SUMMARY

This report covers groundwater samples collected during August 1998 for the Asarco El Paso Copper Smelter Remediation Investigation. This validation has been carried out according to requirements spelled out in the work plan (Asarco El Paso Copper Smelter Remedial Investigation Work Plan, November 1996), which are consistent with those given in the EPA's National Functional Guidelines for Inorganic Data Review (February 1994). Deviations from prescribed quality control procedures and/or exceedances of quality control samples have been noted, and results have been flagged in the database. Data validation codes are defined in Appendix 1, Table 1. Appendix 1 also includes a summary of flagged data (Table 2). Where there are 3 or more existing data points, a statistical historical comparison has been done. A summary of the historical comparison is in Appendix 1, Table 3. The validated database for this data set is in Appendix 2.

Field Quality Control Violations (discussion of these points will be found in Section 3):

- ⇒ As in the previous sampling events for this project, the required frequency for field quality control samples was not met for the August monitoring event.
 - Twelve field duplicates were required, and only five were submitted.
 - Twelve field blanks were required, and only one was submitted.

- ⇒ Flagging information is listed below:

- The field SC results from EM-4 and EP-7 were rejected. This is discussed in Section 10.
- Chloride (1.2 ppm) and TDS (19 ppm) were detected in the field blank submitted on 8/10/98. There were no flags.
- The field duplicate submitted on 8/12/98 was out of control limits for fluoride. Sixteen associated fluoride results were flagged to indicate a possible lack of reproducibility.
- The field duplicate submitted on 8/11/98 was out of control limits for carbonate. Four associated carbonate results were flagged to indicate a possible lack of reproducibility.

Given the failure to meet the required frequency of field quality control samples, it was not possible to evaluate the precision and accuracy of the data as set out in the project work plan. With the exception of two field SC results, however, the Asarco El Paso Copper Smelter Remedial Investigation water results for the August 1998 monitoring are deemed acceptable for the purposes of the project, provided that the flagged data are considered with appropriate caution.

DATA VALIDATION REPORT

1. INTRODUCTION

This validation applies to inorganic analytes from 66 groundwater and 15 surface water samples collected during May of 1998 for the Asarco El Paso Copper Smelter Remedial Investigation.

- The total number of samples included one DI blank, two surface water field duplicates, and three groundwater field duplicates.
- No sample was collected at site EP-87 because it was dry.
- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-25 or at EP-49.
- Validation procedures used are generally consistent with:
(Check all that apply)
 EPA CLP National Functional Guidelines for Inorganics Data Review
 Asarco El Paso Copper Smelter Remedial Investigation Work Plan, El Paso, Texas (November 1996)
 Other
- Overall level of validation:
 Contract Laboratory Program (CLP)
 Standard
 Visual

Notes: The validation consisted of a visual check of lab and field data, a check of laboratory and field quality control samples with flagging for any QC samples that were out of control limits.

2. DELIVERABLES

- All laboratory document deliverables were present as specified in the CLP-Statement of Work (CLP-SOW), EPA, 1993 and/or the project contract.
 Yes
 No
- Field measurements and field documentation were complete.
 Yes
 No

At EP-25 and EP-49, the following field parameters were not measured: pH (at EP-25), SC, dissolved oxygen, and water temperature. The sampler noted that there was heavy diesel in the well, and the above measurements were not taken for fear of damaging the probe.

3. FIELD QUALITY CONTROL SAMPLES

The field quality control samples required by the work plan are 1 field blank (DI) and one field duplicate per day or per 20 samples, whichever is more frequent.

- **Field Blanks:** Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

DI, trip, rinsate, or any other field blanks have been carried out at the proper frequency.

 Yes
X No

Notes: One field blank was submitted with the August 1998 samples. Samples for this monitoring event were collected on twelve different days, so twelve blanks were required.

A total of 80 samples plus one blank were collected. The blank and 8 other samples were collected on 8/10/98. Overall, 90% of the samples were not associated with a field blank.

The almost total lack of field blanks makes it impossible to evaluate the accuracy of low concentration results as was specified in the project work plan.

Reported results on the field blanks are less than the contract required detection limits (CRDL) or the project required detection limits (PRDL) if project detection limits have been specified.

 Yes
X No

Notes: Both chloride (1.2 ppm) and TDS (16 ppm) were detected in the blank. All associated results were greater than 5 times the blank concentrations, so there were no flags.

- **Field duplicates**

Field duplicates have been collected at the proper frequency.

 Yes
X No

Notes: Samples were collected on twelve different days. The project work plan requires at least one field duplicate per day. Field duplicates were submitted on only five of the twelve sampling days. The field duplicates are listed in the following table:

<u>Site</u>	<u>Sample Number</u>	<u>Date</u>	<u>Number of Non-QC Samples</u>
EP-59	EPRI-9808-124/ 184	8/10/98	7
SEP-3	EPRI-9808-163/ 181	8/11/98	3
EP-52	EPRI-9808-176/ 182	8/12/98	7
EP-85	EPRI-9808-150/ 180	8/19/98	9
SEP-13	EPRI-9808-170/ 179	8/20/98	5

No results were flagged for the failure to meet the quality control sample frequency required by the project work plan. However, for the seven sampling days for which field duplicates were not submitted to the laboratory, it is not possible to assess the reproducibility of sample results as specified in the project work plan. Fifty-seven percent of non-QC samples were not covered by field duplicates.

Field duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within \pm the PRDL for water matrix.

 Yes

X No

Notes: Field duplicate exceedances are listed in the following table. Associated sample results were flagged to indicate a possible lack of reproducibility.

- Fluoride results from samples collected on 8/12 and 8/13 were flagged.
- Carbonate results from samples collected on 8/11/98.

Sample Number/ Dup	Site	Parameter	Sample Result (mg/L)	Duplicate Result (mg/L)	Exceedance	# of Flags
EPRI-9808-176/ 182	EP-52	Fluoride	6.4	4.8	29% RPD	16
EPRI-9808-163/ 181	SEP-3	Carbonate	7	5	> \pm 1 ppm	4

Flagging: J₄/UJ₄

4. LABORATORY PROCEDURES

- **Laboratory procedures followed**
 - CLP-SOW
 - SW-846
 - X Methods for Chemical Analysis of Water and Wastes
 - XRF Standard Operating Procedures
- **Holding times met**
 - X Yes
 - No

- **Consistency with project requirements**
Analyses were carried out as requested.
 Yes
 No

Project specified methods were used.
 Yes
 No

5. DETECTION LIMITS

- Reporting detection limits met project required detection limits (PRDLs).

Yes
 No

Notes: The PRDL for sulfate has been set at 1 ppm. The laboratory's reporting detection limit for sulfate was 2 ppm.

- Instrument detection limits (IDLs) were provided by the laboratory.
 NA

Notes: IDL verifications are not required for the project.

6. LABORATORY BLANKS

Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

- **Preparation blanks**

Preparation blanks were prepared and analyzed at the required frequency.
 Yes
 No

All the analytes in the preparation blank were less than the CRDL (or the PRDL if a project detection limit has been specified).

Yes
 No

7. LABORATORY MATRIX SPIKES

- A matrix spike sample (pre-digestion) was analyzed for each digestion batch and/or matrix, or as required in the CLP-SOW.

Yes
 No

- Matrix spike recoveries were within the required control limits (75-125%).

Yes

No

8. LABORATORY DUPLICATES

- Laboratory duplicate samples were analyzed at the proper frequency.

Yes

No

- The laboratory duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix, 35% or less for soil matrix). For low concentration data, that is if the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within \pm the PRDL for water matrix, within \pm 2 times the PRDL for soil matrix.

Yes

No

9. LABORATORY CONTROL STANDARDS

- LCSs were prepared and analyzed at the proper frequency

Yes

No

- LCS recoveries were within the required control limits (80-120% for water).

Yes

No

10. INTERPARAMETER RELATIONSHIPS

- The following relationships have been checked:

Total Recoverable vs Dissolved metals

Lab pH vs field pH.

TDS vs SC

Lab SC vs field SC

Arsenic speciation/dissolved arsenic

Total Recoverable vs Dissolved metals: This relationship was in order.

Lab pH vs field pH: This relationship was generally in order. All samples for which both lab and field pH were measured, all had percent differences less than 15% except for the sample collected at EP-49. At this well, a field pH

was taken, but the sampler noted that there was "heavy diesel" present in the well.

TDS vs SC: The ratio of TDS to SC should lie between 0.55 and 0.75. In natural waters with high sulfate, the ratio may be as high as 0.96. This ratio is intended to be a check on the accuracy of the TDS and SC measurements. (It should be noted that these measurements are less accurate in dilute waters.)

This relationship was generally in order. The exception was again for the sample collected at EP-49, where the ratio was equal to 146%. The ratios were distributed as follows:

less than 50%.....0
50 to 59%.....2
60 to 69%.....25
70 to 79%.....29
80 to 89%.....20
90 to 99 %.....3
over 100%.....1

Lab SC vs field SC: This relationship was generally in order. However, for the samples collected at EP-7 and EM-4:

- Field SC values were respectively 22% and 44% of the laboratory SC values.
- Historical values were in line with laboratory SC values.
- TDS values were in line with laboratory SC values.

As a result, these two field SC values were rejected.

Flagging: R

11. HISTORICAL COMPARISON

Where there were more than 3 existing data points, the data for August 1998 were compared with historical results. Table 3 in Appendix 1 contains a summary of the historical comparison. This table lists all cases where the current value the current value differs by more than 3 standard deviations from the comparison period mean.

12. DATA QUALITY OBJECTIVES

- Project data quality objectives (DQO's) met.
 - Yes - for Laboratory Accuracy and Precision
 - No - for Field Accuracy and Precision
 - No - for Completeness

Data quality objectives for this project are for the quality control samples to be within control limits. Evaluation of field and laboratory QC samples give a measure of the actual precision and accuracy obtained.

Accuracy

The ability to recover a known amount of an analyte is a measure of accuracy. Accuracy is evaluated by recoveries on laboratory matrix spikes and laboratory control samples for higher analyte concentrations, and by blanks for analyte concentrations within five times the PRDL.

All laboratory quality control samples were within control limits, indicating good accuracy for the higher concentration results. However, only one field blank was submitted with the August 1998 samples, making it impossible to fully evaluate the accuracy of low level results.

Precision

Reproducibility of results is a measure of precision. Precision is evaluated by performance on laboratory and field duplicates.

All of the laboratory duplicate measurements and 98% of the field duplicate measurements (124 out of 126) were within control limits. (Note, however, that only 42% of the required field duplicates were submitted for analysis.)

Completeness

One measure of completeness is the percentage of valid results obtained. For the Summer 1998 El Paso RI monitoring,

- ⇒ 1.0 percent of the data was flagged (22 out of 2256 results);
- ⇒ 0.1 percent of the data was rejected (2 out of 2256 results).

Completeness is also evaluated by how well the sampling event met the requirements of the project work plan. Completeness is achieved when the number of valid measurements is sufficient to address all important issues about a site. The quality of sample analyses is assessed indirectly through the analysis of associated quality control samples.

- **Field measurements were incomplete.** With the exception of pH at EP-49, field parameters were taken at 2 wells (EP-25, EP-49) because of hydrocarbon contamination and the possibility of damaging instrument probes.
- **Field quality control samples were not submitted at the required frequency.** The work plan sets the frequency of both field blanks (DI) and field duplicates at one in twenty samples or one per day, whichever is more frequent. As discussed in the field quality control sections, this frequency was not met, making it impossible to evaluate the accuracy and precision of the data to the extent set out in the work plan. For a total of twelve days on which samples were collected,
 - Only one field blank was submitted.
 - Only five field duplicates were submitted, 42 percent of the required number.

TABLES

TABLE 1.
DATA VALIDATION CODES AND DEFINITIONS

<u>CODE</u>	<u>DEFINITION</u>
J	The associated numerical value is an estimated quantity because quality control criteria were not met. Subscripts for the "J" qualifier: 2 - Calibration range exceeded or significant deviation from known value. Possible bias. 3 - Holding time not met. Indicates possible bias. 4 - Other QC outside control limits.
UJ	The material was analyzed for, but was not detected above the associated value. Subscripts for the "UJ" qualifier: 1 - Blank contamination. Indicates possible high bias and/or false positive. 2 - Calibration range exceeded or significant deviation from known value. Possible bias. 3 - Holding time not met. Indicates possible bias. 4 - Other QC outside control limits.
R	Quality control indicates that the data are unusable (compound may or may not be present). Resampling and/or reanalysis is necessary for verification.
E	Estimated. (Not an EPA code.)
A	Anomalous data. No apparent explanation for discrepancy in data. (Not an EPA code.)

NOTES: All quantities in mg/L (Water) or mg/kg (Soil) unless noted. All results LABORATORY unless field (FLD) or calculated (CALC).
N: Number of samples in comparison data set; 50% of data set must be above lab detection limit before mean, median, & SD calculation.
A & R Flags were excluded from Statistics 1/2 the detection limit was used in calculations.

SUMMARY

This report covers groundwater samples collected during November 1998 for the Asarco El Paso Copper Smelter Remediation Investigation. This validation has been carried out according to requirements spelled out in the work plan (Asarco El Paso Copper Smelter Remedial Investigation Work Plan, November 1996), which are consistent with those given in the EPA's National Functional Guidelines for Inorganic Data Review (February 1994). Deviations from prescribed quality control procedures and/or exceedances of quality control samples have been noted, and results have been flagged in the database. Data validation codes are defined in Appendix 1, Table 1. Appendix 1 also includes a summary of flagged data (Table 2). Where there are three or more existing data points, a statistical historical comparison has been done. A summary of the historical comparison is in Appendix 1, Table 3. The validated database for this data set is in Appendix 2.

Completeness of field measurements:

- As in all previous sampling events for this project, the required frequency for field quality control samples was not met for the November 1998 monitoring event.
 - Nine field duplicates were required, and only four were submitted.
 - Nine field blanks were required, but **none** was submitted.
- Field measurements were not taken in duplicate for field duplicate samples.
- The field sampler noted that the dissolved oxygen probe was not functioning on November 12. Dissolved oxygen was not measured for the six samples collected on that day.
- For the last sample collected on November 18 (at SEP-9), the SC probe was not functioning. No field SC measurement was taken for this sample.

Laboratory Quality Control Violations:

- The laboratory matrix spike for batch L982304 was out of control limits for dissolved iron (72% recovery). Thirteen associated iron results were flagged to indicate a possible low bias.
- One TDS value was flagged for holding time exceedance.

Field Quality Control Violations:

- The field SC value for the sample collected at EP-90 was rejected for reasons discussed in Section 10.
- The field duplicate submitted on 11/5/98 was out of control limits for dissolved arsenic. Twenty-one dissolved arsenic results were flagged to indicate a possible lack of reproducibility.

- The field duplicate submitted on 11/10/98 was out of control limits for total suspended solids (TSS). Nineteen TSS results were flagged to indicate a possible lack of reproducibility.
- The field duplicate submitted on 11/18/98 was out of control limits for total recoverable iron. Ten total recoverable iron results were flagged to indicate a possible lack of reproducibility.

Overall, 93.6 percent of the data may be used without qualification (950 out of 1015 results). Sixty-four sample results were flagged for the quality control violations summarized above, including the one result that was rejected. Excluding this one field SC result, water data for the Asarco El Paso Copper Smelter Remedial Investigation for the November 1998 monitoring are deemed acceptable for the purposes of the project, provided that the flagged data are considered with appropriate caution. Possible bias and/or lack of reproducibility indicated by the flags should be taken into account. Please note that the failure to meet the required frequency of field quality control samples made it impossible to evaluate the precision and accuracy of the data as set out in the project work plan.

DATA VALIDATION REPORT

DATA VALIDATION REPORT

1. INTRODUCTION

This validation applies to inorganic analytes from 64 groundwater and 12 surface water samples collected during November of 1998 for the Asarco El Paso Copper Smelter Remedial Investigation.

- The total number of samples included one surface water field duplicates and three groundwater field duplicates.
- No samples were collected at the following sites:

EP-4 Damaged
EP-87 Dry
SEP-1 Construction
SEP-3 Construction
Pond 5 Dry

- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-25, at EP-43 or at EP-49.
- Due to a non-functioning probe, no dissolved oxygen measurements were taken at EP-77 on November 11.
- Due to a non-functioning probe, no dissolved oxygen measurements were taken at the following five sites on November 12:

EP-77
EP-83
EP-84
EP-86
SEP-14

- Due to a non-functioning probe, no field SC measurement was taken at SEP-9 on November 18.

- Validation procedures used are generally consistent with:
(Check all that apply)

EPA CLP National Functional Guidelines for Inorganics Data Review
 Asarco El Paso Copper Smelter Remedial Investigation Work Plan, El
Paso, Texas (November 1996)
 Other

- Overall level of validation:

Contract Laboratory Program (CLP)
 Standard
 Visual

Notes: The validation consisted of a visual check of lab and field data, and an evaluation of laboratory and field quality control samples with flagging for any QC samples that were out of control limits.

2. DELIVERABLES

- All laboratory document deliverables were present as specified in the CLP-Statement of Work (CLP-SOW), EPA, 1993 and/or the project contract.

Yes
 No

- Field measurements and field documentation were complete.

Yes
 No

Notes: Duplicate field measurements were not taken

3. FIELD QUALITY CONTROL SAMPLES

The field quality control samples required by the work plan are 1 field blank (DI) and one field duplicate per day or per 20 samples, whichever is more frequent.

- **Field Blanks:** Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

DI, trip, rinsate, or any other field blanks have been carried out at the proper frequency.

Yes
 No

Notes: No field blanks were submitted with the November 1998 samples. The total lack of field blanks makes it impossible to evaluate the accuracy of low concentration results as was specified in the project work plan.

- **Field duplicates**

Field duplicates have been collected at the proper frequency.

Yes
 No

Notes: Samples were collected on nine different days. The project work plan requires at least one field duplicate per day. Field duplicates were submitted on only four of the nine sampling days. For flagging purposes, samples are considered to be associated if they were collected the same day as the field duplicate or if they were collected on days elapsed since the previous field duplicate. The field duplicates are listed in the following table:

<u>Site</u>	<u>Sample Number</u>	<u>Date</u>	Number of Associated Non-QC Samples
EP-51	EPRI-9811-118/ 178	11/05/99	20
EP-70	EPRI-9811-135/ 180	11/10/99	12
EP-86	EPRI-9811-151/ 181	11/12/99	18
SEP-11	EPRI-9811-168/ 182	11/18/99	22

Field duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within \pm the PRDL for water matrix.

Yes

No

Notes: Field duplicate exceedances are listed in the following table. Associated sample results were flagged to indicate a possible lack of reproducibility.

- Dissolved arsenic from samples collected on 11/3/98, 11/4/98, and 11/5/98 were flagged for the exceedance on the duplicate collected on 11/5/98.
- TSS from samples collected 11/11/98 and 11/12/98 were flagged for the exceedance on the duplicate collected on 11/12/98.
- Total recoverable iron from surface water samples collected on 11/16/98.

Sample Number/ Dup	Site	Parameter	Sample Result (mg/L)	Duplicate Result (mg/L)	Exceedance	# of Flags
EPRI-9811-118/ 178	EP-51	Arsenic (Dis)	0.079	0.110	33% RPD	21
EPRI-9811-151/ 181	EP-86	TSS	183	146	22% RPD	19
EPRI-9811-168/ 182	SEP-11	Iron (TRC)	0.470	0.340	32% RPD	10

Flagging: J₄/UJ₄

4. LABORATORY PROCEDURES

- Laboratory procedures followed
 - CLP-SOW
 - SW-846
 - Methods for Chemical Analysis of Water and Wastes
 - XRF Standard Operating Procedures

- Holding times met

Yes

No

Notes: Reanalysis was requested on TDS for sample EPRI-9811-101, collected at EP-5. This result was used in the database, but it was flagged for holding time exceedance. (The original result was out of line historically and also considering the ratio of TDS to SC).

Flagging: J₃

- **Consistency with project requirements**

Analyses were carried out as requested.

X Yes

 No

Project specified methods were used.

X Yes

 No

5. DETECTION LIMITS

- Reporting detection limits met project required detection limits (PRDLs).

 Yes

X No

Notes: The PRDL for sulfate has been set at 1 ppm. The laboratory's reporting detection limit for sulfate was 2 ppm.

The PRDL for selenium is 0.005 ppm. For batch L982343, the reporting limit was raised to 0.100 ppm due to matrix interference. This affected selenium results for two samples: EPRI-9811-117 (collected at EP-49) and EPRI-9811-120 (collected at EP-55).

6. LABORATORY BLANKS

Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

- **Preparation blanks**

Preparation blanks were prepared and analyzed at the required frequency.

X Yes

 No

All the analytes in the preparation blank were less than the CRDL (or the PRDL if a project detection limit has been specified).

X Yes

 No

7. LABORATORY MATRIX SPIKES

- A matrix spike sample (pre-digestion) was analyzed for each digestion batch and/or matrix, or as required in the CLP-SOW.

X Yes

 No

- Matrix spike recoveries were within the required control limits (75-125%).

 Yes

X No

Notes: For laboratory batch L982304, the matrix spike was out of control limits for dissolved iron, with a recovery of 72 percent. Dissolved iron results for the thirteen samples in the batch were flagged to indicate the possibility of a low bias.

Flagging: J₄/ UJ₄

8. LABORATORY DUPLICATES

- Laboratory duplicate samples were analyzed at the proper frequency.
 Yes
 No
- The laboratory duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix, 35% or less for soil matrix). For low concentration data, that is if the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within plus or minus the PRDL for water matrix.

Yes
 No

9. LABORATORY CONTROL STANDARDS

- LCSs were prepared and analyzed at the proper frequency
 Yes
 No
- LCS recoveries were within the required control limits (80-120% for water).
 Yes
 No

10. INTERPARAMETER RELATIONSHIPS

- The following relationships have been checked:
 Total Recoverable vs Dissolved metals
 Lab pH vs field pH.
 TDS vs SC
 Lab SC vs field SC

Total Recoverable vs Dissolved metals: This relationship was in order.

Lab pH vs field pH: This relationship was generally in order. For samples for which both lab and field pH were measured, all but five had percent differences less than ten percent. Samples collected at the following sites had percent differences greater than ten:

EP-24	11.1%	EP-58	12.7%	EP-56	14.4%
EP-26	19.9%	SEP-4	10.2%		

It is worth noting, however, that 94 percent (64 out of 68) of the field pH values were lower than those measured in the laboratory.

TDS vs SC: The ratio of TDS to SC should lie between 0.55 and 0.75. In natural waters with high sulfate, the ratio may be as high as 0.96. This ratio is intended to be a check on the accuracy of the TDS and SC measurements. (It should be noted that these measurements are less accurate in dilute waters.)

This relationship was generally in order. As in previous sampling events, the exception was for the sample collected at EP-49, where the ratio was equal to 142%. The ratios were distributed as follows:

less than 50%.....	0
50 to 59%.....	2
60 to 69%.....	26
70 to 79%.....	25
80 to 89%.....	21
90 to 99 %.....	1
over 100%.....	1

Lab SC vs field SC: This relationship was generally in order. Only four samples had percent differences greater than 15%. Of these, three had percent differences less than 25%. However, for the sample collected at EP-90, the field SC value was 512 μ mhos per cm compared to the laboratory SC value of 2660 μ mhos per cm.

- The laboratory SC value is in line with values previously obtained at this site.
- The TDS value is in line with laboratory SC.

As a result, the field SC value for EP-90 was rejected.

Flagging: R

11. HISTORICAL COMPARISON

Where there were more than three existing data points, the data for November 1998 were compared with historical results. Table 3 in Appendix 1 contains a summary of the historical comparison. This table lists all cases where the current value differs by more than 3 standard deviations from the comparison period mean.

12. DATA QUALITY OBJECTIVES

- Project data quality objectives (DQO's) met.

Yes - for Laboratory Accuracy and Precision

No - for Field Accuracy and Precision

No - for Completeness

Data quality objectives for this project are for the quality control samples to be within control limits. Evaluation of field and laboratory QC samples give a measure of the actual precision and accuracy obtained.

Accuracy

The ability to recover a known amount of an analyte is a measure of accuracy. Accuracy is evaluated by recoveries on laboratory matrix spikes and laboratory control samples for higher analyte concentrations, and by blanks for analyte concentrations within five times the PRDL.

All laboratory quality control samples were within control limits, indicating good accuracy for the higher concentration results. However, no field blank were submitted with the November 1998 samples, making it impossible to fully evaluate the accuracy of low level results.

Precision

Reproducibility of results is a measure of precision. Precision is evaluated by performance on laboratory and field duplicates.

All of the laboratory duplicate measurements and 97% of the field duplicate measurements (93 out of 96) were within control limits. (Note, however, that only 44% of the required field duplicates were submitted for analysis.)

Completeness

One measure of completeness is the percentage of valid results obtained. For the Summer 1998 El Paso RI monitoring,

⇒ 6.4 percent of the data were flagged (65 out of 1015 results);

⇒ 0.1 percent of the data were rejected (1 out of 1015 results).

Completeness is also evaluated by how well the sampling event met the requirements of the project work plan. Completeness is achieved when the number of valid measurements is sufficient to address all important issues about a site. The quality of sample analyses is assessed indirectly through the analysis of associated quality control samples.

- **Field measurements were incomplete.**
 - Field parameters were not taken at three wells (EP-25, EP-43, and EP-49) because of heavy hydrocarbon contamination and the possibility of damaging instrument probes.
 - Dissolved oxygen measurements were not taken for 6 wells due to a non-functioning probe.
 - Field SC was not measured at SEP-9 due to a non-functioning probe.
- **Field quality control samples were not submitted at the required frequency.** The work plan sets the frequency of both field blanks (DI) and field duplicates at one in twenty samples or one per day, whichever is more frequent. As discussed in the field quality control sections, this frequency was not met, making it impossible to evaluate the accuracy and precision of the data to the extent set out in the work plan. For a total of twelve days on which samples were collected,
 - No field blanks were submitted.
 - Only four field duplicates were submitted, 44 percent of the required number.
 - For the field duplicates that were submitted, duplicate field measurements were not taken.

APPENDIX 1

TABLES

TABLE 1.
DATA VALIDATION CODES AND DEFINITIONS

<u>CODE</u>	<u>DEFINITION</u>
J -	The associated numerical value is an estimated quantity because quality control criteria were not met. Subscripts for the "J" qualifier: 2 - Calibration range exceeded or significant deviation from known value. Possible bias. 3 - Holding time not met. Indicates possible bias. 4 - Other QC outside control limits.
UJ -	The material was analyzed for, but was not detected above the associated value. Subscripts for the "UJ" qualifier: 1 - Blank contamination. Indicates possible high bias and/or false positive. 2 - Calibration range exceeded or significant deviation from known value. Possible bias. 3 - Holding time not met. Indicates possible bias. 4 - Other QC outside control limits.
R -	Quality control indicates that the data are unusable (compound may or may not be present). Resampling and/or reanalysis is necessary for verification.
E -	Estimated. (Not an EPA code.)
A -	Anomalous data. No apparent explanation for discrepancy in data. (Not an EPA code.)

NOTES: All quantities in mg/L (Water) or mg/kg (Soil) unless noted. All results LABORATORY unless field (FLD) or calculated (CALC).
N: Number of samples in comparison data set; 50% of data set must be above lab detection limit before mean, median, & SD calculation.
A & R Flags were excluded from Statistics
The detection limit was used in calculations.

SUMMARY

This report covers groundwater samples collected during February 1999 for the Asarco El Paso Copper Smelter Remediation Investigation. This validation has been carried out according to requirements spelled out in the work plan (Asarco El Paso Copper Smelter Remedial Investigation Work Plan, November 1996), which are consistent with those given in the EPA's National Functional Guidelines for Inorganic Data Review (February 1994). Deviations from prescribed quality control procedures and/or exceedances of quality control samples have been noted, and results have been flagged in the database. Data validation codes are defined in Appendix 1, Table 1. Appendix 1 also includes a summary of flagged data (Table 2). Where there are three or more existing data points, a statistical historical comparison has been done. A summary of the historical comparison is in Appendix 1, Table 3. The validated database for this data set is in Appendix 2.

Completeness of field measurements:

- The required frequency for field quality control samples was almost met for the February 1999 monitoring event.
 - The required eleven field duplicates were submitted.
 - Eleven field blanks were required, and ten were submitted.
- Field measurements were taken in duplicate for field duplicate samples.

All laboratory quality control was within control limits.

Field Quality Control Violations:

- Exceedances on field duplicates resulted in a total of 50 flags.
 - 10 dissolved arsenic
 - 7 dissolved iron
 - 6 nitrate + nitrite as nitrogen
 - 13 sulfate
 - 14 total suspended solids (TSS)
- Detections in the field blanks resulted in the flagging of 3 dissolved zinc results.

Overall, 97.8 percent of the data may be used without qualification (2408 out of 2461 results). Fifty-five sample results were flagged for the quality control violations summarized above. The data for the February 1999 monitoring for the Asarco El Paso Copper Smelter Remedial Investigation are deemed acceptable for the purposes of the project, provided that the flagged data are considered with appropriate caution. The possible lack of reproducibility indicated by

the flags should be taken into account. For this sampling event, the much-improved performance on the submission of the required field quality control samples made it possible to evaluate the precision and accuracy of the data as set out in the project work plan.

DATA VALIDATION REPORT

DATA VALIDATION REPORT

1. INTRODUCTION

- This validation applies to inorganic analytes from 91 samples collected during February of 1999 for the Asarco El Paso Copper Smelter Remedial Investigation. The total number of samples included:
 - 10 DI blanks
 - 11 Field duplicates (1 surface water, 10 groundwater)
 - 11 Surface water field samples
 - 59 Groundwater field samples
- No samples were collected at the following sites:
 - EP-22.....Well has been abandoned
 - EP-25.....Well blocked by construction
 - EP-87.....Dry
 - SEP-3Canal under construction
- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-23, EP-24, EP-43, or EP-49.
- Validation procedures used are generally consistent with:
(Check all that apply)
 - EPA CLP National Functional Guidelines for Inorganics Data Review
 - Asarco El Paso Copper Smelter Remedial Investigation Work Plan, El Paso, Texas (November 1996)
 - Other
- Overall level of validation:
 - Contract Laboratory Program (CLP)
 - Standard
 - Visual

Notes: The validation consisted of a visual check of lab and field data, and an evaluation of laboratory and field quality control samples with flagging for any QC samples that were out of control limits.

2. DELIVERABLES

- All laboratory document deliverables were present as specified in the CLP-Statement of Work (CLP-SOW), EPA, 1993 and/or the project contract.
 - Yes
 - No

- Field measurements and field documentation were complete.

Yes

No

3. FIELD QUALITY CONTROL SAMPLES

The field quality control samples required by the work plan are 1 field blank (DI) and one field duplicate per day or per 20 samples, whichever is more frequent.

- **Field Blanks:** Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

DI, trip, rinsate, or any other field blanks have been carried out at the proper frequency.

Yes - For groundwater samples.

No - For surface water samples.

Notes: Ten DI blanks were submitted for eleven days of sampling. No blank was submitted on February 19. All twelve surface water samples (including one field duplicate) were collected on this day.

Reported results on the field blanks are less than the contract required detection limits (CRDL) or the project-required detection limits (PRDL) if project detection limits have been specified.

Yes

No

Notes: When an analyte is detected in a blank, associated results up to 5 times the blank level are flagged to indicate that the results may be biased high due to contamination. Results "associated" with a field blank are generally results for samples collected on the same day as the blank.

Low-level sulfate was detected in three of the blanks, and low-level bicarbonate was detected in three other blanks. There were no flags for these detections.

Dissolved zinc was detected at 0.020 ppm in the field blank submitted on 2/4/99. Three associated results were flagged to indicate a possible high bias at concentrations below 0.1 ppm.

Flagging: UJ₁

- **Field duplicates**

Field duplicates have been collected at the proper frequency.

Yes

No

Notes: One field duplicate was submitted on each of the eleven days of sampling. The field duplicates are listed in the following table.

Sample/ Duplicate #	Site	Date	Matrix
EVT-9902-103/ 177	EP-7	02/03/99	Groundwater
EVT-9902-123/ 179	EP-56	02/04/99	Groundwater

Sample/ Duplicate #	Site	Date	Matrix
EVT-9902-107/ 181	EP-15	02/08/99	Groundwater
EVT-9902-118/ 183	EP-51	02/09/99	Groundwater
EVT-9902-126/ 185	EP-59	02/10/99	Groundwater
EVT-9902-170/ 187	EM-5	02/11/99	Groundwater
EVT-9902-150/ 189	EP-85	01/18/99	Groundwater
EVT-9902-157/ 191	SEP-2	02/19/99	Surface water
EVT-9902-148/ 192	EP-83	02/22/99	Groundwater
EVT-9902-132/ 194	EP-65	02/24/99	Groundwater
EVT-9902-176/ 196	EP-43	02/25/99	Groundwater

Field duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within \pm the PRDL for water matrix.

Yes

No

Notes: Field duplicate exceedances are listed in the following table. Associated sample results were flagged to indicate a possible lack of reproducibility.

Sample Number/ Dup	Site	Sample Date	Analyte	Sample/ Duplicate Result (mg/L)	Exceedance	# of Flags
EPRI-9902-103/ 177	EP-7	02/03/99	Arsenic (Dis)	0.044/ 0.056	24% RPD	5
EPRI-9902-123/ 179	EP-56	02/04/99	TSS	1107/ 5485	133% RPD	6
EPRI-9902-123/ 179	EP-56	02/04/99	Arsenic (Dis)	0.74/ 1.3	55% RPD	5
EPRI-9902-107/ 181	EP-15	02/08/99	TSS	94/ 117	22% RPD	4
EPRI-9902-118/ 183	EP-51	02/09/99	Sulfate	1848/ 1340	32% RPD	5
EPRI-9902-118/ 183	EP-51	02/09/99	Iron (D)	3.2/ 2.6	21% RPD	5
EPRI-9902-148/ 192	EP-83	02/22/99	NO ₃ +NO ₂ as N	8.3/ 6.1	31% RPD	6
EPRI-9902-132/ 194	EP-65	02/24/99	Sulfate	1635/ 2309	34% RPD	8
EPRI-9902-176/ 196	EP-43	02/25/99	TSS	190/ 242	24% RPD	4
EPRI-9902-176/ 196	EP-43	02/25/99	Iron (Dis)	0.48/ 0.77	46% RPD	2

Flagging: J₄/UJ₄

4. LABORATORY PROCEDURES

- Laboratory procedures followed

CLP-SOW

SW-846

Methods for Chemical Analysis of Water and Wastes

XRF Standard Operating Procedures

- **Holding times met**

Yes

No

Notes: Reanalysis was requested on TDS for sample EPRI-9811-101, collected at EP-5. This result was used in the database, but it was flagged for holding time exceedance. (The original result was out of line historically and also considering the ratio of TDS to SC).

Flagging: J₃

- **Consistency with project requirements**

Analyses were carried out as requested.

Yes

No

Project specified methods were used.

Yes

No

5. DETECTION LIMITS

- Reporting detection limits met project required detection limits (PRDLs).

Yes

No

Notes: The PRDL for sulfate has been set at 1 ppm. The laboratory's reporting detection limit for sulfate was 2 ppm.

The PRDL for selenium is 0.005 ppm. For batch L982343, the reporting limit was raised to 0.100 ppm due to matrix interference. This affected selenium results for two samples: EPRI-9811-117 (collected at EP-49) and EPRI-9811-120 (collected at EP-55).

6. LABORATORY BLANKS

Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

- **Preparation blanks**

Preparation blanks were prepared and analyzed at the required frequency.

Yes

No

All the analytes in the preparation blank were less than the CRDL (or the PRDL if a project detection limit has been specified).

Yes

No

7. LABORATORY MATRIX SPIKES

- A matrix spike sample (pre-digestion) was analyzed for each digestion batch and/or matrix, or as required in the CLP-SOW.

Yes

No

- Matrix spike recoveries were within the required control limits (75-125%).

Yes

No

Notes: For laboratory batch L982304, the matrix spike was out of control limits for dissolved iron, with a recovery of 72 percent. Dissolved iron results for the thirteen samples in the batch were flagged to indicate the possibility of a low bias.

Flagging: J₄/ UJ₄

8. LABORATORY DUPLICATES

- Laboratory duplicate samples were analyzed at the proper frequency.

Yes

No

- The laboratory duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix, 35% or less for soil matrix). For low concentration data, that is if the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within plus or minus the PRDL for water matrix.

Yes

No

9. LABORATORY CONTROL STANDARDS

- LCSs were prepared and analyzed at the proper frequency

Yes

No

- LCS recoveries were within the required control limits (80-120% for water).

Yes

No

10. INTERPARAMETER RELATIONSHIPS

- The following relationships have been checked:

Total Recoverable vs Dissolved metals

Lab pH vs field pH.

TDS vs SC

Lab SC vs field SC

Total Recoverable vs Dissolved metals: This relationship was in order.

Lab pH vs field pH: This relationship was generally in order. For samples for which both lab and field pH were measured, all but nine had percent differences equal to or less than ten percent. The percent differences were distributed as follows:

less than 11%.....	67
11 to 15%.....	7
15 to 20%.....	2
> 20%	0

TDS vs SC: The ratio of TDS to SC should lie between 0.55 and 0.75. In natural waters with high sulfate, the ratio may be as high as 0.96. This ratio is intended to be a check on the accuracy of the TDS and SC measurements. (It should be noted that these measurements are less accurate in dilute waters.)

This relationship was generally in order. As in previous sampling events, the highest ratio (109%) was for the sample collected at EP-49. The ratios were distributed as follows:

less than 50%.....	0
50 to 59%.....	6
60 to 69%.....	22
70 to 79%.....	30
80 to 89%.....	19
90 to 99 %.....	1
over 100%.....	1

Lab SC vs field SC: This relationship was generally in order. Only six of the 64 groundwater samples with SC measurements had percent differences greater than 15%. Of the 12 surface water samples, however, ten had percent differences greater than 15%. Percent differences for the SEP sites along the Rio Grande ranged from 15% at SEP-1 to 32 % at SEP-11, SEP-12, and SEP-13. Field SC measurements for all of the SEP sites were lower than the corresponding SCs measured in the laboratory.

less than 11%.....	49
11 to 15%.....	11
16 to 20%.....	6
20 to 30%.....	6
30 to 40%.....	4

11. HISTORICAL COMPARISON

The data for February 1999 were compared with historical results. Table 3 in Appendix 1 contains a summary of the historical comparison. This table lists all cases where the current value differs by more than 3 standard deviations from the comparison period mean.

- At EP-61, dissolved arsenic had increased to 0.73 ppm. This was the highest ever, and was almost 9 standard deviations above the mean.
- Selenium was the lowest ever at 7 sites by 3 to 7 standard deviations.
- Potassium was the lowest ever at 10 sites by 3 to 5 standard deviations. (Six of the sites were SEP sites--surface water from the Rio Grande.)
- Sodium was the lowest ever at 15 sites by 3 to 9 standard deviations.
- Sulfate was the lowest ever at 16 sites by 3 to 6 standard deviations, with one site greater than 10 standard deviations.
- At 1618 ppm, sulfate was the highest ever at EM-4 by more than 10 standard deviations.
- TSS was the highest ever at 5 sites; at two of these sites (EP-4 and EP-53), the February 1999 value was more than 10 standard deviations above the mean.
- Dissolved oxygen was the highest ever at 12 sites by 3 to more than 10 standard deviations. Nine of these sites were SEP sites--surface water from the Rio Grande.)

12. DATA QUALITY OBJECTIVES

- Project data quality objectives (DQO's) met.

Yes

No

Data quality objectives for this project are for the quality control samples to be within control limits. Evaluation of field and laboratory QC samples give a measure of the actual precision and accuracy obtained.

Accuracy

The ability to recover a known amount of an analyte is a measure of accuracy. Accuracy is evaluated by recoveries on laboratory matrix spikes and laboratory control samples for higher analyte concentrations, and by blanks for analyte concentrations within five times the PRDL.

All laboratory quality control samples were within control limits, indicating good accuracy for the higher concentration results. In general, results on the laboratory and field blanks also indicated good accuracy at lower concentrations. An exception was for three dissolved zinc results from 2/4/99; these were flagged to show possible lack of accuracy as indicated by dissolved zinc detected in the field blank.

Precision

Reproducibility of results is a measure of precision. Precision is evaluated by performance on laboratory and field duplicates.

All of the laboratory duplicate measurements and 97% of the field duplicate measurements (280 out of 290) were within control limits.

Completeness

One measure of completeness is the percentage of valid results obtained. For the Winter 1999 El Paso RI monitoring,

- ⇒ 2.3 percent of the data were flagged (55 out of 2461 results);
- ⇒ None of the data were flagged as rejected (R) or anomalous (A).

Completeness is also evaluated by how well the sampling event met the requirements of the project work plan. Completeness is achieved when the number of valid measurements is sufficient to address all important issues about a site. The quality of sample analyses is assessed indirectly through the analysis of associated quality control samples.

- Field parameters were not taken at four wells (EP-23, EP-24, EP-43, and EP-49) because of heavy hydrocarbon contamination and the possibility of damaging instrument probes.
- The work plan sets the frequency of both field blanks (DI) and field duplicates at one in twenty samples or one per day, whichever is more frequent. As discussed in the field quality control sections, this frequency was met for field duplicates, and was almost met for field blanks. This makes it possible to evaluate the accuracy and precision of the data as set out in the work plan. For a total of eleven days on which samples were collected,
 - Ten field blanks were submitted.
 - Eleven field duplicates were submitted. Also, duplicate field measurements were taken.

APPENDIX 1

TABLES

TABLE 1.

DATA VALIDATION CODES AND DEFINITIONS

<u>CODE</u>	<u>DEFINITION</u>
J	<p>The associated numerical value is an estimated quantity because quality control criteria were not met.</p> <p>Subscripts for the "J" qualifier:</p> <ul style="list-style-type: none"> 2 - Calibration range exceeded or significant deviation from known value. Possible bias. 3 - Holding time not met. Indicates possible bias. 4 - Other QC outside control limits.
UJ	<p>The material was analyzed for, but was not detected above the associated value.</p> <p>Subscripts for the "UJ" qualifier:</p> <ul style="list-style-type: none"> 1 - Blank contamination. Indicates possible high bias and/or false positive. 2 - Calibration range exceeded or significant deviation from known value. Possible bias. 3 - Holding time not met. Indicates possible bias. 4 - Other QC outside control limits.
R	Quality control indicates that the data are unusable (compound may or may not be present). Resampling and/or reanalysis is necessary for verification.
E	Estimated. (Not an EPA code.)
A	Anomalous data. No apparent explanation for discrepancy in data. (Not an EPA code.)

SUMMARY

This report covers the validation of data for groundwater and surface water samples collected during May 1999 for the Asarco El Paso Copper Smelter Remediation Investigation. The validation has been carried out according to requirements spelled out in the work plan (Asarco El Paso Copper Smelter Remedial Investigation Work Plan, November 1996). Deviations from prescribed quality control procedures and/or exceedances of quality control samples have been noted, and results have been flagged in the database. Data validation codes are defined in Appendix 1, Table 1. Appendix 1 also includes the summary of flagged data (Table 2) and the summary of a statistical historical comparison (Table 3). The validated database for this data set is in Appendix 2.

Due to a plant shut down, water levels and some other water conditions have changed at the following sites: EP-26, EP-56, and EP-77.

Completeness of field measurements:

- The required frequency for field quality control samples was met for the May 1999 monitoring event.
 - The required nine field duplicates were submitted.
 - The required nine field blanks were submitted.
- Field measurements were taken in duplicate for all field duplicate samples.
- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-24, EP-25, EP-43, or EP-49.

Laboratory Quality Control Violations:

- Holding time exceedances resulted in the flagging of 100 flags to indicate that the results may not be representative of the true sample values. There were 30 flags for laboratory specific conductivity, 22 flags for sulfate; 21 flags each for bicarbonate and carbonate, and 6 flags for fluoride.
- The ICP laboratory duplicate for batch L990882 was out of control limits for selenium, resulting in 5 flags to indicate a possible lack of reproducibility.
- The laboratory matrix spike for batch L990799 was out of control limits for dissolved iron (128% recovery). One associated result was flagged to indicate the possibility of a high bias.
- The laboratory matrix spike for batch L990800 was out of control limits for dissolved zinc (74% recovery). Twenty-one associated results were flagged to indicate the possibility of a low bias.

Field Quality Control Violations:

- Three field SC results (from samples collected at EP-15, EP-26, and EP-53) were rejected due to the following considerations (this is discussed further in Section 10, Interparameter Relationships):
 - The percent difference between the lab and field SC.
 - The ratio of TDS to lab and field SC.
 - Laboratory and field SC values observed historically at the respective sites.
- Nitrate + nitrite as N detected in the field blank submitted On 5/12/99 resulted in 3 flags to indicate a possible high bias.
- Thirteen of the field duplicate measurements were out of control limits resulting in a total of 100 flags to indicate a possible lack of reproducibility. Results were flagged as follows:

Analyte	Number of Flags
TSS	9
Bicarbonate	8
Chloride	20
Fluoride	10
Potassium	11
Sulfate	3
NO ₃ + NO ₂ as N	31
Selenium	8

Ninety-two percent of the data may be used without qualification (2283 out of 2468 results). Quality control violations resulted in the flagging of 185 values; of these flagged values, three were considered not valid, and were rejected (flagged R). Overall, the data for the May 1999 monitoring for the Asarco El Paso Copper Smelter Remedial Investigation are deemed acceptable for the purposes of the project, provided that the flagged data are considered with appropriate caution. Any possible bias and/or lack of reproducibility indicated by the flags should be taken into account. For this sampling event, the continued-improved performance on the submission of the required field quality control samples made it possible to evaluate the precision and accuracy of the data as set out in the project work plan.

DATA VALIDATION REPORT

DATA VALIDATION REPORT

1. INTRODUCTION

- This validation applies to inorganic analytes from 90 samples collected during May of 1999 for the Asarco El Paso Copper Smelter Remedial Investigation. The total number of samples included:
 - 9..... DI blanks
 - 9..... Field duplicates (2 surface water, 7 groundwater)
 - 12..... Surface water field samples
 - 60..... Groundwater field samples

(Two non-QC samples were collected at EP-23 and at EP-54.)
- No samples were collected at the following sites:
 - EP-71..... Blocked by construction
 - EP-87..... Dry
- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-24, EP-25, EP-43, or EP-49.
- Validation procedures used are generally consistent with:
(Check all that apply)
 - EPA CLP National Functional Guidelines for Inorganics Data Review
 - Asarco El Paso Copper Smelter Remedial Investigation Work Plan, El Paso, Texas (November 1996)
 - Other
- Overall level of validation:
 - Contract Laboratory Program (CLP)
 - Standard
 - Visual

Notes: The validation consisted of a visual check of lab and field data, and an evaluation of laboratory and field quality control samples with flagging for any QC samples that were out of control limits.

2. DELIVERABLES

- All laboratory document deliverables were present as specified in the CLP-Statement of Work (CLP-SOW), EPA, 1993 and/or the project contract.
 - Yes
 - No
- Field measurements and field documentation were complete.
 - Yes
 - No

3. FIELD QUALITY CONTROL SAMPLES

The field quality control samples required by the work plan are 1 field blank (DI) and one field duplicate per day or per 20 samples, whichever is more frequent.

- **Field Blanks:** Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

DI, trip, rinsate, or any other field blanks have been carried out at the proper frequency.

X Yes

 No

Reported results on the field blanks are less than the contract required detection limits (CRDL) or the project-required detection limits (PRDL) if project detection limits have been specified.

 Yes

X No

Notes: When an analyte is detected in a blank, associated results up to 5 times the blank level are flagged to indicate that the results may be biased high due to contamination. Results "associated" with a field blank are generally results for samples collected on the same day as the blank.

- One or more blanks had low-level sulfate and/or chloride and/or fluoride. There were no flags, as all associated results were greater than 5 times the blank levels.
- Low-level nitrate + nitrite as N was detected in the blank submitted on 5/12/99. Three results were flagged to indicate a possible high bias.

Site	Sample Number	Date	Result (ppm)
DI	EPRI-9905-189	5/12/99	0.10
SEP-1	EPRI-9905-157	5/12/99	0.14
SEP-3	EPRI-9905-159	5/12/99	0.38
SEP-7	EPRI-9905-161	5/12/99	0.13

Flagging: UJ₁

- **Field duplicates**

Field duplicates have been collected at the proper frequency.

X Yes

 No

Notes: One field duplicate was submitted on each of the nine days of sampling. The field duplicates are listed in the following table.

Sample/ Duplicate #	Site	Date	Matrix
EVT-9905-103/ 177	EP-29	05/04/99	Groundwater
EVT-9905-123/ 179	EP-6	05/05/99	Groundwater
EVT-9905-107/ 181	EP-63	05/06/99	Groundwater
EVT-9905-118/ 183	EP-73	05/07/99	Groundwater
EVT-9905-126/ 185	EM-4	05/10/99	Groundwater

Sample/ Duplicate #	Site	Date	Matrix
EVT-9905-170/ 187	EP-78	05/11/99	Groundwater
EVT-9905-157/ 191	SEP-3	05/12/99	Surface water
EVT-9905-148/ 192	SEP-11	05/13/99	Surface water
EVT-9905-150/ 189	EP-12	05/14/99	Groundwater

Field duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within \pm the PRDL for water matrix.

 Yes

X No

Notes: Field duplicate exceedances are listed in the following table. Associated sample results were flagged to indicate a possible lack of reproducibility.

- Thirteen of the field duplicate measurements were out of control limits resulting in a total of 100 flags.

Sample Number/ Duplicate	Site	Sample Date	Analyte	Sample/ Duplicate Result (mg/L)	Exceedance	# of Flags
EPRI-9905-115/ 177	EP-29	05/04/99	TSS	170/ 280	49% RPD	4
EPRI-9905-115/ 177	EP-29	05/04/99	Sulfate	1049/ 812	25% RPD	3
EPRI-9905-131/ 181	EP-63	05/06/99	Chloride	1163/ 870	29% RPD	11
EPRI-9905-131/ 181	EP-63	05/06/99	Potassium	37/ 46	22% RPD	11
EPRI-9905-131/ 181	EP-63	05/06/99	NO ₃ /NO ₂ as N	6.4/ 7.9	21% RPD	4
EPRI-9905-140/ 183	EP-73	05/07/99	NO ₃ /NO ₂ as N	16/ 21	27% RPD	9

EPRI-9905-144/ 186	EP-78	05/11/99	Fluoride	2.6/ 9.2	112% RPD	10
EPRI-9905-159/ 190	SEP-3	05/12/99	NO ₃ +NO ₂ as N	0.38/ 1.0	> \pm 0.1 ppm	9
EPRI-9905-164/ 191	SEP-11	05/13/99	NO ₃ +NO ₂ as N	0.25/ <0.10	> \pm 0.1 ppm	9
EPRI-9905-104/ 193	EP-12	05/14/99	TSS	41/ 66	47% RPD	5
EPRI-9905-104/ 193	EP-12	05/14/99	HCO ₃	2013/ 1037	64% RPD	8
EPRI-9905-104/ 193	EP-12	05/14/99	Selenium	0.260/ 0.320	21% RPD	8

Flagging: J₄/UJ₄

4. LABORATORY PROCEDURES

- **Laboratory procedures followed**

- CLP-SOW
- SW-846
- Methods for Chemical Analysis of Water and Wastes
- XRF Standard Operating Procedures

- **Holding times met**

- Yes
- No

Notes: A total of 118 results were flagged for holding time exceedances. These are detailed in the following table.

Lab Batch	Analyte	# Results Flagged	Holding Limit (Days)	Time Held (Days)
L990776	Fluoride	6	28	29
L990776	Sulfate	20	28	29 to 31
L990800	Sulfate	2	28	29
L990819	Conductivity	17	28	29 to 30
L990819	Bicarbonate	17	14	15 to 16
L990819	Carbonate	17	14	15 to 16
L990820	Conductivity	4	28	29
L990820	Bicarbonate	4	14	15
L990820	Carbonate	4	14	15
L990882	Conductivity	9	28	34

Flagging: J₃/ UJ₃

- **Consistency with project requirements**

Analyses were carried out as requested.

- Yes
- No

Project specified methods were used.

- Yes
- No

5. DETECTION LIMITS

- Reporting detection limits met project required detection limits (PRDLs).

- Yes
- No

Notes: The PRDL for sulfate has been set at 1 ppm. The laboratory's reporting detection limit for sulfate was 2 ppm.

6. LABORATORY BLANKS

Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

- Preparation blanks

Preparation blanks were prepared and analyzed at the required frequency.

Yes

No

All the analytes in the preparation blank were less than the CRDL (or the PRDL if a project detection limit has been specified).

Yes

No

7. LABORATORY MATRIX SPIKES

- A matrix spike sample (pre-digestion) was analyzed for each digestion batch and/or matrix, or as required in the CLP-SOW.

Yes

No

- Matrix spike recoveries were within the required control limits (75-125%).

Yes

No

Notes: For laboratory batch L990800, the ICP-MS matrix spike recovery (74%) was out of control limits for dissolved zinc. Dissolved zinc results for 21 samples in the batch were flagged to indicate the possibility of a low bias. (The remaining zinc sample was analyzed by ICP.)

For laboratory batch L990799, the matrix spike recovery (128%) was out of control limits for dissolved iron analyzed by ICP. One associated result was flagged to indicate the possibility of a high bias. All other dissolved iron results were below the reporting limit.

Flagging: J₄/ UJ₄

8. LABORATORY DUPLICATES

- Laboratory duplicate samples were analyzed at the proper frequency.

Yes

No

- The laboratory duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix, 35% or less for soil matrix). For low concentration data, that is if the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within plus or minus the PRDL for water matrix.

 Yes

X No

Notes: The ICP selenium lab duplicate for laboratory batch L990882 was out of control limits with an RPD of 54%. The analyst noted that this was possibly due to high sodium in the sample matrix. Normally the lab would have chosen to report the ICP-MS analysis results for selenium. In this case, however, the ICP-MS results were suspect because of matrix interference for samples with high chloride. Five selenium results from this batch were reported from the ICP analysis, and were therefore flagged to indicate a possible lack of reproducibility..

Flagging: J4/ UJ4

9. LABORATORY CONTROL STANDARDS

- LCSs were prepared and analyzed at the proper frequency
X Yes
 No
- LCS recoveries were within the required control limits (80-120% for water).
X Yes
 No

10. INTERPARAMETER RELATIONSHIPS

- The following relationships have been checked:
X Total Recoverable vs. Dissolved metals
X Lab pH vs. field pH.
X TDS vs. SC
X Lab SC vs. field SC

Total Recoverable vs. Dissolved metals: With the exception of the following 2 results, this relationship was in order.

Site	Sample Number	Sample Date	Analyte	Dissolved/ Total Recoverable	RPD
POND-6	EPRI-9905-176	5/12/99	Selenium	0.034/ 0.025 ppm	30%
POND-1	EPRI-9905-174	5/12/99	Zinc	33/ 20 ppm	49%

Lab pH vs. field pH: This relationship was generally in order. For samples for which both lab and field pH were measured, all but nine had percent differences equal to or less than ten percent. Rounding off to the nearest percent, the percent differences were distributed as follows:

less than 10%.....	55
10 to 15%.....	9
15 to 20%.....	8
> 20%	5

The samples with percent differences greater than 20% are listed in the following table:

Site	Sample Number	Sample Date	Field pH/ Lab pH	Percent Difference
SEP-3	EPRI—9905-159	5/12/99	7.77/ 9.4	21%
SEP-3 (Dup)	EPRI—9905-190	5/12/99	7.77/ 9.5	22%
SEP-4	EPRI—9905-160	5/13/99	6.84/ 8.5	24%
SEP-12	EPRI—9905-165	5/13/99	6.94/ 8.4	21%
SEP-13	EPRI—9905-166	5/13/99	6.89/ 8.6	25%

TDS vs. SC: The ratio of TDS to SC should lie between 0.55 and 0.75. In natural waters with high sulfate, the ratio may be as high as 0.96. This ratio is intended to be a check on the accuracy of the TDS and SC measurements. (It should be noted that these measurements are less accurate in dilute waters.)

This relationship was generally in order. As in previous sampling events, the highest ratio (133%) was for the sample collected at EP-49. The ratios were distributed as follows:

less than 50%.....	0
50 to 75%.....	49
75 to 100%.....	31
over 100%.....	1

Lab SC vs. field SC: This relationship was generally in order. The distribution of the percent differences was as follows:

less than 10%.....	62
11 to 20%.....	12
over 20%.....	3

Only three samples had percent differences greater than 20%. Note, however, that the field SC results have been rejected in all three cases. For the sample collected at EP-26, the field SC value appeared to be high by a factor of ten. For the other two samples, the field SC measurements were about twice what

had been previously observed. In both cases the ratio of TDS to SC was acceptable using the laboratory SC. The three samples are listed in the following table.

Site	Sample Number	Sample Date	Field SC/ Lab SC	Percent Difference	TDS/ field SC	TDS/lab SC	Flag
EP-15	EPRI-9905-107	5/5/99	8580/4170	51%	36%	74%	R
EP-26	EPRI-9905-114	5/5/99	362/4440	92%	5%	66%	R
EP-53	EPRI-9905-121	5/5/99	7120/15650	54%	37%	82%	R

11. HISTORICAL COMPARISON

The data for May 1999 were compared with historical results. Table 3 in Appendix 1 contains a summary of the historical comparison. This table lists all cases where the current value differs by more than 3 standard deviations from the comparison period mean.

12. DATA QUALITY OBJECTIVES

- Project data quality objectives (DQOs) met.

Yes

No

Data quality objectives for this project are for the quality control samples to be within control limits. Evaluation of field and laboratory QC samples give a measure of the actual precision and accuracy obtained.

Accuracy

The ability to recover a known amount of an analyte is a measure of accuracy. Accuracy is evaluated by recoveries on laboratory matrix spikes and laboratory control samples for higher analyte concentrations, and by blanks for analyte concentrations within five times the PRDL.

Except for 2 matrix spikes, all laboratory quality control samples were within control limits, indicating good accuracy for the higher concentration results. One dissolved iron result was flagged to indicate a possible high bias, and 21 nitrate + nitrite as N results were flagged to indicate a possible low bias.

In general, results on the laboratory and field blanks also indicated good accuracy at lower concentrations. An exception was for three nitrate + nitrite as N results from 5/12/99; these were flagged to show possible lack of accuracy as indicated by nitrate + nitrite as N detected in the field blank.

Precision

Reproducibility of results is a measure of precision. Precision is evaluated by performance on laboratory and field duplicates.

All but one of the laboratory duplicate measurements and 95% of the field duplicate measurements (237 out of 250) were within control limits.

Completeness

One measure of completeness is the percentage of valid results obtained. For the Spring 1999 El Paso RI monitoring,

- ⇒ 7.5 percent of the data were flagged (185 out of 2468 results);
- ⇒ Three of the field SC results were rejected and flagged (R).

Completeness is also evaluated by how well the sampling event met the requirements of the project work plan. Completeness is achieved when the number of valid measurements is sufficient to address all important issues about a site. The quality of sample analyses is assessed indirectly through the analysis of associated quality control samples.

- Field parameters were not taken at four wells (EP-24, EP-25, EP-43, and EP-49) because of heavy hydrocarbon contamination and the possibility of damaging instrument probes.
- The required frequency for field quality control samples was met, making it possible to evaluate the accuracy and precision of the data as set out in the work plan.
- Duplicate field measurements were taken for the field duplicates, making it possible to evaluate the precision of field measurements.

TABLE 1.

DATA VALIDATION CODES AND DEFINITIONS

<u>CODE</u>	<u>DEFINITION</u>
J	<p>The associated numerical value is an estimated quantity because quality control criteria were not met.</p> <p>Subscripts for the "J" qualifier:</p> <ul style="list-style-type: none">2 - Calibration range exceeded or significant deviation from known value. Possible bias.3 - Holding time not met. Indicates possible bias.4 - Other QC outside control limits.
UJ	<p>The material was analyzed for, but was not detected above the associated value.</p> <p>Subscripts for the "UJ" qualifier:</p> <ul style="list-style-type: none">1 - Blank contamination. Indicates possible high bias and/or false positive.2 - Calibration range exceeded or significant deviation from known value. Possible bias.3 - Holding time not met. Indicates possible bias.4 - Other QC outside control limits.
R	- Quality control indicates that the data are unusable (compound may or may not be present). Resampling and/or reanalysis is necessary for verification.
E	- Estimated. (Not an EPA code.)
A	- Anomalous data. No apparent explanation for discrepancy in data. (Not an EPA code.)

NOTES: All quantities in mg/L (Water) or mg/kg (Soil) unless noted. All results LABORATORY unless field (FLD) or calculated (CALC).

N: Number of samples in comparison data set; 50% of data set must be above lab detection limit before mean, median, & SD calculation.

A & R Flags were excluded from Statistics

1/2 the detection limit was used in calculations.

SUMMARY

This report covers the validation of data for groundwater and surface water samples collected during August 1999 for the Asarco El Paso Copper Smelter Remediation Investigation. The validation has been carried out according to requirements spelled out in the work plan (Asarco El Paso Copper Smelter Remedial Investigation Work Plan, November 1996). Deviations from prescribed quality control procedures and/or exceedances of quality control samples have been noted, and results have been flagged in the database. Data validation codes are defined in Appendix 1, Table 1. Appendix 1 also includes the summary of flagged data (Table 2) and the summary of a statistical historical comparison (Table 3). The validated database for this data set is in Appendix 2.

For this monitoring event, sediment samples were collected at eleven of the surface water sites. These sediment samples were analyzed by XRF using a matrix-specific calibration for arsenic and lead, and using a fundamental parameters calibration for cadmium, chromium, copper, iron, selenium, and zinc. The matrix-specific calibration, however, was for sandy soils from Murray, Utah rather than being specific to soils from El Paso. All laboratory quality control information that was provided for the XRF analyses was within control limits.

- For arsenic and lead only, information was provided for calibration verification samples (1 in 10) and laboratory control samples (1 in 20).
- No information was provided for recoveries on reference standards for the analyses using the fundamental parameters calibration. According to the analyst, results on these analyses can only be regarded as semi-quantitative, and it would not be meaningful to try to evaluate the accuracy of the results by extrapolating from recoveries on the reference standards.
- Information was provided for all analytes for laboratory duplicates, which were performed at a frequency of 1 in 20.

Completeness of field measurements:

- The required frequency for field quality control samples was not met for the August 1999 monitoring event. No field duplicate was submitted on August 2, and seven non-QC samples were collected on that day.
- Seven sediment samples were submitted on 8/20/99, but no field duplicate was submitted for this matrix. The only field duplicate for this day was a surface water sample.
- Four sediment samples were submitted on 8/11/99, but no field duplicate was submitted for this matrix. The only field duplicate for this day was a groundwater sample.

- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-25.
- Due to construction, no sample was collected at EP-76.
- Due to a non-functional oxygen probe, dissolved oxygen was not measured at ten sites on 8/4/99 and 8/5/99

Laboratory Quality Control Violations resulted in a total of 30 flags:

- In batch L991431, the laboratory duplicate for total iron measured by ICP was out of control limits with an RPD of 26 percent. Fourteen associated total iron results were flagged to indicate a possible lack of reproducibility.
- In batch L991431, the laboratory duplicate for total recoverable iron measured by ICP was out of control limits with an RPD of 22 percent. Three associated total recoverable iron results were flagged to indicate a possible lack of reproducibility.
- In batch L991377, the ICP laboratory control standard for total zinc was out of control limits with a recovery of 125 percent. Nine associated total zinc results were flagged to indicate the possibility of a high bias.
- Total zinc was detected in the ICP laboratory preparation blank for batch L991431. One associated total zinc result was flagged to indicate the possibility of a high bias.
- Total recoverable iron was detected in the ICP laboratory preparation blank for batch L991431. Two associated total recoverable iron results were flagged to indicate the possibility of a high bias.
- One chloride result was flagged for holding time exceedance.

Field Quality Control Violations resulted in a total of 121 flags:

- Detections in 4 of the field blanks resulted in a total of 16 flags: 2 flags for nitrate + nitrite measured as N, 5 flags for total lead, and 9 flags for dissolved zinc.
- Thirteen of the field duplicate measurements were out of control limits resulting in a total of 105 flags to indicate a possible lack of reproducibility.

Ninety-five percent of the data may be used without qualification (3124 out of 3275 results). Overall, the data for the August 1999 monitoring for the Asarco El Paso Copper Smelter Remedial Investigation are deemed acceptable for the purposes of the project, provided that the flagged data are considered with appropriate caution. Any possible bias and/or lack of reproducibility indicated by the flags should be taken into account. For this sampling event, the continued-improved performance on the submission of the required field quality control samples made it possible to evaluate the precision and accuracy of the data as set out in the project work plan.

DATA VALIDATION REPORT

1. INTRODUCTION

- This validation applies to inorganic analytes from 101 samples collected during August of 1999 for the Asarco El Paso Copper Smelter Remedial Investigation. The total number of samples included:

9DI blanks
8Field duplicates (1 surface water, 7 groundwater)
14Surface water field samples
59Groundwater field samples
11Sediment samples

- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-25.
- Due to construction, no sample was collected at EP-76.
- Due to a non-functional oxygen probe, dissolved oxygen was not measured at ten sites on 8/4/99 and 8/5/99:

<u>8/4/99</u>	<u>8/5/99</u>
EP-26	EP-67
EP-51	EP-68
EP-53	EP-70
EP-54	EP-71
EP-56	
EP-66	

- Validation procedures used are generally consistent with:
(Check all that apply)

EPA CLP National Functional Guidelines for Inorganics Data Review
 Asarco El Paso Copper Smelter Remedial Investigation Work Plan, El
Paso, Texas (November 1996)
 Other

- Overall level of validation:

Contract Laboratory Program (CLP)
 Standard
 Visual

Notes: The validation consisted of a visual check of lab and field data, and an evaluation of laboratory and field quality control samples with flagging for any QC samples that were out of control limits.

2. DELIVERABLES

- All laboratory document deliverables were present as specified in the CLP-Statement of Work (CLP-SOW), EPA, 1993 and/or the project contract.

Yes
 No

- Field measurements and field documentation were complete.

Yes - Exceptions are listed in Section 1, Introduction.
 No

3. FIELD QUALITY CONTROL SAMPLES

The field quality control samples required by the work plan are one field blank (DI) and one field duplicate per day or per 20 samples, whichever is more frequent.

- **Field Blanks:** Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

DI, trip, rinsate, or any other field blanks have been carried out at the proper frequency.

Yes
 No

Reported results on the field blanks are less than the contract required detection limits (CRDL) or the project-required detection limits (PRDL) if project detection limits have been specified.

Yes
 No

Notes: When an analyte is detected in a blank, associated results up to 5 times the blank level are flagged to indicate that the results may be biased high due to contamination. Results "associated" with a field blank are generally results for samples collected on the same day as the blank.

- The following table lists blank detections that did not result in flagging.

Sample Number	Date	Analyte	Result (ppm)	Reporting Limit (ppm)	PRDL (ppm)
EPRI-9908-193	8/2/99	TSS	1.1	1	10
EPRI-9908-193	8/2/99	Sulfate	2.4	2	1
EPRI-9908-193	8/2/99	Chloride	1.3	1	1
EPRI-9908-197	8/4/99	TSS	5.5	1	10
EPRI-9908-199	8/5/99	Bicarbonate	2.2	1	1
EPRI-9908-199	8/5/99	Sulfate	2.3	2	1
EPRI-9908-201	8/6/99	TSS	1.2	1	10
EPRI-9908-203	8/9/99	TSS	1.8	1	10

- Note that for TSS, the reporting level was much less than the PRDL. No results were qualified due to blank detections for the following reasons:
 - Results less than 10 ppm can be ignored for the project.
 - Results greater than 10 ppm probably represent real values and should not be flagged as possibly non-detect.
- The blank submitted on 8/2/99 (EPRI-9908-193) contained nitrate + nitrite as N and total lead. The blanks submitted on 8/10 and on 8/11/99 contained dissolved zinc. The detections and the resulting flagging are summarized in the following table.

Sample Number of Blank	Date of Blank	Analyte	Result (ppm)	5 times Blank Level (ppm)	Sample, Site (Result in ppm) Flagged
EPRI-9908-193	8/2/99	NO ₂ + NO ₃ as N	0.055	0.275	EPRI-9908-100, EP-4 (0.076) EPRI-9908-103, EP-7 (0.130)
EPRI-9908-193	8/2/99	Lead (Tot)	0.004	0.020	EPRI-9908-100, EP-4 (0.015) EPRI-9908-101, EP-5 (0.018) EPRI-9908-108, EP-20 (0.005) EPRI-9908-115, EP-29 (0.008) EPRI-9908-116, EP-35 (0.009)
EPRI-9908-205	8/10/99	Zinc (Dis)	0.021	0.105	EPRI-9908-109, EP-21 (0.031) EPRI-9908-133, EP-65 (0.021) EPRI-9908-153, EP-87 (0.032)
EPRI-9908-207	8/11/99	Zinc (Dis)	0.022	0.110	EPRI-9908-168, EM-1 (0.033) EPRI-9908-104, EP-12 (0.024) EPRI-9908-113, EP-25 (0.024) EPRI-9908-206, EP-43 (0.023) EPRI-9908-176, Pond 6 (0.092) EPRI-9908-167, Sep-14 (0.025)

Flagging: UJ₁

- Field duplicates

Field duplicates have been collected at the proper frequency.

Yes

No

Notes: Eight field duplicates were submitted for a total of nine days of sampling. No duplicate was submitted on 8/2/99. No duplicate was submitted for sediment samples. The field duplicates are listed in the following table.

Sample/ Duplicate #	Site	Date	Matrix
EPRI-9908-107/194	EP-15	08/03/99	Groundwater
EPRI-9908-119/196	EP-51	08/04/99	Groundwater
EPRI-9908-155/198	EP-89	08/05/99	Groundwater
EPRI-9908-172/200	EM-6	08/06/99	Groundwater
EPRI-9908-151/202	EP-85	08/09/99	Groundwater
EPRI-9908-133/204	EP-65	08/10/99	Groundwater

Sample/ Duplicate #	Site	Date	Matrix
EPRI-9908-117/ 206	EP-43	08/11/99	Groundwater
EPRI-9908-177/ 208	SEP-6	08/20/99	Surface water

Field duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within \pm the PRDL for water matrix.

Yes
X No

Notes: The thirteen field duplicate exceedances are listed in the following table. Associated sample results were flagged to indicate a possible lack of reproducibility. Samples collected the same day as the duplicate are generally considered to be associated. In this case, however, the field duplicate collected on 8/3/99 was applied to samples from 8/2/99 as well as to those from 8/3/99. The reasons were as follows:

- No field duplicate was collected on 8/2/99.
- The 8/3/99 field duplicate sample pair was submitted to the laboratory in the same sample delivery group as samples collected on 8/2/99.
- The 8/3/99 field duplicate sample pair was analyzed in the same laboratory batch as the samples collected on 8/2/99.

Over the entire sampling event, thirteen of the field duplicate measurements were out of control limits resulting in a total of 113 flags. Note that historical values were taken into account when flagging dissolved iron results for the field duplicate submitted on 8/20/99. Only results that were above the detection limit were flagged.

Flagging: J4/UJ4

Sample Number/ Duplicate	Site	Sample Date	Analyte	Sample/ Duplicate Result (mg/L)	Exceedance	# of Flags
EPRI-9908-107/ 194	EP-15	08/03/99	TSS	83/ 49	52% RPD	16
EPRI-9908-119/ 196	EP-51	08/04/99	Arsenic (Tot)	0.37/ 0.55	39% RPD	4
EPRI-9908-119/ 196	EP-51	08/04/99	Chromium	0.10/ 0.51	134% RPD	8
EPRI-9908-119/ 196	EP-51	08/04/99	Copper (Tot)	0.051/ 0.084	$> \pm 0.025$ ppm	8
EPRI-9908-119/ 196	EP-51	08/04/99	Iron (Tot)	0.31/ 1.3	$> \pm 0.1$ ppm	8
EPRI-9908-119/ 196	EP-51	08/04/99	Lead (Tot)	0.004/ 0.012	$> \pm 0.003$ ppm	6
EPRI-9908-172/ 200	EM-6	08/06/99	Arsenic (Dis)	0.042/ 0.033	24% RPD	3
EPRI-9908-151/ 202	EP-85	08/09/99	Lead (Tot)	0.015/ 0.004	$> \pm 0.003$ ppm	10
EPRI-9908-151/ 202	EP-85	08/09/99	Selenium (Tot)	0.18/ 0.46	88% RPD	10
EPRI-9908-133/ 204	EP-65	08/10/99	Fluoride	1.1/ 1.9	53% RPD	8

Sample Number/ Duplicate	Site	Sample Date	Analyte	Sample/ Duplicate Result (mg/L)	Exceedance	# of Flags
EPRI-9908-133/204	EP-65	08/10/99	NO ₃ /NO ₂	36/29	22% RPD	9
EPRI-9908-177/208	SEP-6	08/20/99	Carbonate	<1/22	> ± 1 ppm	12
EPRI-9908-177/208	SEP-6	08/20/99	Iron (Dis)	0.46/0.10	> ± 0.1 ppm	3

4. LABORATORY PROCEDURES

- Laboratory procedures followed

CLP-SOW
 SW-846
 Methods for Chemical Analysis of Water and Wastes
 XRF Standard Operating Procedures

- Holding times met

Yes - See Notes for the one exception.
 No

Notes: Reanalysis of chloride was requested for sample EPRI-9908-106 collected at EP-14 on 8/3/99. As indicated by chloride values previously obtained at this site, the reanalysis value from 10/22/99 was accepted as more representative of the true value. However, since the holding time for the reanalysis value was 80 days, the result has been flagged.

Flagging: J3

- Consistency with project requirements

Analyses were carried out as requested.
 Yes
 No

Project specified methods were used.

Yes
 No

5. DETECTION LIMITS

- Reporting detection limits met project detection limit goals (PDLGs).

Yes
 No

Notes:

Water--The PDLG for sulfate has been set at 1 ppm. The laboratory's reporting detection limit for sulfate was 2 ppm.

Sediment: As shown in the following table, the PDLG was not met for chromium, copper, or iron in the XRF analyses.

Analyte	Reporting Detection Limit	PDGL
Chromium	80 ppm	20 ppm
Copper	20 ppm	10 ppm
Iron	50 ppm	20 ppm

6. LABORATORY BLANKS

Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

- Preparation blanks

Preparation blanks were prepared and analyzed at the required frequency.

Yes
 No

All the analytes in the preparation blank were less than the CRDL (or the PRDL if a project detection limit has been specified).

Yes
 No

Notes: Total zinc was detected at 0.020 ppm in the ICP laboratory preparation blank for batch L991431. Associated total zinc results up to 0.1 ppm were flagged to indicate the possibility of a high bias (one result, EPRI-9908-10).

Total recoverable iron was detected at 0.11 ppm in the ICP laboratory preparation blank for batch L991431. Associated total recoverable iron results up to 0.55 ppm were flagged to indicate the possibility of a high bias (two results, (EPRI-9908-174 & 176).

7. LABORATORY MATRIX SPIKES

- A matrix spike sample (pre-digestion) was analyzed for each digestion batch and/or matrix, or as required in the CLP-SOW.

Yes
 No

- Matrix spike recoveries were within the required control limits (75-125%).

Yes
 No

8. LABORATORY DUPLICATES

- Laboratory duplicate samples were analyzed at the proper frequency.

Yes
 No

- The laboratory duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix, 35% or less for soil matrix). For low concentration data, that is if the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within plus or minus the PRDL for water matrix.

 Yes

No

Notes: The laboratory duplicate for batch L991431 total iron measured by ICP was out of control limits with an RPD of 26 percent. Fourteen associated total iron results were flagged to indicate a possible lack of reproducibility.

The laboratory duplicate for batch L991431 total recoverable iron measured by ICP was out of control limits with an RPD of 22 percent. Three associated total recoverable iron results were flagged to indicate a possible lack of reproducibility.

9. LABORATORY CONTROL STANDARDS

- LCSs were prepared and analyzed at the proper frequency
 Yes
 No
- LCS recoveries were within the required control limits (80-120% for water).
 Yes
 No

Notes: The ICP laboratory control standard for batch L991377 total zinc was out of control limits with a recovery of 125 percent. Nine associated total zinc results were flagged to indicate the possibility of a high bias.

10. INTERPARAMETER RELATIONSHIPS

- The following relationships have been checked:
 Total (or Total Recoverable) vs. Dissolved metals
 Lab pH vs. field pH.
 TDS vs. SC
 Lab SC vs. field SC

Total Recoverable vs. Dissolved metals: With the exception of the following 7 results, this relationship was in order.

Site	Sample Number	Sample Date	Analyte	Dissolved/ Total (or Total Recoverable)	RPD
EP-56	EPRI--9908-124	08/04/99	Arsenic	2.8/ 2.2 ppm	24%
EP-26	EPRI--9908-114	08/04/99	Cadmium	3.5/ 2.5 ppm	33%
EP-26	EPRI--9908-114	08/04/99	Zinc	7.1/ 5.4 ppm	27%

EP-54	EPRI—9908-122	08/04/99	Selenium	0.17/ 0.13 ppm	27%
EP-6	EPRI—9908-102	08/02/99	Selenium	0.043/ 0.028 ppm	42%
EP-70	EPRI—9908-137	08/05/99	Zinc	0.16/ 0.13 ppm	21%
POND-1	EPRI—9908-174	08/11/99	Zinc	9.8/ 2.1 ppm	129%

Lab pH vs. field pH: This relationship was generally in order. For samples for which both lab and field pH were measured, all but eight had percent differences equal to or less than ten percent. Rounded off to the nearest percent, the percent differences were distributed as follows:

equal to or less than 10%.....	72
11 to 15%.....	6
16 to 20%.....	2
> 20%.....	1

The sample with a percent difference greater than 20% is listed in the following table:

Site	Sample Number	Sample Date	Field pH/ Lab pH	Percent Difference
EP-58	EPRI—9908-126	08/10/99	6.49/ 8	23%

TDS vs. SC: The ratio of TDS to SC should lie between 0.55 and 0.75. In natural waters with high sulfate, the ratio may be as high as 0.96. This ratio is intended to be a check on the accuracy of the TDS and SC measurements. (It should be noted that these measurements are less accurate in dilute waters.)

This relationship was generally in order. The TDS to SC ratios ranged from 56.8% at EP-23 to 106.6% at Pond 1. The ratios were distributed as follows:

less than 55%.....	0
55 to 75%	46
75 to 100%	34
over 100%	1

Lab SC vs. field SC: This relationship was generally in order. Rounded to the nearest percent, only eleven samples had percent differences greater than ten percent. The distribution of the percent differences was as follows:

less than 10%....	70
11 to 15%	8
16 to 20%	3

11. HISTORICAL COMPARISON

The data for August 1999 were compared with historical results. Table 3 in Appendix 1 contains a summary of the historical comparison. This table lists all cases where the current value differs by more than 3 standard deviations from the comparison period mean.

12. DATA QUALITY OBJECTIVES

- Project data quality objectives (DQOs) met.

Yes

No

Data quality objectives for this project are for the quality control samples to be within control limits. Evaluation of field and laboratory QC samples give a measure of the actual precision and accuracy obtained.

Accuracy

The ability to recover a known amount of an analyte is a measure of accuracy. Accuracy for water matrix is evaluated by recoveries on laboratory matrix spikes and laboratory control samples for higher analyte concentrations, and by blanks for analyte concentrations within five times the PRDL.

All laboratory quality control samples were within control limits, indicating good accuracy for the higher concentration results.

In general, results on the laboratory and field blanks also indicated good accuracy at lower concentrations. An exception was for the field blank submitted on 8/9/99: low level nitrate + nitrite as N and total lead were detected in this blank. In all, 8 results were flagged to show possible high bias.

Accuracy for sediment matrix is evaluated by recoveries on laboratory reference standards, which in this case included calibration standards and laboratory control standards for arsenic and lead only since these were analyzed using a matrix-specific calibration. Recoveries on these QC samples were all within control limits. No information was provided for evaluation of accuracy for the other parameters analyzed by XRF (cadmium, chromium, copper, iron, selenium, and zinc).

Precision

Reproducibility of results is a measure of precision. Precision is evaluated by performance on laboratory and field duplicates.

All but one of the laboratory duplicate measurements and 95% of the field duplicate measurements (257 out of 270) were within control limits.

Completeness

One measure of completeness is the percentage of valid results obtained. For the Summer 1999 El Paso RI monitoring,

- ⇒ 4.6 percent of the data were flagged (151 out of 3275 results).
- ⇒ Ninety-five percent of the data may be used without qualification (3124 out of 3275 results).
- ⇒ No results were flagged as anomalous (A) or rejected (R).

Completeness is also evaluated by how well the sampling event met the requirements of the project work plan. Completeness is achieved when the number of valid measurements is sufficient to address all important issues about a site. The quality of sample analyses is assessed indirectly through the analysis of associated quality control samples.

- Due to construction, no sample was collected at EP-76.
- Due to a non-functional oxygen probe, dissolved oxygen was not measured at ten sites on 8/4/99 and 8/5/99.
- Field parameters were not taken at EP-25 because of heavy hydrocarbon contamination and the possibility of damaging instrument probes.
- The required frequency for field quality control samples was nearly met, making it possible to evaluate the accuracy and precision of the data as set out in the work plan.
- Duplicate field measurements were taken for the field duplicates, making it possible to evaluate the precision of field measurements.

APPENDIX 1

TABLES

TABLE 1.
DATA VALIDATION CODES AND DEFINITIONS

<u>CODE</u>	<u>DEFINITION</u>
J -	The associated numerical value is an estimated quantity because quality control criteria were not met. Subscripts for the "J" qualifier: 2 - Calibration range exceeded or significant deviation from known value. Possible bias. 3 - Holding time not met. Indicates possible bias. 4 - Other QC outside control limits.
UJ -	The material was analyzed for, but was not detected above the associated value. Subscripts for the "UJ" qualifier: 1 - Blank contamination. Indicates possible high bias and/or false positive. 2 - Calibration range exceeded or significant deviation from known value. Possible bias. 3 - Holding time not met. Indicates possible bias. 4 - Other QC outside control limits.
R -	Quality control indicates that the data are unusable (compound may or may not be present). Resampling and/or reanalysis is necessary for verification.
E -	Estimated. (Not an EPA code.)
A -	Anomalous data.. No apparent explanation for discrepancy in data. (Not an EPA code.)

SUMMARY

This report covers the validation of data for quarterly monitoring water and sediment samples collected during October and November of 1999 for the Asarco El Paso Copper Smelter Remediation Investigation. The validation has been carried out according to requirements spelled out in the work plan (Asarco El Paso Copper Smelter Remedial Investigation Work Plan, November 1996). Deviations from prescribed quality control procedures and/or exceedances of quality control samples have been noted, and results have been flagged in the database. Data validation codes are defined in Appendix 1, Table 1. Appendix 1 also includes the summary of flagged data (Table 2) and the summary of a statistical historical comparison (Table 3). The validated database for this data set is in Appendix 2.

For this monitoring event, sediment samples were collected at ten of the surface water sites. These sediment samples were analyzed by XRF using a matrix-specific calibration for arsenic and lead, and using a fundamental parameters calibration for cadmium, chromium, copper, iron, selenium, and zinc. The matrix-specific calibration, however, was for sandy soils from Murray, Utah rather than being specific to soils from El Paso.

For the sediment XRF analyses all laboratory quality control information that was provided was within control limits.

- For arsenic and lead only, information was provided for calibration verification samples (at a frequency of 1 in 10) and laboratory control samples (1 in 20).
- Reference standard analyses were not conducted for the analyses using the fundamental parameters calibration.
- Information was provided for all analytes for laboratory duplicates, which were performed at a frequency of 1 in 20.

For water, laboratory quality control violations resulted in a total of 158 flags:

- In batch L991925, the ICP laboratory control sample for total iron was out of control limits with a recovery of 122 percent. Twenty-five total iron results from the batch were flagged to indicate a possible high bias.
- In batch L991925, the ICP-MS laboratory control sample for total selenium was out of control limits with a recovery of 75 percent. Thirty-three total selenium results from this batch were flagged to indicate the possibility of a low bias.
- In batch L991936, the ICP-MS laboratory control sample for total zinc was out of control limits with a recovery of 122 percent. Fifteen total zinc results from the batch were flagged to indicate the possibility of a high bias.

- In batch L991938, the laboratory control sample for total iron measured by ICP was out of control limits with a recovery of 122 percent. Nineteen total iron results from the batch were flagged to indicate a possible high bias.
- Thirty-three bicarbonate, and thirty-three carbonate results were flagged for holding time exceedance..

Field Quality Control Violations resulted in a total of 180 flags:

- The field SC results from EP-115 and from Pond 1 were considered to be unusable and were rejected. This is discussed in detail in Section 10.
- Detections in eight of the ten field blanks resulted in a total of 26 flags to indicate possible high bias.
- Eighteen of the field duplicate measurements were out of control limits resulting in a total of 152 flags to indicate a possible lack of reproducibility.

Completeness of field measurements:

- The required frequency for field quality control samples was not met for the Fall 1999 monitoring event. Samples were collected on fifteen days; for five of these days, no field QC samples were submitted.
- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-49.
- Due to a non-functional oxygen probe, dissolved oxygen was not measured at fourteen sites on 10/26, 10/30, and 10/31/99.

Ninety-one percent of the data may be used without qualification (3160 out of 3460 results). Overall, the data for the Fall 1999 monitoring for the Asarco El Paso Copper Smelter Remedial Investigation are deemed acceptable for the purposes of the project, provided that the flagged data are considered with appropriate caution. Any possible bias and/or lack of reproducibility indicated by the flags should be taken into account. Note that 18 percent of the samples were not associated with any field QC samples.

DATA VALIDATION REPORT

1. INTRODUCTION

- This validation applies to inorganic analytes from 117 water samples and 11 sediment samples collected during October and November of 1999 for the Asarco El Paso Copper Smelter Remedial Investigation. The total number of samples included:

10	DI blanks
11	Field duplicates (1 surface water, 9 groundwater, 1 sediment)
13	Surface water field samples
84	Groundwater field samples
10	Sediment samples

- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-49.
- No sample was collected at EP-76; it appeared to have been buried.
- Due to difficulty of access, no sample was collected at EP-75.
- No sample was collected at EP-87; it was dry.
- Due to a non-functional oxygen probe, dissolved oxygen was not measured at fourteen sites on 10/26, 10/30, and 10/31/99:

10/26/99	10/30/99	10/31/99
EP-95	EP-23	EP-78
EP-108	EP-83	EP-79
EP-109	EP-84	EP-82
	EP-88	EP-86
	EP-90	
	EM-1	
	EM-7	

- Validation procedures used are generally consistent with:
(Check all that apply)

EPA CLP National Functional Guidelines for Inorganics Data Review
 Asarco El Paso Copper Smelter Remedial Investigation Work Plan, El Paso, Texas (November 1996)
 Other

- Overall level of validation:

Contract Laboratory Program (CLP)
 Standard
 Visual

Notes: The validation consisted of a visual check of lab and field data, and an evaluation of laboratory and field quality control samples with flagging for any QC samples that were out of control limits.

2. DELIVERABLES

- All laboratory document deliverables were present as specified in the CLP-Statement of Work (CLP-SOW), EPA, 1993 and/or the project contract.

Yes

No

- Field measurements and field documentation were complete.

Yes

No

Notes: In addition to the exceptions listed under the bulleted items in Section 1, the following items were noted.

- One field turbidity measurement was recorded on 10/26/99, but no calibration of the turbidity meter was recorded for that day.
- Duplicate field measurements were not recorded for the duplicates listed in the following table:

Site	Date
EP-7	10/25/99
EP-56	10/26/99
EP-77	10/29/99
EP-83	10/30/99
EP-87	10/31/99

3. FIELD QUALITY CONTROL SAMPLES

The field quality control samples required by the work plan are one field blank (DI) and one field duplicate per day or per 20 samples, whichever is more frequent.

- **Field Blanks:** Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

DI, trip, rinsate, or any other field blanks have been carried out at the proper frequency.

Yes

No

Notes: Out of 15 days on which samples were collected, there were 5 days on which no DI blank was submitted (10/13, 10/18, 10/21, 11/18, and 11/22). A total of 18 non-QC samples were collected on these days. For these 18 samples, accuracy at low concentrations cannot be evaluated as intended by the project work plan.

Reported results on the field blanks are less than the contract required detection limits (CRDL) or the project-required detection limits (PRDL) if project detection limits have been specified.

Yes

No

Notes: When an analyte is detected in a blank, associated results up to 5 times the blank level are flagged to indicate that the results may be biased high due to contamination. Results "associated" with a field blank are generally results for samples collected on the same day as the blank. For this sampling event, 5 total lead and 21 nitrate+nitrite as N results were flagged due to detections in the field blanks.

- The following table lists blank detections. Note that for the three TDS detections that are in boldface, the results seemed totally out of line for blanks. Samples collected on the same days had results that were consistent with historical values and also had reasonable ratios of TDS to SC. Therefore, no flags were applied to the associated data.

Sample Number	Date	Analyte	Result (ppm)	5 times Blank (ppm)	PRDL (ppm)	# of Flags
EPRI-9911-222	10/26/99	TDS	1909	9545	10	0
EPRI-9911-223	10/27/99	Pb	0.004	0.020	0.003	5
EPRI-9911-226	10/28/99	TDS	2.6	13	10	0
EPRI-9911-226	10/28/99	N	0.11	0.55	0.1	3
EPRI-9911-228	10/29/99	TDS	423	2115	10	0
EPRI-9911-228	10/29/99	N	0.17	0.85	0.1	5
EPRI-9911-230	10/30/99	TDS	84	420	10	0
EPRI-9911-230	10/30/99	N	0.15	0.75	0.1	3
EPRI-9911-232	10/31/99	N	0.34	1.7	0.1	0
EPRI-9911-234	11/01/99	TDS	817	4085	10	0
EPRI-9911-234	11/01/99	SO4	2.2	11	1	0
EPRI-9911-234	11/01/99	N	0.26	1.3	0.1	10
EPRI-9911-237	11/02/99	TDS	54	270	10	0

Flagging: UJ1

- Field duplicates**

Field duplicates have been collected at the proper frequency.

Yes

X No

Notes: Eleven field duplicates were submitted for the fifteen days of sampling. No duplicates were submitted on 10/13, 10/18, 10/21, 11/18, and 11/22. For the eighteen samples collected on these days, precision could not be evaluated as intended in the work plan.

The field duplicates are listed in the following table. Duplicate field measurements were not taken for six of the ten water duplicates (marked with *).

Sample/ Duplicate #	Site	Date	Matrix
EPRI-9911-103/ 206	EP-7*	10/25/99	Groundwater
EPRI-9911-124/ 220	EP-56*	10/26/99	Groundwater
EPRI-9911-151/ 224	EP-85	10/27/99	Groundwater
EPRI-9911-155/ 225	EP-89	10/28/99	Groundwater
EPRI-9911-143/ 227	EP-77*	10/29/99	Groundwater

Sample/ Duplicate #	Site	Date	Matrix
EPRI-9911-149/ 229	EP-83*	10/30/99	Groundwater
EPRI-9911-152/ 231	EP-86*	10/31/99	Groundwater
EPRI-9911-160/ 223	SEP-12	11/01/99	Surface water
EPRI-9911-165/ 236	EM-5*	11/02/99	Groundwater
EPRI-9911-216/ 235	SEP-2-SED	11/02/99	Sediment
EPRI-9911-113/ 238	EP-25	11/03/99	Groundwater

Field duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within \pm the PRDL for water matrix.

Yes
X No

Notes: Eighteen, or approximately seven percent, of the 247 field duplicate measurements were out of control limits. The field duplicate exceedances are listed in the following table. Associated sample results were flagged to indicate a possible lack of reproducibility. Samples collected the same day as the duplicate are generally considered to be associated. A total of 152 results were flagged to indicate a possible lack of reproducibility.

Flagging: J4/UJ4

Sample Number/ Duplicate	Site	Sample Date	Analyte	Sample/ Duplicate Result (mg/L)	Exceedance	# of Flags
EPRI-9911-124/ 220	EP-56	10/26/99	TSS	2079/ 1395	39% RPD	10
EPRI-9911-124/ 220	EP-56	10/26/99	HCO ₃	430/ 350	21% RPD	10

4. LABORATORY PROCEDURES

- **Laboratory procedures followed**

CLP-SOW
 SW-846
 Methods for Chemical Analysis of Water and Wastes
 XRF Standard Operating Procedures

- **Holding times met**

Yes
 No

Notes: Holding times were exceeded for batch L991925 carbonate and bicarbonate results. A total of 66 flags were applied to the data to indicate that the results may not be representative of the true sample values.

Flagging: J₃/UJ₃

- **Consistency with project requirements**

Analyses were carried out as requested.

Yes
 No

Project specified methods were used.

Yes
 No

5. DETECTION LIMITS

- Reporting detection limits met project detection limit goals (PDLGs).

Yes
 No

Notes:

Water--The PDLG for sulfate has been set at 1 ppm. The laboratory's reporting detection limit for sulfate was 2 ppm.

Due to matrix interference, the reporting detection limit for chromium for the sample collected at POND 1 (EPRI-9911-168) was raised from 0.010 ppm to 0.050 ppm.

Sediment: As shown in the following table, the PDLG was not met for chromium, copper, or iron in the XRF analyses.

Analyte	Reporting Detection Limit	PDGL
Chromium	80 ppm	20 ppm
Copper	20 ppm	10 ppm
Iron	50 ppm	20 ppm

6. LABORATORY BLANKS

Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

- Preparation blanks**

Preparation blanks were prepared and analyzed at the required frequency.

Yes

No

All the analytes in the preparation blank were less than the CRDL (or the PRDL/PDLG if a project detection limit has been specified).

Yes

No

7. LABORATORY MATRIX SPIKES

- A matrix spike sample (pre-digestion) was analyzed for each digestion batch and/or matrix, or as required in the CLP-SOW.

Yes

No

- Matrix spike recoveries were within the required control limits (75-125%).

Yes

No

8. LABORATORY DUPLICATES

- Laboratory duplicate samples were analyzed at the proper frequency.

Yes

No

- The laboratory duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix, 35% or less for soil matrix). For low concentration data, that is if the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within plus or minus the PRDL for water matrix.

Yes

No

9. LABORATORY CONTROL STANDARDS

- LCSs were prepared and analyzed at the proper frequency

Yes

No

- LCS recoveries were within the required control limits (80-120% for water).

 Yes

X No

Notes: Recoveries on four laboratory control standards were out of control limits. Information for these LCSs is summarized in the following table. In all, associated batch results were flagged to indicate the possibility of bias.

Laboratory Batch	Analyte	LCS Recovery	# of Flags	Possible Bias of Associated Samples
L991925	Iron	122%	25	Possible high bias
L991925	Selenium	75%	33	Possible low bias
L991936	Zinc	122%	15	Possible high bias
L991938	Iron	122%	19	Possible high bias

Flagging: J2/ UJ2

10. INTERPARAMETER RELATIONSHIPS

- The following relationships have been checked:

X Lab pH vs. field pH.

X Lab SC vs. field SC

X TDS vs. SC

Lab pH vs. field pH: This relationship was generally in order. For samples for which both lab and field pH were measured, all but eight had percent differences equal to or less than ten percent. Rounded off to the nearest percent, the percent differences were distributed as follows:

equal to or less than 10%.....	58
11 to 15%.....	23
16 to 20%.....	14
21 to 31%.....	6

Lab SC vs. field SC: This relationship was generally in order. Rounded to the nearest percent, only eleven samples had percent differences greater than ten percent. The distribution of the percent differences was as follows:

less than 10%....	83
11 to 15%	14
16 to 20%	1
> 20%	3

The samples for which the percent difference between the lab and field SC was greater than 20% are listed in the following table. Note that the Field SC results for EP-54 and EP-115 have been rejected and flagged R: The field SC

from EP-115 was almost ten times less than the laboratory SC, the field SC from Pond 1 was almost seventeen and a half times less than the laboratory SC, and the TDS measurements were consistent with the laboratory SC results.

Site	Sample #	Lab SC	Field SC	% Difference	Ratio of TDS to SC	Flag
EP-54	EPRI-9911-122	10500	8290	26.7%	73.1%	---
EP-115	EPRI-9911-179	17800	1842	866.3%	78.5%	R
POND 1	EPRI-9911-168	215000	12370	1638.1%	68.6%	R

TDS vs. SC: The ratio of TDS to SC should lie between 0.55 and 0.75. In natural waters with high sulfate, the ratio may be as high as 0.96. This ratio is intended to be a check on the accuracy of the TDS and SC measurements. (It should be noted that these measurements are less accurate in dilute waters.)

This relationship was generally in order. The TDS to laboratory SC ratios ranged from 42.2% at EP-77 to 102.1% at EP-65. The ratios were distributed as follows:

less than 55%.....	5
55 to 75%	75
75 to 100%	26
over 100%	1

Site	Sample #	Date	Lab SC	TDS	Ratio of TDS to SC
EP-65	EPRI-9911-133	11/3/99	6440	6536	102.1%

11. HISTORICAL COMPARISON

The data for the Fall 1999 monitoring were compared with historical results. Table 3 in Appendix 1 contains a summary of the historical comparison. This table lists all cases where the current value differs by more than 3 standard deviations from the comparison period mean.

12. DATA QUALITY OBJECTIVES

- **Project data quality objectives (DQOs).**

Data quality objectives for this project are for the quality control samples to be within control limits. Evaluation of field and laboratory QC samples give a measure of the actual precision and accuracy obtained.

Accuracy

The ability to recover a known amount of an analyte is a measure of accuracy. Accuracy for water matrix is evaluated by recoveries on laboratory matrix spikes and laboratory control samples for higher analyte concentrations, and by blanks for analyte concentrations within five times the PRDL.

Overall, all the laboratory matrix spikes and 95 percent of the laboratory control samples were within control limits, indicating good accuracy for the higher concentration results. There were nine laboratory control standards measured for each parameter.

- Two iron LCSs had recoveries of 122 percent;
- One zinc LCS had a recovery of 122 percent;
- One selenium LCS had a recovery of 75 percent.

In general, results on the laboratory and field blanks also indicated good accuracy at lower concentrations. Note, however, that the required frequency for field blanks was not met. Field blank detections are listed in the following bulleted items.

- TDS was detected in 5 of the ten field blanks.
- Nitrate+nitrite as N was detected in five of the ten field blanks.
- Sulfate was detected in one of the field blanks.
- Lead was detected in one of the field blanks

Accuracy for sediment matrix is evaluated by recoveries on laboratory reference standards, which in this case included calibration standards and laboratory control standards for arsenic and lead only since these were analyzed using a matrix-specific calibration. Recoveries on these QC samples were all within control limits. No information was provided for evaluation of accuracy for the other parameters analyzed by XRF (cadmium, chromium, copper, iron, selenium, and zinc).

Precision

Reproducibility of results is a measure of precision. Precision is evaluated by performance on laboratory and field duplicates.

All of the laboratory duplicate measurements and 93% of the field duplicate measurements (229 out of 247) were within control limits. Note, however, that the required frequency for field duplicates was not met.

Completeness

One measure of completeness is the percentage of valid results obtained. For the Fall 1999 El Paso RI monitoring,

- ⇒ Ninety-one percent of the data may be used without qualification (3160 out of 3460 results).
- ⇒ Two field SC results were considered to be unusable, and were rejected (flagged R).

Completeness is also evaluated by how well the sampling event met the requirements of the project work plan. Completeness is achieved when the number of valid measurements is sufficient to address all important issues about a site. The quality of sample analyses is assessed indirectly through the analysis of associated quality control samples.

- The required frequency for field quality control samples was not met for the Fall 1999 monitoring event. Samples were collected on fifteen days; for five of these days, no field QC samples were submitted. Eighteen samples were not associated with field quality control.
- Due to a non-functional oxygen probe, dissolved oxygen was not measured at fourteen sites on 10/26, 10/30, and 10/31/99.
- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-49.
- No sample was collected at EP-76; it appeared to have been buried.
- Due to difficulty of access, no sample was collected at EP-75.
- No sample was collected at EP-87; it was dry.

SUMMARY

This report covers the validation of data for quarterly monitoring water and sediment samples collected during January and February of 2000 for the Asarco El Paso Copper Smelter Remediation Investigation. The validation has been carried out according to requirements spelled out in the work plan (Asarco El Paso Copper Smelter Remedial Investigation Work Plan, November 1996). Deviations from prescribed quality control procedures and/or exceedances of quality control samples have been noted, and results have been flagged in the database. Data validation codes are defined in Appendix 1, Table 1. Appendix 1 also includes the summary of flagged data (Table 2) and the summary of a statistical historical comparison (Table 3). The validated database for this data set is in Appendix 2.

The following measurements were taken in the field: static water levels, dissolved oxygen, pH, conductivity, turbidity, and water temperature. Samples were then sent to Asarco's Technical Services laboratory in Salt Lake City for the following analyses:

Physical Parameters	Major Constituents	Metals
pH	Calcium	Arsenic (Tot)
Conductivity	Magnesium	Cadmium (Tot)
TDS	Sodium	Chromium (Tot)
TSS	Potassium	Copper (Tot)
	Bicarbonate	Iron (Tot)
	Carbonate	Lead (Tot)
	Sulfate	Zinc (Tot)
	Chloride	
	Fluoride	
	NO ₃ +NO ₂ as N	

Note that as for the Fall 1999 monitoring, both groundwater and surface water samples from the Winter 2000 monitoring event were analyzed for total metals only. Turbidity was measured in the field. Where the turbidity was less than 10 NTU, the total metals portion submitted to the laboratory was unfiltered; for turbidities greater than 10 NTU, the total metals portion was filtered. For the statistics calculations summarized in Table 3, the total metals results were combined with the existing data. (For example at EM-1, nine dissolved arsenic results and two total arsenic results were used to calculate the statistics for arsenic with an N value of eleven; at SEP-1, one total arsenic, eight dissolved arsenic, eight total recoverable arsenic results were used to calculate the statistics for arsenic with an N value of seventeen.)

For this monitoring event, sediment samples were collected at eleven of the surface water sites, and were analyzed for the metals. The sediment samples were analyzed by XRF using a matrix-specific calibration for arsenic and lead, and using a fundamental parameters calibration for cadmium, chromium, copper, iron, selenium, and zinc. (The matrix-specific calibration, however, was for sandy soils from the Asarco site in Murray, Utah rather than being specific to soils from El Paso.)

Laboratory quality control violations for the sediment XRF analyses resulted in a total of eight flags:

- For arsenic and lead only, information was provided for calibration verification samples (at a frequency of 1 in 10) and laboratory control samples (1 in 20). Recoveries on these standards were all within control limits.
- Reference standard analyses were not conducted for the analyses using the fundamental parameters calibration.
- Information was provided for all analytes for laboratory duplicates, which were performed at a frequency of 1 in 20. The duplicate for cadmium was out of control limits, resulting in 8 flags.

For water, laboratory quality control violations resulted in a total of 54 flags:

- Fifty-four results were flagged for holding time exceedances. These flags indicate that the result may not be representative of the true sample value.

Field Quality Control Violations resulted in a total of 133 flags:

- Four field SC results from February 1st were considered to be unusable and were rejected. This is discussed in more detail in Section 10.
- Detections in eight of the ten field blanks resulted in a total of 48 flags to indicate possible high bias.
- Twelve of the 312 field duplicate measurements were out of control limits resulting in a total of 81 flags to indicate a possible lack of reproducibility.

Completeness of field measurements:

- The required frequency for field quality control samples was not met for the February 2000 monitoring event. On February 14, seven surface water samples were collected, but no DI blank was submitted. Also, sediment samples were submitted on two different days, but no sediment duplicate was submitted.
- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-12, at EP-25, or at EP-43.

- Turbidity was not recorded at EP-23 or at EP-53 on 2/1. Consequently, it was not known whether the total metals portions were filtered or unfiltered.
- Due to a non-functional probe, turbidity was not measured at five sites. For these five samples, the total metals portion was filtered.
- EP-87 was dry; no sample was taken.
- No samples were collected at EP-5 or at EP-99. The wells went dry during pumping and did not recover.

Ninety-four percent of the data may be used without qualification (3139 out of 3327 results). Overall, the data for the Winter 2000 monitoring for the Asarco El Paso Copper Smelter Remedial Investigation are deemed acceptable for the purposes of the project, provided that the flagged data are considered with appropriate caution. Any possible bias and/or lack of reproducibility indicated by the flags should be taken into account.

DATA VALIDATION REPORT

DATA VALIDATION REPORT

1. INTRODUCTION

- This validation applies to inorganic analytes from 119 water samples and 11 sediment samples collected during January and February of 2000 for the Asarco El Paso Copper Smelter Remedial Investigation. The total number of samples included:

10	DI blanks
11	Field duplicates (1 surface water, 10 groundwater)
12	Surface water samples (not counting duplicate)
86	Groundwater samples (not counting duplicates)
11	Sediment samples

- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-12, at EP-25, or at EP-43.
- No sample was collected at EP-87; it was dry.
- No samples were collected at EP-5 or at EP-99. The wells went dry and did not recover.

- Validation procedures used are generally consistent with:
(Check all that apply)

EPA CLP National Functional Guidelines for Inorganics Data Review
 Asarco El Paso Copper Smelter Remedial Investigation Work Plan, El Paso, Texas (November 1996)
 Other

- Overall level of validation:

Contract Laboratory Program (CLP)
 Standard
 Visual

Notes: The validation consisted of a visual check of lab and field data, and an evaluation of laboratory and field quality control samples with flagging for any QC samples that were out of control limits.

2. DELIVERABLES

- All laboratory document deliverables were present as specified in the CLP-Statement of Work (CLP-SOW), EPA, 1993 and/or the project contract.

Yes
 No

- Field measurements and field documentation were complete.

Yes
 No

3. FIELD QUALITY CONTROL SAMPLES

The field quality control samples required by the work plan are one field blank (DI) and one field duplicate per day or per 20 samples, whichever is more frequent.

- **Field Blanks:** Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

DI, trip, rinsate, or any other field blanks have been carried out at the proper frequency.

 Yes

X No

Notes: For eleven sampling days, ten DI blanks were submitted. No DI blank was submitted on February 14; but seven surface water samples were collected on this day. For these samples, accuracy at low concentrations cannot be evaluated as intended by the project work plan.

Reported results on the field blanks are less than the contract required detection limits (CRDL) or the project-required detection limits (PRDL) if project detection limits have been specified.

 Yes

X No

Notes: When an analyte is detected in a blank, associated results up to 5 times the blank level are flagged to indicate that the results may be biased high due to contamination. Results "associated" with a field blank are generally results for samples collected on the same day as the blank.

For this sampling event, 24 total lead, 2 total selenium, 2 total iron and 20 nitrate+nitrite as N results were flagged due to detections in the field blanks.

- The following table lists blank detections.

Sample Number	Date	Analyte	Result (ppm)	5 times Blank (ppm)	PRDL (ppm)	# of Flags
EPRI-0002-220	01/24/00	HCO3	3.4	17	1	0
EPRI-0002-220	01/24/00	Pb	0.009	0.045	0.003	12
EPRI-0002-220	01/24/00	Se	0.005	0.025	10	2
EPRI-0002-222	01/25/00	N	0.11	0.55	0.1	2
EPRI-0002-222	01/25/00	Pb	0.008	0.040	0.003	12
EPRI-0002-224	01/26/00	HCO3	1.22	6.1	1	0
EPRI-0002-224	01/26/00	N	0.10	0.50	0.1	0
EPRI-0002-225	01/27/00	HCO3	2.9	14.5	1	0
EPRI-0002-225	01/27/00	N	0.26	1.3	0.1	1

EPRI-0002-234	02/01/00	SO4	1.3	6.5	1	0
EPRI-0002-234	02/01/00	N	0.082	0.41	0.1	2
EPRI-0002-234	02/01/00	Fe	0.26	1.3	0.1	2
EPRI-0002-235	02/07/00	N	0.53	2.65	0.1	4
EPRI-0002-238	02/08/00	N	0.41	2.05	0.1	2

Flagging: UJ₁

- **Field duplicates**

Field duplicates have been collected at the proper frequency.

Yes

No

Notes: No field duplicate was submitted for the 13 sediment samples.

The field duplicates are listed in the following table.

Sample/ Duplicate #	Site	Date	Matrix
EPRI-0002-137/ 219	EP-70	01/24/00	Groundwater
EPRI-0002-136/ 221	EP-68	01/25/00	Groundwater
EPRI-0002-154/ 223	EP-88	01/26/00	Groundwater
EPRI-0002-149/ 226	EP-83	01/27/00	Groundwater
EPRI-0002-145/ 227	EP-79	01/28/00	Surface water
EPRI-0002-103/ 230	EP-7	01/29/00	Groundwater
EPRI-0002-108/ 232	EP-20	01/31/00	Groundwater
EPRI-0002-124/ 233	EP-56	02/01/00	Groundwater
EPRI-0002-133/ 236	EP-65	02/07/00	Groundwater
EPRI-0002-104/ 237	EP-12	02/08/00	Groundwater
EPRI-0002-193/ 239	SEP-13	02/14/00	Surface Water

Field duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within \pm the PRDL for water matrix.

Yes

No

Notes: Twelve, or approximately four percent, of the 312 field duplicate measurements were out of control limits. The field duplicate exceedances are listed in the following table. Associated sample results were flagged to indicate a possible lack of reproducibility. Samples collected the same day as the duplicate are generally considered to be associated. A total of 81 results were flagged to indicate a possible lack of reproducibility.

Flagging: J₄/UJ₄

Sample Number/ Duplicate	Site	Sample Date	Analyte	Sample/ Duplicate Result (mg/L)	Exceedance	# of Flags
EPRI-0002-103/ 230	EP-7	01/29/00	Chloride	581/ 469	21% RPD	6
EPRI-0002-104/ 237	EP-12	02/08/00	TSS	46/ 68	39% RPD	2

4. LABORATORY PROCEDURES

- Laboratory procedures followed

- CLP-SOW
 SW-846
 Methods for Chemical Analysis of Water and Wastes
 XRF Standard Operating Procedures

- Holding times met

- Yes
 No

Notes: A total of 54 results were flagged because the holding times were exceeded: These holding time exceedances are summarized in the following table.

Analyte	Maximum Holding Time	Time Held Before Analysis	# of Flags
TDS	7 days	9 days	2
TDS	7 days	9 days	2
Chloride	28 days	34 days	1
NO ₃ + NO ₂ AS n	28 days	29 to 33 days	49

Flagging: J₃/ UJ₃

- Consistency with project requirements

Analyses were carried out as requested.

- Yes
 No

Project specified methods were used.

- Yes
 No

5. DETECTION LIMITS

- Reporting detection limits met project detection limit goals (PDLGs).

Yes

No

Notes:

Water--The PDLG for sulfate has been set at 1 ppm. The laboratory's reporting detection limit for sulfate was 2 ppm.

Sediment: As shown in the following table, the PDLG was not met for chromium, copper, or iron in the XRF analyses. This was not an issue for iron and copper, as all eleven sediment samples contained greater than the reporting level of these parameters. For chromium, however, nine of the eleven samples were reported as less than 80 ppm.

Analyte	Reporting Detection Limit	PDGL
Chromium	80 ppm	20 ppm
Copper	20 ppm	10 ppm
Iron	50 ppm	20 ppm

6. LABORATORY BLANKS

Please note that the highest blank value associated with any particular analyte is the blank value used for the flagging process.

- Preparation blanks

Preparation blanks were prepared and analyzed at the required frequency.

Yes

No

All the analytes in the preparation blank were less than the CRDL (or the PRDL/PDLG if a project detection limit has been specified).

Yes

No

7. LABORATORY MATRIX SPIKES

- A matrix spike sample (pre-digestion) was analyzed for each digestion batch and/or matrix, or as required in the CLP-SOW.

Yes

No

- Matrix spike recoveries were within the required control limits (75-125%).

Yes

No

8. LABORATORY DUPLICATES

- Laboratory duplicate samples were analyzed at the proper frequency.

Yes

No

- The laboratory duplicate relative percent differences (RPDs) were within the required control limits (RPD of 20% or less for water matrix, 35% or less for soil matrix). For low concentration data, that is if the sample or duplicate result is less than 5 times the PDLG, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within plus or minus the PDLG for water matrix, within plus or minus two times the PDLG for sediment or soil matrix.

Yes -- For water

No -- For sediment

Notes: The XRF batch L000196 laboratory duplicate was out of control limits for cadmium. The original sample was measured at 51 ppm, and the duplicate was 17 ppm. Since the sample/duplicate difference was greater than 20 ppm (two times the PDLG), eight low-concentration cadmium results from this batch were flagged to indicate possible lack of reproducibility.

Flagging: J4/ UJ4

9. LABORATORY CONTROL STANDARDS

- LCSs were prepared and analyzed at the proper frequency

Yes

No

- LCS recoveries were within the required control limits (80-120% for water, 75-125% for arsenic and lead analyzed by XRF).

Yes

No

10. INTERPARAMETER RELATIONSHIPS

- The following relationships have been checked:

Lab pH vs. field pH

Lab SC vs. field SC

TDS vs. SC

Lab pH vs. field pH: This relationship was generally in order. For samples for which both lab and field pH were measured, all but one had percent differences equal to or less than sixteen percent. Rounded off to the nearest percent, the percent differences were distributed as follows:

equal to or less than 10% 80
11 to 16% 24
35% 1

Lab SC vs. field SC: This relationship was generally in order. With the exception of four samples, all samples had percent differences equal to or less than 20%. Rounded to the nearest percent, the distribution of the percent differences was as follows:

less than 10%.....	96
11 to 15%.....	4
20%.....	1
over 20%.....	4

The four samples with SC percent differences greater than 20% are listed in the following table. Historical SC values and TDS measurements were consistent with the laboratory SC results. Therefore, for these four samples, the field SC results are considered unusable, and have been flagged R for rejected.

Site	Sample #	Sample Date	Field SC	Lab SC	% Difference	Ratio of TDS to lab SC
EP-21	EPRI-0002-109	02/01/00	1101,R	4880	343%	60%
EP-23	EPRI-0002-111	02/01/00	951,R	4770	402%	56%
EP-24	EPRI-0002-112	02/01/00	1072,R	5120	378%	54%
EP-53	EPRI-0002-121	02/01/00	1594,R	7520	372%	75%

TDS vs. SC: The ratio of TDS to SC should lie between 0.55 and 0.75. In natural waters with high sulfate, the ratio may be as high as 0.96. This ratio is intended to be a check on the accuracy of the TDS and SC measurements. (It should be noted that these measurements are less accurate in dilute waters.)

This relationship was in order. The TDS to laboratory SC ratios ranged from 48% at EP-85 to 90% at EP-65. The ratios were distributed as follows:

less than 55%.....	2
55 to 75%.....	80
75 to 90%.....	27
over 90%.....	0

11. HISTORICAL COMPARISON

The data for the Winter 2000 monitoring were compared with historical results. Table 3 in Appendix 1 contains a summary of the historical comparison. This table lists all cases where the current value differs by more than 2.5 standard deviations from the comparison period mean or where the current value was highest or lowest over the entire database period.

12. DATA QUALITY OBJECTIVES

- **Project data quality objectives (DQOs).**

Data quality objectives for this project are for the quality control samples to be within control limits. Evaluation of field and laboratory QC samples give a measure of the actual precision and accuracy obtained.

Accuracy

The ability to recover a known amount of an analyte is a measure of accuracy.

Accuracy for water matrix is evaluated by recoveries on laboratory matrix spikes and laboratory control samples for higher analyte concentrations, and by blanks for analyte concentrations within five times the PDLG.

All laboratory matrix spikes and laboratory control samples were within control limits, indicating good accuracy for the higher concentration results.

In general, results on the laboratory and field blanks also indicated good accuracy at lower concentrations. Note, however, that the required frequency for field blanks was not met, as no field blank was submitted with the seven surface water samples collected on 2/14/00.

Field blank detections that resulted in flagging to indicate possible high bias are listed in the following bulleted items.

- Nitrate+nitrite as N, six detections.
- Total lead, two detections.
- Total iron, one detection.
- Total selenium, one detection.

Accuracy for sediment matrix is evaluated by recoveries on laboratory reference standards, which in this case included calibration standards and laboratory control standards for arsenic and lead only since these were analyzed using a matrix-specific calibration. Recoveries on these QC samples were all within control limits. No information was provided for evaluation of accuracy for the other parameters analyzed by XRF (cadmium, chromium, copper, iron, selenium, and zinc).

Precision

Reproducibility of results is a measure of precision. Precision is evaluated by performance on laboratory and field duplicates.

Precision for water matrix: All of the laboratory duplicate measurements and approximately 96 percent (300 of 312) of the field duplicate measurements

were within control limits. Except for the parameters listed below, all of the field duplicates were within control limits.

<u>Analyte</u>	<u>% Field Duplicates within Control Limits</u>	<u>Analyte</u>	<u>% Field Duplicates within Control Limits</u>
TSS	82%	NO ₃ + NO ₂ as N	82%
Chloride	82%	Arsenic	91%
CO ₃	82%	Iron	73%

Precision for sediment matrix: The laboratory duplicate for cadmium was out of control limits, which indicated possible lack of precision at low concentrations. No field duplicate was submitted for the sediment matrix; consequently, a precision evaluation as was intended by the work plan is not possible.

Completeness

One measure of completeness is the percentage of results qualified as a result of the data validation. For the Winter 2000 El Paso RI monitoring,

- ⇒ Ninety-four percent of the data may be used without qualification (3111 out of 3299 results).
- ⇒ Four percent (4 out of 105) of the field SC results were considered to be unusable, and were rejected (flagged R).

A summary of the completeness calculated by parameter is listed in the following table.

Parameter	Number Analyzed	Number Valid	Percent Valid	Number Not Flagged	Percent Not Flagged
DTWL	86	86	100%	86	100%
Oxygen	105	105	100%	105	100%
pH(field)	105	105	100%	105	100%
SC(field)	105	101	96%	101	96%
Turbidity	88	88	100%	88	100%
Water Temp.	104	104	100%	104	100%
pH(lab)	119	119	100%	119	100%
SC(lab)	119	119	100%	119	100%
TDS	119	119	100%	117	98%
TSS	119	119	100%	107	90%
Calcium	119	119	100%	119	100%
Magnesium	119	119	100%	119	100%
Sodium	119	119	100%	119	100%
Potassium	119	119	100%	119	100%
Bicarbonate	119	119	100%	119	100%
Carbonate	119	119	100%	108	91%
Sulfate	119	119	100%	119	100%

Parameter	Number Analyzed	Number Valid	Percent Valid	Number Not Flagged	Percent Not Flagged
Chloride	119	119	100%	107	90%
Fluoride	119	119	100%	119	100%
NO ₃ +NO ₂ as N	119	119	100%	39	33%
Arsenic	130	130	100%	125	96%
Cadmium	130	130	100%	122	94%
Chromium	130	130	100%	130	100%
Copper	130	130	100%	130	100%
Iron	130	130	100%	102	78%
Lead	130	130	100%	106	82%
Selenium	130	130	100%	128	98%
Zinc	130	130	100%	130	100%

Completeness is also evaluated by how well the sampling event met the requirements of the project work plan. Completeness is achieved when the number of valid measurements is sufficient to address all important issues about a site.

- Due to the presence of large amounts of hydrocarbon product, field parameters were not measured at EP-12, at EP-25, or at EP-43.
- Turbidity was not recorded at EP-23 or at EP-53 on 2/1. Consequently, it was not known whether the total metals portions were filtered or unfiltered.
- No samples were collected at EP-5 or at EP-99. The wells went dry and did not recover.
- No sample was collected at EP-87; it was dry.

Since the quality of sample analyses is assessed indirectly through the analysis of associated quality control samples, the following items also affect the completeness of the data for this sampling event.

- The required frequency for field quality control samples was not met for the Winter 2000 monitoring event.
 - On 02/14/00, seven surface water samples were collected, but no DI blank was submitted.
 - Sediment samples were collected on 2 of the sampling days, but no sediment field duplicate was submitted.

Statistics for EPRI Feb 2000 Water Monitoring

Table 3. Summary of Historical Comparisons

**Summary of the Comparison of the February 2000 Data to the Existing Data,
Showing Results that are:**

- *Highest or Lowest over the Database Period
- *2.5 or More Standard Deviations from the Mean
(Marked with #.)
- (All values are in ppm.)

**Note: For groundwater statistics, 'Dissolved' results were combined with 'Total';
for surface water statistics, 'Dissolved' results were combined with 'Total Recoverable'.**

LAB NUMBER	L000196009	L000196011
TYPE	XRF	XRF
SAMPLE NUMBER	EPRI-0002-214	EPRI-0002-215

-- METALS & MINOR CONSTITUENTS --

ARSENIC (AS) TOT	<10.0	1400.0
CADMIUM (CD) TOT	12.0 J4	51.0 J4
CHROMIUM (CR) TOT	<80.0	130.0
COPPER (CU) TOT	96.0	15000.0
IRON (FE) TOT	21000.0	260000.0
LEAD (PB) TOT	66.0	5100.0
SELENIUM (SE) TOT	<10.0	<10.0
ZINC (ZN) TOT	89.0	18000.0

NOTES: All results in mg/L (Water) or mg/kg (Soil) unless noted and are laboratory (LAB) unless field (FLD) or calculated (CALC)
 TOT:Total; DIS:Dissolved; TRC:Total Recoverable; E:Estimated; <:Less Than Detect. Blank: parameter not tested
 Validation Flags: A:Anomalous; UJ1:Blank; J2,UJ2: Standard; J3:Hold Time; J4,UJ4:Duplicate, Spike, or Split Exceedance;
 R:Rejected.

SUMMARY

This report summarizes the validation of XRF analysis results for soil samples collected from July 1999 through February 2000 for Phase II of the Asarco El Paso Copper Smelter Remedial Investigation. The data have been reviewed in accordance with the project work plan (Asarco El Paso Copper Smelter Remedial Investigation, El Paso, Texas, November 1996). Deviations from the prescribed quality control procedures and/or exceedances of quality control limits have been noted in the text, and associated data have been identified as qualified by flagging the sample results in the database with data validation codes. Data validation codes and definitions are listed in Appendix 1, Table 1. Appendix 1 also contains Table 2 (Summary of Flagged Data). Supporting data for the statistical analyses are in Appendix 2, and the validated sample database is in Appendix 3.

Samples were analyzed at Asarco Technical Services laboratory in Salt Lake City, Utah.

- Parameters of interest included arsenic, cadmium, chromium, copper, iron, lead, selenium, and zinc.
- The samples were analyzed for arsenic and lead content using the matrix-specific calibration developed for soils from the Asarco site in Murray, Utah. The other parameters were analyzed using the fundamental parameters calibration.

Precision, accuracy, and completeness information for the XRF analysis is summarized in Section 9. The accuracy of the XRF analyses was evaluated by statistical comparisons to the results obtained by the wet chemistry analysis of split samples. (These wet chemistry samples were also analyzed at Asarco's Technical Services Laboratory in Salt Lake City, Utah). The laboratory was responsible for choosing and splitting samples to be used as XRF confirmation samples. The frequency specified in the work plan (1 in 20) was met; the actual XRF confirmation sample frequency was 1 in 16. Comparisons of the XRF and the confirmation split sample results have been included in this report as Section 10. The comparisons show that in general the values obtained by XRF analysis were higher than those obtained by traditional wet chemistry methods.

A summary of quality control violations follows. It should be noted that not all quality control deficiencies are equally serious, and some may have no practical impact on the usefulness of the data.

Laboratory Quality Control Violations:

- Four XRF laboratory duplicates were out of control limits. A total of 57 associated results were flagged to indicate a possible lack of precision. Eighteen of these results were from a laboratory batch for which there were two laboratory duplicates, and both were out of control limits (for zinc).
- There were no quality control violations for the wet chemistry analyses.

Field Quality Control Violations

- The work plan requires field duplicates to be submitted at a frequency of one in twenty or at least one per day.
 - Overall, one in every ten samples was a field duplicate.
 - Samples were collected on 56 days. On 16 of these days (29 percent), no field duplicate was submitted. Out of a total of 631 non-QC samples, 100 (16 percent) were submitted on days when no field duplicate was collected.
- Out of 520 field duplicate measurements, 52 (ten percent) were out of control limits. A total of 385 results were flagged to indicate a possible lack of precision. (Three lead results were flagged for both laboratory and field duplicates; one zinc result was flagged for two field duplicates.)

Overall, 93 percent of the data may be used without qualification. Seven percent of the data (439 out of 5920 results) were flagged due to quality control exceedances, and may be used with caution, taking into account the possible lack of reproducibility indicated by the flags.

DATA VALIDATION REPORT

1. INTRODUCTION

- This validation applies to the analysis of arsenic, cadmium, copper, chromium, iron, lead, selenium, and zinc for 696 soil samples collected for the El Paso RI project from July 1999 through February 2000. The total number of samples included 631 regular field samples and 65 field duplicates analyzed by XRF, and 44 split samples (confirmation samples) analyzed by wet chemistry methods and used to evaluate the accuracy of the XRF analyses.
- Validation procedures used are generally consistent with:
(Check all that apply)
 - EPA National Functional Guidelines for Inorganic Data Review
 - Project Work Plan: Asarco El Paso Copper Smelter Remedial Investigation Work Plan -- El Paso, Texas (November 1996)
 - Other
- Overall level of validation:
 - Contract Laboratory Program (CLP)
 - Standard - see Notes
 - Visual
 - XRF Auto-Validation using in house Auto Val program

Notes: Both laboratory and field quality control were evaluated for frequency and measured values. Results were flagged for exceedances on field and laboratory quality control.

2. DELIVERABLES

- All laboratory document deliverables were present as specified in the CLP-Statement of Work (CLP-SOW), EPA, 1995 and/or the project contract.
 - Yes
 - No
- All documentation of field procedures was provided as required.
 - Yes
 - No

3. FIELD QUALITY CONTROL SAMPLES

- Field duplicates

Field duplicates have been collected at the proper frequency.

Yes

No

Notes: The field duplicate frequency required by the project work plan is 1 in 20 or 1 per sampling day, whichever is more frequent. Overall, the total number of field duplicates was 1 in 10 (65 field duplicates submitted for 631 non-QC samples). However: the daily frequency was not met.

- On 8/6/99, the specified daily frequency of 1 in 20 was not met: 26 samples were collected, but this included only one field duplicate.
- The frequency of 1 per sampling day has not been met. As shown in the following table, for 101 samples, or 16% of the non-QC samples, no field duplicates were submitted on the day of sample collection.

Date of Sampling	Number of Samples Affected by Lack of QC
7/19/99	8
8/10/99	3
8/12/99	2
8/14/99	5
8/24/99	4
8/27/99	1
9/1/99	9
10/5/99	3
10/12/99	3
10/14/99	2
10/20/99	2
10/27/99	10
10/28/99	5
10/29/99	3
11/15/99	4
02/09/00	36
Totals	100

Field duplicate relative percent differences (RPDs) were within the required control limits (RPD of 35% or less for soil matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within ± 2 times the PRDL for soil matrix.

Yes

No

Notes: A total of 372 results were flagged because the associated field duplicates were out of control limits. These flags indicate possible lack of reproducibility due to the combined effects of variations in field sampling techniques, sample preparation, and laboratory analytical procedures.

Flagging: J₄/UJ₄

Field duplicate exceedances are listed in the following table:

Sample Duplicate Pair	Sample Date	Analyte	Sample Values mg/kg	Duplicate Values mg/kg	# Samples Flagged	RPD or ± Criteria
BH3-2B/ B2	08/23/99	Arsenic	<10	74	7	> ± 20 mg/kg
		Cadmium	<10	37	7	> ± 20 mg/kg
		Copper	82	310	8	116%
		Lead	52	280	7	137%
		Zinc	61	390	6	146%
BH3-5A/ A2	08/25/99	Arsenic	870	550	7	45%
		Lead	3800	2400	7	45%

* EP-102Q was collected on 10/4/99. This sample was flagged for the duplicate collected in the same borehole (EP-102N/N2), and also for the duplicate collected on the same day (EP-103F/F2).

4. LABORATORY PROCEDURES

- Laboratory procedures followed

- CLP-SOW
 SW-846
 Standard Methods for Chemical Analysis of Water and Wastes
 XRF Standard Operating Procedures
 Other

- Holding times met

- Yes
 No

- Analyses were carried out as requested.

- Yes
 No

5. DETECTION LIMITS

The following table lists the laboratory reporting levels by analytical method.

Analyte	Reporting Level	
	XRF	Wet Chemistry (L991997, L991391, L000277)
Arsenic	10 ppm	5, 10 ppm
Cadmium	10 ppm	1, 2.5, 10 ppm
Chromium	80 ppm	5, 20 ppm
Copper	20 ppm	5, 10 ppm
Iron	50 ppm	5, 10, 20 ppm
Lead	10 ppm	5, 10 ppm
Selenium	10 ppm	5, 10 ppm
Zinc	10 ppm	10 ppm

6. XRF CALIBRATION AND CALIBRATION VERIFICATIONS

- Calibration verifications

The calibration verification (CV) standards were analyzed at the required frequency.

Yes

No

Notes: Calibration verification data was provided only for arsenic and lead, as these two parameters were analyzed using a matrix-specific calibration developed for soils from the Asarco site in Murray, Utah. Reference standards were not analyzed for the other parameters, which were analyzed using a fundamental parameters calibration.

The CV standard percent recovery results for arsenic and lead were within the required control limits (75-125%).

Yes

No

Notes: The CV standard was #30651-58 (arsenic=700 ppm; lead=8062 ppm).

7. XRF LABORATORY DUPLICATES

- Laboratory duplicate samples were analyzed at the proper frequency.

Yes

No

- The laboratory duplicate relative percent differences (RPDs) were within the required control limits (RPD of 35% or less for soil matrix). If the sample or duplicate result is less than 5 times the PRDL, the RPD criteria are not used. In these cases, the difference between the sample and the duplicate results must be within ± 2 times the PRDL for soil matrix.

Yes

No

Notes: Flagging for laboratory duplicates is summarized in the following table.

Laboratory Batch	Analyte	# Samples Flagged	RPD or \pm Criteria
L991291	Zinc	10	$> \pm 20$ mg/kg
L991649	Zinc	9	$> \pm 20$ mg/kg
L991649	Zinc	9	$> \pm 20$ mg/kg
L992004	Lead	29	$> \pm 20$ mg/kg

8. XRF LABORATORY CONTROL SAMPLES

- LCSs were prepared and analyzed at the proper frequency

Yes

No

- LCS recoveries were within the required control limits (75-125% for arsenic and lead).

Yes

No

Notes: The standard used was #LCS287 (arsenic=917 ppm; lead=236 ppm). Laboratory control sample data was provided only for arsenic and lead, as these two parameters were analyzed using a matrix-specific calibration developed for soils from the Asarco site in Murray, Utah. Reference standards were not analyzed for the other parameters, which were analyzed using a fundamental parameters calibration.

9. DATA QUALITY OBJECTIVES

Accuracy

The accuracy of the data is indicated by the laboratory's ability to recover a known concentration of an analyte. For the data evaluated in this report, accuracy is to be measured by percent recovery on laboratory standards (the CVs and the LCSs). Target accuracy for the project is for these quality control samples to be within control limits. This target was met for arsenic and lead. Reference standards were not analyzed for the other parameters, which were analyzed using a fundamental parameters calibration.

Another measure of the accuracy of the XRF analyses is the comparison with the confirmation sample splits analyzed by wet chemistry. These comparisons are discussed in Section 10 of this report.

Precision

The precision of the data is indicated by the reproducibility of the results as indicated by laboratory and field duplicate samples. Target precision for the project is for these quality control samples to be within control limits. Overall, 99% (332 out of 336) of the laboratory duplicate measurements and 90% (468 out of 520) of the field duplicate measurements were within control limits.

The following table shows the percentage of duplicates that were within control limits broken down by parameter.

Analyte	# Field Duplicates Out of Control Limits	% of Field Duplicates in Control Limits (n=65)	# Lab Duplicates Out of Control Limits	% of Laboratory Duplicates in Control Limits (n=42)
Arsenic	7	89.2%	0	100%
Cadmium	7	89.2%	0	100%
Chromium	0	100%	0	100%
Copper	9	86.2%	0	100%
Iron	1	98.5%	0	100%
Lead	11	83.1%	1	97.6%
Selenium	3	95.4%	0	100%
Zinc	14	78.5%	3	92.9%

Completeness

Completeness expressed as the percent of results not rejected: 100%
Completeness expressed as the percent of results without flags: 93%

10. CONFIRMATION SAMPLES

- **Introduction**

Forty-four samples were selected by the laboratory as XRF confirmation splits. The purpose of these confirmation samples is to compare analytical results obtained by the XRF instrument with analytical results obtained from traditional wet chemistry soil analysis techniques. These samples were analyzed in three laboratory batches, L991391, L991997, and L000277.

- **All wet chemistry laboratory quality control samples were within control limits.**

- **Data Comparison (XRF Data and CLP-RAS Data)**

XRF results have been compared to corresponding CLP-RAS digested wet chemistry results (validated in this report) using the following statistical methods:

- Relative percent difference calculations
- Recovery rate calculations
- Linear regression analysis with 95% confidence bands (Miller, 1993)

Note that in the sample preparation, these samples were digested using the less complete CLP-RAS 3050 digestion method with nitric and hydrochloric acid rather than the more complete digestion using hydrofluoric acid. It is therefore not surprising that both recovery rate calculations and the regression analyses show that the XRF values are generally biased high with respect to those obtained by traditional wet chemistry methods.

The laboratory's reporting limits for the XRF analyses were sometimes different from the reporting limits for the wet chemistry analyses. For comparison purposes the greater of the two reporting limits for each parameter was used. The following table lists the reporting limits.

Parameter	Reporting Limits (ppm) XRF	Reporting Limits (ppm) Wet Chemistry	Reporting Limit Used in Data Comparison
Arsenic	10	5, 10	10 ppm
Cadmium	10	10	10 ppm
Chromium	80	20	80 ppm
Copper	20	10	20 ppm
Iron	50	20	50 ppm
Lead	10	10	10 ppm
Selenium	10	10	10 ppm
Zinc	10	10	10 ppm

Relative Percent Difference Calculations:

First, all values less than the reporting detection limit were replaced by that reporting detection limit. (If different reporting detection limits were used for wet chemistry and XRF analyses, then the higher limit was chosen for the comparison calculations.) Relative percent difference (RPD) values were calculated for samples with concentrations greater than 5 times the reporting detection limit. A control limit of 35% RPD was used for the comparison. If either the XRF or wet chemistry result was less than 5 times the reporting detection limit, the RPD criteria were not used. In these cases, the difference between the

XRF and wet chemistry result should be within \pm 2 times the PRDL for soil matrix. These criteria are typically used for the comparison of laboratory duplicates. The duplicate criteria were used here to evaluate the agreement of the XRF confirmation sample data pairs relative to generally accepted control limits; however, no data were qualified as a result of the comparison. The results of the RPD calculations (Appendix 2) are summarized in the following table. (There were 44 data pairs for each comparison.)

Parameter	# of Data Pairs in Comparison Limits	% of RPDs within Comparison Limits
Arsenic	35	80%
Cadmium	37	84%
Chromium	41	93%
Copper	22	50%
Iron	25	57%
Lead	36	82%
Selenium	44	100%
Zinc	43	98%

Recovery Rate Calculations:

Recovery rate calculations (XRF result/CLP-RAS result) were used to evaluate the overall accuracy of the XRF analyses compared to the wet chemistry analyses. A range of 75 to 125 % recovery was used as the range of interest since those are the control limits used to evaluate recovery on laboratory standards for XRF analyses. Again, there were a total number of 44 data pairs for each comparison. Recovery rates were then used to determine whether one analytical method consistently gave higher or lower results than the other. This was done by comparing the number of recoveries greater than 100 percent (XRF result higher than wet chemistry result) to the number of recoveries less than 100 percent (XRF result less than wet chemistry result).

Analyte	# of Data Pairs in Comparison Limits	% of Recoveries in Range from 75 to 125%
Arsenic	28	64%
Cadmium	24	55%
Chromium	36	82%
Copper	10	23%
Iron	8	18%
Lead	27	61%
Selenium	27	61%
Zinc	36	82%

Recovery Range	As	Cd	Cr	Cu	Fe	Pb	Se	Zn
over 100 %	66%	77%	30%	98%	95%	75%	41%	59%
equal to 100 %	5%	16%	70%	----	----	2%	50%	9%
less than 100 %	30%	7%	----	2%	5%	23%	9%	32%

Regression analysis:

Regression analysis includes calculation of the R-value, slope and y-intercept for the linear regression of XRF results on EPA wet chemistry results for each analyte. Linear regression is the preferred method over the paired t-test because linear regression accommodates a wide range of concentrations, whereas the paired t-test rests on the assumption that both random and systematic errors are independent of concentration. (Miller, 1992)

The *R-value* shows the strength of the association between variables.

The *slope of the regression line* should be near 1 for methods giving similar results, and may show if a systematic error in calibration plots has occurred during analysis.

The *Y-intercept* should be near 0 for methods giving similar results, and may show if a systematic error has been introduced by background interference, whether it be absorption or fluorescence factors.

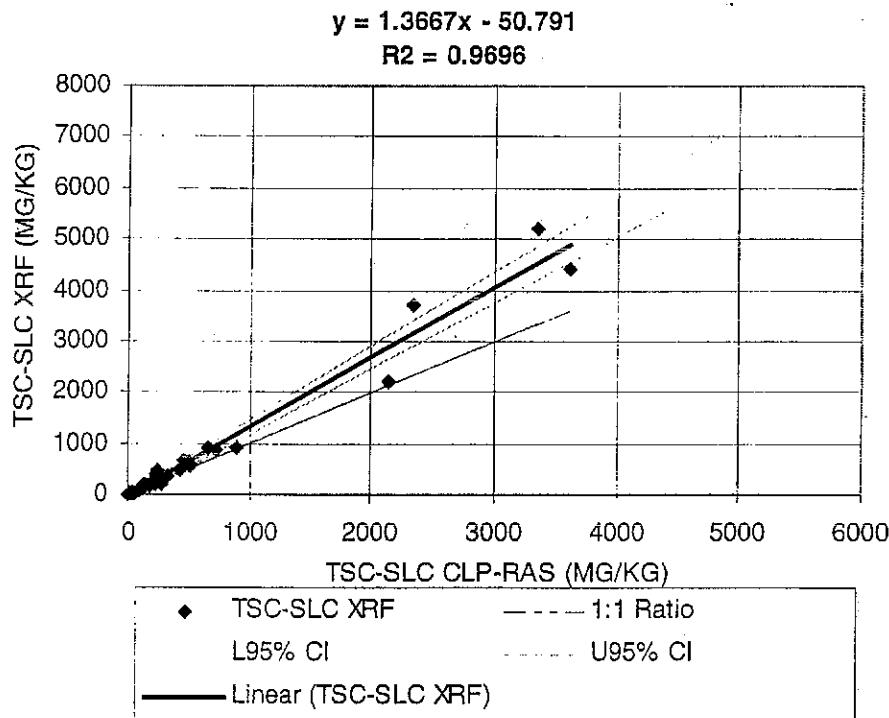

The regression analysis was carried out with an automated in-house soft-ware program

Regression results for each parameter are summarized on the following pages. Full-size graphs and supporting data for each parameter are in Appendix 2.

Arsenic Regression Results: R = 0.985

Slope	y - Intercept
Upper 95%: 1.442	Upper 95%: 19.93
Value: 1.367	Value: -50.79
Lower 95%: 1.291	Lower 95%: -121.51

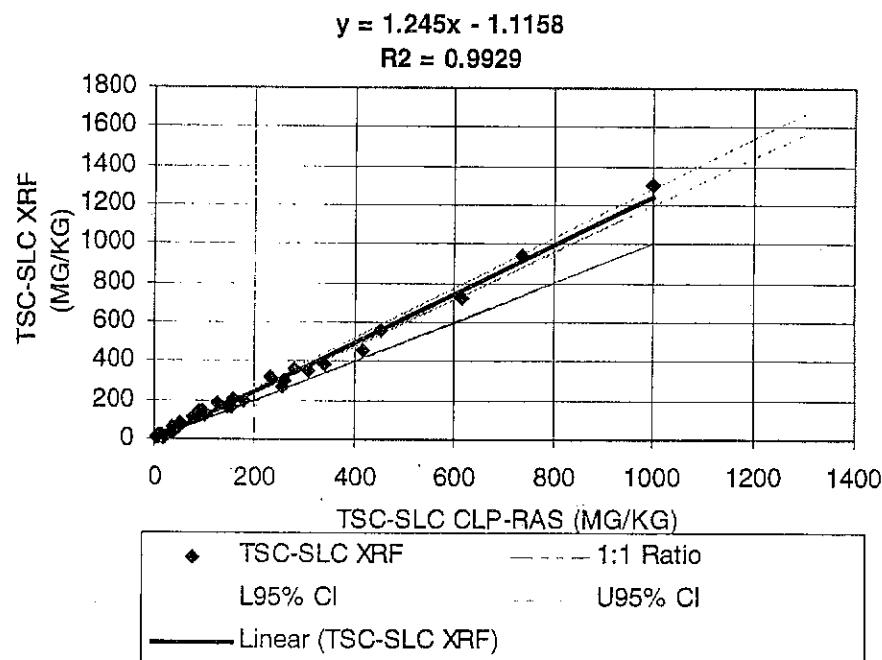

The R value shows a strong correlation between results obtained by the two analytical methods. Also, the 95% confidence bands are narrow, indicating good precision between the two analysis methods. Inspection of the slope, the y-intercept value, and the scatter plot (Appendix 2) indicates that XRF values are biased high with respect to CLP-RAS results. The 95% confidence bands are narrow, indicating a high correlation between the two analysis methods. However, the slope and y-intercept values also indicate systematic error due to calibration plots and due to background interference. This is to be expected when, as in this case, a calibration is used that is not specific to the soils being analyzed.

Cadmium Regression Results: R = 0.996

Slope	y - Intercept
Upper 95%: 1.278	Upper 95%: 7.402
Value: 1.245	Value: -1.116
Lower 95%: 1.212	Lower 95%: -9.634

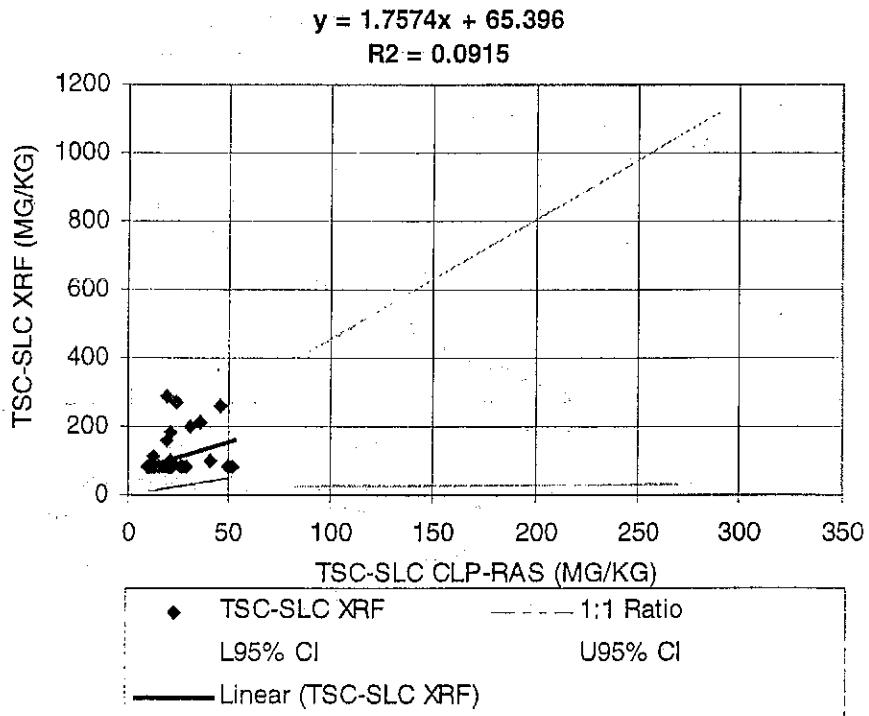

The R value shows a strong correlation between results obtained by the two analytical methods. Inspection of the slope, the y-intercept value, and the scatter plot (Appendix 2) indicates that XRF values are biased high with respect to CLP-RAS results. The 95% confidence bands are narrow, indicating a high correlation between the two analysis methods. However, the slope and y-intercept values also indicate systematic error due to calibration plots and due to background interference. This is to be expected when, as in this case, a calibration is used that is not specific to the soils being analyzed.

Chromium Regression Results: $R = 0.302$

Slope	y - Intercept
Upper 95%: 3.482	Upper 95%: 107.3
Value: 1.757	Value: 65.4
Lower 95%: 0.033	Lower 95%: 23.5

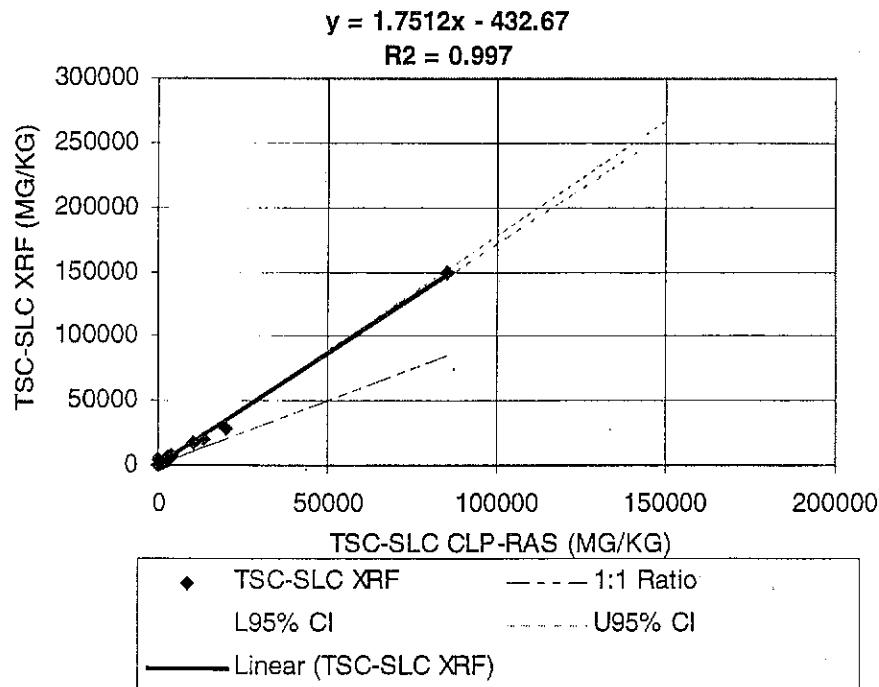

The R value shows no correlation between results obtained by the two analytical methods. Inspection of the Regression Analysis Data Sheet (Appendix 2) shows that for 75 percent (33 out of 44) of the samples, the XRF results were reported to be below the detection limit of 80 ppm, while the wet chemistry CLP-RAS results were reported down to 20 ppm, so these 33 samples were reported as below the detection limit. For the eleven samples reported as detected by XRF analysis, the XRF results were biased extremely high with respect to the CLP-RAS results. Inspection of the scatter plot (Appendix 2) as well as the 95% confidence bands for the slope and the y-intercept shows that the linear regression was essentially meaningless for chromium.

Copper Regression Results: R= 0.998

Slope	y - Intercept
Upper 95%: 1.781	Upper 95%: -27.31
Value: 1.751	Value: -432.67
Lower 95%: 1.721	Lower 95%: -838.03

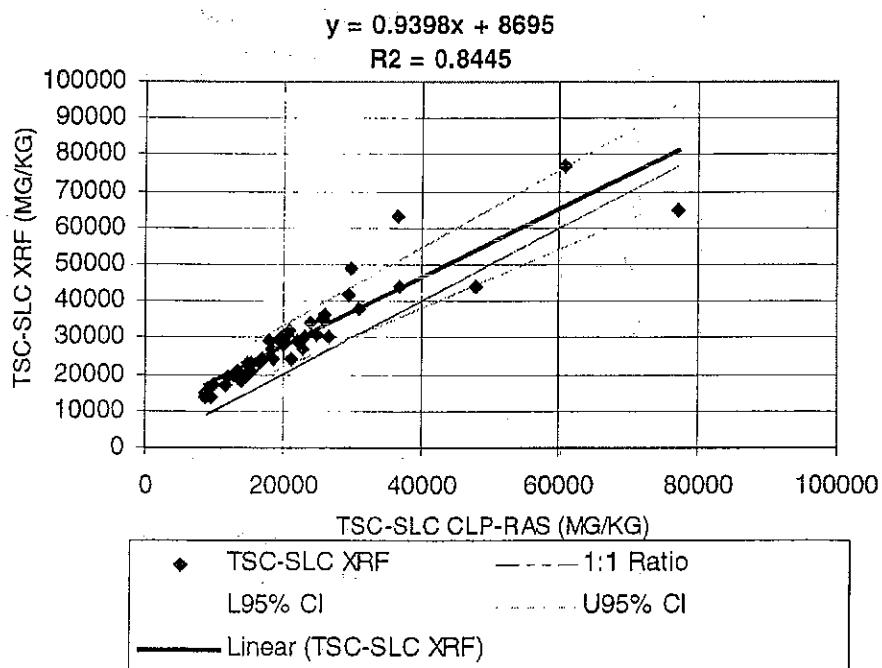

The R value shows a strong correlation between results obtained by the two analytical methods. However, the 95% confidence bands for the slope and y-intercept do not contain the ideal value of 1. Inspection of the slope, the y-intercept value, and the scatter plot (Appendix 2) indicate that XRF values are biased high with respect to CLP-RAS results. The 95% confidence bands are narrow, indicating a high correlation between the two analysis methods. However, the slope and y-intercept values also indicate systematic error due to calibration plots and due to background interference. This is to be expected when, as in this case, a calibration is used that is not specific to the soils being analyzed.

Iron Regression Results: $R = 0.919$

Slope	y - Intercept
Upper 95%: 1.065	Upper 95%: 11927
Value: 0.940	Value: 8695
Lower 95%: 0.814	Lower 95%: 5463

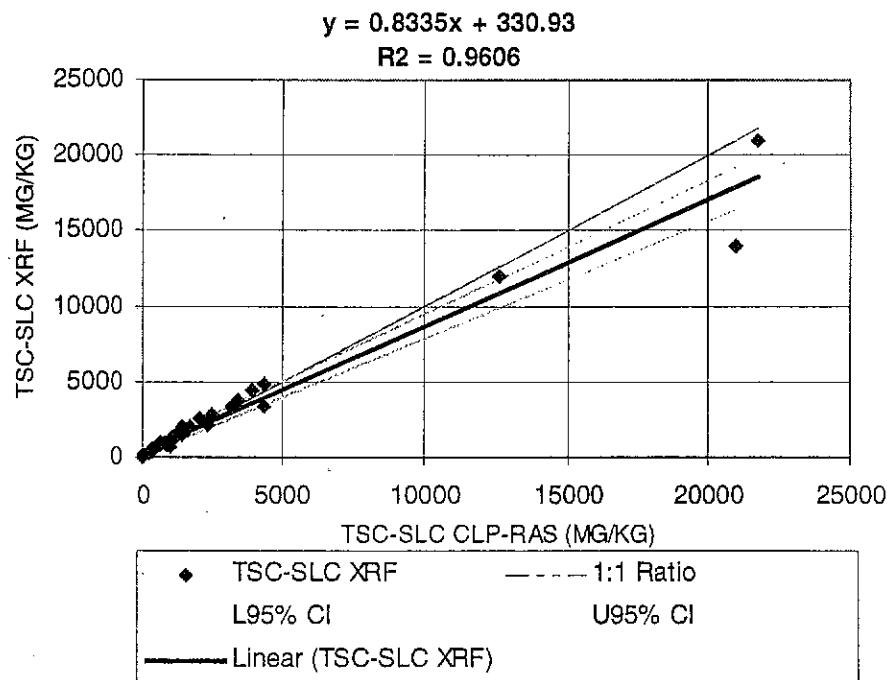

The R value shows a fair correlation between results obtained by the two analytical methods, and the 95% confidence bands for the slope and y-intercept do not contain the ideal value of 1; these bands, however, are comparatively wide, and indicate only a fair precision between the analysis methods. Inspection of the slope, the y-intercept value, and the scatter plot (Appendix 2) indicates that XRF values are biased high with respect to CLP-RAS results, especially at concentrations less than 40,000 ppm. The slope and y-intercept values also indicate systematic error due to calibration plots and due to background interference. This is to be expected when, as in this case, a calibration is used that is not specific to the soils being analyzed.

Lead Regression Results: R = 0.980

Slope	y - Intercept
Upper 95%: 0.886	Upper 95%: 605.7
Value: 0.834	Value: 330.9
Lower 95%: 0.781	Lower 95%: 56.1

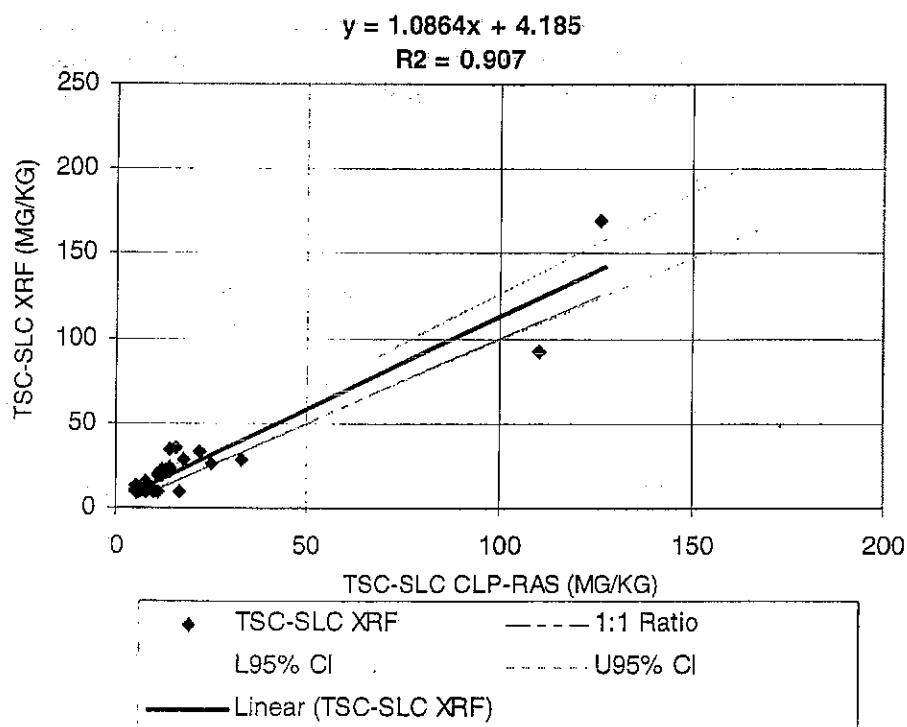

The R value shows good correlation between results obtained by the two analytical methods. Inspection of the scatter plot (Appendix 2) indicates that the correlation is excellent for sample concentrations up to 4,000 ppm. In fact for these lower concentration the 1:1 ratio line falls within the 95% confidence bands, indicating the 95% statistical probability that the XRF value will be equal to the CLP-RAS result. At concentrations higher than 4,000 ppm, however, the 1:1 ratio line lies above the regression line, indicating that at higher concentrations the XRF results are biased low with respect to the results obtained by CLP-RAS. The 95% confidence bands are narrow, indicating a high correlation between the two analysis methods. However, the slope and y-intercept values also indicate systematic error due to calibration plots and due to background interference. This is to be expected when, as in this case, a calibration is used that is not specific to the soils being analyzed.

Selenium Regression Results: $R = 0.952$

Slope		y - Intercept	
Upper 95%:	1.195	Upper 95%:	7.185
Value:	1.086	Value:	4.185
Lower 95%:	0.978	Lower 95%:	1.185

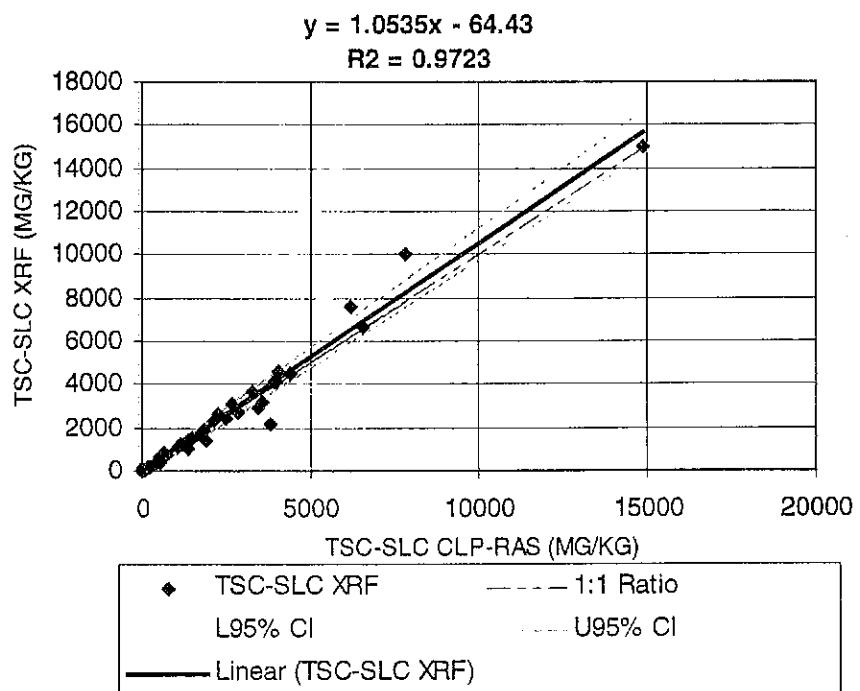

The R value shows a fairly good correlation between results obtained by the two analytical methods, and the 95% confidence bands for the slope do contain the ideal value of 1. However, inspection of the slope, the y-intercept value, and the scatter plot (Appendix 2) indicates that XRF values are biased high with respect to CLP-RAS results. The slope and y-intercept values also indicate systematic error due to calibration plots and due to background interference. This is to be expected when, as in this case, a calibration is used that is not specific to the soils being analyzed.

Zinc Regression Results: R = 0.986

Slope	y - Intercept
Upper 95%: 1.109	Upper 95%: 130.25
Value: 1.054	Value: -64.43
Lower 95%: 0.998	Lower 95%: -259.11

The R value shows a good correlation between results obtained by the two analytical methods. However, the 95% confidence bands for the slope and y-intercept both contain the ideal value of 1, and the 1:1 ratio line lies within the 95% confidence bands for the slope throughout the entire concentration range. This indicates a 95% statistical probability that results obtained by the two methods will be equal over the entire range. Also, the 95% confidence bands for the slope are narrow, indicating a high correlation between the two analysis methods. The y-intercept value, however, is biased low, indicating systematic error due to background interference. This is to be expected when, as in this case, using a calibration that is not specific to the soils being analyzed.
