

Texas Natural Resource Conservation Commission

INTEROFFICE MEMORANDUM

To: Interested Parties

Date: September 5, 1997

From: Toxicology & Risk Assessment Section Staff

Subject: 1997 Effects Screening Levels List

Attached is the latest update of the list of Effects Screening Levels (ESLs) currently used by the TNRCC Toxicology & Risk Assessment (TARA) Section Staff. This update replaces the April 15, 1996 list. ESLs are used to evaluate the potential for effects to occur as a result of exposure to concentrations of constituents in air. ESLs are based on data concerning health effects, odor nuisance potential, vegetation effects, or corrosion effects. They are not ambient air standards. If predicted or measured airborne levels of a constituent do not exceed the screening level, we would not expect any adverse health or welfare effects to result. If ambient levels of constituents in air exceed the screening levels, it does not necessarily indicate a problem. It is just a trigger for a more in-depth review.

We would like to call your attention to several notations used on the list. Short- and long-term ESLs are listed. "Short-term" generally indicates a 1-hour averaging period. However, exceptions are noted parenthetically after a constituent name. An **asterisk immediately after the constituent name** signifies the ESL is currently under review, and thus, subject to change. A **double asterisk after the constituent name** indicates the constituent has disaster potential.

Please note that some ESLs have changed or been added since the April 15, 1996 list was published. Most notably, fluorides are no longer regulated by rule, and thus, undergo ESL review. On this year's ESL list, there are two parenthetical notations that may accompany the ESLs of fluoride-containing constituents -- 1) "as HF, 3hr" or 2) "also evaluate as HF." Fluoride-containing constituents with the first notation have a short-term ESL of $4.9 \mu\text{g}/\text{m}^3$ averaged over three hours and a long-term ESL of $0.5 \mu\text{g}/\text{m}^3$ for evaluation from the standpoint of effects on vegetation. These constituents are to be evaluated only for their contribution to total hydrogen fluoride. Fluoride-containing constituents with the second notation have individual hourly and long-term ESLs for evaluation from a health perspective, but must also be evaluated for their contribution to total 3-hour HF for evaluation from the standpoint of effects on vegetation. If a fluoride-containing constituent has no notation, it is to be evaluated using only its individual short- and long-term ESLs.

Also, ESLs for constituents with odor-based short-term ESLs are noted parenthetically and all corresponding long-term ESLs are now a factor of ten lower than the short-term ESL. (Previously, long-term ESLs were not available for all constituents with odor-based short-term ESLs.) These are provided in response to questions regarding what values to use when evaluating long-term emissions in various programs.

If you cannot find a listing for a particular constituent, this does not mean a health effects evaluation is not required. To find out if a screening level has been established for a constituent not on the list,

please check with TARA Staff. Before you call us, please be sure to check synonyms and Chemical Abstract Service Registry numbers (CAS No.) to make sure the constituent you are interested in is not listed. Please feel free to call Zarena Post at (512) 239-1332 or Jong-Song Lee at (512) 239-1790 with any questions.

Hard copies of the ESL list are available upon request.
