Edwards Aquifer Application Cover Page

Our Review of Your Application

The Edwards Aquifer Program staff conducts an administrative and technical review of all applications. The turnaround time for administrative review can be up to 30 days as outlined in 30 TAC 213.4(e). Generally administrative completeness is determined during the intake meeting or within a few days of receipt. The turnaround time for technical review of an administratively complete Edwards Aquifer application is 90 days as outlined in 30 TAC 213.4(e). Please know that the review and approval time is directly impacted by the quality and completeness of the initial application that is received. In order to conduct a timely review, it is imperative that the information provided in an Edwards Aquifer application include final plans, be accurate, complete, and in compliance with 30 TAC 213.

Administrative Review

1. Edwards Aquifer applications must be deemed administratively complete before a technical review can begin. To be considered administratively complete, the application must contain completed forms and attachments, provide the requested information, and meet all the site plan requirements. The submitted application and plan sheets should be final plans. Please submit one full-size set of plan sheets with the original application, and half-size sets with the additional copies.

   To ensure that all applicable documents are included in the application, the program has developed tools to guide you and web pages to provide all forms, checklists, and guidance. Please visit the below website for assistance: http://www.tceq.texas.gov/field/eapp.

2. This Edwards Aquifer Application Cover Page form (certified by the applicant or agent) must be included in the application and brought to the administrative review meeting.

3. Administrative reviews are scheduled with program staff who will conduct the review. Applicants or their authorized agent should call the appropriate regional office, according to the county in which the project is located, to schedule a review. The average meeting time is one hour.

4. In the meeting, the application is examined for administrative completeness. Deficiencies will be noted by staff and emailed or faxed to the applicant and authorized agent at the end of the meeting, or shortly after. Administrative deficiencies will cause the application to be deemed incomplete and returned.

   An appointment should be made to resubmit the application. The application is re-examined to ensure all deficiencies are resolved. The application will only be deemed administratively complete when all administrative deficiencies are addressed.

5. If an application is received by mail, courier service, or otherwise submitted without a review meeting, the administrative review will be conducted within 30 days. The applicant and agent will be contacted with the results of the administrative review. If the application is found to be administratively incomplete, it can be retrieved from the regional office or returned by regular mail. If returned by mail, the regional office may require arrangements for return shipping.

6. If the geologic assessment was completed before October 1, 2004 and the site contains "possibly sensitive" features, the assessment must be updated in accordance with the *Instructions to Geologists* (TCEQ-0585 Instructions).

Technical Review

1. When an application is deemed administratively complete, the technical review period begins. The regional office will distribute copies of the application to the identified affected city, county, and groundwater conservation district whose jurisdiction includes the subject site. These entities and the public have 30 days to provide comments on the application to the regional office. All comments received are reviewed by TCEQ.

2. A site assessment is usually conducted as part of the technical review, to evaluate the geologic assessment and observe existing site conditions. The site must be accessible to our staff. The site boundaries should be

clearly marked, features identified in the geologic assessment should be flagged, roadways marked and the alignment of the Sewage Collection System and manholes should be staked at the time the application is submitted. If the site is not marked the application may be returned.

3. We evaluate the application for technical completeness and contact the applicant and agent via Notice of Deficiency (NOD) to request additional information and identify technical deficiencies. There are two deficiency response periods available to the applicant. There are 14 days to resolve deficiencies noted in the first NOD. If a second NOD is issued, there is an additional 14 days to resolve deficiencies. If the response to the second notice is not received, is incomplete or inadequate, or provides new information that is incomplete or inadequate, the application must be withdrawn or will be denied. Please note that because the technical review is underway, whether the application is withdrawn or denied **the application fee will be forfeited**.
4. The program has 90 calendar days to complete the technical review of the application. If the application is technically adequate, such that it complies with the Edwards Aquifer rules, and is protective of the Edwards Aquifer during and after construction, an approval letter will be issued. Construction or other regulated activity may not begin until an approval is issued.

Mid-Review Modifications

It is important to have final site plans prior to beginning the permitting process with TCEQ to avoid delays.

Occasionally, circumstances arise where you may have significant design and/or site plan changes after your Edwards Aquifer application has been deemed administratively complete by TCEQ. This is considered a "Mid-Review Modification". Mid-Review Modifications may require redistribution of an application that includes the proposed modifications for public comment.

If you are proposing a Mid-Review Modification, two options are available:

- If the technical review has begun your application can be denied/withdrawn, your fees will be forfeited, and the plan will have to be resubmitted.
- TCEQ can continue the technical review of the application as it was submitted, and a modification application can be submitted at a later time.

If the application is denied/withdrawn, the resubmitted application will be subject to the administrative and technical review processes and will be treated as a new application. The application will be redistributed to the affected jurisdictions.

Please contact the regional office if you have questions. If your project is located in Williamson, Travis, or Hays County, contact TCEQ's Austin Regional Office at 512-339-2929. If your project is in Comal, Bexar, Medina, Uvalde, or Kinney County, contact TCEQ's San Antonio Regional Office at 210-490-3096

Administrative Information

61. ☒ Submit one (1) original and one (1) copy of the application, plus additional copies as needed for each affected incorporated city, groundwater conservation district, and county in which the project will be located. The TCEQ will distribute the additional copies to these jurisdictions.

Attachment 1C – Project Narrative

The proposed development is located on the Northeast corner of the intersection of U.S. Highway 183A and Huddleston Road. The project currently consists of 3 lots, but is in the process of being replatted to a single lot. The legal description of the three current lots is "AW0438 – Mansil, WM. Survey, Acres 2.05, 2.18, & 1.50." The total area for the proposed development is 5.73 acres. The existing conditions of the site is undeveloped, with 654 square feet of existing impervious cover from two existing culver headwalls, one located on the southeast corner of the property and the other located on the northeast corner. None of the existing impervious cover is proposed to be demolished at this time. In its existing condition, the site receives some offsite stormwater from the adjacent residential lots to the east. The high point of the site is located towards the southwest corner of the site, near the intersection of U.S. Highway 183A and Huddleston Road at an elevation of approximately 972'. This drains down to the existing culvert on the northeast corner of the site near Sweetwood Lane at an elevation of approximately 955'. The site slopes down between these two points with a slope of approximately 1% throughout the site.

The proposed site improvements consist of the construction of a 7,800 sf flex retail building, a 19,000 sf mixed use building, a 8,000 sf medical office building, and the associated utility and access infrastructure. These improvements increase the impervious cover of the site to 147,312 sf, or 58.97% of the 5.73-acre site. This increase in impervious cover will be served by a combined detention and water quality pond utilizing a batch detention system. This pond will be located on the northwest corner of the site and discharges towards the existing culvert on the northeast corner of the site.

Attachment 1D – Factors Affecting Surface Water Quality

The factors affecting water quality as a result of proposed site improvements are as follows:

The proposed site improvements consist of the construction of a 7,800 sf flex retail building, a 19,000 sf mixed use building, a 8,000 sf medical office building, and the associated utility and access infrastructure. These improvements increase the impervious cover of the site to 147,312 sf, or 58.97% of the 5.73-acre site. This increase in impervious cover will be served by a combined detention and water quality pond utilizing a batch detention system.

The proposed improvements will facilitate large, industrial vehicular traffic to the site and will cause an increase in Total Suspended Solids (TSS). The vehicular traffic which will be visiting the site will naturally cause an increase in TSS due to unforeseen leaks in vehicles which can include, but are not limited to: brake fluid, hydraulic fluid, antifreeze, oil, gasoline, and diesel fuel. The surface water quality will be affected negatively by this increase in TSS, however, this water quality will be restored to abide by TCEQ (80% TSS Removal) and City of Georgetown's (85% TSS Removal) requirements with the proposed Batch Detention Basin.

Attachment 1E – Volume and Character of Stormwater

The volume and character of stormwater at the project site for both existing and post-development conditions are as follows:

The existing conditions of the 5.735-acre site is undeveloped, with 654 square feet of existing impervious cover from two existing culver headwalls, one located on the southeast corner of the property and the other located on the northeast corner. The existing site information is based on a survey provided by 4Ward Land Surveying, dated March 12, 2024. The high point of the site is located towards the southwest corner of the site, near the intersection of U.S. Highway 183A and Huddleston Road at an elevation of approximately 972'. This drains down to the existing culvert on the northeast corner of the site near Sweetwood Lane at an elevation of approximately 955'. The site slopes down between these two points with a slope of approximately 1% throughout the site. Based on a soils report provided by the United States Department of Agriculture Natural Resources Conservation Service (USDA NRCS), the soils for the site consist of Denton Silty Clay and Doss Silty Clay, both of which are categorized by a hydrologic soil group of D. The condition of the site is undeveloped, with grass in good condition, which gives the site a Runoff Curve Number of 80 when combined with the soils information.

The existing site is split into three separate drainage basins, defined by the existing stormwater infrastructure. A description of the basins can be found below.

- Existing Drainage Basin 1 consists of 4,782.37 square feet on the southeast corner of the site that drains to an existing stormwater culvert. This basin has 16.66sf of existing impervious cover, or 0.35% of the 0.11-acre basin.
- Existing Drainage Basin 2 consists of 256,644.04 square feet, a majority of the site, and drains to an existing stormwater culvert on the northeast corner of the site. This basin also includes an offsite portion to the east that drains to the existing stormwater culvert. This basin has 480.06 sf of existing impervious cover, or 0.19% of the 5.89-acre basin.
- Existing Drainage Basin 3 consists of 73,672.05 square feet entirely of offsite area that drains to an existing stormwater culvert in the U.S. Highway 183A right-of-way. This basin is included in the planset in order to show drainage calculations in the right-of-way, but no portion of this drains to the proposed detention and water quality pond. This basin consists of 45,676.68 square feet of impervious cover, or 62% of the 1.85-acre site.

The proposed site improvements consist of the construction of a 7,800 sf flex retail building, a 19,000 sf mixed use building, a 8,000 sf medical office building, and the associated utility and access infrastructure. These improvements increase the impervious cover of the site to 147,312 sf, or 58.97% of the 5.73-acre site.

The proposed improvements split the existing site into 10 separate basins while trying to maintain the original flow patterns. A description of the basins can be found below.

- Drainage Basin 1 consists of 3,891.21 square feet on the southeast corner of the site that drains to an existing stormwater culvert. This basin has 555.8 square feet of impervious cover, or 14.26% of the 0.09-acre basin.
- Drainage Basin 2 consists of 41,602.06 square feet along the eastern property line, including the portion of offsite area to the east that drains onto the proposed site. This drains to the existing stormwater culvert near Sweetwood Lane and has 3,151.79 square feet of impervious cover, or 7.56% of the 0.96-acre basin.

- Drainage Basin 3 consists of the southeast portion of the proposed improvements that drains to a proposed grate inlet. This basin has 46,058.89 square feet of impervious cover, or 80.15% of the 1.32-acre basin.
- Drainage Basin 4 consists of the southwest portion of the proposed improvements that drains to a proposed grate inlet. This basin has 35,864.16 square feet of impervious cover, or 93.91% of the 0.88-acre basin.
- Drainage Basin 5 consists of the west portion of the proposed improvements that drains to a proposed grate inlet. This basin has 22,259.24 square feet of impervious cover, or 93.32% of the 0.55-acre basin.
- Drainage Basin 6 consists of the east portion of the proposed improvements that drains to a proposed grate inlet. This basin has 13,176.23 square feet of impervious cover, or 64.97% of the 0.47-acre basin.
- Drainage Basin 7 consists of the northern portion of the proposed improvements that drains to a proposed grate inlet. This basin has 24,485.99 square feet of impervious cover, or 89.91% of the 0.63-acre basin.
- Drainage Basin 8 consists of the detention and water quality pond, located on the northeast corner of the proposed site. This basin has 120.49 square feet of impervious cover, or 0.53% of the 0.52-acre basin.
- Drainage Basins 9 and 10 split Existing Drainage Basin 3 into two separate basins because of the proposed driveway connection to U.S. Highway 183A.

A batch detention system is proposed to be used to provide the development with detention and to treat the stormwater runoff that flows across the proposed improvements. Drainage Basins #3-#8 are conveyed to the proposed pond by a stormwater system through the site.

Attachment 1J – BMPs for Upgradient Stormwater

The site receives upgradient stormwater from the residential lots to the east of the property. The total off-site area which drains on the proposed development is approximately 0.22 acres, 0% of which consists of impervious cover. The upgradient stormwater from this area drains onto the site and directly to the nearby existing culver under Sweetwood Lane. This stormwater, while flowing through the proposed site, does not flow across any proposed impervious cover. As such, no BMPs are required to treat Upgradient Stormwater. A combined detention and water quality pond utilizing a Batch Detention System is proposed to treat the on-site stormwater that flows across the proposed improvements. Refer to "Attachment 1K – BMPs for Onsite Stormwater" for more information on this water quality feature.

Attachment 1K – BMPs for On-site Stormwater

In general accordance with the TCEQ Technical Guidance Manual, onsite stormwater BMP's must be designed to remove at least 80% of the increased total suspended solids (TSS) from the proposed project. A Batch Detention Basin is proposed for this CZP. The majority of the proposed site drains to the Batch Detention Basin located on the northwest corner of the proposed site.

As described in the Addendum Sheet of "Complying with the Edwards Aquifer Rules: Technical Guidance on Best Management Practices" (TCEQ Approval of Innovative Technology, Section 3.2.17),

> "Batch Detention Basins capture and temporarily detain the water quality volume from a storm event using an automated controller and valve. They are intended to serve primarily as settling basins for the solids fraction, and as a means of limiting downstream erosion by controlling peak flow rates during erosive events… Batch detention basins are designed to prevent clogging of the outflow structure and resuspension of captured sediment during a discharge. They also provide enhanced dissolved pollutant removal performance. The batch detention design typically incorporates a non-clogging outflow structure, such as an orifice protected by a trash rack, or a perforated riser pipe protected by riprap."

The proposed improvements split the existing site into 10 separate drainage basins. More information about these drainage basins can be found in "Attachment 1E – Volume and Character of Stormwater." Drainage Basins #1 and #2 each drain to an existing culvert, one on the northeast corner and one on the southeast corner, without flowing across any proposed improvements. Drainage Basins #9 and #10 are in the right-of-way of U.S. Highway 183A and are not treated using the Proposed BMP. Drainage Basins #3-8 all drain towards the combination detention and water quality pond before draining towards an existing culvert by Sweetwood Lane to the northeast.

The combined detention and water quality pond utilizing the Batch Detention System has been sized to treat all of the additional impervious cover from the proposed improvements. Using the TCEQ Calculation Spreadsheet, the required water volume for this Batch Detention Basin is 14,115 cubic feet and requires an additional 2,823 cubic feet for storage of sediment, bringing the total to 16,938 cubic feet. The proposed Batch Detention Basin has a water quality volume of 17,920.85 cubic feet at an elevation of 960.60', 2.734' above the bottom of the pond, and a total volume of 73,282.39 cubic feet at the top of berm elevation of 964.00'. This water quality volume exceeds the volume necessary for the minimum 80% TSS required by TCEQ and the calculations performed using TCEQ's TSS Calculations spreadsheet can be found in the following pages.

No BMPS are proposed to specifically affect surface streams. Attachment N – Inspection, Maintenance, Repair, and Retrofit Plan

The following are recommended maintenance procedures as outlined in TCEQ's Complying with the Edwards Aquifer Rules: Technical Guidance on Best Management Practices.

Batch Detention Basins:
Batch detention basins may have somewhat higher maintenance requirements than an extended detention basin since they are active stormwater controls. The maintenance activities are identical to those of extended detention basins with the addition of maintenance and inspections of the automatic controller and the valve at the outlet.

Inspections: Inspections should take place a minimum of twice a year. One inspection should take place during wet weather to determine if the basin is meeting the target detention time of 12 hours and a drawdown time of no more than 48 hours. The remaining inspections should occur between storm events so that manual operation of the valve and controller can be verified. The level sensor in the basin should be inspected and any debris or sediment in the area should be removed. The outlet structure and the trash screen should be inspected for signs of clogging. Debris and sediment should be removed from the orifice and outlet(s) as described in previous sections. Debris obstructing the valve should be removed. During each inspection, erosion areas inside and downstream of this BMP should be identified and repaired/revegetated immediately.

Mowing: The basin, basin side-slopes, and embankment of the basin must be mowed to prevent woody growth and control weeds. A mulching mower should be used, or the grass clippings should be caught and removed. Mowing should take place at least twice a year, or more frequently if vegetation exceeds 18 inches in height. More frequent mowing to maintain aesthetic appeal may be necessary in landscaped areas.

Litter and Debris Removal: Litter and debris removal should take place at least twice a year, as part of the periodic mowing operations and inspections. Debris and litter should be removed from the surface of the basin. Particular attention should be paid to floatable debris around the outlet structure. The outlet should be checked for possible clogging or obstructions and any debris removed.

Erosion Control: The basin side slopes and embankment all may periodically suffer from slumping and erosion. To correct these problems, corrective action, such as regrading and revegetation, may be necessary. Correction of erosion control should take place whenever required based on the periodic inspections.

Nuisance Control: Standing water or soggy conditions may occur in the basin. Some standing water may occur after a storm event since the valve may close with 2 to 3 inches of water in the basin. Some flow into the basin may also occur between storms due to spring flow and residential water use that enters the storm sewer system. Twice a year, the facility should be evaluated in terms of nuisance control (insects, weeds, odors, algae, etc.).

Structural Repairs and Replacement: With each inspection, any damage to structural elements of the basin (pipes, concrete drainage structures, retaining walls, etc.) should be identified and repaired immediately. An example of this type of repair can include patching of cracked concrete, sealing of voids, removal of vegetation from cracks and joints. The various inlet/outlet structures in a basin will eventually deteriorate and must be replaced.

Sediment Removal: A properly designed batch detention basin will accumulate quantities of sediment over time. The accumulated sediment can detract from the appearance of the facility and reduce the pollutant removal performance of the facility. The sediment also tends to accumulate near the outlet structure and can interfere with the level sensor operation. Sediment shall be removed from the basin at least every 5 years, when sediment depth exceeds 6 inches, when the sediment interferes with the level sensor or when the basin does not drain within 48 hours. Care should be taken not to compromise the basin lining during maintenance.

Logic Controller: The Logic Controller should be inspected as part of the twice-yearly investigations. Verify that the external indicators (active, cycle in progress) are operating properly by turning the controller off and on, and by initiating a cycle by triggering the level sensor in the basin. The valve should be manually opened and closed using the open/close switch to verify valve operation and to assist in inspecting the valve for debris. The solar panel should be inspected and any dust or debris on the panel should be carefully removed. The controller and all other circuitry and wiring should be inspected for signs of corrosion, damage from insects, water leaks, or other damage. At the end of the inspection, the controller should be reset.

Record Keeping: Records of all inspections and maintenance for the facility shall be recorded and maintained for the water quality facility beginning at startup of the facility. Record keeping shall be detailed to provide type of maintenance or repair made, date of the service, and detail of the extent of the maintenance or repair. The owner or responsible party of the facility is responsible for maintaining the facility as outlined in this plan until such time as another entity assumes responsibility in writing or ownership of the property is transferred. A copy of the transfer of ownership or responsibility must be filed with the Executive Director of TCEQ within 30 days of the transfer.

Attachment 1P–Measures for Minimizing Surface Stream Contamination

BMPs proposed to reduce pollutants in surface streams are discussed in Attachment 1K: "BMPs for Onsite Stormwater." Peak runoff rates for the existing and developed conditions were calculated using NRCS method and HEC-HMS 4.11. Atlas 14 rainfall precipitation data obtained from City of Leander was input into HEC-HMS and used in conjunction with the drainage basin information discussed below to determine the existing and post-developed runoff rates in the 2-year, 10-year, 25-year, and 100-year storm events.

The total site area for the proposed development is 5.735 acres. The existing site is undeveloped slopes towards the north at approximately 1%. The proposed site improvements consist of the construction of a 7,800 sf flex retail building, a 19,000 sf mixed use building, a 8,000 sf medical office building, and the associated utility and access infrastructure. These improvements increase the impervious cover of the site to 147,312 sf, or 58.97% of the 5.73-acre site.

Existing Conditions Hydrologic Analysis

Prior to this drainage analysis, 4Ward Land Surveying, LLC. performed a survey of the site and surrounding area dated March 2024. Based on the surveyed topography, the site drains naturally towards the north direction. Based on a soils report provided by the United States Department of Agriculture Natural Resources Conservation Service (USDA NRCS), the soils for the site consist of Denton Silty Clay and Doss Silty Clay, both of which are categorized by a hydrologic soil group of D. The condition of the site is undeveloped, with grass in good condition, which gives the site a Runoff Curve Number of 80 when combined with the soils information.

The existing site is split into three separate drainage basins, defined by the existing stormwater infrastructure. A description of the basins can be found below.

- Existing Drainage Basin 1 consists of 4,782.37 square feet on the southeast corner of the site that drains to an existing stormwater culvert. This basin has 16.66sf of existing impervious cover, or 0.35% of the 0.11-acre basin.
- Existing Drainage Basin 2 consists of 256,644.04 square feet, a majority of the site, and drains to an existing stormwater culvert on the northeast corner of the site. This basin also includes an offsite portion to the east that drains to the existing stormwater culvert. This basin has 480.06 sf of existing impervious cover, or 0.19% of the 5.89-acre basin.
- Existing Drainage Basin 3 consists of 73,672.05 square feet entirely of offsite area that drains to an existing stormwater culvert in the U.S. Highway 183A right-of-way. This basin is included in the planset in order to show drainage calculations in the right-of-way, but no portion of this drains to the proposed detention and water quality pond. This basin consists of 45,676.68 square feet of impervious cover, or 62% of the 1.85-acre site.

A summary of the existing conditions Drainage Basin information is provided in the table below:

Drainage Analysis

Peak runoff rates for the existing and developed conditions were calculated using the HEC-HMS 4.11. Atlas 14 rainfall precipitation data was obtained from the City of Leander's website Engineering page, since City of Leander has created its own time-series data. The Depth-Duration-Frequency table for the City of Leander City Limits is provided below and this data was input into the HEC-HMS model and used in conjunction with the drainage basin information

found in the previous section to determine the existing and post-developed runoff rates in the 2-year, 10-year, 25-year, and 100-year storm events.

Detention and Water Quality Pond

Since this site is located in Edwards Aquifer Contributing Zone, this development proposes the use of a water quality and detention pond located near the northwest corner of the site. The water quality treatment method is designed to meet the 80% total suspended solids (TSS) removal requirement of the Texas Commission on Environmental Quality (TCEQ). The water quality and detention pond will utilize a Batch Detention System that provides a TSS removal efficiency of 91%. The bottom of the proposed pond is at an elevation of 957.866' and the 4' wide top of berm of the pond is at an elevation of 964.000'. The pond will have a perforated pvc riser pipe at the bottom of the pond that is connected to a valve that will slowly release the water quality volume over 46 hours. This pipe connects to a concrete outfall structure, that also has a 0.5'x2' wide rectangular orifice at an elevation of 960.60', which is the same as the water quality elevation. The concrete structure also has a 1' tall, 5' wide weir at an elevation of 963.00' to allow for the 100-year stormwater to be released from the pond. The concrete structure connects to a 24" RCP pipe that conveys the stormwater runoff to the existing culvert located near the northeast corner of the site. The pond stage-storage-discharge table can be seen in the table below.

Pond Stage-Storage-Discharge Calculations			
Elevation (ft)	Area (sf)	Cumulative Volume (cf)	Discharge (cfs)

A table showing the peak inflow, discharge, and elevation of the pond for the 2, 10, 25, and 100-year storm events can be seen below.

Pond Calculations				
Event	2-YR	10-YR	25-YR	100-YR
Peak Inflow (cfs)	16.73	26.30	32.81	44.13
Peak Discharge (cfs)	6.04	8.02	9.23	17.73
Peak Elevation (ft)	961.74	962.41	962.92	963.57

Conclusion

As demonstrated above, the stormwater runoff for the 2-year, 10-year, 25-year, and 100-year rainfall events for the points of interest that are onsite are lower in the proposed than in the existing conditions by utilizing the pond described above that will be utilized to provide detention and water quality for the proposed improvements.

Attachment 2A – Spill Response Actions

No spills of hydrocarbons or hazardous substances are expected. However, in the event such an incident does occur, the contractor should carefully follow the following TCEQ guidelines:

Cleanup:

1) Clean up leaks and spills immediately.
2) Use a rag for small spills on paved surfaces, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be disposed of as hazardous waste.
3) Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly.

Minor Spills:

1) Minor spills typically involve small quantities of oil, gasoline, paint, etc. which can be controlled by the first responder at the discovery of the spill.
2) Use absorbent materials on small spills rather than hosing down or burying the spill.
3) Absorbent materials should be promptly removed and disposed of properly.
4) Follow the practice below for a minor spill:
    a. Contain the spread of the spill.
    b. Recover spilled materials.
    c. Clean the contaminated area and properly dispose of contaminated materials.

Semi-Significant Spills:

Semi-significant spills still can be controlled by the first responder along with the aid of other personnel such as laborers and the foreman, etc. This response may require the cessation of all other activities. Spills should be cleaned up immediately:

1) Contain the spread of the spill.
2) Notify the project foreman immediately.
3) If the spill occurs on paved or impermeable surfaces, clean up using “dry” methods (absorbent materials, cat litter, and/or rags). Contain the spill by encircling it with absorbent materials and do not let the spill spread widely.
4) If the spill occurs in dirt areas, immediately contain the spill by constructing an earthen dike. Dig up and properly dispose of contaminated soil.
5) If the spill occurs during rain, cover the spill with tarps or other material to prevent contaminating runoff.

Significant/Hazardous Spills:
For Reportable Quantity (RQ) events and amounts see the TCEQ website at:
http://www.tceq.state.tx.us/response/spills.html.

For significant or hazardous spills that are in reportable quantities:

1) Notify the TCEQ by telephone as soon as possible and within 24 hours at 512-339-2929 (Austin) or 210-490-3096 (San Antonio) between 8 AM and 5 PM. After hours, contact the Environmental Release Hotline at 1-800-832-8224. It is the contractor's responsibility to have all emergency phone numbers at the construction site. Additionally, in the event of a hazardous material spill, local Williamson county and/or city of Georgetown police, fire, and potentially EMS should be contacted in order to initiate the hazardous material response team.
2) For spills of federally reportable quantities, in conformance with the requirements in 40 CFR parts 110, 119, and 302, the contractor should notify the National Response Center at (800) 424-8802.
3) Notifications should first be made by telephone and followed up with a written report of which one copy is to be kept onsite in the report binder and one copy provided to the TCEQ.
4) The services of a spills contractor or a Haz-Mat team should be obtained immediately. Construction personnel should not attempt to clean up until the appropriate and qualified staff have arrived at the job site.
5) Other agencies that may need to be consulted include, but are not limited to, the City Police Department, County Sheriff Office, Fire Departments, etc.

2) The environmental project manager, and/or site supervisor, and/or designated responsible party, and general contractor will follow the stormwater pollution prevention plan (SWPPP) posted on the site. Temporary erosion and sedimentation controls will be revised, if needed, to comply with city inspectors' directives, and revised construction schedule relative to the water quality plan requirements and the erosion and sedimentation control plan.
3) Temporary erosion and sedimentation controls will be inspected and maintained in accordance with the stormwater pollution plan (SWPPP) posted on the site.
4) Begin site clearing and demolition activities. Approximately 6.48 acres will be disturbed during this activity.
5) Complete construction and begin re-vegetation of the site.
6) After construction is complete and all disturbed areas have been re-vegetated per plan to at least 90% established, remove the temporary erosion and sedimentation controls and complete any necessary final re-vegetation resulting from the removal of the controls. Attachment 2D – Temporary Best Management Practices and Measures

Prior to the commencement of any construction activity whatsoever, the contractor shall install the silt fencing, concrete washout, fencing rock berm, contractor staging area, and stabilized construction entrances per the Erosion and Sedimentation Control Plan. The temporary erosion controls shall be installed per TCEQ and local requirements. The proposed temporary BMPs are intended to control increased TSS from construction activities in the following manner:

A) The proposed site receives upgradient off-site stormwater from the residential properties to the east, but this stormwater doesn't flow over any areas of proposed development. That said, the culvert that this stormwater drains to will have a temporary rock berm to catch any potential TSS.
B) The temporary BMPs proposed during construction activities will prevent pollution of surface water by filtering the increased sediment loads and other pollutant sources listed in 'Attachment 2B – Potential Sources of Contamination' by preventing stormwater with increased TSS from exiting the site without first being filtered. The primary methods of treating sediment-laden stormwater runoff are through silt control fencing, fencing rock berm, a concrete washout area, and stabilized construction entrances. These temporary BMPs will be placed per the erosion and sedimentation control plan.
C) There are temporary silt fences, fencing rock berm, a concrete washout, and stabilized construction entrances in place to aid in treating the site runoff before it leaves the limits of construction. No stormwater runoff enters any surface streams or sensitive features.
D) The proposed project seeks to honor the natural drainage patterns that currently exist in the proposed project area. There are no known sensitive geologic features on the site. After construction is completed, the site will maintain its current drainage patterns with the stormwater runoff draining towards the northeast and northwest.

Attachment 2F – Structural Practices

The following temporary BMP structural practices will be employed on the site:

1) Silt Fence – used as barrier protection around the downslope perimeter of the project. The fence retains sediment primarily by retarding flow and promoting deposition on the uphill side of the slope. Runoff is filtered as it passes through the geotextile fabric.
2) Rock Berm – used to intercept sediment-laden runoff in areas of concentrated flow, detaining it, and releasing the water as sheet flow.
3) Concrete Washout Area – used to prevent or reduce the discharge of pollutants to stormwater from concrete waste. The concrete washout area is a designated area to wash out wastes into the temporary pit where the concrete can set, be broken up, and disposed of properly.
4) Stabilized Construction Entrance – used to provide a stable entrance/exit condition from the construction site and keep mud and sediment off public roads. The stabilized construction entrance is a stabilized pad of crushed stone and should be located at any point traffic will be entering or leaving the construction site from a public right-of-way.
5) Contractor Staging Area – used as an area for the contractor to store and prepare equipment and materials before using them during the construction phase.

A) An inspection shall occur weekly and after any rain event. This inspection should include an inspection of the temporary concrete washout area.
B) The authorized party shall inspect all disturbed areas of the site, areas used for storage of materials that are exposed to precipitation, structural control measures, and locations where vehicles enter or exit the site.
C) Disturbed areas and areas used for storage of materials that are exposed to precipitation or within limits of the 1% annual chance (100-year) floodplain must be inspected for evidence of, or the potential for, pollutants entering the runoff from the site. Erosion and sediment control measures identified in the plan must be observed to ensure that they are operating correctly. Observations can be made during wet or dry weather conditions. Where discharge locations or points are accessible, they must be inspected to ascertain whether erosion control measures are effective in preventing significant impacts on receiving waters. This can be done by inspecting receiving waters to see whether any signs of erosion or sediment are associated with the discharge location. Locations, where vehicles enter or exit the site, must be inspected for evidence of off-site sediment tracking.
D) Based on the results of the inspection, the site description and the pollution prevention measures identified in the plan must be revised as soon as possible after an inspection that reveals inadequacies. The inspection and plan review process must provide for timely implementation of any changes to the plan within 7 calendar days following the inspection.
E) An inspection report that summarizes the scope of the inspection, name(s) and qualifications of personnel conducting the inspection, the dates of the inspection, and major observations relating to the implementation of the SW3P. Major observations shall include as a minimum location of discharges of sediment or other pollutants from the site, the location of BMPs that need to be maintained, the location of BMPs that failed to operate as designed or proved inadequate for a particular location, and locations where BMPs are needed. Actions taken as a result of the inspections must be described within and retained as a part of, the SWP3. Reports must identify any incidents of non-compliance. Where a report does not identify any incidents of non-compliance, the report must contain a certification that the facility or site is in compliance with the SWP3 and the TPDES general permit. The report must be signed by the authorized representative delegated by the operators in accordance with TAC 305.128.

Maintenance and Corrective Actions - Maintenance of erosion control facilities shall consist of the minimum requirements as follows:

A) In ongoing construction areas inspect erosion control improvements to confirm facilities are in place and operable. Where facilities have been temporarily set aside or damaged due to construction activity, place facilities in service before leaving job site.
B) If weather forecast predicts possibility of rain, check entire facilities throughout site to assure facilities are in place and operable. If job site weather conditions indicate high probability of rain, make special inspection of erosion control facilities.
C) After rainfall events review erosion control facilities as soon as site is accessible. Clean rock berms, berm/swales and other structural facilities. Determine where additional facilities or alternative techniques are needed to control sediment leaving site.
D) After portions of site have been seeded, review these areas on regular basis in accordance with project specifications to assure proper watering until grass is established. Reseed areas where grass is not well established.
E) Spills are to be handled as specified by the manufacturer of the product in a timely safe manner by personnel. The site superintendent will be responsible for coordinating spill prevention and cleanup operations.
F) Concrete trucks will discharge extra concrete or wash out drum only at an approved location on site. Residual product shall be properly disposed of.
G) Inspect vehicle entrance and exits for evidence of off-site tracking and correct as needed.
H) If sediment escapes the site, the contractor where feasible and where access is available shall collect and remove sedimentation material by appropriate non-damaging methods. Additionally, the contractor shall correct the condition causing discharges.
I) If inspections or other information sources reveal a control has been used incorrectly, or that a control is performing inadequately, the contractor must replace, correct or modify the control as soon as practical after discovery of the deficiency.

Silt Fence – Inspection and maintenance guidelines for silt fences are as follows:

A) Inspect all fencing weekly, and after any rainfall.
B) Remove sediment when buildup reaches 6 inches.
C) Replace any torn fabric or install a second line of fencing parallel to the torn section.
D) Replace or repair any sections crushed or collapsed in the course of construction activity. If a section of fence is obstructing vehicular access, consider relocating it to a spot where it will provide equal protection, but will not obstruct vehicles. A triangular filter dike may be preferable to a silt fence at common vehicle access points.
E) When construction is complete, the sediment should be disposed of in a manner that will not cause additional siltation and the prior location of the silt fence should be revegetated. The fence itself should be disposed of in an approved landfill.

Rock Berm – Inspection and maintenance guidelines for inlet protection is as follows:

A) Inspection should be made weekly and after each rainfall by the responsible party. For installations in streambeds, additional daily inspections should be made.
B) Remove sediment and other debris when buildup reaches 6 inches and dispose of the accumulated silt in an approved manner that will not cause any additional siltation.
C) Repair any loose wire sheathing.
D) The berm should be reshaped as needed during inspection.

E) The berm should be replaced when the structure ceases to function as intended due to silt accumulation among the rocks, washout, construction traffic damage, etc.
F) The rock berm should be left in place until all upstream areas are stabilized and accumulated silt removed.

Stabilized Construction Entrance

A) The entrance should be maintained in a condition, which will prevent tracking or flowing of sediment onto public rights-of-way. This may require periodic top dressing with additional stone as conditions demand and repair and/or cleanout of any measures used to trap sediment.
B) All sediments spilled, dropped, washed or tracked onto public rights-of-way should be removed immediately by contractor.
C) When necessary, wheels should be cleaned to remove sediment prior to entrance onto public rights-of-way.
D) When washing is required, it should be done on an area stabilized with crushed stone that drains into an approved sediment trap or sediment basin.
E) All sediment should be prevented from entering any storm drain, ditch, or water course by using approved methods.

Concrete Washout Area

A) Concrete washout areas should be located at least 50 feet from sensitive features, storm drains, open ditches, or water bodies.
B) Do not allow runoff from this area by constructing a temporary pit or bermed area large enough for liquid and solid waste.
C) Plastic lining material should be a minimum of 10 mil in polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.
D) When temporary concrete washout facilities are no longer required for the work, the hardened concrete should be removed and disposed of. Materials sued to construct temporary concrete washout facilities should be removed from the site of the work and disposed of. Holes, depressions, or other ground disturbance caused by the removal of the temporary concrete washout facilities should be backfilled and repaired.

Attachment 2J – Schedule of Interim and Permanent Soil Stabilization Practices

Prior to Disturbance – Install all temporary erosion and sedimentation control features.

During Construction – Inspect and maintain all temporary erosion and sedimentation control structures per TCEQ regulations. Permanent seeding will be applied immediately after the final design grades are achieved on portions of the site but no later than 14 days after final grading or where construction activity has temporarily ceased for more than 21 days.

After Completion of Permanent Erosion and Sediment Controls – Stabilize and restore all areas disturbed during construction. After the entire site is stabilized, any accumulated sediment will be removed and hauled off-site for disposal. Construction debris, trash, and temporary BMPs (silt fences, material storage areas, sanitary toilets, etc.) will also be removed, and any areas disturbed during removal will be seeded immediately.

1. STEEL OR WOOD POSTS WHICH SUPPORT THE SILT FENCE SHALL BE INSTALLED ON A SLIGHT ANGLE TOWARD THE ANTICIPATED RUNOFF SOURCE. POST MUST BE EMBEDDED A MINIMUM OF 300 mm (12 INCHES). IF WOOD POSTS CANNOT ACHIEVE 300 mm (12 Inches) DEPTH, USE STEEL POSTS.

2. THE TOE OF THE SILT FENCE SHALL BE TRENCHED IN WITH A SPADE OR MECHANICAL TRENCHER, SO THAT THE DOWNSLOPE FACE OF THE TRENCH IS FLAT AND PERPENDICULAR TO THE LINE OF FLOW.

3. THE TRENCH MUST BE A MINIMUM OF 150 mm (6 Inches) DEEP AND 150 mm (6 Inches) WIDE TO ALLOW FOR THE SILT FENCE FABRIC TO BE LAID IN THE GROUND AND BACKFILLED WITH COMPACTED MATERIAL.

4. SILT FENCE FABRIC SHOULD BE SECURELY FASTENED TO EACH STEEL OR WOOD SUPPORT POST OR TO WOVEN WIRE , WHICH IS IN TURN ATTACHED TO THE STEEL OR WOOD FENCE POST.

5. INSPECTION SHALL BE MADE WEEKLY OR AFTER EACH RAINFALL EVENT AND REPAIR OR REPLACEMENT SHALL BE MADE PROMPTY AS NEEDED.

6. SILT FENCE SHALL BE REMOVED WHEN THE SITE IS COMPLETELY STABILIZED SO AS NOT TO BLOCK OR IMPEDE STORM FLOW OR DRAINAGE.

7. ACCUMULATED SILT SHALL BE REMOVED WHEN IT REACHES A DEPTH OF 150 mm (6 Inches). THE SILT SHALL BE DISPOSED OF ON AN APPROVED SITE AND IN SUCH A MANNER THAT WILL NOT CONTRIBUTE TO ADDITIONAL SILTATION.

2. THE ROCK BERM SHALL BE SECURED WITH A WOVEN WIRE SHEATHING HAVING MAXIMUM 25 mm (1") OPENING AND MINIMUM WIRE DIAMETER OF 12.9 mm (20 GAUGE).
3. THE ROCK BERM SHALL BE INSPECTED DAILY OR AFTER EACH RAIN, AND THE STONE AND/OR FABRIC CORE-WOVEN SHEATHING SHALL BE REPLACED WHEN THE STRUCTURE CEASES TO FUNCTION AS INTENDED, DUE TO SEDIMENT ACCUMULATION AMONG THE ROCKS, WASHOUT, CONSTRUCTION TRAFFIC DAMAGE, ETC.
4. IF SEDIMENT REACHES A DEPTH EQUAL TO ONE-THIRD THE HEIGHT OF THE BERM OR 150 mm (6"), WHICHEVER IS LESS, THE SEDIMENT SHALL BE REMOVED AND DISPOSED OF ON AN APPROVED SITE AND IN A MANNER THAT WILL NOT CREATE A SEDIMENTION PROBLEM.
