- If the technical review has begun your application can be denied/withdrawn, your fees will be forfeited, and the plan will have to be resubmitted.
- TCEQ can continue the technical review of the application as it was submitted, and a modification application can be submitted at a later time.

If the application is denied/withdrawn, the resubmitted application will be subject to the administrative and technical review processes and will be treated as a new application. The application will be redistributed to the affected jurisdictions.

Please contact the regional office if you have questions. If your project is located in Williamson, Travis, or Hays County, contact TCEQ's Austin Regional Office at 512-339-2929. If your project is in Comal, Bexar, Medina, Uvalde, or Kinney County, contact TCEQ's San Antonio Regional Office at 210-490-3096

Re: Edwards Aquifer, Travis County

NAME OF PROJECT: Lake Travis High School; Located 3322 RR 620 S, Austin, Texas

TYPE OF PLAN: Request for Modification of an Approved Contributing Zone Plan (CZP-MOD); 30 Texas Administrative Code (TAC) Chapter 213 Subchapter B Edwards Aquifer

Edwards Aquifer Protection Program ID No. 11002952; Regulated Entity No. RN101495851

Dear Mr. Winovitch:

The Texas Commission on Environmental Quality (TCEQ) has completed its review of the CZP-MOD for the above-referenced project submitted to the Austin Regional Office by Malone Wheeler, Inc. on behalf of Lake Travis Independent School District on February 23, 3022. Final review of the CZP was completed after additional material was received on April 8, 2022. As presented to the TCEQ, the Temporary and Permanent Best Management Practices (BMPs) were selected, and construction plans were prepared by a Texas Licensed Professional Engineer to be in general compliance with the requirements of 30 TAC Chapter 213. These planning materials were sealed, signed, and dated by a Texas Licensed Professional Engineer. Therefore, based on the engineer's concurrence of compliance, the planning materials for construction of the proposed project and pollution abatement measures are hereby approved subject to applicable state rules and the conditions in this letter. The applicant or a person affected may file with the chief clerk a motion for reconsideration of the executive director's final action on this Edwards Aquifer Protection Plan. A motion for reconsideration must be filed no later than 23 days after the date of this approval letter. *This approval expires two (2) years from the date of this letter unless, prior to the expiration date, more than 10 percent of the construction has commenced on the project or an extension of time has been requested.*

BACKGROUND

A Contributing Zone Plan (CZP) was approved by letter dated December 3, 2013 (EAPP ID No. 11-1309001). The plan included the construction of two partial sedimentation/filtration basins (Pond 1 and Pond 2) for water quality. A CZP-MOD was approved by letter dated June 26, 2019 (EAPP ID No. 11001572). The CZP-MOD include ethe construction of a batch detention basin (Pond 3) for water quality.

PROJECT DESCRIPTION

The proposed non-residential project will have an area of approximately 124.41 acres. It will include a new storm collection system, addition to the existing storm system, additional parking, a new plaza, modification to a detention basin weir, modification of the existing batch detention basin (Pond 3) weir, and sidewalk additions. The impervious cover will be 39.17 acres (31.5 percent). No wastewater will be generated by this project.

PERMANENT POLLUTION ABATEMENT MEASURES

To prevent the pollution of stormwater runoff originating on-site or upgradient of the site and potentially flowing across and off the site after construction, two partial sedimentation/filtrations basins (Pond 1 and Pond 2) and a batch detention basin (Pond3), designed using the TCEQ technical guidance document, Complying with the Edwards Aquifer Rules: Technical Guidance on Best Management Practices (2005), will be used to treat stormwater runoff. The required total suspended solids (TSS) treatment for this project is 12,943 pounds of TSS generated from the 124.41 acres of impervious cover. The approved measures meet the required 80 percent removal of the increased load in TSS caused by the project.

SPECIAL CONDITIONS

I. This modification is subject to all Special and Standard Conditions listed in the CZP approval letters dated December 3, 2013, and June 26, 2019.

II. All permanent pollution abatement measures shall be operational prior to occupancy of the facility.

III. All sediment and/or media removed from the water quality basins during maintenance activities shall be properly disposed of according to 30 TAC 330 or 30 TAC 335, as applicable.

STANDARD CONDITIONS

1. Pursuant to Chapter 7 Subchapter C of the Texas Water Code, any violations of the requirements in 30 TAC Chapter 213 may result in administrative penalties.
2. The holder of the approved Edwards Aquifer protection plan must comply with all provisions of 30 TAC Chapter 213 and all best management practices and measures contained in the approved plan. Additional and separate approvals, permits, registrations and/or authorizations from other TCEQ Programs (i.e., Stormwater, Water Rights, UIC) can be required depending on the specifics of the plan.
3. In addition to the rules of the Commission, the applicant may also be required to comply with state and local ordinances and regulations providing for the protection of water quality.

Prior to Commencement of Construction:

4. All contractors conducting regulated activities at the referenced project location shall be provided a copy of this notice of approval. At least one complete copy of the approved Contributing Zone Plan and this notice of approval shall be maintained at the project location until all regulated activities are completed.
5. Any modification to the activities described in the referenced CZP application following the date of approval may require the submittal of a plan to modify this approval, including the payment of appropriate fees and all information necessary for its review and approval prior to initiating construction of the modifications.

6. The applicant must provide written notification of intent to commence construction, replacement, or rehabilitation of the referenced project. Notification must be submitted to the Austin Regional Office no later than 48 hours prior to commencement of the regulated activity. Written notification must include the name of the approved plan and file number for the regulated activity, the date on which the regulated activity will commence, and the name of the prime contractor with the name and telephone number of the contact person.
7. Temporary erosion and sedimentation (E&S) controls, i.e., silt fences, rock berms, stabilized construction entrances, or other controls described in the approved Storm Water Pollution Prevention Plan (SWPPP) must be installed prior to construction and maintained during construction. Temporary E&S controls may be removed when vegetation is established, and the construction area is stabilized. If a water quality pond is proposed, it shall be used as a sedimentation basin during construction. The TCEQ may monitor stormwater discharges from the site to evaluate the adequacy of temporary E&S control measures. Additional controls may be necessary if excessive solids are being discharged from the site.

<u>During Construction:</u>

8. During the course of regulated activities related to this project, the applicant or his agent shall comply with all applicable provisions of 30 TAC Chapter 213, Edwards Aquifer. The applicant shall remain responsible for the provisions and conditions of this approval until such responsibility is legally transferred to another person or entity.
9. If sediment escapes the construction site, the sediment must be removed at a frequency sufficient to minimize offsite impacts to water quality (e.g., fugitive sediment in street being washed into surface streams or sensitive features by the next rain). Sediment must be removed from sediment traps or sedimentation ponds not later than when design capacity has been significantly reduced. Litter, construction debris, and construction chemicals exposed to stormwater shall be prevented from becoming a pollutant source for stormwater discharges (e.g., screening outfalls, picked up daily).
10. Intentional discharges of sediment laden water are not allowed. If dewatering becomes necessary, the discharge will be filtered through appropriately selected best management practices. These may include vegetated filter strips, sediment traps, rock berms, silt fence rings, etc.
11. The following records shall be maintained and made available to the executive director upon request: the dates when major grading activities occur, the dates when construction activities temporarily or permanently cease on a portion of the site, and the dates when stabilization measures are initiated.
12. Stabilization measures shall be initiated as soon as practicable in portions of the site where construction activities have temporarily or permanently ceased, and construction activities will not resume within 21 days. When the initiation of stabilization measures by the 14th day is precluded by weather conditions, stabilization measures shall be initiated as soon as practicable.
13. This approval does not authorize the installation of temporary aboveground storage tanks on this project. If the contractor desires to install a temporary aboveground storage tank for use during construction, an application to modify this approval must be submitted and approved prior to installation. The application must include information related to tank location and spill containment. Refer to Standard Condition No. 5, above.

<u>After Completion of Construction:</u>

14. Owners of permanent BMPs and measures must ensure that the BMPs and measures are constructed and function as designed. A Texas Licensed Professional Engineer must certify in writing that the permanent BMPs or measures were constructed as designed. The certification letter must be submitted to the Austin Regional Office within 30 days of site completion.

15. The applicant shall be responsible for maintaining the permanent BMPs after construction until such time as the maintenance obligation is either assumed in writing by another entity having ownership or control of the property (such as without limitation, an owner's association, a new property owner or lessee, a district, or municipality) or the ownership of the property is transferred to the entity. Such entity shall then be responsible for maintenance until another entity assumes such obligations in writing or ownership is transferred. A copy of the transfer of responsibility must be filed with the executive director through the Austin Regional Office within 30 days of the transfer. A copy of the transfer form (TCEQ-10263) is enclosed.
16. Upon legal transfer of this property, the new owner(s) is required to comply with all terms of the approved Contributing Zone Plan. If the new owner intends to commence any new regulated activity on the site, a new Contributing Zone Plan that specifically addresses the new activity must be submitted to the executive director. Approval of the plan for the new regulated activity by the executive director is required prior to commencement of the new regulated activity.
17. A Contributing Zone Plan approval or extension will expire, and no extension will be granted if more than 50 percent of the total construction has not been completed within ten years from the initial approval of a plan. A new Contributing Zone Plan must be submitted to the Austin Regional Office with the appropriate fees for review and approval by the executive director prior to commencing any additional regulated activities.
18. At project locations where construction is initiated and abandoned, or not completed, the site shall be returned to a condition such that the aquifer is protected from potential contamination.

This action is taken under authority delegated by the Executive Director of the Texas Commission on Environmental Quality. If you have any questions or require additional information, please contact James “Bo” Slone, P.G. of the Edwards Aquifer Protection Program of the Austin Regional Office at (512) 339-2929.

Sincerely,

Lillian Butler

TYPE OF PLAN: Request for Approval of a Contributing Zone Plan (CZP)
30 Texas Administrative Code (TAC) Chapter 213 Edwards Aquifer

Edwards Aquifer Protection Program ID (EAPP) No. 11001572; Regulated Entity No. RN101495851

Dear Mr. Winovitch:

The Texas Commission on Environmental Quality (TCEQ) has completed its review of the CZP Application for the above-referenced project submitted to the Austin Regional Office by Malone Wheeler, Inc. on behalf of Lake Travis Independent School District on May 21, 2019. Final review of the CZP was completed after additional material was received on June 24, 2019. As presented to the TCEQ, the Temporary and Permanent Best Management Practices (BMPs) were selected and construction plans were prepared by a Texas Licensed Professional Engineer to be in general compliance with the requirements of 30 TAC Chapter 213. These planning materials were sealed, signed and dated by a Texas Licensed Professional Engineer. Therefore, based on the engineer's concurrence of compliance, the planning materials for construction of the proposed project and pollution abatement measures are hereby approved subject to applicable state rules and the conditions in this letter. The applicant or a person affected may file with the chief clerk a motion for reconsideration of the executive director's final action on this Edwards Aquifer Protection Plan. A motion for reconsideration must be filed no later than 23 days after the date of this approval letter. *This approval expires two (2) years from the date of this letter unless, prior to the expiration date, more than 10 percent of the construction has commenced on the project or an extension of time has been requested.*

BACKGROUND

The Lake Travis High School/Middle School CZP (EAPP ID No. 11-13091001), approved by letter dated December 3, 2013, included the use of two partial sedimentation/filtration basins to provide permanent stormwater treatment for the portions of the school constructed after June 1, 1999.

PROJECT DESCRIPTION

The proposed non-residential project will have an area of approximately 124.41 acres. It will include multiple site improvements such as the reconstruction of a main drive, a new parking lot, utility improvements, a batch detention basin, and new sidewalks. The site is partially on the Contributing Zone and partially on the "No Zone." The proposed improvements will add 3.69 acres of impervious cover on the Contributing Zone; therefore, the total impervious cover on the Contributing Zone will increase to 38.81 acres (31.20 percent). No wastewater will be generated by this project.

PERMANENT POLLUTION ABATEMENT MEASURES

To prevent the pollution of stormwater runoff originating on-site or upgradient of the site and potentially flowing across and off the site after construction, two existing partial sedimentation/filtration basins (EAPP ID No. 11-13091001) and a proposed batch detention basin, designed using the TCEQ technical guidance document, Complying with the Edwards Aquifer Rules: Technical Guidance on Best Management Practices (2005), will be utilized to treat stormwater runoff. The required total suspended solids (TSS) treatment for this project is 3,212 pounds of TSS generated from the 3.69 acres of impervious cover. The approved measures meet the required 80 percent removal of the increased load in TSS caused by the project.

SPECIAL CONDITIONS

I. All permanent pollution abatement measures shall be operational prior to occupancy of the facility.

II. All sediment and/or media removed from the water quality basin during maintenance activities shall be properly disposed of according to 30 TAC 330 or 30 TAC 335, as applicable.

STANDARD CONDITIONS

1. Pursuant to Chapter 7 Subchapter C of the Texas Water Code, any violations of the requirements in 30 TAC Chapter 213 may result in administrative penalties.
2. The holder of the approved Edwards Aquifer protection plan must comply with all provisions of 30 TAC Chapter 213 and all best management practices and measures contained in the approved plan. Additional and separate approvals, permits, registrations and/or authorizations from other TCEQ Programs (i.e., Stormwater, Water Rights, UIC) can be required depending on the specifics of the plan.
3. In addition to the rules of the Commission, the applicant may also be required to comply with state and local ordinances and regulations providing for the protection of water quality.

Prior to Commencement of Construction:

4. All contractors conducting regulated activities at the referenced project location shall be provided a copy of this notice of approval. At least one complete copy of the approved CZP and this notice of approval shall be maintained at the project location until all regulated activities are completed.
5. Any modification to the activities described in the referenced CZP application following the date of approval may require the submittal of a plan to modify this approval, including the

payment of appropriate fees and all information necessary for its review and approval prior to initiating construction of the modifications.

6. The applicant must provide written notification of intent to commence construction, replacement, or rehabilitation of the referenced project. Notification must be submitted to the Austin Regional Office no later than 48 hours prior to commencement of the regulated activity. Written notification must include the name of the approved plan and file number for the regulated activity, the date on which the regulated activity will commence, and the name of the prime contractor with the name and telephone number of the contact person.
7. Temporary erosion and sedimentation (E&S) controls, i.e., silt fences, rock berms, stabilized construction entrances, or other controls described in the approved Storm Water Pollution Prevention Plan (SWPPP) must be installed prior to construction and maintained during construction. Temporary E&S controls may be removed when vegetation is established and the construction area is stabilized. If a water quality pond is proposed, it shall be used as a sedimentation basin during construction. The TCEQ may monitor stormwater discharges from the site to evaluate the adequacy of temporary E&S control measures. Additional controls may be necessary if excessive solids are being discharged from the site.

<u>During Construction:</u>

8. During the course of regulated activities related to this project, the applicant or his agent shall comply with all applicable provisions of 30 TAC Chapter 213, Edwards Aquifer. The applicant shall remain responsible for the provisions and conditions of this approval until such responsibility is legally transferred to another person or entity.
9. If sediment escapes the construction site, the sediment must be removed at a frequency sufficient to minimize offsite impacts to water quality (e.g., fugitive sediment in street being washed into surface streams or sensitive features by the next rain). Sediment must be removed from sediment traps or sedimentation ponds not later than when design capacity has been significantly reduced. Litter, construction debris, and construction chemicals exposed to stormwater shall be prevented from becoming a pollutant source for stormwater discharges (e.g., screening outfalls, picked up daily).
10. Intentional discharges of sediment laden water are not allowed. If dewatering becomes necessary, the discharge will be filtered through appropriately selected best management practices. These may include vegetated filter strips, sediment traps, rock berms, silt fence rings, etc.
11. The following records shall be maintained and made available to the executive director upon request: the dates when major grading activities occur, the dates when construction activities temporarily or permanently cease on a portion of the site, and the dates when stabilization measures are initiated.
12. Stabilization measures shall be initiated as soon as practicable in portions of the site where construction activities have temporarily or permanently ceased, and construction activities will not resume within 21 days. When the initiation of stabilization measures by the 14th day is precluded by weather conditions, stabilization measures shall be initiated as soon as practicable.
13. This approval does not authorize the installation of temporary aboveground storage tanks on this project. If the contractor desires to install a temporary aboveground storage tank for use during construction, an application to modify this approval must be submitted and approved prior to installation. The application must include information related to tank location and spill containment. Refer to Standard Condition No. 5, above.

After Completion of Construction:

14. Owners of permanent BMPs and measures must insure that the BMPs and measures are constructed and function as designed. A Texas Licensed Professional Engineer must certify in writing that the permanent BMPs or measures were constructed as designed. The certification letter must be submitted to the Austin Regional Office within 30 days of site completion.
15. The applicant shall be responsible for maintaining the permanent BMPs after construction until such time as the maintenance obligation is either assumed in writing by another entity having ownership or control of the property (such as without limitation, an owner's association, a new property owner or lessee, a district, or municipality) or the ownership of the property is transferred to the entity. Such entity shall then be responsible for maintenance until another entity assumes such obligations in writing or ownership is transferred. A copy of the transfer of responsibility must be filed with the executive director through the Austin Regional Office within 30 days of the transfer. A copy of the transfer form (TCEQ-10263) is enclosed.
16. Upon legal transfer of this property, the new owner(s) is required to comply with all terms of the approved CZP. If the new owner intends to commence any new regulated activity on the site, a new CZP that specifically addresses the new activity must be submitted to the executive director. Approval of the plan for the new regulated activity by the executive director is required prior to commencement of the new regulated activity.
17. A CZP approval or extension will expire and no extension will be granted if more than 50 percent of the total construction has not been completed within ten years from the initial approval of a plan. A new CZP must be submitted to the Austin Regional Office with the appropriate fees for review and approval by the executive director prior to commencing any additional regulated activities.
18. At project locations where construction is initiated and abandoned, or not completed, the site shall be returned to a condition such that the aquifer is protected from potential contamination.

This action is taken under authority delegated by the Executive Director of the Texas Commission on Environmental Quality. If you have any questions or require additional information, please contact Ms. Michelle Zvonkovic of the Edwards Aquifer Protection Program of the Austin Regional Office at (512) 339-2929.

Sincerely,

Robert Sadlier, Section Manager

MODIFICATION OF A PREVIOUSLY APPROVED CONTRIBUTING ZONE PLAN

ATTACHMENT B – NARRATIVE OF PROPOSED MODIFICATION

MODIFICATION OF A PREVIOUSLY APPROVED CONTRIBUTING ZONE PLAN

ATTACHMENT B – NARRATIVE OF PROPOSED MODIFICATION

This application is a proposed modification to a previously modified Contributing Zone Plan approved April 14, 2022, for Lake Travis High School. The original CZP was approved in 2019. As part of the previously approved modification plan, a batch detention pond was modified to provide additional volume to provide the required TSS removal for new impervious cover. The construction associated with that modification is complete.

This new modification includes two phases for construction at Lake Travis High School in 2024, Phase 1 and Phase 2. The first phase will change one of the BMPs, WQ Pond 1, from a sand filter system to a batch detention pond. Another existing BMP, WQ Pond 2, will be removed. The area previously draining to WQ Pond 2 will now be routed to WQ Pond 1.

WQ Pond 1 modifications and the removal of WQ Pond 2 will occur in the Phase 1 plans. Construction associated with Phase 2 plans will route some of runoff from WQ Pond 3 to WQ Pond 1. WQ Pond 1 has been sized to accommodate the additional area that was previously draining to WQ Ponds 2 & 3. WQ Pond 1 is providing the TSS removal for 10 acres of additional impervious cover than was being accounted for in the previously approved modified CZP.

CONTRIBUTING ZONE PLAN APPLICATION
ATTACHMENT C – PROJECT NARRATIVE

CONTRIBUTING ZONE PLAN APPLICATION

ATTACHMENT C - Project Narrative

The improvements proposed by this project fall within the limits of the 155.74-acre Lake Travis High School property. The property has been developed in several stages as the result of several projects being constructed over a long period of time. This property is split between two drainage basins, one to the north and one to the south. Each basin drains to an existing detention pond. The northern basin lies outside of the Edwards Aquifer Contributing Zone. The southern basin lies within the Contributing Zone and totals 124.45 acres.

This application is a proposed modification to a previously modified Contributing Zone Plan approved April 14, 2022, for Lake Travis High School. The original CZP was approved in 2019. As part of the previously approved modification plan, a batch detention pond was modified to provide additional volume to provide the required TSS removal for new impervious cover. The construction associated with that modification is complete.

This new modification includes two phases for construction at Lake Travis High School in 2024, Phase 1 and Phase 2. The first phase will change one of the BMPs, WQ Pond 1, from a sand filter system to a batch detention pond. Another existing BMP, WQ Pond 2, will be removed. The area previously draining to WQ Pond 2 will now be routed to WQ Pond 1.

WQ Pond 1 modifications and the removal of WQ Pond 2 will occur in the Phase 1 plans. Construction associated with Phase 2 plans will route some of runoff from WQ Pond 3 to WQ Pond 1. WQ Pond 1 has been sized to accommodate the additional area that was previously draining to WQ Ponds 2 & 3. WQ Pond 1 is providing the TSS removal for 10 acres of additional impervious cover than was being accounted for in the previously approved modified CZP.

Lake Travis High School 2024 Phase 1 & Phase 2 plans propose a total of 4.78 acres of impervious cover. An additional 5.22 acres of future impervious cover is accounted for in this plan. The previously approved modified CZP had a TSS removal of 12,943 lbs. This updated plan provides a TSS removal of 21,647 lbs.

CONTRIBUTING ZONE PLAN APPLICATION ATTACHMENT D – FACTORS AFFECTING SURFACE WATER QUALITY

CONTRIBUTING ZONE PLAN APPLICATION

ATTACHMENT D - Factors Affecting Surface Water Quality

The proposed improvements will contain additional asphalt pavement drives & parking lots, concrete sidewalks, storm drainage structures, driveways and detention structures that will increase the impervious cover for the site and school campus. Due to the impervious cover areas, potential factors could affect surface water and groundwater quality. They are as follows:

1. Driveways, streets, drives and parking lots may potentially collect fluids such as oil, fuel, etc. from vehicles and can be conveyed downstream of the site.
2. Trash may contain commercial products or chemicals that could potentially leak and be conveyed downstream of site.
3. During construction activities, vehicle and equipment maintenance can generate pollutants that can also be conveyed downstream of the site.
4. During construction activities, soil disturbing activities can expose pollutants and be conveyed downstream.
5. During construction activities, materials used for construction can be moved downstream due to surface stormwater and distribute pollutants.

Following the 2024 Improvement projects there will be 43.95 acres of impervious cover at Lake Travis High School within the contributing zone. Runoff will be conveyed to the existing detention ponds for a majority of the site via overland flow and storm sewer systems. The existing detention ponds will reduce the runoff from the campus to be less than predeveloped flows. The type of pollutants produced by this campus will be consistent with other school facilities.

ATTACHMENT J – BMPs for Upgradient Stormwater

In accordance with Texas Commission on Environmental Quality (TCEQ), permanent BMPs or measures are required to prevent pollution of surface water, groundwater or stormwater that originates upgradient from this site or flows across this site. The proposed BMP TSS calculation will incorporate this up-gradient drainage area.

CONTRIBUTING ZONE PLAN APPLICATION ATTACHMENT K – BMPs FOR ON-SITE STORMWATER

CONTRIBUTING ZONE PLAN APPLICATION

ATTACHMENT K – BMPs for On-Site Stormwater

Due to the proposed impervious cover for the school campus improvements being over the 20% threshold, permanent BMPs and measures will be required to prevent pollution caused by the contaminated stormwater runoff that originates from on-site and flows off site. The permanent BMPs and measures for the proposed project are the following:

- One proposed and one existing batch detention pond that captures surface stormwater and treats pollutants during a specific time and discharges flows at a rate in which pollutants are captured within the batch detention pond

Additionally, temporary BMPs and measures will be implemented during the construction of the school campus improvements to prevent pollution from being conveyed downstream of the construction activity. The temporary BMPs and measures are as follows:

- Concrete Washout Areas: A pit containment area to prevent or reduce the discharge of pollutants from concrete waste.
- Silt Fence: A barrier consisting of geotextile fabric supported by metal posts to prevent soil and sediment loss from a site.
- Rock Berms: A structure of 3-to-5-inch diameter rock secured with a woven wire sheath to serve as a check dam in areas of concentrated flow, to intercept sediment-laden runoff, detain the sediment and release of the water in sheet flow.
- Seeding: Seeding of disturbed areas to stabilize grades and minimize silt erosion; applied to areas expected to not have any construction activity for at least 21 days.

CONTRIBUTING ZONE PLAN APPLICATION

ATTACHMENT L – BMPs for Surface Streams

As stated in the previous attachment sections and on the construction plans, temporary and permanent BMPs & measures will be utilized for the proposed project site to prevent pollution from entering surface streams.

Temporary BMPs to be implemented are concrete washout areas, silt fences, rock berms and seeding. These BMPs will mitigate pollution and sedimentation from being conveyed offsite or downstream to surface streams.

Permanent BMPs to be implemented for the proposed improvements are one existing and one proposed batch detention pond & two existing sand filter systems. These BMPs will permanently mitigate pollution and sediments from being conveyed offsite or downstream to surface streams.

IF EXPOSED ROOT AREAS ARE NOT BACKFILLED WITHIN 2 DAYS, COVER THEM WITH ORGANIC MATERIAL IN A MANNER WHICH REDUCES SOIL TEMPERATURE AND MINIMIZES WATER LOSS DUE TO EVAPORATION.
11. NO LANDSCAPE TOPSOIL DRESSING GREATER THAN 4 INCHES SHALL BE PERMITTED WITHIN THE DRIPLINE OF TREES. NO SOIL IS PERMITTED ON THE ROOT FLARE OF ANY TREE.
12. PRUNING TO PROVIDE CLEARANCE FOR STRUCTURES, VEHICULAR TRAFFIC AND EQUIPMENT SHALL TAKE PLACE BEFORE DAMAGE OCCURS (RIPPING OF BRANCHES, ETC.)

OPERATIONS & TEST CYCLE CONTROL FOR BATCH DETENTION POND VALVE CONTROLLER

SYSTEM OVERVIEW
-THIS SYSTEM SHALL UTILIZE A SINGLE FLOAT SWITCH TO ACTIVATE TIMERS THAT CONTROL A SINGLE VALVE OPEN AND CLOSE COMMANDS.

MODES OF OPERATION
-THE SYSTEM SHALL HAVE THREE BASIC MODES OF OPERATION; OFF, MANUAL, AND AUTOMATIC.
-WHEN THE ON/OFF SWITCH IS IN THE 'OFF' POSITION, POWER SHALL NOT BE PROVIDED TO THE VALVE ACTUATOR OR VALVE PROGRAMMABLE LOGIC CONTROLLER (PLC).
-WHEN THE ON/OFF SWITCH IS IN THE 'ON' POSITION, THE SYSTEM SHALL OPERATE BASED ON THE OPEN/AUTO/CLOSE SWITCH POSITION. THE SOLAR CIRCUIT IS FULLY OPERATIONAL, TO CHARGE THE BATTERY, WHITE THE SWITCH IS IN THE 'ON' OR 'OFF' POSITION.

MANUAL CONTROL
-THE OPEN/AUTO/CLOSE SWITCH SHALL HAVE TWO MANUAL POSITIONS, OPEN AND CLOSE.
-THERE SHOULD BE A FIVE SECOND DELAY BEFORE THEY SYSTEM SHALL RECOGNIZE THE AUTO POSITION, SO THE VALVE CAN BE SWITCHED FROM OPEN TO CLOSE WITHOUT AUTOMATIC OPERATION.
-WHEN THE OPEN/AUTO/CLOSE SWITCH IS IN THE OPEN POSITION, THE VALVE SHALL OPEN AND STAY OPEN, WHEN THE OPEN/AUTO/CLOSE SWITCH IS IN THE CLOSE POSITION, THE VALVE SHALL CLOSE AND STAY CLOSED.

AUTOMATIC CONTROL
-VALVE SHALL HAVE A DEFAULT CLOSED POSITION. AN INSTALLED FLOAT SWITCH SHALL INDICATE THE PRESENCE OF WATER FOLLOWING A RAIN EVENT.
-UPON ACTIVATION OF THE FLOAT SWITCH, A 12 HOUR DETENTION TIMER SHALL BE STARTED. THE VALVE SHALL REMAIN CLOSED.
-AFTER THE 12 HOUR TIMER EXPIRES, THE VALVE SHALL OPEN. VALVE SHALL REMAIN OPEN WHILE WATER IS DRAINING AND REMAIN OPEN AS LONG AS THE FLOAT SWITCH CONTACT REMAINS CLOSED.
-WHEN THE WATER LEVEL FALLS BELOW THE FLOAT SWITCH ELEVATION, AND THE FLOAT SWITCH CONTACT OPENS, A 2 HOUR TIMER SHALL BE STARTED. AFTER THE 2 HOUR TIMER EXPIRES, THE VALVE SHALL CLOSE.
-WHEN THE VALVE CLOSES, THE SYSTEM BEGINS A STANDBY PERIOD, WITH THE VALVE CLOSED, UNTIL THE WATER LEVEL RISES ABOVE THE FLOAT SWITCH ELEVATION.

ADDITIONAL FEATURES

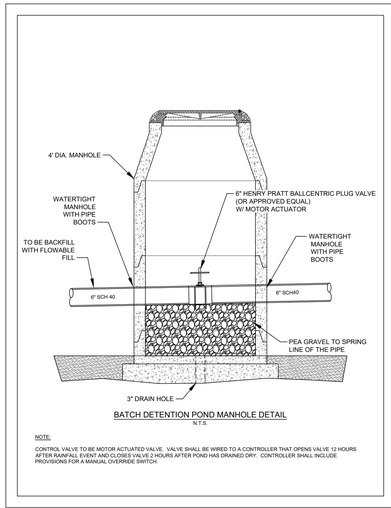
THE FOLLOWING FEATURES SHALL BE PART OF THE NORMAL CONTROL SEQUENCE OF OPERATION.

VALVE EXERCISE
-A TIMER IN THE VALVE CONTROLLER, SET AT ONE WEEK, SHALL START WHEN THE FLOAT SWITCH CONTACT HAS REMAINED OPEN FOR THE SEVEN DAYS. THE VALVE CONTROLLER SHALL OPEN THE VALVE FOR 120 MINUTES. AFTER 120 MINUTES THE VALVE CONTROLLER SHALL CLOSE. THE VALVE.

VALVE ACTUATION TIME
-A TIMER IN THE VALVE CONTROLLER SHALL MONITOR THE VALVE OPEN OR CLOSE COMMAND TIME. THIS TIMER SHALL BE SYNCHRONIZED WITH THE VALVE OPENINGN AND CLOSING SEQUENCE, TO SAVE BATTERY POWER.

CHANGING TIMER SET POINTS
-FOUR TIMERS SHALL BE PROIDED AND MODIFIED AS NEEDED FOR FINE TUNED CONTROL. THESE TIMERS, IN ORDER OF DISPLAY ON THE PLC SCREEN, SHALL BE:
- -DELAY ON TIME (DEFAULT 12 HOURS) : TIME DELAY BETWEEN THE FLOAT INDICATING WATER IS PRESENT AND THE VALVE AUTOMATICALLY OPENING.
- -DELAY OFF TIME (DEFAULT 2 HOURS) : TIME DELAY BETWEEN THE FLOAT INDICATING WAS HAS EMPTIED AND THE VALVE AUTOMATICALLY CLOSING.
- -EXERCISE TIME (DEFAULT 120 MINUTES) : LENGTH OF TIME THE VALVE SHALL STAY OPEN WHILE IN EXERCISE MODE.
- -ACTUATION TIME (DEFAULT 60 SECONDS) : LENGTH OF TIME THE OPEN OR CLOSE COMMANDS SHALL BE GIVEN TO THE VALVE ACTUATOR.

NOTES:
1. WATER QUALITY POND IS A BATCH DETENTION POND PER TCEQ DESIGN CRITERIA.
2. OUTLET STRUCTURE FOR WATER QUALITY POND IS A PVC PIPE (PER DETAIL) WITH A DOWNSTREAM ACTUATOR VALVE.
3. ACTUATOR VALVE IS TO BE CONTROLLED SUCH THAT A 12 HOUR MINIMUM DETENTION TIME IS ACHIEVED AND SHALL REMAIN OPEN FOR TWO HOURS AFTER THE LEVEL SENSOR INDICATES THE BASIN IS EMPTY TO ALLOW ANY REMAINING SHALLOW WATER TO BE DISCHARGED.
4. ORIFICE/PIPE HAS BEEN SIZED TO ALLOW COMPLETE DRAWDOWN OF WATER QUALITY VOLUME WITHIN 48 HOURS AFTER THE 12 HOUR DETENTION TIME.
5. ELECTRIC CONTROL PANEL SHALL BE CAPABLE OF:
   1. 12 HOUR DELAY PRIOR TO OPENING ACTUATED VALVE
   2. PROVIDE MANUAL OVERRIDE TO ACTUATOR



BATCH DETENTION POND MANHOLE DETAIL
N.T.S.

NOTE:
CONTROL VALVE TO BE MOTOR ACTUATED VALVE. VALVE SHALL BE WIRED TO A CONTROLLER THAT OPENS VALVE 12 HOURS AFTER RAINFALL EVENT AND CLOSES VALVE 2 HOURS AFTER POND HAS DRAINED DRY. CONTROLLER SHALL INCLUDE PROVISIONS FOR A MANUAL OVERRIDE SWITCH.

Development Ordinance – EXHIBIT U
Tree Survey and Protection Specifications

CHAIN LINK FENCE, PRUNING AND PLANKING
(Tree Protection Notes #7, Exhibits K and L)

Exceptions to installing fences at tree drip lines may be permitted in the following cases:

1. Where there is to be an approved grade change, impermeable paving surface, tree well, or other such site development, erect the fence approximately 2 to 4 feet behind the area in question.
2. Where permeable paving is to be installed within a tree's drip line, erect the fence at the outer limits of the permeable paving area (prior to site grading so that this area is graded separately prior to paving installation to minimize root damage).
3. Where trees are close to proposed buildings, erect the fence to allow 6 to 10 feet of work space between the fence and the building.
4. Where any of the above exceptions result in a fence being closer than 4 feet to a tree trunk, protect the trunk with strapped-on planking to a height of 8 feet (or to the limits of lower branching) in addition to the reduced fencing provided.
5. All branches that hang over the fence shall be pruned to a minimum height of 13.5 feet or higher if required for equipment clearance.

MEASURING TREE DIAMETERS
(Section 10.04, Exhibits B, C, D, F and G)

1. Measure tree diameters at a height of 4-1/2 feet (4 feet 6 inches).
2. If the tree forks at 4-1/2 feet, measure below the swell.
3. Diameter measurement should be accurate to one inch and should be rounded up or down to the nearest inch. (Examples: 15.3" = 15", 15.7" = 16")
4. Trees which are connected at ground level or above are considered to be multi-trunk trees. Look for bark at the base joining the stems.
   a. Measure all trunks larger than 6 inches at a height of 4-1/2 feet and add for total diameter inches.
   b. If none of the trunks is larger than 6 inches when measured at 4-1/2 feet, measure the trunk below the swell beneath the lowest fork.
   c. Example: A Spanish oak with three 8 inch stems and two 4 inch stems would be shown as a "24 inch multi-stem Spanish Oak."
      i. Only the three 8 inch stems would count toward the total.
      ii. Show the total diameter inches in the tree list. Do not show as "8" 8" 8" SO" or "8 inch triple oak", etc.
5. Clusters of many small stems forking from the ground do not need to be measured or shown on the tree survey.
   a. The only exception is the rare Texas Madrone, for which the tree survey should show an approximate height and drip line.

TREE SURVEY SPECIFICATIONS
(Section 10.04, Exhibits B, C, D, F and G)

All General Development Plans, Preliminary Plans, Final Plats, Subdivision Improvement Plans and Site Development Plans require an accurate tree survey which meets the following specifications.

1. The surveyor should locate and measure the following trees according to City of Lakeway standards:
   a. All hardwood trees six (6) inches and larger in diameter.
   b. All trees of any size of the following species which is rare in Lakeway: Texas Madrone (*Arbutus xalapensis var. texana*)
2. All trees should be tagged and numbered on site.
3. The tree survey plat should include a tree list showing tag number, DBH and species.
4. The tree list should show the total diameter inches of multi-trunk trees, with the exception of Texas Madrones.
5. Texas Madrones should be shown in the tree list and on the survey with an approximate height and an actual (not calculated) drip line.
6. The tree survey should show the location of each tree and a calculated drip line drawn for each tree at one foot radius per inch of diameter.
   a. Example: a 10 inch diameter oak would show a calculated drip line with a 10 foot radius.
7. The tree survey plat must contain a surveyor's certification (Exhibit I).
8. Field work for the tree survey shall be performed within one year of submittal to the City.

Texas Madrone: Small multi-stem evergreen tree, usually less than 20 feet tall, rarely 30 feet. Distinguishing feature is smooth bark, rose to deep red in color. Leaves are oval, up to 3-1/2 inches long, leathery and light green. Rare in this area, usually found on slopes sheltered beside Ashe Juniper (cedar) trees.

1. POSTS WHICH SUPPORT THE SILT FENCE SHALL BE INSTALLED ON A SLIGHT ANGLE TOWARD THE ANTICIPATED RUNOFF SOURCE. POST MUST BE EMBEDDED A MINIMUM OF 300 mm (12 INCHES).
2. THE TOE OF THE SILT FENCE SHALL BE TRENCHED IN WITH A SPADE OR MECHANICAL TRENCHER, SO THAT THE DOWNSLOPE FACE OF THE TRENCH IS FLAT AND PERPENDICULAR TO THE LINE OF FLOW.
3. THE TRENCH MUST BE A MINIMUM OF 150 mm (6 inches) DEEP AND 150 mm (6 inches) WIDE TO ALLOW FOR THE SILT FENCE FABRIC TO BE LAID IN THE GROUND AND BACKFILLED WITH COMPACTED MATERIAL.
4. SILT FENCE FABRIC SHOULD BE SECURELY FASTENED TO EACH SUPPORT POST OR TO WOVEN WIRE, WHICH IS IN TURN ATTACHED TO THE FENCE POST.
5. INSPECTION SHALL BE MADE WEEKLY OR AFTER EACH RAINFALL EVENT AND REPAIR OR REPLACEMENT SHALL BE MADE PROMPTLY AS NEEDED.
6. SILT FENCE SHALL BE REMOVED WHEN THE SITE IS COMPLETELY STABILIZED SO AS NOT TO BLOCK OR IMPEDE STORM FLOW OR DRAINAGE.
7. ACCUMULATED SILT SHALL BE REMOVED WHEN IT REACHES A DEPTH OF 150 mm (6 inches). THE SILT SHALL BE DISPOSED OF ON AN APPROVED SITE AND IN SUCH A MANNER THAT WILL NOT CONTRIBUTE TO ADDITIONAL SILTATION.

HEAVY DUTY TRENCH

Materials: All frames and grates/lids are furnished standard in gray iron, meeting ASTM-A48 Class 35-B for heavy-duty use. For extra heavy-duty use or superior durability requirements, see our ductile iron Airport and Port Grating Series on page 286.

Neenah recommends project designers avoid the use of light duty trench installations because it is likely that applications will be subjected to heavy delivery vehicle traffic at some time. Furthermore, the use of a site could be changed to heavy duty use patterns at some unanticipated future date.

- Complete catalog number
- Frame end pieces, when required
- Type of Lid or Grate: A, C, D, E, P or Q
- Length of trench sections
- Angles and intersections *
- Load requirements

*Trenches with angles, intersections, size changes or other special requirements require detail drawings prior to ordering. Contact your sales representative or product engineering for assistance.

LEVEL SPREADER NOTES:

INSTALLATION:

- LEVEL SPREADERS SHOULD BE CONSTRUCTED ON UNDISTURBED SOIL (NOT FILL MATERIAL)
- THE ENTRANCE TO THE SPREADER SHOULD BE SHAPED IN SUCH A MANNER AS TO INSURE THAT RUNOFF ENTERS DIRECTLY ONTO THE 0% GRADE CHANNEL.
- CONSTRUCT A TRANSITION SECTION FROM THE DIVERSION CHANNEL TO BLEND SMOOTHLY TO THE WIDTH AND DEPTH OF THE SPREADER.
- THE LEVEL LIP SHOULD BE CONSTRUCTED AT 0% GRADE TO INSURE UNIFORM SPREADING OF STORMWATER RUNOFF.
- IMMEDIATELY AFTER ITS CONSTRUCTION, ESTABLISH VEGETATION ALONG THE ENTIRE DISTURBED AREA OF THE SPREADER. A VEGETATIVE COVER DENSITY OF 80% WITH NO LARGE BARE AREAS IS REQUIRED.
- LEVEL SPREADER TO BE STAKED ALONG A CONTOUR PRIOR TO CONSTRUCTION

INSPECTION AND MAINTENANCE GUIDELINES:

- THE LEVEL SPREADER SHOULD BE INSPECTED ANNUALLY AND REPAIRS MADE, IF REQUIRED.
- LEVEL SPREADER LIP SHOULD REMAIN AT 0% SLOPE TO ALLOW PROPER FUNCTION OF MEASURE.
- THE CONTRACTOR SHOULD AVOID THE PLACEMENT OF ANY MATERIAL ON AND PREVENT CONSTRUCTION TRAFFIC ACROSS THE STRUCTURE. IF THE MEASURE IS DAMAGED BY CONSTRUCTION TRAFFIC, IT SHOULD BE REPAIRED IMMEDIATELY.

CHAIN LINK FENCE, PRUNING AND PLANKING
(Tree Protection Notes #7, Exhibits K and L)

Exceptions to installing fences at tree drip lines may be permitted in the following cases:

1. Where there is to be an approved grade change, impermeable paving surface, tree well, or other such site development, erect the fence approximately 2 to 4 feet behind the area in question.
2. Where permeable paving is to be installed within a tree's drip line, erect the fence at the outer limits of the permeable paving area (prior to site grading so that this area is graded separately prior to paving installation to minimize root damage).
3. Where trees are close to proposed buildings, erect the fence to allow 6 to 10 feet of work space between the fence and the building.
4. Where any of the above exceptions result in a fence being closer than 4 feet to a tree trunk, protect the trunk with strapped-on planking to a height of 8 feet (or to the limits of lower branching) in addition to the reduced fencing provided.
5. All branches that hang over the fence shall be pruned to a minimum height of 13.5 feet or higher if required for equipment clearance.

MEASURING TREE DIAMETERS
(Section 10.04, Exhibits B, C, D, F and G)

1. Measure tree diameters at a height of 4-1/2 feet (4 feet 6 inches).
2. If the tree forks at 4-1/2 feet, measure below the swell.
3. Diameter measurement should be accurate to one inch and should be rounded up or down to the nearest inch. (Examples: 15.3" = 15", 15.7" = 16")
4. Trees which are connected at ground level or above are considered to be multi-trunk trees. Look for bark at the base joining the stems.
   a. Measure all trunks larger than 6 inches at a height of 4-1/2 feet and add for total diameter inches.
   b. If none of the trunks is larger than 6 inches when measured at 4-1/2 feet, measure the trunk below the swell beneath the lowest fork.
   c. Example: A Spanish oak with three 8 inch stems and two 4 inch stems would be shown as a "24 inch multi-stem Spanish Oak."
      i. Only the three 8 inch stems would count toward the total.
      ii. Show the total diameter inches in the tree list. Do not show as "8" 8" 8" 5.0" or "8 inch triple oak", etc.
5. Clusters of many small stems forking from the ground do not need to be measured or shown on the tree survey.
   a. The only exception is the rare Texas Madrone, for which the tree survey should show an approximate height and drip line.

TREE SURVEY SPECIFICATIONS
(Section 10.04, Exhibits B, C, D, F and G)

All General Development Plans, Preliminary Plans, Final Plats, Subdivision Improvement Plans and Site Development Plans require an accurate tree survey which meets the following specifications.

1. The surveyor should locate and measure the following trees according to City of Lakeway standards:
   a. All hardwood trees six (6) inches and larger in diameter.
   b. All trees of any size of the following species which is rare in Lakeway: Texas Madrone (*Arbutus xalapensis var. texana*)
2. All trees should be tagged and numbered on site.
3. The tree survey plat should include a tree list showing tag number, DBH and species.
4. The tree list should show the total diameter inches of multi-trunk trees, with the exception of Texas Madrones.
5. Texas Madrones should be shown in the tree list and on the survey with an approximate height and an actual (not calculated) drip line.
6. The tree survey should show the location of each tree and a calculated drip line drawn for each tree at one foot radius per inch of diameter.
   a. Example: a 10 inch diameter oak would show a calculated drip line with a 10 foot radius.
7. The tree survey plat must contain a surveyor's certification (Exhibit I).
8. Field work for the tree survey shall be performed within one year of submittal to the City.

Texas Madrone: Small multi-stem evergreen tree, usually less than 20 feet tall, rarely 30 feet. Distinguishing feature is smooth bark, rose to deep red in color. Leaves are oval, up to 3-1/2 inches long, leathery and light green. Rare in this area, usually found on slopes sheltered beside Ashe Juniper (cedar) trees.

INSPECTION, MAINTENANCE, REPAIR AND RETROFIT PLAN

LAKE TRAVIS HIGH SCHOOL 2024 IMPROVEMENTS

Batch Detention Basin

Inspections. Inspections should take place a minimum of twice a year. One inspection should take place during wet weather to determine if the basin is meeting the target detention time of 12 hours and a drawdown time of no more than 48 hours. The remaining inspections should occur between storm events so that manual operation of the valve and controller can be verified. The level sensor in the basin should be inspected and any debris or sediment in the area should be removed. The outlet structure and the trash screen should be inspected for signs of clogging. Debris and sediment should be removed from the orifice and outlet(s) as described in previous sections. Debris obstructing the valve should be removed. During each inspection, erosion areas inside and downstream of this BMP should be identified and repaired/revegetated immediately.

Mowing. The basin, basin side-slopes, and embankment of the basin must be mowed to prevent woody growth and control weeds. A mulching mower should be used, or the grass clippings should be caught and removed. Mowing should take place at least twice a year, or more frequently if vegetation exceeds 18 inches in height. More frequent mowing to maintain aesthetic appeal may be necessary in landscaped areas.

Litter and Debris Removal. Litter and debris removal should take place at least twice a year, as part of the periodic mowing operations and inspections. Debris and litter should be removed from the surface of the basin. Particular attention should be paid to floatable debris around the outlet structure. The outlet should be checked for possible clogging or obstructions and any debris removed.

Erosion control. The basin side slopes and embankment all may periodically suffer from slumping and erosion. To correct these problems, corrective action, such as regrading and revegetation, may be necessary. Correction of erosion control should take place whenever required based on the periodic inspections.

Nuisance Control. Standing water or soggy conditions may occur in the basin. Some standing water may occur after a storm event since the valve may close with 2 to 3 inches of water in the basin. Some flow into the basin may also occur between storms due to spring flow and residential water use that enters the storm sewer system. Twice a year, the facility should be evaluated in terms of nuisance control (insects, weeds, odors, algae, etc.).

Structural Repairs and Replacement. With each inspection, any damage to structural elements of the basin (pipes, concrete drainage structures, retaining walls, etc.) should be identified and repaired immediately. An example of this type of repair can include patching

of cracked concrete, sealing of voids, removal of vegetation from cracks and joints. The various inlet/outlet structures in a basin will eventually deteriorate and must be replaced.

Sediment Removal. A properly designed batch detention basin will accumulate quantities of sediment over time. The accumulated sediment can detract from the appearance of the facility and reduce the pollutant removal performance of the facility. The sediment also tends to accumulate near the outlet structure and can interfere with the level sensor operation. Sediment shall be removed from the basin at least every 5 years, when sediment depth exceeds 6 inches, when the sediment interferes with the level sensor or when the basin does not drain within 48 hours. Care should be taken not to compromise the basin lining during maintenance.

Logic Controller. The Logic Controller should be inspected as part of the twice yearly investigations. Verify that the external indicators (active, cycle in progress) are operating properly by turning the controller off and on, and by initiating a cycle by triggering the level sensor in the basin. The valve should be manually opened and closed using the open/close switch to verify valve operation and to assist in inspecting the valve for debris. The solar panel should be inspected and any dust or debris on the panel should be carefully removed. The controller and all other circuitry and wiring should be inspected for signs of corrosion, damage from insects, water leaks, or other damage. At the end of the inspection, the controller should be reset.

"Proper" disposal of vegetation trimmings and accumulated silt shall be accomplished following Texas Commission on Environmental Quality, City of Cedar Park, and Williamson County rules and regulations.

Recordkeeping. Maintain a field logbook to record any relevant information noted during inspections. At a minimum, the field notebook should include the date and time, field staff names, weather conditions, uniformity of grass cover, presence of debris and/or litter, and areas of sediment accumulation as well as any corrective actions taken and date they were completed. Records shall be maintained for a minimum of 3 years and shall be made available to TCEQ upon request. A sample inspection report is included with this attachment.

An amended copy of this document will be provided to the Texas Commission on Environmental Quality within thirty (30) days of any changes in the following information.

CONTRIBUTING ZONE PLAN APPLICATION ATTACHMENT P – MEASURES FOR MINIMIZING SURFACE STREAM CONTAMINATION

CONTRIBUTING ZONE PLAN APPLICATION

ATTACHMENT P – Measures for Minimizing Surface Stream Contamination

Temporary and permanent BMPs measure will be utilized for the proposed project site to avoid or minimize surface stream contamination and changes in the way in which water enters a stream as a result of the construction and development. These BMP's and measures have been described previously in other sections of this report and are included within the construction plans. Below is a description of the measures and their intended use.

Temporary BMPs and measures to be implemented are stabilized construction entrances / exits, concrete washout area, silt fences, rock berms and seeding. These BMPs & measures will be utilized to avoid or decrease the amount of contamination that could potentially enter a stream. These components provide a barrier to prevent and capture pollution and sediments from being conveyed to surface streams due to construction activity. The components additionally provide measures to prevent erosion by disbursing and slowing down storm water being conveyed to surface streams.

Permanent BMPs are an existing water quality batch detention pond and a proposed batch detention pond. This BMP will permanently mitigate pollution and sediments from being conveyed to surface streams. These BMPs will treat and capture pollutants from storm water permanently for the life of the development. Water quality ponds and engineered outlets provide measures to disburse water and prevent erosion at outfall areas.

13. [X] All control measures must be properly selected, installed, and maintained in accordance with the manufacturer's specifications and good engineering practices. If periodic inspections by the applicant or the executive director, or other information indicate a control has been used inappropriately, or incorrectly, the applicant must replace or modify the control for site situations.

14. [X] If sediment escapes the construction site, off-site accumulations of sediment must be removed at a frequency sufficient to minimize offsite impacts to water quality (e.g., fugitive sediment in street being washed into surface streams or sensitive features by the next rain).

Inlet protection will be installed to stop the pollution of stormwater runoff by preventing soil and debris from entering storm drain inlets. Silt fences will be utilized to filter stormwater runoff and keep soil on the disturbed land, rather than letting it be washed off into natural water bodies. Silt fences and rock berms downstream of disturbed areas shall be installed per the plans, maintained, and regularly inspected throughout the duration of all major construction activities until revegetation is complete. The revegetation shall be deemed complete when coverage is 85% on slopes of 0-5% and 95% on areas exceeding 5% slope with no bare areas greater than ten (10) square feet remain.

In addition to the installation of silt fencing and inlet protection, a stabilized construction entrance will be provided for all traffic accessing the site and a concrete washout will be provided. Tree protection will also be provided as needed.
