## Sediment PCLs

## Direct Human Contact Sediment PCLs

Under TRRP (§350.75(i)(15)), sediment PCLs must be established when the TCEQ determines that relevant exposure pathways are complete or are reasonably anticipated to be complete for a given chemical of concern (COC). With sediment contamination, the following human health exposure pathways are assumed to be potentially relevant: incidental ingestion of sediment, dermal contact with sediment, and transfer of COCs from sediment to the tissue of finfish/shellfish within a water body.

Direct human contact sediment PCLs which address the ingestion/dermal contact with sediment pathways are available, and are described in more detail below. Refer to Determining PCLs for Surface Water and Sediment (RG-366/TRRP-24) for a complete discussion of the basis and application of these PCLs. Although the bioconcentration of a contaminant from water into fish/shellfish (and subsequent ingestion by humans) may be addressed in setting surface water PCLs, sediment contamination may also act as a continuing source of contamination to the water column, or contribute to the accumulation of COCs in fish/shellfish tissue through direct biological contact with impacted sediment. Thus, human exposures through the consumption of contaminated fish/shellfish may also be a pathway of concern when addressing sediment contamination, and the direct human contact PCLs cannot be assumed to be protective of transfers to fish/shellfish tissue. These direct human contact sediment PCLs are also clearly not intended to be relevant to ecological receptors. Refer to Determining PCLs for Surface Water and Sediment and Guidance for Conducting Ecological Risk Assessments at Remediation Sites in Texas (RG-263) for information on how to appropriately assess ecological exposures and risks.

## Summary of PCL Development

It is anticipated that individuals may potentially be exposed to COCs in sediment through incidental ingestion of and dermal contact with sediment while wading/recreating. Residential contact equations RBEL-2 (dermal contact with COCs in soil) and RBEL-3 (ingestion of COCs in soil) (see Figure 30 TAC $\S 350.74(a)$ ) were followed to calculate risks/hazards for the sediment exposure pathway. TRRP assumptions were generally applied in calculating the sediment PCLs. However, for several critical parameters, sediment-specific exposure assumptions were necessary as detailed in RG-366/TRRP-24.

Pathway-specific technical details are handled in a manner consistent with the evaluation of TRRP soil exposure pathways. For example, dermal exposure to sediment is not evaluated for those COCs which are defined as volatile organic compounds. Also, certain sediment PCLs (e.g., lead, cadmium, dioxins/furans) are based on alternative chemical-specific technical approaches that are described more fully in TRRP. Although certain site-specific factors may differ among waterbodies, TCEQ recommends that these PCLs only be adjusted when the underlying assumptions are clearly not appropriate for a given waterbody (e.g., documented observations of the actual frequency of recreational contact with sediment).

Note that the sediment PCL table will be updated periodically. At the least, the values will be updated annually in March along with the main PCL and RBEL tables.

| Footnotes |  |  |  |  |  |  |  |  |  |
| ${ }^{1}$ In accordance with $\S 350.72$ (b), when establishing Tier 1 PCLs for individual COCs for each of the individual and combined human health exposure pathways, the person must evaluate whether the PCLs need to be adjusted to lower concentrations to meet the cumulative carcinogenic risk level and hazard index criteria specified §350.72(c). For COCs which exhibit both carcinogenic and noncarcinogenic characteristics, they shall be evaluated as both a carcinogen and noncarcinogen when determining whether the PCL established for an individual COC for each of the individual and combined human health exposure pathways needs to be adjusted to a lower concentration to meet the cumulative risk and hazard criteria. The person shall then use the lower of the carcinogenic or noncarcinogenic PCL as the Tier 1 human health PCL. In other words, the Tier 1 PCLs provided in this table for an individual COC should not be used as the final Tier 1 human health PCL for any of $t$ individual or combined exposure pathways in cases where there are more than 10 carcinogenic and/or more than 10 noncarcinogenic COCs within a source medium unless it can be demonstrated that further downward adjustment is not necessary to meet the cumulative risk and hazard criteria. |  |  |  |  |  |  |  |  |  |
| ${ }^{3} \mathrm{c}=$ carcinogenic; $\mathrm{n}=$ noncarcinogenic |  |  |  |  |  |  |  |  |  |
| *These compounds are not necessarily of concern from a human health standpoint, therefore calculation of human health-based values is not required. However, aesthetics and ecological criteria would still apply. See table entitled "Compounds for which Calculation of a Human Health PCL is Not Required" available on the TCEQ website at http://www.tceq.state.tx.us/remediation/trrp/trrp.html. All values capped at $1 \mathrm{E}+06$ |  |  |  |  |  |  |  |  |  |
