TCEQ Analysis of TCEQ Water Quality Sampling Data

Texas Commission on Environmental Quality (TCEQ) assessed water quality data for up to 71 constituents collected at the sampling site(s). The samples were collected on December 1, 2019 by TCEQ. The constituents consist of total organic carbon, chemical oxygen demand, organics, nutrients, and oil and grease. The samples were the following:

- W012071-01
- W012071-02
- W012071-03
- W012071-04
- W012071-05
- W012071-06

The sampling sites were above the dam on the downstream side (samples W012071-01 through W012071-04) and adjacent to the pipeline crossing in the discharge canal (samples W012071-05 through W012071-06).

TCEQ evaluated sample results as received from the laboratory and is not making a determination regarding the QA/QC of the samples. TCEQ used the Texas Water Quality Standards and the Texas Risk Reduction Program as references for determining the known health protective concentration levels (PCLs) in surface water. PCLs are very conservative and below levels where we would expect any health impacts. TCEQ is using these PCLs to evaluate impacts to aquatic life and human health.

No constituents exceeded their known PCL at the sampling site(s).

Table 1: Assessment of Laboratory Results

Number of Constituents	Table 1. Assessment of Lat.	W012071-01	W012071-02	W012071-03	W012071-04	W012071-05	W012071-06

^{*}Two constituents, oil and grease for sample W012071-04 and naphthalene for sample W012071-06 had an MS/MSD recovery which was found to be outside of the laboratory control limits. These constituents were excluded from the assessment of final laboratory results.

^{**} The water quality parameters ammonia, total Kjeldahl nitrogen, and total organic carbon, are not related to human health; therefore it is not appropriate to develop a human health comparison value to evaluate this parameter. There is no surface water comparison value and consequently it will not be evaluated. These water quality parameters are not directly related to the incident, and the TCEQ is evaluating the chemicals that are directly related to the incident. C6-12, C12-28 and C28-35 range hydrocarbons, as well as total petroleum hydrocarbons, are included in the assessment of oil and grease. Therefore, these constituents are not assessed individually.
