

2024 Texas Integrated Report - Waterbodies Evaluated

Explanation of Column Headings

SegID and Name: The unique identifier (SegID), segment name, and location of the water body. The SegID may be one of three types of numbers. The first type is a classified segment number (4 digits, e.g., 0218), as defined in the Texas Surface Water Quality Standards (TSWQS). The second type is a water body described in Appendix D of the TSWQS, or an unclassified water body, not defined in the TSWQS, though associated with a classified water body in the same watershed. The third type include special Segments for Oyster Water Use (e.g., 2421OW) and Beach Watch Use (e.g., 2481CB) special areas.

Segment Description: Describes a specific location of the water body

Segment Type: The type of water body (e.g., Reservoir, Estuary, Freshwater Stream, Tidal Stream etc).

AU_ID and Description: Identifies the assessment unit (AU_ID, six or seven digits, e.g., 0101A_01) and describes a specific area within a classified or unclassified water body. This report includes all Assessment Units (AUs) identified for each Segment, including those without assessments.

Flow Type: Type of flow regime (perennial, intermittent, intermittent with perennial pools) for streams. For non-stream water bodies, Flow type and Segment Type are typically the same.

Flow Type Source: This is the reference source used to determine the flow type of an AU.

ALU Designation: This is the designated Aquatic Life Use (ALU) associated with the AU (exceptional, high, intermediate, limited, and minimal).

ALU Designation Source: This is the reference source of the ALU designation.

Station ID(s): Station IDs are the numbers that identify specific monitoring sites associated an AU ID, but do not necessarily indicate data were available from that station for the period of record. Some assessment units do not have monitoring stations; other information may have been evaluated to determine support status for those AUs.
